discharges and all discharges that contain a hazardous substance in excess of reportable quantities established in Title 40, Sections 117.3 or 302.4 of the CFR, unless a separate NPDES permit has been issued to regulate those discharges. The Construction General Permit requires that all developers of land where construction activities will occur over more than 1 acre do the following:

- Complete a risk assessment to determine pollution prevention requirements pursuant to the three risk levels established in the General Permit;
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the US;
- Develop and implement a SWPPP, which specifies BMPs that will reduce pollution in stormwater discharges to the Best Available Technology Economically Achievable/ Best Conventional Pollutant Control Technology standards; and
- Perform inspections and maintenance of all BMPs.

To obtain coverage under the NPDES Construction General Permit, the Legally Responsible Person must electronically file all permit registration documents with the SWRCB before the start of construction. Permit registration documents must include:

- Notice of Intent,
- Risk Assessment,
- Site Map,
- SWPPP,
- Annual Fee, and
- Signed Certification Statement.

Typical BMPs contained in SWPPPs are designed to minimize erosion during construction, stabilize construction areas, control sediment, control pollutants from construction materials, and address post construction runoff quantity (volume) and quality (treatment). The SWPPP must also include a discussion of the program to inspect and maintain all BMPs.⁴⁵

⁴⁵ State Water Resources Control Board. *Construction General Permit Fact Sheet*. Available online at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/constpermits/wqo_2009_0009_compl_ete.pdf, accessed August 27, 2019.

Industrial General Permit

The Statewide General Permit for Storm Water Discharges Associated with Industrial Activities, Order 2014-0057-DWQ (Industrial General Permit or IGP) implements the federally required storm water regulations in California for storm water associated with industrial activities discharging to waters of the United States.⁴⁶

Municipal Stormwater Program

The Municipal Storm Water Program regulates storm water discharges from municipal separate storm sewer systems (MS4s) throughout California. Pursuant to the Federal Water Pollution Control Act (Clean Water Act) section 402(p), storm water permits are required for discharges from an MS4 serving a population of 100,000 or more. The Municipal Storm Water Program manages the Phase I Permit Program (serving municipalities over 100,000 people), the Phase II Permit Program (for municipalities less than 100,000), and the Statewide Storm Water Permit for the State of California Department of Transportation (Caltrans).⁴⁷

Caltrans is responsible for the design, construction, management, and maintenance of the State highway system, including freeways, bridges, tunnels, Caltrans' facilities, and related properties, and is subject to the permitting requirements of CWA Section 402(p). Caltrans' discharges consist of storm water and non-storm water discharges from state-owned rights-of-way.

Before July 1999, discharges from Caltrans' MS4 were regulated by individual NPDES permits issued by the RWQCBs. On July 15, 1999, the SWRCB issued a statewide permit (Order No. 99-06-DWQ) that regulated all discharges from Caltrans MS4s, maintenance facilities, and construction activities.⁴⁸ On September 19, 2012, Caltrans' permit was reissued (Order No. 2012-0011-DWQ), and it became effective on July 1, 2013.⁴⁹

- ⁴⁷ State Water Resources Control Board. *Municipal Stormwater Program*. Available at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/municipal.html, accessed October 31, 2019.
- ⁴⁸ Caltrans. *Stormwater & Water Pollution Control*. Available online at: <https://dot.ca.gov/programs/traffic-operations/ep/stormwater>, accessed August 27, 2019.
- ⁴⁹ California State Water Resources Control Board. *Order No. 2012-0011-DWQ NPDES No. CAS000003 National Pollutant Discharge Elimination System (NPDES) Statewide Storm Water Permit Waste Discharge Requirements (WDRS) for State of California Department of Transportation*. Available online at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2012/wqo2012_0011_dwq.pdf, accessed August 27, 2019.

The Caltrans permit requires development of a program for communication with local agencies, and coordination with other MS4 programs where those programs overlap geographically with Caltrans facilities. As part of the permit, Caltrans is required to create and annually update a Stormwater Management Plan (SWMP) that is used to outline the regulation of pollutant discharge caused by current and future construction and maintenance activities. SWMP requirements apply to discharges from Caltrans stormwater conveyances, including catch basins and drain inlets, curbs, gutters, ditches, channels, and storm drains. The SWMP applies to discharges consisting of stormwater and non-stormwater resulting from the following:

- maintenance and operation of state-owned highways, freeways, and roads;
- maintenance facilities;
- other facilities with activities that have the potential for discharging pollutants;
- permanent discharges from subsurface dewatering;
- temporary dewatering; and
- construction activities.

Caltrans' Storm Water Management Plan (SWMP) describes the procedures and practices used to reduce or eliminate the discharge of pollutants to storm drainage systems and receiving waters. The SWMP was most recently updated in July of 2016.⁵⁰

California Green Building Standards Code

Chapters 4 and 5 of the California Green Building Standards Code (CalGreen) include mandatory measures for residential and nonresidential development, respectively. Section 4.106.2 requires residential projects that disturb less than 1 acre and are not part of a larger common plan of development, manage stormwater drainage during construction through use of on-site retention basins, filtration systems where stormwater is conveyed to a public drainage system, and/or compliance with a stormwater management ordinance. Section 5.106.1 requires newly constructed nonresidential projects and additions of less than one acre to prevent the pollution of stormwater runoff because of construction

⁵⁰ Caltrans. 2016. *Statewide Stormwater Management Plan*. Available online at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/caltrans/swmp/swmp_approved.pdf, accessed August 27, 2019.

through compliance with a local ordinance or implementing BMPs that address soil loss and good housekeeping to manage equipment, materials, and wastes.⁵¹

California Fish and Game Code

The California Department of Fish and Wildlife (CDFW) is responsible for conserving, protecting, and managing California's fish, wildlife, and native plant resources. To meet this responsibility, the Fish and Game Code (Section 1602) requires an entity to notify CDFW of any proposed activity that may substantially modify a river, stream, or lake. Notification is required by any person, business, state or local government agency, or public utility that proposes an activity that will:

- substantially divert or obstruct the natural flow of any river, stream or lake;
- substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake;
or
- deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

The notification requirement applies to any work undertaken in or near a river, stream, or lake that flows at least intermittently through a bed or channel. This includes ephemeral streams, desert washes, and watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a body of water.⁵²

California Ocean Plan

The California Ocean Plan establishes water quality objectives for California's ocean waters and provides the basis for regulation of wastes discharged into the state's coastal waters. The plan applies to point and nonpoint source discharges. Both the SWRCB and the six coastal RWQCBs implement and interpret the California Ocean Plan. The California Ocean Plan identifies the applicable beneficial uses of marine waters. These beneficial uses include preservation and enhancement of designated Areas of Special Biological Significance (ASBS), rare and endangered species, marine habitat, fish migration, fish spawning, shellfish harvesting, recreation, commercial and sport fishing, mariculture, industrial water supply, aesthetic enjoyment, and navigation.

⁵¹ California Building Standards Commission. 2017. *2016 California Green Building Standards Code*. Available online at: https://ladbs.org/docs/default-source/publications/code-amendments/2016-calgreen_complete.pdf?sfvrsn=6, accessed August 27, 2019.

⁵² California Legislative Information. *Chapter 6. Fish and Wildlife Protection and Conservation [1600-1617], Section 1602*.

The California Ocean Plan establishes a set of narrative and numerical water quality objectives to protect beneficial uses. These objectives are based on bacterial, physical, chemical, and biological characteristics as well as radioactivity. The water quality objectives in Table 1 (formerly Table B) of the California Ocean Plan apply to all receiving waters under the jurisdiction of the plan and are established for the protection of aquatic life and for the protection of human health from both carcinogens and noncarcinogens. Within Table 1 there are 21 objectives for protecting aquatic life, 20 for protecting human health from noncarcinogens, and 42 for protecting human health from exposure to carcinogens. The Ocean Plan also includes an implementation program for achieving water quality objectives. Effluent limitations are established for the protection of marine waters.⁵³

Urban Water Management Planning Act

In 1983, the California Legislature enacted the Urban Water Management Planning Act (Water Code, Section 10610 et seq.), which requires urban water suppliers to develop water management plans to actively pursue the efficient use of available supplies. Every five years, water suppliers are required to develop Urban Water Management Plans (UWMPs) to identify short-term and long term water demand management measures to meet growing water demands.⁵⁴

Conservation Requirements

Executive Order B-37-16 established a new water use efficiency framework for California. The order bolstered the state's drought resilience and preparedness by establishing longer-term water conservation measures that include permanent monthly water use reporting, new urban water use targets, reducing system leaks and eliminating clearly wasteful practices, strengthening urban drought contingency plans and improving agricultural water management and drought plans. Based on monthly water use reporting, most urban water suppliers reported sufficient supplies to meet demand in three additional dry years and are not subject to state conservation mandates. On February 8, 2017, SWRCB adopted an emergency water conservation regulation to amend and extend the May 2016 regulation. The amended regulation allows certain suppliers the opportunity to submit or resubmit their water supply reliability assessments.⁵⁵

California State Lands Commission

The California State Lands Commission (SLC) provides stewardship of California's public trust lands, waterways, and resources through economic development, protection, preservation, and restoration. The SLC is tasked with public land management and resource protection to ensure the future quality of the environment and balanced use of the lands and resources entrusted to its care. The State's public trust lands include tidelands, navigable waterways, and submerged coastal lands extending to a distance of three nautical miles, as well as the waters and underlying beds of more than 120 rivers, lakes, streams, and sloughs.

The California SLC regulates the use of tidelands and submerged lands under its jurisdiction to ensure that proposed uses of these lands are consistent with the Public Trust Doctrine principle that certain resources are preserved for public use. Generally, the SLC has jurisdiction over land below mean high tide (MHT). Public and private entities may apply to the SLC for land leases or permits on State lands for many purposes including dredging among others. CGC Section 65940 describes the degree of specificity and contents required for a surface land lease application.

California Geological Survey Tsunami Inundation Maps

The California Geological Survey provides geologic and seismic expertise to the public, other State government offices, and local government agencies (cities and counties). The California Geological Survey is working closely with the California Emergency Management Agency (Cal EMA) and the University of Southern California Tsunami Research Center to produce statewide tsunami inundation maps for California. These maps are used by coastal communities to produce emergency evacuation plans. The Cal EMA provides generalized maps for projected tsunami inundation to coastal government agencies for emergency planning purposes. These maps are used as a basic guideline for what areas are prone to tsunami inundation.

California Coastal Commission Sea-Level Rise Policy Guidance

The CCC has developed Sea-Level Rise Policy Guidance intended to help local governments, permit applicants, and other interested parties address the challenges presented by sea-level rise in California's coastal zone. The CCC's adopted Sea-Level Rise Policy Guidance outlines the types of information, analysis, and design considerations that the agency's staff requires to determine whether shoreline projects conform to the above-listed Coastal Act policies. Specifically, the Sea-Level Rise Policy Guidance provides step-by-step guidance on how to address sea-level rise in new and updated Local Coastal Programs (LCPs) and Coastal Development Permits (CDPs) according to the policies of the California Coastal Act. LCPs and the CDP processes are the fundamental land use planning and regulatory

governing mechanisms in the coastal zone. While it is advisory, the data requirements, resource considerations, projections for sea-level rise, alternatives analyses, and monitoring requirements outlined in detail in the CCC's Sea-Level Rise Policy Guidance represent information that would likely be required to produce as part of the CCC's evaluation of coastal projects in conformance with Sections 30235 and 30253 of the Coastal Act. Specifically, the Sea-Level Rise Policy Guidance outlines that projects will need to be planned, located, designed, and engineered for the changing water levels and associated impacts that might occur over the life of the development. In addition, project planning should anticipate the migration and natural adaptation of coastal resources (beaches, access, etc.) due to future sea-level rise conditions in order to avoid future impacts to those resources from the new development.

The most recent update in 2018 of the Sea-Level Rise Guidance document aims to respond to the needs for guidance that can help cities, counties and the State prepare for, and adapt to, sea-level rise. The 2018 update provides a science-based methodology for state and local governments to analyze and assess the risks associated with sea-level rise, and to incorporate sea-level rise into their planning, permitting, and investment decisions. The Guidance expands the preferred coastal adaptation planning approaches, incorporating existing law, expressed policy preferences by the Governor and Legislature, and the goal of fostering consistency across coastal and ocean government agencies. Some recommendations include protection of coastal habitats and public access, adaptation strategies that prioritize protection of vulnerable communities, and adaptive capacity should be built in to design and planning.⁵⁶

California Stormwater Quality Association BMP Handbooks

The California Stormwater Quality Association (CASQA) is a professional member association dedicated to the advancement of stormwater quality management through collaboration, education, implementation guidance, regulatory review, and scientific assessment. CASQA's membership is comprised of a diverse range of stormwater quality management organizations and individuals, including cities, counties, special districts, industries, and consulting firms throughout the state. CASQA develops and publishes four BMP Handbooks. The New Development and Redevelopment Handbook provides guidance on developing project specific SWMPs, including selection and implementation of BMPs, for a particular development or redevelopment project.⁵⁷

⁵⁶ California Natural Resources Agency. 2018. State of California Sea-Level Rise Guidance. Available at: http://www.opc.ca.gov/webmaster/ftp/pdf/agenda_items/20180314/Item3_Exhibit-A OPC SLR Guidance-rd3.pdf, accessed September 17, 2019.

3.10.2.3 Regional

Water Quality Control Plan for the Central Coastal Basin

The Water Quality Control Plan for the Central Coastal Basin, or basin plan, identifies how the quality of the surface and ground waters in the Central Coast Region should be managed to provide the highest water quality reasonably possible. This basin plan lists the various water uses. Second, it describes the water quality which must be maintained to allow those uses. It then describes the programs, projects, and other actions which are necessary to achieve the standards established in this plan. It summarizes SWRCB and RWQCB plans and policies to protect water quality, and describes statewide surveillance and monitoring programs as well as regional surveillance and monitoring programs. The Regional Board implements the basin plan by issuing and enforcing waste discharge requirements to individuals, communities, or businesses whose waste discharges can affect water quality. These requirements can be either state waste discharge requirements for discharges to land, or federally delegated NPDES permits for discharges to surface water. Methods of treatment are not specified. When such discharges are managed so that: (1) they meet these requirements, (2) water quality objectives are met, and (3) beneficial uses are protected and water quality is controlled. The basin plan is also implemented by encouraging water users to improve the quality of their water supplies, particularly where the wastewater they discharge is likely to be reused. Public works or other projects which can affect water quality are reviewed and their impacts identified. Proposals which implement or help achieve the goals of the basin plan are supported; the Regional Board makes water quality control recommendations for other projects.⁵⁸

Water Quality Control Plan for the Los Angeles Region

The RWQCB has prepared a Water Quality Control Plan for the Los Angeles Region. This basin plan encompasses all coastal drainages flowing to the Pacific Ocean between Rincon Point (on the coast of western Ventura County) and the eastern Los Angeles County line, as well as the drainages of five coastal islands (Anacapa, San Nicolas, Santa Barbara, Santa Catalina, and San Clemente). In addition, the Los Angeles region includes all coastal waters within three miles of the continental and island coastlines. As the eastern boundary, formed by the Los Angeles County line, departs somewhat from the hydrologic divide, the Los Angeles and Santa Ana regions share jurisdiction over watersheds along their common border.

⁵⁸ California Water Boards. 2019. *Water Quality Control Plan for the Central Coastal Basin*. Available online at: https://www.waterboards.ca.gov/centralcoast/publications_forms/publications/basin_plan/docs/2019_basin_plan_r3_complete.pdf, accessed August 27, 2019.

This basin plan assigned beneficial uses to surface and groundwater such as municipal water supply and water-contact recreation to all waters in the basin. It also set water quality objectives, subject to approval by the EPA, intended to protect designated beneficial uses. These objectives apply to specific parameters (numeric objectives) and general characteristics of the water body (narrative objectives). An example of a narrative objective is the requirement that all waters must remain free of toxic substances in concentrations producing detrimental effects upon aquatic organisms. Numeric objectives specify concentrations of pollutants that are not to be exceeded in ambient waters of the basin. The Los Angeles RWQCB is involved in the regulation of several activities that are relevant to the consideration of the basin plan:

- Prepares, monitors compliance with, and enforces Waste Discharge Requirements, including NPDES permits;
- Implements and enforces local stormwater control efforts;
- Enforces water quality laws, regulations, and waste discharge requirements; and
- General Construction Activity Stormwater Discharges

Stormwater discharges that are composed entirely of runoff from qualifying construction activities may require regulation under the General Construction Activity Storm Water Permit issued by the SWRCB. Construction activities that qualify include clearing, grading, excavation, reconstruction, and dredge-and-fill activities that result in the disturbance of at least one acre and less than five acres of total land area. The evaluation of the plan does not generate the need for compliance with the Construction General Permit. The development of single-family residences would require permit coverage if the development disturbs greater than one acre of land. Additionally, the plan would require the consideration of a Standard Urban Stormwater Management Plan (SUSMP) as part of compliance with the NPDES General Construction Activity Storm Water Permit to reduce water quality impacts to the maximum extent practicable. A SUSMP is a report that includes one or more site maps, an identification of construction activities that could cause pollutants to enter the stormwater, and a description of measures or BMPs to control these pollutants to the maximum extent practicable.⁵⁹

⁵⁹ California Water Boards. 2019. *Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*. Available online at: https://www.waterboards.ca.gov/losangeles/water_issues/programs/basin_plan/basin_plan_documentation.html, accessed August 27, 2019.

Water Control Plan for the Lahontan Region

This basin plan for the Lahontan Region sets forth water quality standards for the surface and ground waters which include both designated beneficial uses of water and the narrative and numerical objectives which must be maintained or attained to protect those uses. It identifies general types of water quality problems, which can threaten beneficial uses. It then identifies required or recommended control measures for these problems. The plan also summarizes past and present water quality monitoring programs, and identifies monitoring activities, which should be carried out to provide the basis for future basin plan updates and for waste discharge requirements or conditional waivers.

Additionally, the Lahontan basin plan implements a number of state and federal laws, the most important of which are the federal CWA and the State Porter-Cologne Water Quality Control Act. Other pertinent federal laws include the Safe Drinking Water Act, Toxic Substances Control Act, Resource Conservation and Recovery Act, and Endangered Species Act, and the Comprehensive Response, Compensation, and Liability Act (CERCLA or “Superfund”) and Superfund Amendment and Reauthorization Act (SARA). Other applicable California laws include the Health and Safety, Fish and Game, and Food and Agriculture Codes.⁶⁰

Water Control Plan for the Colorado River Basin

The intent of this basin plan is to provide definitive guidelines and give direction to the full scope of activities that serve to optimize the beneficial uses of the state waters within the Colorado River Basin by preserving and protecting the quality of these waters. Water uses and water benefits vary. Water quality is an important factor in determining use and benefit. For example, drinking water must be of higher quality than the water used to irrigate pastures. Both are beneficial water uses, but the quality requirements for irrigation water are different from those for drinking water. The basin plan recognizes the variations of water quality and water uses. The basin plan lists and defines the various beneficial water uses (Chapter 2). It describes the water quality which must be maintained to support such uses (Water Quality Objectives, Chapter 3). The section on implementation (Chapter 4) describes the programs, projects and other actions that are necessary to achieve the standards established in this basin plan. Plans, Policies and Issues (Chapter 5), summarize the various plans and policies which protect water quality. This chapter also describes water quality issues which require special attention.

⁶⁰ California Environmental Protection Agency. *Water Quality Control Plan for the Lahontan Region (Basin Plan)*. Available online at: https://www.waterboards.ca.gov/lahontan/water_issues/programs/basin_plan/references.shtml, accessed August 27, 2019.

Surveillance and Monitoring (Chapter 6), describes activities within the Colorado River Basin Region related to surveillance, monitoring, assessment, lab support, and quality assurance and quality control.⁶¹

Water Quality Control Plan for the Santa Ana River Basin

This basin plan establishes water quality standards for the ground and surface waters of the region. The term “water quality standards,” as used in the federal CWA, includes both the beneficial uses of specific waterbodies and the levels of quality that must be met and maintained to protect those uses. The plan describes actions by the Regional Board and others that are necessary to achieve and maintain water quality standards. The Regional Board regulates waste discharges to minimize and control their effect on the quality of the region’s ground and surface water. Permits are issued under several programs and authorities. The terms and conditions of these discharge permits are enforced through a variety of technical, administrative, and legal means. Water quality problems in the region are listed in the plan, along with the causes, where they are known. For waterbodies with quality below the levels necessary to allow all the beneficial uses of the water to be met, plans for improving water quality are included.⁶²

Water Quality Control Plan for the San Diego Basin

The San Diego Regional Board's basin plan is designed to preserve and enhance water quality and protect the beneficial uses of all regional waters. Specifically, the plan: (1) designates beneficial uses for surface and ground waters, (2) sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the state’s antidegradation policy, (3) describes implementation programs to protect the beneficial uses of all waters in the region, and (4) describes surveillance and monitoring activities to evaluate the effectiveness of the plan (California Water Code sections 13240–13244, section 13050(j)). Additionally, the plan incorporates by reference all applicable state and regional board plans and policies.⁶³

3.10.2.4 Local

County of Los Angeles General Plan

As part of the Conservation and Natural Resources Element of the 2040 General Plan Update, the Board of Supervisors of the County of Los Angeles has adopted three goals for water quality initiatives related to hydrology and water quality and two goals related to watershed and river master plans:⁶⁴

Water Quality Initiatives

- Support multi-benefit outcomes, such as water quality benefits arising from ecosystem restoration efforts, and identify, attract, and create funds and resources to implement this initiative.
- Participate in enhanced watershed management programs and watershed management programs in coordination with other agencies throughout Los Angeles County.
- Participate in coordinated integrated watershed monitoring plans in coordination with other agencies throughout Los Angeles County.

Watershed and Rivers Master Plans

- Participate with stakeholders in the preparation of watershed management plans in response to the NPDES MS4 Permit by promoting multi-benefit outcomes, including, but not limited to new public access to natural resources, new recreational opportunities, enhanced aquatic habitats, and restored natural features, where appropriate, while maintaining necessary levels of flood protection.
- Identify, attract, and create funds and resources to implement these plans.

County of Riverside General Plan

The County of Riverside General Plan specifically addresses hydrology and water quality in four categories: water resources, water quality (including groundwater quality), floodplain management, and wetlands.⁶⁵

⁶⁴ Los Angeles Department of Regional Planning. *General Plan, Chapter 9: Conservation and Natural Resources Element*. Available online at: <http://planning.lacounty.gov/generalplan/generalplan>, accessed August 27, 2019.

⁶⁵ Riverside County Planning Department. 2015. *General Plan Multipurpose Open Space Element*. Available online at: [https://planning.rctlma.org/Portals/14/genplan/general Plan 2017/elements/OCT17/Ch05 MOSE 120815.pdf?ver=2017-10-11-102103-833](https://planning.rctlma.org/Portals/14/genplan/general%20Plan%202017/elements/OCT17/Ch05%20MOSE%20120815.pdf?ver=2017-10-11-102103-833), accessed August 27, 2019.

Water Resources

The General Plan acknowledges that contamination from natural or manufactured sources has reduced groundwater quality such that its use requires treatment. Management of the amount of water available (local and imported) and its quality, is identified as an important response to the gap between supply and demand in Riverside County. The General Plan provides policies that seek to protect and enhance the water resources in the county. These policies address broad water planning issues, and the relationship of land use decisions to water issues.

Water Quality

The General Plan recognizes BMPs established by the three applicable RWQCBs, Regions 7, 8, and 9 to provide state-level water quality policy and NPDES as effective means of managing water quality problems that have occurred in Riverside County. Such problems are related to inadequate subsurface sewage disposal, waste disposal management of the Santa Ana River, agriculturally related problems such as citricultural runoff in the western county and increasing salinity of the desert groundwater basins, sediment buildup of water bodies from construction-related erosion, lake water quality problems, and pollution due to urban stormwater system runoff.

Floodplain and Riparian Area Management

The intent of the county is to sustain living riparian habitats to the maximum extent possible, recognizing that flooding is part of the dynamic nature of healthy rivers and ecosystems. High flows and flood waters are needed to cleanse the channels of accumulated debris, build stream banks, import gravels for aquatic life, thin riparian forests and create riparian habitat. The open space of floodplains adjacent to rivers and streams helps store and slowly release floodwaters, thus reducing flood flow and peaks and their subsequent impacts during small and frequent flood events. Further, riparian habitat within floodplains is of great value to resident and migratory animal species, as it provides corridors and linkages to and from the biotic regions of the county. The numerous essential habitat elements provided by the remaining riparian corridors of Riverside County make them a significant contributor to wildlife habitat throughout the county.

Wetlands

The General Plan provides specific policies for the protection of wetlands including the requirement to ensure compliance with the Section 404 of the federal CWA in terms of wetlands mitigation policies and policies concerning fill material in jurisdictional wetlands during development review and approval process; preservation of buffer zones around wetlands where feasible and biologically appropriate; and

consideration of wetlands for use as natural water treatment areas that will result in improvement of water quality.

San Bernardino County General Plan

San Bernardino County has established goal and policies to ensure coordination and cooperation with governmental agencies at all levels to ensure safe, reliable, and high-quality water supply for all residents and ensure prevention of surface and ground water pollution. The County General Plan provides specific policies for adherence to federal and state water quality standards for surface and groundwater and wastewater discharge requirements in the review of development proposals that relate to type, location and size of the project to safeguard public health. Similarly, the County General Plan specifies the need to work with the RWQCBs to establish uniform criteria for appropriate sewerage options for new development. The County General Plan further directs cooperation with state, regional, and responsible authorities to expand water sampling programs to determine ambient groundwater quality conditions affecting public, agricultural, and private wells. Identify the sources, extent, and types of organic and inorganic groundwater contaminants, and evaluation of their impacts on groundwater resources. The County General Plan calls for the prevention of surface and groundwater pollution through continued cleanup of contaminated waters and watersheds.⁶⁶

Imperial County General Plan

The Imperial County General Plan provides specific goals and policies related to maintaining the viability of the Salton Sea and other surface water resources in the county.⁶⁷

- **Goal 2:** Long-term viability of the Salton Sea, Colorado River, and other surface waters in the County will be protected for sustaining wildlife and a broad range of ecological communities.
 - **Objective 2.1:** The continued viability of the agricultural sector as an important source of surface water for the maintenance of valuable wildlife and recreational resources in the County.
 - **Objective 2.2:** A balanced ecology associated with the riparian and ruderal biological communities important as breeding and foraging habitats for native and migratory birds and animals occurring within the County.

⁶⁶ San Bernardino County Land Use Services. 2007. *County of San Bernardino 2007 General Plan*. Available online at: <http://www.sbcounty.gov/Uploads/lus/GeneralPlan/FINALGP.pdf>, accessed August 27, 2019.

⁶⁷ Imperial County Planning/Building Department. 1997. *Imperial County General Plan Water Element*. Available online at: <http://www.icpds.com/CMS/Media/Water-Element.pdf>, accessed August 27, 2019.

- **Objective 2.3:** Preservation of riparian and ruderal habitats as important biological filters as breeding and foraging habitats for native and migratory birds and animals.

Orange County General Plan

In the Orange County region, the protection of water quality is a major concern. The need to maintain safe water quality may constrain the development of energy resources, from methane (landfills) and geothermal sources. At a minimum, water quality concerns will need to be considered during the process of developing these resources and water intensive resources such as agriculture.

Development of land and the increase in population density has also created new sources of non-stormwater discharges and pollutants in stormwater discharges. The San Diego and Santa Ana RWQCBs require that water quality and watershed protection principles are considered as part of land use planning and development review.

Drainage Area Management Plan (DAMP)

The specific water pollutant control elements of the Orange County Stormwater Program are documented in the 2003 Drainage Area Management Plan (DAMP) which is the County of Orange, incorporated cities of Orange County, and Orange County Flood Control District's (collectively referred to as Permittees) primary policy, planning and implementation document for municipal NPDES Stormwater Permit compliance. The DAMP was prepared and is periodically updated using a consensus building process that involving public and private sector input and public review through the CEQA process.⁶⁸

The DAMP describes the agreements, structures and programs that:

- Provide the framework for the program management activities and plan development (DAMP Section 2.0 and Section 3.0);
- Provide the legal authority for prohibiting unpermitted discharges into the storm drain system and for requiring BMPs in new development and significant redevelopment (DAMP Section 4.0);
- Improve existing municipal pollution prevention and removal best management practices (BMPs) to further reduce the amount of pollutants entering the storm drain system (DAMP Section 5.0);

⁶⁸ Orange County Public Works. *2003 Drainage Area Management Plan (DAMP)*. Available online at: <https://cms.ocgov.com/gov/pw/watersheds/documents/damp/mapplan.asp>, accessed August 27, 2019.

- Educate the public about the issue of urban stormwater and non-stormwater pollution and obtain their support in implementing pollution prevention BMPs (DAMP Section 6.0);
- Ensure that all new development and significant redevelopment incorporates appropriate Site Design, Source Control and Treatment Control BMPs to address specific water quality issues (DAMP Section 7.0);
- Ensure that construction sites implement control practices that address control of construction related pollutants discharges including erosion and sediment control and on-site hazardous materials and waste management (DAMP Section 8.0);
- Ensure that existing development will address discharges from industrial facilities, selected commercial businesses, residential development and common interest areas/homeowner associations (Note: The San Diego permit explicitly outlines a residential component, but the Santa Ana permit is more general about residential requirements) (DAMP Section 9.0);
- Detect and eliminate illegal discharges/illicit connections to the municipal storm drain system (DAMP Section 10.0);
- Identify impacted receiving waters and produce environmental quality information to direct management activities, including prioritization of pollutants to support the development of specific controls to address these problems (DAMP Section 11.0); and
- Assess watersheds and manage urban runoff on a watershed basis (DAMP Section 12.0).

One of the major challenges for the Permittees in updating the programs was the reconciliation between the two Regional Board permits and the resulting program requirements that have significant differences for the first time. As a result of this separation, the 2003 DAMP now includes Local Implementation Plans (LIPs – also termed Jurisdictional Urban Runoff Management Programs – JURMP – in the San Diego Regional Board Third Term Permit). The LIPs were created to assist each Permittee in implementing an increasingly complex program within its jurisdiction while maintaining a single policy document that addresses two sets of permit requirements.⁶⁹ The LIPs were completed by the San Diego Permittees in February 2003 and by the Santa Ana Permittees in June 2003.

⁶⁹ Orange County Public Works. *Drainage Area Management Plan (DAMP), Appendix A – Stormwater Program Local Implementation Plan (LIP)*. Available online at: <https://media.ocgov.com/gov/pw/watersheds/documents/damp/lip.asp>, accessed August 27, 2019.

The requirement to overlay separate, but nonetheless, highly interrelated water quality protection and planning processes based on hydrologic rather than political boundaries was addressed through the creation of Watershed Action Plans (WAP). A WAP (see DAMP Appendix D) was created for each of the six watersheds under the jurisdiction of the San Diego Regional Board in August 2003. A model WAP was created for the Newport Bay watershed during 2005-06 and draft WAPs are being prepared for the other watersheds in the area of Orange County under the jurisdiction of the Santa Ana Regional Board.⁷⁰

Ventura County General Plan

The Ventura County General Plan provides specific goals and policies related to the inventory and monitoring of water quantity and quality to facilitate effective management of the resources. The Ventura County General Plan has identified ten specific programs to support achievement of the goals and policies. The programs include:

- Support of the Seawater Intrusion Abatement Project;
- Enforcement of Chapter 70 (Excavation and Grading) of the Uniform Building Code, as incorporated by reference in and amended by the Ventura County Building Code, to ensure that any proposed grading in a waterway or wetland is adequately investigated and that any development incorporates appropriate design provisions to protect waterways or wetlands;
- Support the Fox Canyon Groundwater Management Agency Plan for both the Upper and Lower Aquifer Systems;
- Continued coordination with water districts and other appropriate agencies to establish a data base on actual available supply, projected use factors for types of land use and development, and threshold limits for development within available water resources;
- Planning Division will continue to promote of the efficient use of water through the Landscape Design Criteria Program;
- Cooperation between the Public Works Agency and the Environmental Health Division, to pursue the use of reclaimed water for agricultural irrigation;
- Continued monitoring, inspection and regulation of underground storage tanks;

⁷⁰ Orange County Public Works. *Drainage Area Management Plan (DAMP)*. Available online at: <https://cms.ocgov.com/gov/pw/watersheds/documents/damp/default.asp>, accessed August 27, 2019.

- Identification of waste disposal sites and seek to mitigate impacts to water resources; and consideration of the Board of Supervisors of a Countywide water conservation retrofit program to fund the installation of water conservation fixtures) for businesses and residents located within Ventura County.⁷¹

City General Plan and Ordinances

In accordance with Sections 65560(g) of the California Government Code, all cities are required to have a conservation element as part of their General Plans.⁷² The conservation element provides goals and policies related to conservation, development, and utilization of natural resources including water and its hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources. One of the six required aspects of the open space element is for planning, conservation and management of open space for the preservation of natural resources, including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, bays and estuaries; and coastal beaches, lakeshores, banks of rivers and streams, and watershed lands. In addition, many cities have ordinances related to protection, conservation and management of natural water resources consistent with the applicable beneficial uses stipulated in the applicable RWQCB basin plan.

Furthermore, some local jurisdictions have started to address climate change impacts such as sea level rise in policy documents. For example, the City of Long Beach developed a draft of its Climate Action and Adaptation Plan (CAAP) to help reduce greenhouse gas (GHG) emissions, prepare the community for the impacts of climate change, improve the quality of life, and enhance economic vitality. The CAAP provides a framework for creating or updating policies, programs, practices, and incentives to reduce the City's GHG footprint, and ensure the community and physical assets are better protected from the impacts of climate change.⁷³

3.10.3 ENVIRONMENTAL IMPACTS

3.10.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the Plan could result in significant adverse impacts to hydrology and water resources, if the Plan would result in any of the following:

⁷¹ City of Ventura. *Ventura General Plan*. Available online at: <https://docs.vcrma.org/images/pdf/planning/plans/Goals-Policies-and-Programs.pdf>, accessed August 27, 2019.

⁷² California Legislative Information. *Article 10.5. Open-Space Lands [65560-65570], Section 65560*.

⁷³ City of Long Beach Development Services. *Climate Action and Adaptation Plan*. Available online at: <http://www.longbeach.gov/lbds/planning/caap/>, accessed September 17, 2019.

- Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality;
- Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
 - Result in substantial erosion or siltation on- or off-site;
 - Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;
 - Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
- In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation; or
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

3.10.3.2 Methodology

The analysis of water quality impacts identifies the types of pollutants potentially associated with future development as a result of implementation of the Plan and considers their effects on water quality. Consideration is given to BMPs, which would serve to minimize pollutants in stormwater runoff. Further, the Plan's consistency with relevant regulatory permits/requirements is evaluated to demonstrate how compliance would protect water quality.

As summarized in Regulatory Framework, independent of the CEQA process, there is a comprehensive set of regulations implemented at the State and jurisdictional level to impacts related to storm drainage, urban pollutants, and flood hazards. As such, the analysis presented herein assumes future projects would comply with these regulations.

This discussion of hydrology and water quality addresses impacts within the entire SCAG region. The impact analysis was based on several factors, including the policies and land uses of the Plan, the degree

to which existing land uses in the region would change, and the thresholds of significance for hydrology and water quality.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.10.3.3 Impacts and Mitigation Measures

Impact HYD-1 Potential to violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.

Significant and Unavoidable Impact - Mitigation Required.

Hydrology and water quality resources of concern within the SCAG region are subject to extensive regulatory controls at the federal, state, and local level. Grading, excavation, and other construction activities associated with implementation of transportation projects and development projects anticipated to occur under the Plan, could impact water quality due to erosion resulting from exposed soils that may be transported in stormwater runoff. In addition, construction activities have the potential to generate short-term water pollutants, including sediment, trash, construction materials, and equipment fluids. However, all construction activities are subject to NPDES GCASP permit requirements in addition to any applicable local requirements. As shown in **Table 3.10-3, Pollutants Associated with Transportation**, there are several pollutants specific to transportation that could also impact water quality. Many urban runoff pollutants are attributable to landscape irrigation, highway runoff, and illicit dumping that flows into nearby water bodies during storm events. These pollutants could include, but are not limited to, oil, grease, auto emissions, and pesticides, urban runoff debris, and air pollution residue. Highway runoff is a component of urban runoff contributing oil and grease, sediment, nutrients, heavy metals, and toxic substances. If such contaminated runoff remains largely untreated, long-term degradation of water quality could occur.

The SWRCB has developed trash, metal, and bacteria TMDLs for many watersheds in the region, including Dominguez Channel, Santa Monica Bay, Los Angeles River, Santa Clara River, Ventura River, Malibu Creek, Calleguas Creek, and Ballona Creek. The TMDLs provide a numerical threshold for each pollutant within each watershed to be used for regulating both point and non-point source discharges and is implemented through the NPDES permit process. An NPDES storm water permit is required for any construction activity that would disturb greater than one acre. Acquisition of the General Construction permit is dependent on the preparation of a SWPPP that should contain specific BMPs to control the discharge of pollutants, including sediment, into the local surface water drainages. In addition, all state projects for which Caltrans is the sponsor agency would comply with the Caltrans Statewide NPDES permit that regulates all storm-water discharges from Caltrans owned conveyances, maintained facilities and construction activities. The inclusion of runoff control measures in the design of future roadway projects should improve water quality and result in fewer impacts to the environment.

**Table 3.10-3
Pollutants Associated with Transportation**

Pollutant	Source
Asbestos	Clutch plates, brake linings
Cadmium	Tire wear and insecticides
Copper	Thrust-bearing, bushing, brake linings, and fungicides and insecticides
Chromium	Pavement materials, metal plating, rocker arms, crankshafts, rings, and brake linings
Cyanide	Anti-caking compound in de-icing salt
Lead	Leaded gasoline, motor oil, transmission babbitt metal bearings, tire wear
Iron	Auto-body rust, steel highway structures, moving engine parts
Manganese	Moving engine parts
Nickel	Diesel fuel and gasoline, pavement material, lubricating oil, metal plating, bushing wear, and brake linings
Nitrogen and Phosphorus	Motor oil additives, fertilizers
Sulphates	Roadway beds, fuel, and de-icing salt
Zinc	Motor oil and tires
Grease and Hydrocarbons	Spills and leaks of oil and n-paraffin lubricants, antifreeze, hydraulic fluids
Rubber	Tire wear
Sediment	Pavement wear, construction and maintenance activities

U.S. Environmental Protection Agency, Office of Water. 1995. *Controlling Nonpoint Source Runoff Pollution from Roads, Highways, and Bridges*. EPA-841-F-95-008a.

Construction of transportation projects and development projects anticipated to occur under the Plan would increase impervious surfaces throughout the SCAG region. The growth projections reflected in the

Plan would substantially increase the amount of urbanized land or densify existing urbanized areas in the SCAG region. Connect SoCal envisions more compact, infill development patterns which may result in higher levels of paved surfaces and pollution associated with water run-off from paved surfaces into urban waterways.

Increased impervious surfaces could add to storm water runoff volumes and peak flow rates which could result in increased pollutants loads. Future projects could also result in increased stormwater runoff, and thus increased pollutant loading, being captured in existing storm drain systems and conveyed to local or regional wastewater treatment facilities. The land use patterns included in the Plan would generate new sources of sanitary sewage, which would also be conveyed to wastewater treatment facilities in the region for secondary or tertiary treatment. Suspended sediments, oxygen demanding substances, and oil and grease would constitute a substantial part of these pollutant loads. Total nitrogen and total phosphorous would increase less than these other pollutants, but would have the potential for influencing algal growth, reducing dissolved oxygen, and affecting aquatic species abundance and composition. Contaminated urban runoff, if left untreated, would result in incremental degradation of water quality. This is of particular concern where projects are located on previously contaminated sites. Without effective erosion and storm water control, contaminated soils exposed during construction activities may result in surface water contamination.

Transportation and land use strategies in the Plan anticipate increased urbanization in high-quality transit areas (HQTAs). Additional impervious surfaces in these already developed areas could increase the potential for pollutants to enter impaired receiving waters. Project grading and construction of impervious surfaces for the Plan's transportation projects and anticipated development projects have the potential to alter existing drainage patterns by altering slope and reducing infiltration. Many jurisdictions in the region, such as the County and City of Los Angeles, have strict guidelines requiring no net increase in runoff during construction and operation. These low impact development standards help to reduce the potential for contaminated runoff.

For development projects where construction activities would disturb more than one acre of land, construction activities are also subject to NPDES GCASP requirements, which require the preparation and implementation of a SWPPP. However, since implementation of the Plan would add an additional 6,346 lane miles to the region and 41,546 acres of greenfield land is anticipated to become developed, there is potential for water quality standards and waste discharge requirements to be exceeded due to an expected increase in impervious surfaces. As such, implementation of the Plan may result in significant, unavoidable impacts to surface and groundwater quality requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

SMM HYD-1: SCAG shall continue to work with local jurisdictions and water quality agencies to encourage regional-scale planning for improved water quality management and pollution prevention. Future impacts to water quality shall be avoided to the extent practical and feasible through cooperative planning, information sharing, and comprehensive pollution control measure development within the SCAG region. This cooperative planning shall occur as part of current and existing coordination, an integral part of SCAG's ongoing regional planning efforts.

Project Level Mitigation Measure

PMM HYD-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects from violation of any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Complete, and have approved, a Stormwater Pollution Prevention Plan (SWPPP) prior to initiation of construction.
- b) Implement Best Management Practices to reduce the peak stormwater runoff from the project site to the maximum extent practicable.
- c) Comply with the Caltrans storm water discharge permit as applicable; and identify and implement Best Management Practices to manage site erosion, wash water runoff, and spill control.
- d) Complete, and have approved, a Standard Urban Stormwater Management Plan, prior to occupancy of residential or commercial structures.
- e) Ensure adequate capacity of the surrounding stormwater system to support stormwater runoff from new or rehabilitated structures or buildings.

- f) Prior to construction within an area subject to Section 404 of the Clean Water Act, obtain all required permit approvals and certifications for construction within the vicinity of a watercourse:
- g) Where feasible, restore or expand riparian areas such that there is no net loss of impervious surface as a result of the project.
- h) Install structural water quality control features, such as drainage channels, detention basins, oil and grease traps, filter systems, and vegetated buffers to prevent pollution of adjacent water resources by polluted runoff where required by applicable urban storm water runoff discharge permits, on new facilities.
- i) Provide operational best management practices for street cleaning, litter control, and catch basin cleaning are implemented to prevent water quality degradation in compliance with applicable storm water runoff discharge permits; and ensure treatment controls are in place as early as possible, such as during the acquisition process for rights-of-way, not just later during the facilities design and construction phase.
- j) Comply with applicable municipal separate storm sewer system discharge permits as well as Caltrans' storm water discharge permit including long-term sediment control and drainage of roadway runoff.
- k) Incorporate as appropriate treatment and control features such as detention basins, infiltration strips, and porous paving, other features to control surface runoff and facilitate groundwater recharge into the design of new transportation projects early on in the process to ensure that adequate acreage and elevation contours are provided during the right-of-way acquisition process.
- l) Upgrade stormwater drainage facilities to accommodate any increased runoff volumes. These upgrades may include the construction of detention basins or structures that will delay peak flows and reduce flow velocities, including expansion and restoration of wetlands and riparian buffer areas. System designs shall be completed to eliminate increases in peak flow rates from current levels.
- m) Encourage Low Impact Development (LID) and incorporation of natural spaces that reduce, treat, infiltrate and manage stormwater runoff flows in all new developments, where practical and feasible.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to water quality standards and waste discharge requirements could be significant and unavoidable even with implementation of mitigation.

Impact HYD-2 Potential to substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.

Significant and Unavoidable Impact - Mitigation Required.

Given that most of the groundwater basins in the Plan area are already in a state of overdraft, future development may result in a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of preexisting nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted). Population growth of 3.2 million people by 2045 would increase regional water demand and could substantially deplete groundwater supplies. Additionally, urbanization to accommodate future growth would potentially interfere with groundwater recharge due to increased impervious surfaces.

According to the Public Policy Institute of California, groundwater overdraft in some agricultural regions averages about 2 million af annually.⁷⁴ In contrast to surface water, groundwater use has largely been unregulated under California law until recently. Many basins have experienced long-term overdraft, and 21 of the state's 515 basins are now considered critically overdrafted, including Indian Wells Valley Basin which has portions within San Bernardino County and the Santa Clara River Valley – Oxnard Basin in Ventura County.^{75,76}

⁷⁴ The Public Policy Institute. 2017. *Just the Facts. Groundwater in California*. May. Available online at: https://www.ppic.org/wp-content/uploads/ITF_GroundwaterITF.pdf, accessed August 14, 2019.

⁷⁵ The Public Policy Institute. 2017. *Just the Facts. Groundwater in California*. May. Available online at: https://www.ppic.org/wp-content/uploads/ITF_GroundwaterITF.pdf, accessed August 14, 2019.

Most transportation projects involve the modification of existing facilities and do not themselves generate water supply impacts but could affect groundwater by increasing impervious surfaces and reducing opportunities for recharge. The Plan anticipates approximately 6,346 new lane miles would be added to the region in the form of new facilities, additional right-of-way on existing transportation facilities, extending roads to accommodate bike lanes on existing transportation facilities, and even associated landscaping and future plantings. Additionally, under the Plan, 41,546 acres of greenfield land is anticipated to be urbanized as the region adds housing and jobs. Under natural conditions, vegetation intercepts and retains rainfall before infiltration or runoff occurs. Without hard-surfaced land areas, this hydrology cycle favors groundwater recharge. With a roadway or other hard surface this infiltration dynamic is significantly impeded. The magnitude of this effect is reported by studies indicating that the volume of storm water washed off one-acre of roadway is about sixteen times greater than that of a comparably sized meadow.

The increase in impervious surfaces due to additional lane miles and conversion of greenfields into developed land would potentially affect groundwater recharge rates. Reduction in groundwater recharge, either through a net deficit in aquifer volume or through a lowering of the local groundwater table level, presents a significant impact and requires the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

SMM HYD-2: SCAG shall build from existing efforts including those at the sub-regional and local level and shall continue to work with local jurisdictions and water agencies, to encourage regional-scale planning for improved stormwater management and groundwater recharge, including consideration of alternative recharge technologies and practices. Future adverse impacts may be avoided through cooperative planning, information sharing, and comprehensive implementation efforts within the SCAG region.

Project Level Mitigation Measures

PMM HYD-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation

⁷⁶ California Department of Water Resources. 2019. *Bulletin 118 Groundwater Basins Subject to Critical Conditions of Overdraft*. Available online at: <https://water.ca.gov/-/media/DWR-Website/Web-Pages/Programs/Groundwater-Management/Bulletin-118/Critically-Overdrafted-Basins/Files/2018CODBasins.pdf?la=en&hash=3014D2F2299AA503C469D41BBC0E8DCFCE0267F8>, accessed September 17, 2019.

measures to reduce substantial adverse effects from violation of any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Avoid designs that require continual dewatering where feasible.

For projects requiring continual dewatering facilities, implement monitoring systems and long-term administrative procedures to ensure proper water management that prevents degrading of surface water and minimizes adverse impacts on groundwater for the life of the project, Construction designs shall comply with appropriate building codes and standard practices including the Uniform Building Code.

- b) Maximize, where practical and feasible, permeable surface area in existing urbanized areas to protect water quality, reduce flooding, allow for groundwater recharge, and preserve wildlife habitat. Minimize new impervious surfaces, including the use of in-lieu fees and off-site mitigation.
- c) Avoid construction and siting on groundwater recharge areas, to prevent conversion of those areas to impervious surface.
- d) Reduce hardscape to the extent feasible to facilitate groundwater recharge as appropriate.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to groundwater supplies could be significant and unavoidable even with implementation of mitigation..

Impact HYD-3a Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition

of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site.

Significant and Unavoidable Impact - Mitigation Required.

Implementation of transportation projects as well as anticipated development under the Plan would occur within watersheds that have impaired water bodies. Many of the impaired water bodies are located near a freeway, transit, or rail projects included in the Plan. Several projects may impact water bodies by placing fill material within a stream channel. For example, several of the lane widening projects and new transportation facilities could cross existing creeks or be expanded into wetland areas. However, these potential intrusions would have to comply with existing State and local regulations and would be subject to permitting by the USACOE and a RWQCB pursuant to Sections 404 and 401 of the CWA.

Stormwater runoff is influenced by rainfall intensity, ground surface permeability, watershed size and shape, and physical barriers. The introduction of impermeable surfaces greatly reduces natural infiltration, allowing for a greater volume of runoff. In addition, paved surfaces and drainage conduits can accelerate the velocity of runoff, concentrating peak flows in downstream areas faster than under natural conditions. Significant increases to runoff and peak flow can overwhelm drainage systems and alter flood elevations in downstream locations.

Construction and earth-moving activities can be a major source of sediment loading in local waterways. There is significant potential for unprotected soil to erode as stormwater runoff as a result of construction activity. However, state regulation requires that prior to commencement of construction, a SWPPP must be submitted to the SWRCB. SWPPPs identify best management practices (BMPs) used during construction. Individual projects included or discussed in the Plan, are expected to adopt BMPs appropriate to local conditions and to the proposed construction techniques that will reduce stormwater runoff.

The Plan recognizes that as population continues to grow, there is increasing pressure on natural lands. One of the goals of the Plan (See **Section 2.0, Project Description**) is to promote conservation of natural lands and restoration of critical habitats which would have a positive effect on the region's hydrology. The land use mix for the Plan assumes that 60 percent of new housing and 73 percent of new jobs will be in Growth Priority Areas and therefore would be directed away from sensitive habitat or greenfields. However, the Plan would still result in an overall increase in impervious surface.

In addition, due to the anticipated demographic growth in the SCAG region reflected in the Plan, urbanization may also occur in areas that have the potential to result in changes to the drainage patterns. Examples include hillsides and ridgelines which can experience development pressure as urbanization

increases in nearby cities. While the Plan encourages denser, infill development in existing urban areas near HQTAs, many of which are located on relatively flat lands, construction on hillsides and other similar land areas greatly increases the potential for impacts to occur. Therefore, impacts related to altering the existing drainage patterns of a site or area is considered significant.

Mitigation Measures

SCAG Mitigation Measures

See **SMM HYD-1** and **SMM HYD-2**.

SMM HYD-3: SCAG shall build from existing efforts including those at the sub-regional and local level and shall continue to work with local jurisdictions to encourage regional-scale planning for maintaining and/or improving existing drainage patterns. Future adverse impacts may be avoided through cooperative planning, information sharing, and comprehensive implementation efforts within the SCAG region.

Project Level Mitigation Measures

See **PMM HYD-1**.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to drainage facilities and potential erosion or siltation could be significant and unavoidable even with implementation of mitigation.

Impact HYD-3b **Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of flooding on- or off-site.**

Significant and Unavoidable Impact - Mitigation Required.

As discussed in Impact HYD-3a, the Plan has the potential to change existing drainage patterns. Transportation projects such as lane widening projects, new highways, as well as bridges/tunnels, and transportation facilities projects that could cross existing creeks, water crossings, rivers or be expanded into wetland areas may impact water bodies by placing fill material within a stream channel. Such changes could result in increased flooding. In addition, implementation of the Plan's land use strategies, while mostly aimed at concentrating development in more compact urban areas, would result in more impervious surfaces including the consumption of 41,546 acres of greenfield lands. Impacts related to the substantial alteration of the existing drainage pattern of the site or area and/or the substantial increase in the rate or amount of surface runoff that would result in flooding on site or off site would be significant, requiring mitigation measures.

*Mitigation Measures*SCAG Mitigation Measures

See **SMM HYD-1** through **SMM HYD-3**.

Project Level Mitigation Measures

See **PMM HYD-1** and **PMM HYD-2**.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to flooding and drainage could be significant and unavoidable even with implementation of mitigation.

Impact HYD-3c **Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff**

water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.

Significant and Unavoidable Impact - Mitigation Required.

As discussed in Impact HYD-3a, the Plan has the potential to alter existing drainage patterns. Implementation of the Plan's transportation projects as well as land use strategies may increase impervious surfaces, which in turn could increase urban runoff if not regulated, resulting in the transport of greater volumes of polluted water into storm drain systems. Storm water runoff is influenced by rainfall intensity, ground surface permeability, watershed size and shape, and physical barriers. The introduction of impermeable surfaces greatly reduces natural infiltration, allowing for a greater volume of runoff.

As stated previously, paved surfaces and drainage conduits can accelerate the velocity of runoff, concentrating peak flows in downstream areas faster than under natural conditions. Significant increases to runoff and peak flow can overwhelm drainage systems and alter flood elevations in downstream locations. Increased runoff velocity can also promote scouring of existing drainage facilities, reducing system reliability and safety (see **Table 3.10-3, Pollutants Associated with Transportation**). In addition, this increase in velocity has the potential to create or contribute runoff flows that would exceed the capacity of existing or planned storm water drainage systems. In addition, placing new structures within an existing floodplain can impede flood waters, altering the flood risks both upstream and downstream. As a result, there is a significant impact to substantially create and contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems and providing substantial additional sources of polluted runoff, requiring mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

Project Level Mitigation Measures

See **PMM HYD-1** and **PMM HYD-2**.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing

regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to drainage and stormwater facility capacity and potential for polluted runoff could be significant and unavoidable even with implementation of mitigation.

Impact HYD-4 In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.

Significant and Unavoidable Impact – Mitigation Required.

The entire SCAG region is susceptible to impacts from seismic activity including the occurrence of seiches in Big Bear Lake, Lake Arrowhead, Lake Casistas, Castaic Lake, Pyramid Lake, Lake Elsinore, Diamond Valley Lake, and the Salton Sea. With more than 150 miles of coastline, significant portions of the SCAG region are also at risk of tsunamis.

With regard to flooding, implementation of transportation projects and development projects anticipated to occur under the Plan built in low-lying areas or in proximity to waterways and/or dam inundation zones may be subject to flood hazards. Flooding risks are associated with projects that are located downstream of dams and retention basins or afforded protection by levee system. These areas may be subject to failure as a result seismic ground-shaking or other natural or anthropogenic actions that compromise the stability of such structures. Additional compact urban development, as well as possible expansion of existing urban areas in areas that are potentially subject to flooding as a result of failure of a levee or dam, could create a potential to expose people or structures to a significant risk of loss, injury, or death involving flooding. Furthermore, for the Plan's transportation projects and anticipated development projects that are near the coast in areas susceptible to tsunamis, there is a potentially significant risk of releasing pollutants due to project inundation (See **Figure 3.7-6, Areas Susceptible to Tsunamis**). However, compliance with existing regulatory requirements described above and in 3.10.2 Regulatory Framework would ensure that the land use changes and transportation network would not expose people or structures to a significant risk of loss, injury, or death from flooding, tsunami, or seiche.

The Plan encourages higher-density housing and commercial development in the region's HQTAs. HQTAs are generally located in areas that are subject to Flood Management Plans (FMPs) and major

flood control infrastructure that have been constructed to constrain the 100-year flood in to flood control systems.

Flood-prone areas in Imperial County are managed pursuant to an FMP, which includes a future-oriented approach to planning in flood risk areas. It is a pre-disaster planning approach that is required by FEMA for the County to continue to participate in the National Flood Insurance Program (NFIP). When a community chooses to join the NFIP, it must adopt and enforce minimum floodplain management standards for participation. The floodplain management requirements within the Special Flood Hazard Area (SFHA) are designed to prevent new developments from increasing the flood threat and to protect new and existing buildings from anticipated flood events. When a community chooses to join the NFIP, it must require permits for all development within the SFHA and ensure that construction materials and methods used will minimize future flood damage.

The Los Angeles Flood Control District includes the vast majority of drainage infrastructure within incorporated and unincorporated areas in every watershed in the County, including 500 miles of open channel, 2,800 miles of underground storm drain, and an estimated 120,000 catch basins.

The County of Orange maintains 350 miles of concrete, rock lined and earthen flood control facilities. Flood control facilities are designed to handle water flow from storm drains and other runoff and "channel" the water into the bay or ocean.

The Riverside County Flood Control District owns and operates over 600 miles of channels storm drains and levees along with 74 dams and detention basin that reduce flood risk throughout the District.

Similarly, the San Bernardino County Flood Control District has developed a very extensive system of facilities, including dams, conservation basins, channels, and storm drains to intercept and convey flood flows through and away from the major developed areas of the County.

The Ventura County Flood Control District provides for the control and conservation of flood and storm waters and for the protection of watercourses, watersheds, public highways, life and property in the district from damage or destruction from these waters.

The flood control districts in the SCAG region participate in the NFIP, which is based on a mutual agreement between the federal government and communities. Participating communities agree to regulate floodplain development according to specified criteria and standards. Specifically, communities must adopt and enforce minimum floodplain management regulations so that development, including buildings, is undertaken in ways that reduce exposure to flooding.

The Plan encourages development in HQTAs and other land use patterns of development in areas that are generally located in areas afforded flood protection by flood control facilities and are subject to specific land use planning regulations pursuant to the NFIP; therefore, the Plan would not be expected to result in development in flood hazard zones.

Rising sea levels will increase the potential for coastal flooding and flood hazards in the future (see **Section 3.10.1.7**, above), and the issue of sea-level rise is a critical component of land use planning and hazard analysis in coastal areas. Until the year 2050, most of the climate models predict a similar degree of sea-level rise; however, after 2050, projections of sea-level rise become less certain because of divergent modeling results and differences in various estimates of greenhouse gas emissions (California Climate Action Team 2010). In 2045 it is expected that an additional 1,301 persons and 151 dwelling units would be at risk due to sea level rise.⁷⁷ **Figure 3.10-3, Areas Vulnerable to Sea Level Rise**, shows areas vulnerable to sea level rise with the Plan.

The CCC's Sea-Level Rise Policy Guidance outlines the types of information, analysis, and design considerations the CCC's staff requires to determine whether shoreline projects conform to the Coastal Act policies. In order to be consistent with the Coastal Act, projects must be designed to minimize conflicts with applicable requirements, including that new development: (1) be designed to eliminate or mitigate adverse effects on local shoreline sand supply; and (2) ensure stability and structural integrity, and neither create nor contribute significantly to erosion, geologic instability, or destruction of a site or surrounding area or in any way require the construction of protective devices that would substantially alter natural landforms along the coast (California Coastal Act Sections 30235 and 30253).

Sea level rise and the risk of tsunamis are existing environmental conditions, and unless the Project will exacerbate these conditions, they are not considered potentially significant impacts under CEQA. As discussed in **Section 3.8, Greenhouse Gas Emissions**, the Plan could result in a significant impact with respect to greenhouse gas emissions (GHGs) and GHGs are considered a primary cause of global climate change and sea level rise. However, the relationship between development in any given region or country and measurable sea level rise is not possible to determine and is therefore considered too speculative to be analyzed any further in this environmental document.

Transportation and anticipated development projects are expected to be built in areas already subject to the flooding hazards discussed above, and existing planning and design standards and regulations would serve to address and minimize the associated potential impacts. In addition, project-specific technical studies would be required to reduce potential risks associated with the Plan to levels of

⁷⁷ SCAG SPM modeling 2019

insignificance. Based on the above analysis and compliance with the regulations outlined in Section 3.10.2, people or structures would not be exposed to a significant risk of inundation due to flooding, tsunamis, and seiches from development associated with the Plan. Therefore, the Plan would result in significant impacts with respect to risk of inundation by flooding, tsunami, or seiche. Consideration of the following mitigation measures is necessary.

Mitigation Measures

SCAG Mitigation Measure

SMM HYD-4: SCAG shall continue to work with local jurisdictions and water quality agencies to encourage flood protection and prevent development in flood hazard areas that do not have appropriate protections. This shall be accomplished through cooperation and information sharing regarding specific alignments and rights-of-way planning for RTP projects, and regional program development as part of SCAG's ongoing regional planning efforts. These include but are not limited to web-based data distribution planning tools and sustainability programs in conjunction with local governments. Such services would potentially consist of an inventory of areas located in or near a 100-year flood hazard zone or hazard areas that would potentially be affected by a failure of a levee or dam; or inundation by seiche, tsunami, or mudflow.

Project Level Mitigation Measure

PMM HYD-4: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures capable of avoiding or reducing the potential impacts of locating structures that would impede or redirect flood flows, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Ensure that all roadbeds for new highway and rail facilities be elevated at least one foot above the 100-year base flood elevation. Since alluvial fan flooding is not often identified on FEMA flood maps, the risk of alluvial fan flooding should be evaluated and projects should be sited to avoid alluvial fan flooding. Delineation of floodplains and alluvial fan boundaries should attempt to account for future hydrologic changes caused by global climate change.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to flood hazards could be significant and unavoidable even with implementation of mitigation.

Impact HYD-5 Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan

Significant and Unavoidable Impact - Mitigation Required.

As discussed in Section 3.10.1, there are six RWQCBs (either wholly or in part) that have jurisdiction within the SCAG region (**Figure 3.10-1, Regional Water Quality Control Boards**). The RWQCB is responsible for the protection of the beneficial uses of waters within each county. In general, the RWQCB uses its planning, permitting, and enforcement authority to meet this responsibility and adopts a Water Quality Control Plan (basin plan) to implement plans, policies, and provisions for water quality management. The basin plan for each of the six SCAG counties is discussed in **Section 3.10.2.3**. In accordance with state policy for water quality control, the RWQCB employs a range of beneficial use definitions for surface waters, groundwater basins, marshes, and mudflats that serve as the basis for establishing water quality objectives and discharge conditions and prohibitions. The basin plan identifies existing and potential beneficial uses supported by the key surface water drainages throughout its jurisdiction. The basin plan also includes water quality objectives that are protective of the identified beneficial uses; the beneficial uses and water quality objectives collectively make up the water quality standards for a given region and basin plan.

As discussed under **Impact HYD-2**, implementation of Connect SoCal would increase impervious surfaces due to additional lane miles and conversion of greenfields to developed land. An increase in impervious surfaces would increase water runoff and potentially affect groundwater recharge rates and water quality in the basins. Therefore, the Plan may conflict with or obstruct the implementation of a water quality control plan or sustainable groundwater management plan and mitigation measures are required.

Mitigation Measures

SCAG Mitigation Measure

3.11 LAND USE AND PLANNING

This section of the Program Environmental Impact Report (PEIR) describes the existing land use characteristics within the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect land use and planning, and analyzes the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.11.1 ENVIRONMENTAL SETTING

3.11.1.1 Definitions

Agricultural Lands Land designated for farming; specifically the production of crops and rearing of animals to provide food and other products.

Air Quality Management Plans: The Air Quality Management Plan (AQMP) is a plan prepared by local air districts and is a regional blueprint for achieving air quality standards and healthful air.

Carbon Sequestration The ability for natural elements such as forests, soils and oceans to store carbon instead of releasing it into the atmosphere, preventing GHG Emissions.

Complete Communities Suburban communities that provide a mix of land uses in strategic growth areas, wherein most daily needs can be met within a short distance of home. Complete communities provide residents with the opportunity to support their local area and run daily errands by walking or bicycling rather than traveling by automobile.

Established Community: Refers to a place where there are existing populations of people that have been living in that place for some period of time. The term is used in Appendix G of the *CEQA Guidelines* under the land use thresholds of significance

Farmland: §21060.1(a) of CEQA (Public Resources Code §§21000-21177) delineates the consideration of agricultural land to include “prime farmland, farmland of statewide importance, or unique farmland, as defined by the United States Department of Agriculture (USDA) land inventory and monitoring criteria,

as modified for California,” and is herein collectively referred to as “Farmland.” The following are categories mapped by the CDC:¹

Federal Transportation Improvement Program: Federal Transportation Improvement Program – A six-year comprehensive listing of transportation projects proposed for federal funding, that require a federal action, or are regionally significant, and are within the planning area of an MPO, the last two years are for informational purposes only.

General Plan: California State Law requires every city and county to adopt a comprehensive General Plan to guide its future development. The General Plan essentially serves as a "constitution for development" - the document that serves as the foundation for all land use decisions. Every jurisdiction's General Plan includes seven required "Elements" that are mandated by State law; local governments may adopt additional optional Elements to address local priorities and planning goals.

Grazing Land: Land on which the existing vegetation is suited to the grazing of livestock. This category was developed in cooperation with the California Cattlemen's Association, University of California Cooperative Extension, and other groups interested in the extent of grazing activities. The minimum mapping unit for Grazing Land is 40 acres.

Greenfield: Also known as “raw land,” land that is privately owned, lacks urban services, has not been previously developed, and is located at the fringe of existing urban areas.

Land Use Designation: A land use classification with associated land use or management policies. Land use designations are applied to specific areas through the county land use planning processes and culminate in the adoption of a land use element to the General Plan. Some land use designations have been established through legislation (e.g., National Forest), while other designations, such as Significant Ecological Areas, have been established through policy or planning processes.

Land Use Element: The land use element is one of seven mandatory elements of the General Plan required pursuant to General Land Use Law in California.

Natural Lands Biologically diverse landscapes such as forested and mountainous areas, shrub lands, deserts and other ecosystems which contain habitat that supports wildlife and vegetation.

¹ California Department of Conservation, Division of Land Resource Protection. 2004. *A Guide to the Farmland Mapping and Monitoring Program*. Available at: http://www.conservation.ca.gov/dlrp/fmmp/Documents/fmmp_guide_2004.pdf, accessed October 25, 2018.

Open Space: Generally understood as any area of land or water which, for whatever reason, is not developed for urbanized uses and which therefore enhances residents' quality of life. Each county and city in California must adopt an open space element as part of its general plan. The element is a statement of local planning policies focusing on the use of unimproved land or water for: 1) the preservation or managed production of natural resources, 2) outdoor recreation, and 3) the promotion of public health and safety. Therefore, open space will be defined by each jurisdiction based on their own unique resources and environment.

Ordinance: A law set forth by a governmental authority; a municipal regulation.

Rangelands: Rangelands include any expanse of natural land that is not fertilized, irrigated, or cultivated and is predominately used for grazing by livestock and wildlife.

Recreation: Recreation areas may be composed of one large site or several sites located in proximity that together provide a recreation opportunity at the local and/or regional level. These parks may include areas of significant natural resources, as well as more developed activity sites.

Regional Housing Needs Assessment: Regional Housing Needs Assessment – Quantifies the need for housing within each jurisdiction of the SCAG region based on population growth projections. Communities then address this need through the process of completing the housing elements of their General Plans.

Regional Transportation Plan (RTP): A Regional Transportation Plan provides a vision for transportation investments throughout the region. SCAG updates its RTP every four years. Using growth forecasts and economic trends, the RTP considers the role of transportation in the broader context of economic, environmental, and quality-of-life goals for the future, identifying regional transportation strategies to address mobility needs.

Smart Growth: A term that covers a range of development and conservation strategies that help protect the natural environment and make communities more attractive, economically stronger, and more socially diverse. A balance is sought between economically prosperous, socially equitable, and environmentally sustainable community development.

Specific Plan: A specific plan is a tool for the systematic implementation of the general plan. It effectively establishes a link between implementing policies of the general plan and the individual development proposals in a defined area. A specific plan may be as general as setting forth broad policy concepts, or as detailed as providing direction to every facet of development from the type, location and intensity of uses

to the design and capacity of infrastructure; from the resources used to finance public improvements to the design guidelines of a subdivision.

Subregion: A total of 15 subregions represent portions of Southern California with shared interests, issues and geography. Subregions play an important role as a conduit between SCAG and the cities and counties of the region by participating and providing input on SCAG’s planning activities. This involvement helps the Regional Council and its committees make better-informed decisions.

Urban Areas: Urban Areas in the SCAG region represent densely developed territory, and encompass residential, commercial and other nonresidential urban land uses where population is concentrated over 2,500 people in a given locale.

Vacant Land: Vacant land is generally referred to land with no buildings on it.

Zoning Designation: The regulation of the use of real property by local government, which restricts land use to residential, commercial, industrial, or other uses, is affected by the zoning designation allocated to each property. The local governing body considers the character of the property as well as its fitness for particular uses. It must enact the regulations in accordance with a well-considered and comprehensive plan intended to avoid arbitrary exercise of government power.

3.11.1.2 Existing Land Uses

The SCAG region serves as the nation’s gateway for global trade. The SCAG region is comprised of six counties—Imperial, Orange, Los Angeles, Riverside, San Bernardino, and Ventura—and totals approximately 38,000 square miles in area (almost 25 million acres). The region stretches from the state borders with Nevada and Arizona to the Pacific Ocean and from the southernmost edge of the Central Valley to the Mexican border. The region includes the county with the largest area in the nation, San Bernardino County, as well as the county with the highest population in the nation, Los Angeles County. The SCAG region includes the second largest city in the nation, Los Angeles, and six additional cities that rank in the top 100 by population: Long Beach (36th), Anaheim (55th), Santa Ana (57th), Riverside (59th), Irvine (91st), and San Bernardino (98th). In addition to its numerous and diverse urban centers that serve as home for the approximately 19 million people, the vast area includes millions of acres of open space and recreational land as well as large amounts of farmland.

The SCAG region stretches from the state borders with Nevada and Arizona to the Pacific Ocean and from the southernmost edge of the Central Valley to the Mexican border. The region includes the county with the largest area in the nation, San Bernardino County, as well as the county with the highest population in the nation, Los Angeles County (**Figure 3.11-1, SCAG Region**). The SCAG region is

comprised of complex patterns of land uses including residential, commercial/office, industrial, institutional, agricultural, and open space land uses (**Figure 3.11-2, Existing Land Uses**). The four largest cities, which provide housing and employment for over half of the population in the SCAG region, are located in the coastal basins that are favored by moderate climate: Los Angeles, Long Beach, Santa Ana, and Anaheim.

While the SCAG region houses nearly half of the state's population, of the 38,000 square miles, nearly 61 percent of the land is open space, most of that is in public ownership, primarily federal. (**Figure 3.11-3, Protected Areas in the SCAG Region**).

As a whole, vacant lands account for more than 20 million of the total 25 million acres of overall land available in the SCAG region. Vacant lands include areas that have not been developed with man-made structures and contain no agricultural uses or water bodies. Generally, these areas are open, and contain natural or disturbed natural vegetation. Rangeland is included in this category. Undeveloped areas of parks are also included. Most vacant land is in an undeveloped state, containing native or non-native vegetation such as grasses, herbaceous plants, shrubs, and trees. Vacant lands outside of urban areas may also provide habitat for biological resources. No or few structures or improvements are present. Rangeland may be open land or fenced over large areas. Rangeland vegetation may be no different than open vacant land, or may contain grassland for grazing livestock. Additionally, vacant lands include abandoned orchards and vineyards, beaches, and vacant land with limited improvements.

Vacant lands with limited improvements include areas where streets have been laid in a subdivision pattern, but no further building or improvements have occurred over time. Lastly, vacant lands include open undeveloped land within urban areas that are not associated with a particular facility. Typically, these areas are vacant lots. They normally contain no structures but may have such improvements as curbs and sidewalks. The land may be in a graded condition with little or no vegetation, or may be in a successional vegetated state, with numerous shrubs and grasses, growing at different rates, in an unkempt condition. Examples of vacant lands in the SCAG region, include but are not limited to, the region's national forests, state parks, national parks and monuments, lands administered by the BLM, other public lands, and various private holdings. Some examples of the larger areas of vacant land in the SCAG region include the Los Padres National Forest, Angeles National Forest, Cleveland National Forest, San Bernardino National Forest, Joshua Tree National Park, Death Valley National Park, the East Mojave Preserve, and Anza Borrego Desert State Park. Military lands are included in a separate category and include, but are not limited to, Barstow Marine Corps Logistics Base, Edwards Air Force Base, El Centro Naval Air Facility, Fort Irwin, Los Angeles Air Force Base, March Air Reserve Base, Naval Warfare Assessment Station Corona, Naval Weapons Station Seal Beach, Point Mugu Naval Air Weapons Station,

Twentynine Palms Marine Corps Combat Center, and Chocolate Mountains Aerial Gunnery Range. With limited exceptions, the military lands are not open to the public.

Active farmlands account for slightly less than one million acres. Approximately 2.3 million acres in the region are developed with a highway network of 80,170 lane miles and transit network of 14,906 route miles.²

3.11.1.3 Established Communities

The SCAG region consists of six counties, 191 cities, and 16 tribal reservations. As shown in **Table 3.11-1, Summary of Established Communities in the SCAG Region**, the population in the unincorporated territories of the counties and the member cities varies widely by area. The table also shows the newest and oldest communities based on the date of incorporation, and current population for each county.

**Table 3.11-1
Summary of Established Communities in the SCAG Region**

	County					
	Imperial	Los Angeles	Orange	Riverside	San Bernardino	Ventura
Total county square miles	4,482	4,751	948	7,303	20,105	2,208
Total 2019 county population	190,266	10,253,716	3,222,498	2,440,124	2,192,203	856,598
Oldest city date of incorporation	City of Imperial – 1904	Los Angeles – 1850	Anaheim – 1876	Riverside – 1883	San Bernardino – 1869	San Buenaventura – 1866
Newest city date of incorporation	City of Westmorland – 1934	Malibu – 1991	Aliso Viejo – 2001	Jurupa Valley – 2011	Yucca Valley – 1991	Moorpark – 1983
Largest city by population (2019)	El Centro – 46,248	Los Angeles – 4,040,079	Anaheim – 359,339	Riverside – 328,101	San Bernardino – 219,233	Oxnard – 209,879
Smallest city by population (2019)	Westmorland – 2,461	Vernon – 301	Villa Park – 5,888	Indian Wells – 5,445	Needles – 5,085	Ojai – 7,769
Largest city by square miles	El Centro – 11	Los Angeles – 503	Irvine – 66	Palm Springs – 95	Hesperia – 73	Thousand Oaks – 55
Smallest city by square miles	Westmorland – 5.9	Hawaiian Gardens – 0.96	La Palma – 1.81	Canyon Lake – 5	Grand Terrace – 4	Filmore – 3.3

² SCAG. 2019. Scenario Planning Model Output.

3.11.1.4 Counties

The SCAG region is composed of six counties: Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The Plan's land use policies and strategies encourage improvement in the jobs-housing balance by focusing new housing and employment in High Quality Transit Areas (HQTAs). A general discussion of the land use patterns is provided for each of the six SCAG counties below.

- Imperial County:** The nature of land use within Imperial County is linked to its rural beginnings, beginning as an isolated farming community. Imperial County is predominantly an agricultural area.³ However, pressure of growth from nearby San Diego and Riverside Counties have resulted in a significant population boom. Between 2000 and 2018, the County has seen a 33.9 percent population growth, higher than the SCAG region rate of 15.9 percent.⁴ As such, a primary goal as stated in the Land Use Element of the Imperial County General Plan is to “diversify employment and economic opportunities in the County while preserving agricultural activity (Goal 2).”⁵
- Los Angeles County:** One of the largest counties in the country, Los Angeles County encompasses approximately 4,083 square miles, consisting of 88 incorporated cities⁶ and an unincorporated area that accounts for approximately 65 percent of the total land area of Los Angeles County.⁷ Los Angeles County is further divided into nine SCAG subregions: North Los Angeles County; San Fernando Valley Council of Governments; Las Virgenes Malibu Conejo Council of Governments; Arroyo Verdugo; Westside Cities Council of Governments; South Bay Cities Council of Governments; City of Los Angeles; San Gabriel Valley Council of Governments; and Gateway Cities Council of Governments. Between 2000 and 2018, the total population of Los Angeles County increased by 8 percent, which was lower than the SCAG region increase of 15.9 percent. It is also important to note that 53.7 percent of the total 2018 population of SCAG region is in Los Angeles County.⁸

The unincorporated areas in the northern portion of Los Angeles County are covered by large amounts of sparsely populated land, and include Angeles National Forest, part of Los Padres National Forest, and the Mojave Desert. The unincorporated areas in the southern portion of Los

⁶ County of Los Angeles. *Incorporated Cities*. Available online at: <https://www.lacounty.gov/government/about-lacounty/incorporated-cities/>, accessed August 22, 2019.

⁷ County of Los Angeles Department of Regional Planning. 2015. *Los Angeles County General Plan – Land Use Element*. October 6.

⁸ SCAG. 2019. Local Profiles. May. Available online at: <https://scag.ca.gov/DataAndTools/Pages/LocalProfiles.aspx>, accessed August 21, 2019.

Angeles County consist of many non-contiguous land areas, which are often referred to as the County’s unincorporated urban islands. More than half of the unincorporated area is designated for natural resources. The next largest designation is rural, which accounts for approximately 39 percent of the unincorporated areas, followed by residential, which accounts for approximately three percent of the unincorporated areas.⁹

The incorporated areas of Los Angeles represent diverse urban, suburban, and rural land use patterns. Generally, the Land Use Element for each incorporated city encourages the retention of the stable residential neighborhoods and promotes growth to locate in neighborhood districts, commercial and mixed-use centers, along boulevards, industrial districts, and in proximity to transportation corridors and transit stations. These are general characterizations, and do not capture all land use types or patterns associated with the 88 incorporated cities that make up Los Angeles County.

- **Orange County:** Between 2000 and 2018, the total population of Orange County increased by 13.2 percent which was lower than the SCAG region increase of 15.9 percent.¹⁰ The General Plan assessed that Orange County would experience a “steady but declining amount of land available for development.” The General Plan projected a significant level of new housing is anticipated to be constructed in the south and eastern portions of the County, while infill and redevelopment are anticipated to occur in the northern and central regions. Significant commercial and industrial development is anticipated to occur along major transportation arteries over the lifetime of the Plan.¹¹
- **Riverside County:** Between 2000 and 2018, the total population of Riverside County increased by 56.3 percent; much higher than the SCAG region increase of 15.9 percent. Riverside County adopted the County General Plan that strives to create a high-quality, balanced, and sustainable environment for the citizens of Riverside County and to make Riverside County’s communities great places to live, work, and play. Riverside County is the fourth largest county in the State, encompassing approximately 7,400 square miles and extending westward from the Colorado River to within 14 miles of the Pacific Ocean, a stretch of some 200 miles. Riverside County contains diverse geographical features, including deserts, snowcapped peaks, deep valleys, forests, and rich agricultural lands. Set among this rich landscape is a variety of established and/or growing urban,

⁹ Los Angeles County Department of Regional Planning. 2015. *Los Angeles County General Plan – Land Use Element*. October 6.

suburban and rural communities. The diversity of Riverside County offers a variety of living environments such as dense urban cities, suburban enclaves, resorts, rural communities, agricultural communities, equestrian communities and sparsely populated outposts.¹²

- **San Bernardino:** Between 2000 and 2018, the total county population increased by 27 percent; above the SCAG region increase of 15.9 percent.¹³ Much of the development in San Bernardino has occurred on unincorporated county land. The General Plan focuses economic development along key corridors and in selected activity centers through the utilization of Strategic Area Overlay districts. The goal of these districts to achieve “greater private sector profit, public benefit, and sustainability over the long haul.”¹⁴
- **Ventura County:** Between 2000 and 2018, Ventura County’s population growth increase of 14.1 percent was lower than the SCAG region increase of 15.9 percent.¹⁵ Ventura County and cities within the county have developed policies seeking to maintain a balance of protecting agricultural land while providing jobs and housing within a heavily used transportation network. The approach has been to provide urban growth boundaries as a way of channeling development and preserving farmland.

3.11.1.5 Cities

There are 191 cities in the six-county area, including the City of Los Angeles, which is the second largest city in the nation and the largest city in California, and the City of Long Beach, which is among the 50 largest cities in the nation and the seventh largest city in California. Urban centers in the SCAG region exist in the form of clusters, linked by freeways and commercial corridors interspersed with identifiable activity centers. Most existing urban development is found along the coastal plains of Los Angeles, Orange, and Ventura Counties, as well as in adjoining valleys that extend inland from the coastal areas. Urban development also has moved into the inland valleys such as the Antelope, San Bernardino, Yucca, Moreno, Hemet–San Jacinto, Coachella, and Imperial Valleys.

¹² County of Riverside. 2019. *County of Riverside General Plan Chapter 3: Land Use Element*. Available at: https://planning.rctlma.org/Portals/14/genplan/2019/elements/Ch03_Land%20Use_041619.pdf, accessed September 9, 2019.

¹⁴ City of San Bernardino. November. City of San Bernardino General Plan. Available online at: <http://www.sbcity.org/civicax/filebank/blobdload.aspx?blobid=26199>, accessed August 21, 2019.

¹⁵ SCAG. 2019. Local Profiles. May. Available online at: <https://scag.ca.gov/DataAndTools/Pages/LocalProfiles.aspx>, accessed September 17, 2019.

Downtown Los Angeles is the largest urbanized center within the SCAG region. Other urbanized areas with substantial density in Los Angeles County include Long Beach, Burbank, Glendale, Pasadena, and Pomona. Office-core centers have emerged in Woodland Hills (Warner Center), Universal City, Westwood, around Los Angeles International Airport (LAX), and Century City. In the other five counties within the SCAG region, urban centers exist in the cities of Riverside, San Bernardino, Santa Ana, Anaheim, Irvine, Oxnard, and Ventura. Development centers in desert areas include the Lancaster-Palmdale corridor in the Antelope Valley (Los Angeles County); the Hesperia-Victorville corridor in Yucca Valley (San Bernardino County); and the Palm Springs–Palm Desert–Indio corridor in the Coachella Valley (Riverside County). El Centro is the county seat and focal point of activity in Imperial County. There is also substantial activity occurring in Imperial County at the three ports of entry along the border with Mexico.

3.11.1.6 Land Use Planning

Many of the key strategies for coping with climate change are linked to land use planning:

- Growth of vehicle-related GHG emissions are influenced by transportation infrastructure.
- Compact development protects ecologically valuable open space and requires less energy and materials to build and operate.
- Reducing GHG emissions from deforestation requires policies to protect woodlands and other valuable carbon sinks. Carbon sinks are natural or artificial reservoirs that remove and store carbon from the atmosphere, thereby offsetting carbon dioxide emissions. Examples include forests, soils, and oceans.
- Land use planning is critical in enabling communities to adapt to sea level rise, more frequent extreme weather conditions, and other climate-related hazards.¹⁶

“Smart growth” is a term that covers a range of development and conservation strategies that help protect the natural environment and make communities more attractive, economically stronger, and more socially diverse. Land use planning is an essential part of any smart growth strategy, and it is especially important when efforts to mitigate GHG emissions and adapt to climate change are needed.

¹⁶ Sofian, Sibarani & Li, Xin & Kusumawardhani, Putri & Widiyani, Wenes. (2015). *Sustainable Systems Integration Model-Metrics in Design Process*. Available online at: https://www.researchgate.net/publication/277478162_Sustainable_Systems_Integration_Model-Metrics_in_Design_Process, accessed September 17, 2019.

SCAG Roles and Responsibilities

In addition to the federal designation as an MPO, SCAG is designated under California state law as the Multicounty Designated Transportation Planning Agency and Council of Governments (COG) for the six-county region. Founded in 1965, SCAG is a Joint Powers Authority, established as a voluntary association of local governments and agencies.

SCAG serves as the regional forum for cooperative decision making by local government elected officials and its primary responsibilities in fulfillment of federal and state requirements includes the development of the Plan; the Federal Transportation Improvement Program (FTIP); and transportation-related portions of local air quality management plans. SCAG's other major functions include determining the regional transportation plans and ensuring programs are in conformity with state air quality plans; periodic preparation of a Regional Housing Need Allocation (RHNA); and intergovernmental review of regionally significant projects.

Regional Cooperation and Subregions

SCAGs role is to bring stakeholders together and participate in regional planning through collaboration and participation in regional programs and on-going dialogue. SCAG seeks feedback from local elected officials and their staff through 15 subregional organizations that have been recognized by the Regional Council as partners in the regional policy planning process. The subregional organizations represent various parts of the SCAG region that have identified themselves as having common interests and concerns. The subregions vary according to geographical size, number of local member jurisdictions, staffing, decision-making structure, and legal status.

Standing committees at SCAG include the Executive/Administration Committee, the Transportation Committee, the Community, Economic & Human Development Committee, the Energy & Environment Committee, and Legislative/Communications & Membership Committee. In addition to the standing committees, there are various subcommittees, technical advisory committees, working groups, and task forces that report to the standing committees, while other groups are established on an ad hoc basis to assist with specific projects or address specific regional policy. The Regional Council is SCAG's governing body. It consists of 86 elected officials, representing cities, counties, county transportation commissions, transportation corridor agencies, tribal governments, and air districts in the region. The Regional Council has general authority to conduct the affairs of SCAG and directs the actions of the agency throughout the year. Additionally, the Regional Council implements the policy direction provided at the annual General Assembly of the membership, acts upon policy recommendations from SCAG's standing policy committees and external agencies, and appoints subcommittees to study specific programs or issues.

County and City General Plans

Comprehensive land use planning for the SCAG region is provided by county and city general plans, which local governments are required by state law to prepare as a guide for future development. General plans contain goals and policies concerning topics that are mandated by state law or that the jurisdiction has chosen to include. Required topics are land use, circulation, housing, conservation, open space, noise, and safety. Other topics that local governments frequently choose to address include sustainability, public facilities, parks and recreation, community design, and growth management, among others. City and county general plans must be consistent with each other. Cities and counties implement their general plans through zoning ordinances. Zoning ordinances provide a much greater level of detail including the general plan land use designations and such information as permitted uses, yard setbacks, and uses that would require a conditional use permit (**Figure 3.11-4, General Plan Land Use Designations**, shows the general land use designations (consolidated for purposes of consistency and mapping) for the six SCAG member counties and 191 cities in the SCAG region).

Existing Land Uses by County

The land use elements of the county and city general plans within the SCAG region generally classify lands in to 20 land use categories (**Table 3.11-2, SCAG Region General Land Use Categories**).

The Plan would add an additional 41,546 urbanized acres to the region by 2045.¹⁷ **Table 3.11-3, Existing Urban, Suburban, and Rural Land Use Patterns by County** displays the percent of each county in rural, urban and suburban land uses. The following paragraphs describe the existing land use categories found within the SCAG region.

Existing Urban, Suburban, and Rural Land Use Patterns by County**

County	Urban Land Use Pattern (Square Miles)	Percent Urban Land of Overall Area	Suburban Land Use Pattern (Square Miles)	Percent Suburban Land of Overall Area	Rural Land Use Pattern (Square Miles)	Percent Rural Land of Overall Area
Imperial	77.8	1.8%	34.6	0.8%	4327.0	97.5%
Los Angeles	465.6	12.3%	522.8	13.8%	2789.8	73.8%
Orange	144.9	20.6%	191.9	27.3%	366.0	52.1%
Riverside	82.2	4.5%	85.1	4.7%	1647.5	90.8%
San Bernardino	348.9	1.8%	234.5	1.2%	19348.1	97.1%
Ventura	233.2	3.3%	230.8	3.2%	6667.2	93.5%
SCAG region	1352.5	3.6%	1299.8	3.4%	35145.8	93.0%

Source: SCAG Existing Land Uses (03/2017). Land use patterns have been interpreted from the following existing land use categories:

- **Urban:** multi-family residential, general office, commercial and services, facilities, education, industrial, transportation/communications/utilities, mixed commercial and industrial, and under construction.
- **Suburban:** single-family residential, mobile homes and trailer parks, mixed residential, and mixed residential and commercial
- **Rural:** rural residential, military installations, open space and recreation, agriculture, vacant, water, undevelopable, and unknown

Residential Land Uses

The residential pattern of the SCAG region is largely shaped by topography. Most residents live in southern parts of Ventura, Los Angeles, and San Bernardino Counties, with the urban form limited by national forests and mountains. In Orange County, residents live near the coast and west of the Cleveland National Forest. Residents also have moved inland to the high desert in northern Los Angeles and San Bernardino Counties and the low desert in the Coachella and Imperial Valleys.

The majority of medium- and high-density housing in the region is found in the urban core of the region, in Downtown Los Angeles, East Los Angeles, the South Bay, and the “West Side” of Los Angeles. Large cities, such as Long Beach, Santa Ana, Glendale, Oxnard, and Pasadena, also have concentrations of high-density development in their downtown areas. Several beach communities, such as the Cities of Santa Monica, Manhattan Beach, Hermosa Beach, Redondo Beach, Huntington Beach, and Newport Beach, have high density close to the ocean.

Surrounding suburbs are predominantly low-density housing tracts. Low-density housing expands west into Ventura County, east through southeast Los Angeles County, throughout much of Orange County, and through the western Inland Empire. The resort communities and cities of the Coachella Valley in Riverside County also are built primarily on a low-density scale.

The developing land on the urban fringe, such as the Antelope Valley of Los Angeles County and the Victorville-Hesperia area, Lucerne Valley, and Yucca Valley of San Bernardino County, also are primarily low-density residential. The Imperial Valley in Imperial County is primarily an agricultural region with a growing, yet still relatively small, population that lives in primarily low-density developments. The SCAG region also contains mixed residential and commercial land uses.

The following provides definitions of the types of residential land uses found in the SCAG region:

The residential category of land uses in the SCAG region includes areas of single family residences, multi-unit dwellings, and mobile homes. Also included is a mixed residential category that consists of two or more of the aforementioned groups.

Single Family Residential

These residential areas are typically made up of detached dwellings, where each structure houses a single family, located in an urban or suburban setting. (Single family residential units located in a rural setting are classified as code 1151 or code 1152 under Rural Residential.) These single family residences are usually served by all utilities, are on paved streets, and are

provided with or have access to all urban facilities such as schools, parks, police, and fire stations.

Single family residential neighborhoods are normally large contiguous areas of residential lots. Some areas have subdivisions or tracts of homes with similar size or architectural design. In these areas the roofs may be similar in shape or color when viewed on the aerial photo. Typically, single family lots contain landscaped front and back yards, one driveway, and one walkway either to the sidewalk or to the driveway. Some lots may have swimming pools in the back yards. High or low density is determined by the size of the lot on which the residence is located. If an area is under construction, and the residential lots or pads are easily identifiable, then the area can be properly mapped.

High-Density Single Family Residential. This category contains single family detached residential units with a unit density of >2 units/acre. These units are typically found in modern urban and suburban subdivisions.

Low-Density Single Family Residential. This category contains single family detached residential units with a unit density of <2 units/acre. These units may include areas of urban ranch homes or estates. Also included are urban areas where single family lots have been established but houses have not been built on all of them and are not likely to be built in the near future. The homes are spaced at a density of <2 units/acre. In some situations, a low-density area may be rural in appearance because it was once a rural area but is now within the urban setting or a transitional area.

Multi-Family Residential

Multi-family units are attached residences, apartments, condominiums, and townhouses. Multi-family residences are usually served by all utilities, are on paved streets, and are provided with or have access to all urban facilities such as schools, parks, police and fire stations. Senior citizen apartment buildings are included in these classes. Also included are off-campus university owned housing and off-campus fraternity/sorority houses.

Mixed Multi-Family Residential. This category is used when there is a mixture of multi-family uses (duplexes, triplexes, apartments, condominiums, and/or townhouses of any type), none of which is over 2.5 acres in size, and no one type dominates. This situation may occur in older neighborhoods.

Duplexes, Triplexes, and 2- or 3-Unit Condominiums and Townhouses. This category is composed of duplexes, triplexes, and 2- or 3-unit condominiums and townhouses that are attached multi-family structures.

Duplex and triplex residences may occur together or mixed with single family houses in some older neighborhoods (see code 1121 and 1140). Typically, the multi-unit structure is one story located on a lot approximately the same size as nearby single-family residential lots. There may be minimal landscaping or yard space. On the aerial photo, one may be able to count the driveways, sidewalks, entryway overhangs, chimneys, or air conditioning units corresponding to the number of units in the structure. Some newer duplexes and triplexes occur as 2- or 3-unit structures in complexes as condominiums and townhouses, with common grounds.

Low-Rise Apartments, Condominiums, and Townhouses. This category includes multi-family structures of one to two stories and approximately 10 to 18 units/acre. The area consists of either a large single structure or a group of structures, of four or more units each, in a complex with associated common grounds, facilities and parking areas.

Typically, low-rise apartments, condominiums, and townhouses occur together in large contiguous areas since land use is restricted to multi-family zoned areas. However, in some areas one to a few buildings may occur on individual lots in single family residential neighborhoods. In newer neighborhoods they may appear as a large complex composed of many structures of similar architecture with common grounds and facilities. Some older structures are U-shaped or O-shaped with a swimming pool in the middle. A parking level maybe located underneath the living area, in which case it is not counted as a story. Parking for larger complexes may include garages or carports along the periphery of the complex. Low-rise apartments and condominiums are the most common types of multi-family structures in the study area. Also included are off-campus fraternity/sorority houses and senior citizen apartments. Residential units located above first floor commercial in buildings along a commercial strip are considered commercial use (1223, 1224). An area mapped as Low-Rise Apartments, Condominiums, and Townhouses may contain an occasional Medium-Rise building.

Medium-Rise Apartments and Condominiums. This category includes multi-family structures of three to four stories and >18 units/acre. The area consists of a large single structure or a group of structures, of four or more units each, in a complex with associated common grounds, facilities and parking areas.

Many medium-rise apartments and condominiums occur in older areas as hotel/apartments. Several may be located next to each other in compact areas. Some may occur as large complexes, composed of many structures of similar architecture, with common grounds and facilities. Medium-rise apartments and condominiums are not as common as low-rise. Senior citizen apartments are included. If an area contains commercial use on the first floor and multi-family residential use on the upper floors, then the area is considered strip commercial (codes 1223, 1224). Some older urban core cities contain apartment and condominium buildings predominantly of three, four, or more stories. An area mapped as Medium-Rise

may contain occasional Low-Rise or High-Rise buildings. Use of stereoscopic viewing of aerial photos is essential in determining relative height in relation to other structures in the area.

High-Rise Apartments and Condominiums. This category includes multi-family structures of five stories or greater and >18 units/acre. The area consists of either a single large structure or a group of adjacent structures with common grounds, facilities and parking areas.

Many high-rise apartments and condominiums occur as single or groups of high residential towers. Parking may be underground or in an adjacent parking structure. Smaller high-rise structures may contain only residential units with no other uses. High-rise residential structures are configured to maximize availability of window access to each individual residential unit. Thus the building may be long and narrow, or contain narrow lateral wings that provide window access. Senior citizen apartments are included. If an area contains commercial use on the first floor and multi-family residential use on the upper floors, then it is considered High-Rise Apartments and Condominiums.¹⁸

Commercial Land Uses

Across the region, commercial development typically follows transportation corridors. Office development generally locates at the terminals of major transportation features, particularly airports and train stations, or at the intersection of major freeways. Downtown Los Angeles is the historical center of jobs in the region. Los Angeles International Airport (LAX) and John Wayne Airport have considerable office clusters around them. Office buildings tend to cluster around major intersections, including areas such as the “El Toro Y” (intersection of the I-5 and the I-405) and the “Orange Crush” (intersection of I-5, SR-22, and SR-57) in Orange County. The SCAG region also contains some mixed commercial and industrial land uses.

Infrastructure and Institutional Land Uses

Institutional land uses, which include large government and private operations, such as military bases, airports, and universities, encompass a considerable footprint in the region. Military operations consume a substantial quantity of land. The 10 active duty military facilities in the SCAG region are listed below:

- El Centro Naval Air Facility
- Los Angeles Air Force Base
- Joint Forces Training Base, Los Alamitos

¹⁸ Aerial Information Systems. 1990. *Southern California 1990 Aerial Land Use Study*. Available online at: <http://egis3.lacounty.gov/dataportal/2012/04/10/countywide-zoning/>, accessed August 28, 2019.

- Naval Weapons Station, Seal Beach
- Naval Warfare Assessment Station, Corona
- March Air Reserve Base
- Barstow Marine Corps Logistics Base
- Fort Irwin
- Twentynine Palms Marine Corps Combat Center
- Naval Base Ventura County

In addition, land controlled by Edwards Air Force Base, based in Kern County, extends into Los Angeles and San Bernardino Counties. The Chocolate Mountains Aerial Gunnery Range in Imperial and Riverside Counties is also an institutional use that is off-limits to the public.

A substantial quantity of land is dedicated to airports in Los Angeles County. In the Antelope Valley, a large portion of land is dedicated to airport uses at Palmdale Airport. LAX is another major institutional land use. Bob Hope Airport and Long Beach Airport are the other commercial airports in Los Angeles County. Airports in other parts of the region include Ontario International Airport, Southern California Logistics Airport, and San Bernardino International Airport in San Bernardino County, Palm Springs International Airport and March Inland Port in Riverside County, John Wayne Airport in Orange County, and numerous general aviation airports scattered across the SCAG region.

University and college campuses are located in every county of the SCAG region. The largest are universities in the University of California system (Irvine, Los Angeles, and Riverside) and the California State University system (Channel Islands, Dominguez Hills, Fullerton, Long Beach, Los Angeles, Northridge, San Bernardino, and San Diego-Imperial Valley Campus). California Polytechnic University at Pomona and the University of Southern California are the other large universities in the region. There are numerous smaller universities and colleges in the region, both public and private, as well as an extensive community college system that spans the SCAG region.

Industrial Land Uses

The main focal points of industrial activity in the region are the Ports of Los Angeles and Long Beach. Altogether, these adjacent ports handle approximately 20 percent of the volume imported into the

country.¹⁹ The industrial activity spreads north from the ports along the Alameda Corridor (a 20 mile freight line connecting downtown Los Angeles to the Ports of Los Angeles and Long Beach), and extends east through the City of Industry and the City of Commerce toward San Bernardino County.

Many manufacturing industries, distribution centers, and warehouses have established businesses in Riverside and San Bernardino Counties (also known as the Inland Empire). This activity has made the Inland Empire a distribution center for the region, state, and nation. Adding to the goods coming by highway and rail through San Bernardino County are goods coming to the county by air through several airports that cater to air cargo, primarily Ontario International Airport. Industrial uses tend to cluster around cargo-handling airports to take advantage of transportation options.

Significant air cargo and associated industrial land uses also are located around LAX. A third port in the region, located in Port Hueneme in Ventura County, is also surrounded with industrial activity.

Along the Mexican border, the three ports of entry in Imperial County have large amounts of commerce going back and forth between the two countries.

Extraction activities in the region focus on oil and minerals. Ventura County has extensive extraction activities in the far southwestern part of the county and along Route 126. These activities extend into Los Angeles County to the area around the City of Santa Clarita. Oil wells and oil refineries remain across southern Los Angeles County. Oil drilling and refining also takes place in Orange County, near Huntington Beach, Newport Beach, and Brea. Significant mining operations take place in the eastern portion of Imperial County. Wind energy generation facilities are located in the San Geronio Pass between Banning and Palm Springs.

Open Space, Recreation, and Agricultural Land Uses

There are vast areas of open space, recreation, and agricultural land uses throughout the SCAG region (**Figure 3.11-6, SCAG Region Open Space, Recreation, and Agricultural Land Uses**). Open spaces vary in size and location and, generally include but are not limited to, public parks, recreational facilities, national forests, national parks, national monuments, military reservations, and other areas planned for such uses. Some open spaces are comprised of lands that have been acquired by public agencies or private institutions for long-term management as open space. Other open space is comprised of land

¹⁹ U.S. Department of Transportation, Bureau of Transportation Statistics. 2018. *Freight Facts and Figures 2017*. January. Available online at: <http://aapa.files.cms-plus.com/Statistics/Freight%20Facts%20and%20Figures%202013.pdf>, accessed March 21, 2019.

designated for passive and active recreation. In addition, there are undeveloped areas in the SCAG region that are natural lands, designated for land uses other than open space or recreation.

Agriculture may be included as open space depending on the location and use. Agriculture may range from open grasslands and rangelands used for livestock grazing to areas supporting row and tree crops. These lands although in agricultural use, may also provide some habitat value, particularly open grasslands grazing land and rangelands. In yet other instances, lands may be designated or zoned as open space but still allow for development of a single-family home. Lands evaluated as natural lands in the Plan are generally evaluated as wildlife habitat in **Section 3.4, Biological Resources** and not agricultural lands. In general, in this PEIR, agricultural lands are farmlands and natural lands provide valued habitat.

Farmlands and rangelands are agricultural lands that are part of the region's open landscape and entail various types and degrees of modifications to natural lands. Also discussed in **Section 3.2, Agricultural and Forestry Resources**, farmlands include irrigated and non-irrigated crop production. Rangelands include any expanse of natural land that is not fertilized, irrigated, or cultivated and is predominately used for grazing by livestock and wildlife.

The distribution of farmlands and rangelands in the SCAG region and vicinity is based primarily on data provided by the California Department of Conservation (CDC). It also provides a summary of existing plans and programs in the region to conserve agricultural lands, plus a summary of growth management plans in other states that include provisions for conserving agricultural lands.

Based on the most recent available data from the CDC in 2016 (verified by SCAG, and its member jurisdictions), there are approximately 2,603,158 acres of agricultural lands in the SCAG region consisting of 1,482,826 acres of grazing land and 1,120,312 acres of farmland which includes, Farmland of Statewide Importance, Prime Farmland, Unique Farmland, and Farmland of Local Importance.²⁰

There is substantially more farmland than rangeland in Riverside and Imperial Counties and the reverse in Los Angeles, Orange, San Bernardino, and Ventura Counties. By comparison, Kern County has more farmland than the six SCAG counties combined and also has more total acres of rangeland.

Historically, development patterns in the region have been tied as much to the conversion of agricultural lands as to the consumption of natural lands for urban uses. A key issue in the region today is whether the high rate of farmland conversion in recent years can be slowed to prevent irreversible losses. If the

²⁰ Department of Conservation. 2016. *Farmland Mitigation and Monitoring Program (FMMP)*. Available at: <http://www.conservation.ca.gov/dlrp/fmmp/Pages/Index.aspx>, accessed March 21, 2019.

intense conversion of agricultural lands continues unabated, the existing inventory of agricultural lands could be reduced by 700,000 acres before 2030.²¹

Tribal Lands

Approximately 266,112 acres, or 416 square miles, of the SCAG region consist of tribal lands from 16 different tribal affiliations (**Table 3.11-4, Tribal Lands within the SCAG Region**, lists the name, county, and acreage of tribal lands within the SCAG region; and **Figure 3.11-7, Tribal Lands in SCAG Region**, shows where tribal lands are located within the SCAG region). Indian Trust Assets (ITAs) include land, natural resources, money, or other assets held by the federal government in trust or that are restricted against alienation for Indian tribes or individuals.²² The Department of Interior Order No. 3175 requires all its bureaus and offices to explicitly address anticipated effects on ITAs in planning, decision, and operation documents.²³ The Bureau of Indian Affairs (BIA) develops inventories of ITAs for all Indian tribes. Tribes must conduct soil and range inventories, land evaluations and range utilization; collect data about soil productivity, erosion, stability problems, and other physical land factors for program development, conservation planning, and water rights claims settlements. In addition, tribes are required to develop land management plans.²⁴

Sixteen tribal lands and their respective governments are in the SCAG region, including the Agua Caliente Band of Cahuilla Indians, Augustine Band of Mission Indians, Cabazon Band of Mission Indians, Cahuilla Band of Mission Indians, Chemehuevi Reservation, Colorado River Reservation, Fort Mojave Indian Tribe, Fort Yuma Reservation, Morongo Band of Mission Indians, Pechanga Band of Luiseno Indians, Ramona Band of Mission Indians, San Manuel Band of Mission Indians, Santa Rosa Band of Mission Indians, Soboba Band of Luiseno Indians, Torres-Martinez Desert Cahuilla Indians, and Twenty-Nine Palms Band of Mission Indians.

Coastal Programs

The Coastal Program in the SCAG region consists of approximately 350,956 acres, or 548 square miles, and includes the islands off of the Southern California coast. The Coastal Program affects Ventura, Los Angeles, and Orange Counties in addition to 28 incorporated cities (**Table 3.11-5, Cities in the SCAG Region with Coastal Zone Jurisdiction**). Each local jurisdictional authority (city or county) with lands within the coastal zone is required to develop, and comply with, a coastal management plan. The Coastal Act requires that any person or public agency proposing development within the Coastal Zone obtain a CDP from either the CCC or the city or county having the jurisdictional authority to issue a CDP. To comply with the Coastal Zone Management Act, localities develop Local Coastal Plans (LCPs).²⁵

Regional Habitat Conservation Plans and Multi-Species Habitat Conservation Plans

HCPs and NCCPs are discussed more fully in **Section 3.4, Biological Resources**. There are 13 HCPs and NCCPs within the SCAG region (See **Section 3.4, Biological Resources**, and **Table 3.4-12, HCP's and NCCP's in the SCAG Region**). As a group, these plans provide protection for multiple species by conserving habitats, identifying locations for future mitigation efforts, providing conservation guidance

and practices, and preserving important wildlife linkages. More than 20 million acres of open space within the SCAG region are currently protected under an HCP or NCCP, or will be protected by a future HCP or NCCP that is currently in its planning stages. Major conservation areas in the region are displayed on **Figure 3.11-8 Los Angeles County Significant Ecological Areas** and **Figure 3.11-9 Regional Conservation Plans in the SCAG Region**.

Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP)

Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) is part of a comprehensive planning effort to address species conservation, land use, and transportation. The integration of thoughtful conservation planning with urban development and transportation is providing a more efficient, streamlined, cost-effective way of planning for the future. Approximately \$2.2 billion has been spent on 25 large transportation projects within the Western Riverside County MSHCP. Through the streamlined permitting process, it is estimated that federal and state agencies, and other non-federal landowners saved between \$126 and \$278 million on these important infrastructure projects.²⁶

Lower Colorado River MSHCP

On April 4, 2005, the Secretary of the Interior and representatives from agencies within Arizona, California, and Nevada implemented the Lower Colorado River Multi-Species Conservation Program (LCR MSCP). The LCR MSCP was created to balance the use of the Colorado River water resources with the conservation of native species and their habitats. The program area extends over 400 miles of the lower Colorado River from Lake Mead in Nevada, through southern California, to the southernmost border with Mexico. The HCP calls for the creation of over 8,100 acres of habitat for fish and wildlife species and the production of over 1.2 million native fish to augment existing populations. The Bureau of Reclamation is the implementing agency for the LCR MSCP.²⁷

Orange County Southern Subregion HCP

The Orange County Southern Subregion HCP was approved in 2007 for a 75-year permit. This HCP is a program that established a permanent habitat reserve and perpetual land management program. This regional HCP covers large tracts of land in the County of Orange and the family-held Rancho Mission

²⁶ Regional Conservation Authority. *Western Riverside County Multiple Species Habitat Conservation Plan*. Available online at: <http://www.wrc-rca.org/about-rca/multiple-species-habitat-conservation-plan/>, accessed August 27, 2019.

²⁷ Lower Colorado River Multi-Species Conservation Program. 2005. Overview. Available online at: <http://www.lcrmscp.gov/index.html>, accessed March 22, 2019.

Viejo. Benefits provided by this HCP include the creation of a subregion habitat reserve program including conservation of coastal California gnatcatcher habitat.²⁸

Orange County Central-Coastal HCP/NCCP

In the 18 years since the Orange County Central-Coastal HCP/NCCP was completed, numerous regional HCPs have been approved or are in development throughout California. The NCCP program has also expanded to address a broad range of important natural habitats throughout the state.²⁹

Coachella Valley MSHCP

The Coachella Valley MSHCP was adopted in 2008 and preserves over 240,000 acres of natural habitat in the Coachella Valley. This MSHCP protects 27 sensitive plant and animal species. This plan is managed by the Coachella Valley Conservation Commission.³⁰

Desert Renewable Energy Conservation Plan (DRECP)

The DRECP, a part of the Bureau of Land Management, was undertaken due to statewide and national concerns regarding habitat fragmentation and loss of habitat for listed and candidate species. The DRECP is a landscape-level plan that streamlines renewable energy development, conserves valuable desert ecosystems and provides outdoor recreation opportunities. The DRECP was developed by the BLM, the U.S. Fish and Wildlife Service, the California Energy Commission and the California Department of Fish and Wildlife, collectively known as the Renewable Energy Action Team (REAT). Revisions to the Final Environmental Impact Statement, released in November of 2015, were made as a result of internal reviews, protests, Areas of Critical Environmental Concern (ACEC) public comments and other public feedback.³¹ The DRECP is a proposed multispecies HCP intended to conserve threatened and endangered species and natural communities in the Mojave and Colorado Desert regions of Southern California, while also facilitating the timely permitting of renewable energy projects to help meet the state's goal of providing at least 33 percent of electricity generation through renewable energy by 2020, 50

²⁸ U.S. Fish and Wildlife Service. *Habitat Conservation Plan Documents - Orange County Southern Subregion HCP*. Available online at: <https://www.fws.gov/carlsbad/HCPs/SoOrangeCoSubRegionHCP.html>, accessed August 27, 2019.

³¹ Bureau of Land Management. *Desert Renewable Energy Conservation Plan Frequently Asked Questions*. Available at: https://www.drecp.org/faqs/DRECP_FAQs.pdf, accessed September 9, 2019.

percent by 2026, and 100 percent by 2045, as well as the federal government's goal of increasing renewable energy generation on public land. As planned, the approved DRECP and associated permits would provide renewable energy developers and entities undertaking DRECP conservation efforts with authorization for the incidental take of certain endangered, threatened, and special-status plant and animal species for covered activities (as defined in the DRECP). Such authorizations would be granted by agencies that are formal participants in the DRECP.³²

California Desert Conservation Area Plan

The California Desert Conservation Area Plan is used to manage BLM-controlled areas. The BLM also implements biological resource management policies through its designation of Areas of Critical Environmental Concern.³³

West Mojave Plan. The West Mojave Plan is an amendment to the Bureau of Land Management's (BLM) California Desert Conservation Area Plan. The West Mojave Plan also has a proposed HCP component that, if and when finalized, would provide a program for complying with the federal ESA on private lands within the West Mojave Plan area. Together, the West Mojave Plan and the proposed HCP component would cover over 9 million acres north of the Los Angeles metropolitan area with a purpose of creating a comprehensive strategy to conserve and protect almost 100 sensitive desert species and natural communities.³⁴

3.11.2 REGULATORY FRAMEWORK

3.11.2.1 Federal

United States Department of Transportation Act, Section 4(f) of 1966 (49 U.S.C. § 303)

The Department of Transportation Act was enacted to preserve the natural beauty of the countryside, public park and recreation lands, wildlife and waterfowl refuges, and historic sites. Section 4(f) requires a comprehensive evaluation of all environmental impacts resulting from federal-aid transportation projects

³² California Energy Commission. 2011. Desert Renewable Energy Conservation Plan Environmental Impact Report. December. Available online at: <http://www.energy.ca.gov/2011publications/DRECP-1000-2011-001/DRECP-1000-2011-001.pdf>, accessed March 22, 2019.

³⁴ U.S. Department of Interior, Bureau of Land Management. *California Desert Conservation Area Plan*. Available online at: https://www.blm.gov/ca/pdfs/cdd_pdfs/wemo_pdfs/plan/wemo/Vol-1-Chapter1_Bookmarks.pdf, accessed August 28, 2019.

administered by the Federal Highway Administration, Federal Transit Administration, and Federal Aviation Administration that involve the use – or interference with use – of the following types of land.

- Public park lands;
- Recreation areas;
- Wildlife and waterfowl refuges; and
- Publicly or privately-owned historic properties of federal, state, or local significance.

Endangered Species Act of 1973 (16 USC 1531 et seq.)

The Federal Endangered Species Act (FESA) was established by Congress in order to “provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved [and] to provide a program for the conservation of such ... species.” The US Fish and Wildlife Service (USFWS) administers the Federal Endangered Species Act (FESA), which designates critical habitat for Endangered species. This enables USFWS to carry out its mission to conserve, protect, and enhance the nation’s fish and wildlife and their habitats for the continuing benefit of people. Critical habitat areas cannot be disturbed without permission from the USFWS and other federal agencies, depending on land ownership. The USFWS also manages a system of land and waters for the conservation of wildlife and associated ecosystems. These National Wildlife Refuges are primarily managed for the preservation and protection of unique or important resources and ecosystems. Habitat Conservation Plans (HCPs), established under Section 10(a)(1)(B) of the ESA, are planning documents that provide for partnerships with non-federal parties to conserve the ecosystems upon which listed (and candidate) species depend, ultimately contributing to their recovery. The USFWS requires HCPs as part of an application for an incidental take permit. HCPs describe the anticipated effects of the proposed taking, how those impacts will be minimized or mitigated, and how the HCP is to be funded. HCPs may be prepared on a project level when projects will require the acquisition of an Incidental Take Permit. Regional HCPs may also be prepared in an effort to protect threatened and endangered species during the land use planning process.

Department of Housing and Urban Development Act

The Department of Housing and Urban Development Act created the U.S. Department of Housing and Urban Development (HUD) as a Cabinet-level agency. HUD is responsible for national policy and programs that address housing needs in the U.S. HUD is responsible for enforcing fair housing laws. HUD plays a major role in supporting homeownership by underwriting homeownership for lower- and moderate-income families through its mortgage insurance programs.

Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970

The Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (42 U.S. Code, § 4601 et seq.), passed in 1970 and amended in 1987, is intended to provide for uniform and equitable treatment for persons displaced through federally-funded or assisted transportation and redevelopment projects that require property acquisition. The act lays out rules for notification, relocation counseling, social services or assistance for disabled residents, and compensation for replacement housing and moving costs. The rules stipulate that replacement housing must be comparable to previous housing in terms of location, size, access to jobs and public facilities, and must be “decent, safe, and sanitary.” The rules apply if federal funds are in any phase of the program or project, even if the property acquisition itself is not federally funded.

Federal Coastal Zone Management Act

The Federal Coastal Zone Management Act (CZMA; 16 USC 1451–1464, Chapter 33; Public Law 92-583, October 27, 1972; 86 Stat. 1280), administered by the National Oceanic and Atmospheric Administration (NOAA), provides for the management of the nation’s coastal resources, including the Great Lakes. The goal is to “preserve, protect, develop, and where possible, to restore or enhance the resources of the nation’s coastal zone.” The CZMA outlines three national programs, the National Coastal Zone Management Program, the National Estuarine Research Reserve System, and the Coastal and Estuarine Land Conservation Program (CELCP). The National Coastal Zone Management Program aims to balance competing land and water issues through state and territorial coastal management programs, the reserves serve as field laboratories that provide a greater understanding of estuaries and how humans impact them, and CELCP provides matching funds to state and local governments to purchase threatened coastal and estuarine lands or obtain conservation easements.

Federal Land Policy and Management Act (FLPMA) of 1976, as Amended

The FLPMA (Public Law 94-579) governs how public lands administered by the Bureau of Land Management (BLM) are managed. FLPMA provides guiding principles for BLM land management including multiple use, sustained yield, and environmental protection. The intent of FLPMA is to ensure that the BLM manages public lands so that they are utilized in the combination that will best meet the present and future needs of the American people for renewable and non-renewable natural resources.

FLPMA addresses topics such as land use planning, land acquisition, fees and payments, administration of federal land, range management, and right-of-ways on federal land. FLPMA has specific objectives and time frames in which to accomplish these objectives, giving it more authority and eliminating the uncertainty surrounding the BLM’s role in wilderness designation and management.

Code of Federal Regulations Title 25

Federally recognized Native American tribes are considered domestic dependent nations. Tribal sovereignty refers to tribes' right to govern themselves, define their own membership, manage tribal property, and regulate tribal business and domestic relations; it further recognizes the existence of a government-to-government relationship between such tribes and the federal government. In general, state and local governments do not have "civil regulatory" jurisdiction (i.e., land use) on Indian Land, which is land held in trust or restricted status for a tribe.

Federal Highway Administration (FHWA) National Scenic Byways Program

The FHWA National Scenic Byways Program, which was established in Title 23, Section 162 of the United States Code under the Intermodal Transportation Efficiency Act of 1991, is a grassroots collaborative effort that designates selected highways as "All American Road" (a roadway that is a destination unto itself), America's Byways or "National Scenic Byway" (a roadway that possesses outstanding qualities that exemplify regional characteristics).

United States Bureau of Land Management (BLM) Scenic Areas and Back Country Byways

The BLM designates some of its holdings as Scenic Areas and some roadways in remote areas as Back Country Byways. The BLM Back Country Byways Program was established in 1989 and is a component of the National Scenic Byways Program. The counties of San Bernardino, Riverside, and Imperial in the SCAG region include land with such BLM designations.

United States Forest Service (USFS) National Scenic Byways Program

The USFS also has a National Scenic Byways Program, independent from the BLM program, which was established in 1995 under the Intermodal Transportation Efficiency Act of 1991 to indicate roadways of scenic importance that pass through national forests. The SCAG region includes Forest Service Scenic Byways in the counties of San Bernardino, Ventura, Los Angeles, and Riverside.

3.11.2.2 State

California Coastal Act of 1976

The California Coastal Act constitutes the California Coastal Management Program for the purposes of the Federal Coastal Zone Management Act (California Coastal Act of 1976, Public Resources Code [PRC] §30000 et seq.). The act established the California Coastal Commission (CCC), identified a designated California Coastal Zone, and established the CCC's responsibility to include the preparation and ongoing

oversight of a Coastal Plan for the protection and management of the Coastal Zone. Each local jurisdictional authority (city or county) with lands within the coastal zone is required to develop, and comply with, a coastal management plan. The Coastal Act requires that any person or public agency proposing development within the Coastal Zone obtain a Coastal Development Permit (CDP) from either the CCC or the city or county having the jurisdictional authority to issue a CDP. New school construction in portions of the Central and South Los Angeles Unified School District (LAUSD) areas could require a CDP. Any construction within the Coastal Zone must conform to the requirements of the California Coastal Act generally, and Chapter 3, Section 6 (Development) specifically. On or near the shoreline, coastal-dependent developments have priority over those uses not dependent on a coastal location (PRC §30255). To comply with the Coastal Zone Management Act, localities develop Local Coastal Plans (LCPs).

Natural Community Conservation Planning Act of 1991, as Amended

The Natural Community Conservation Planning Act of 1991, as amended in 2003 (California Fish and Game Code Section 2800-2835) established the Natural Community Conservation Planning program for the protection and perpetuation of the state's biological diversity. The CDFW established the program in order to conserve natural communities at the ecosystem level while accommodating compatible land use. An NCCP identifies and provides for the regional or area-wide protection of plants, animals, and their habitats, while allowing compatible and appropriate economic activity. The CDFW provides support, direction, and guidance to participants in order to ensure that NCCPs are consistent with the state ESA.

Modernization of Transportation Analysis for Transit- Oriented Infill Projects Senate Bill 743 (SB 743)

On September 27, 2013, Governor Brown signed Senate Bill (SB) 743. To further the state's commitment to the goals of SB 375 and AB 32, SB 743 adds Chapter 2.7, Modernization of Transportation Analysis for Transit- Oriented Infill Projects, to Division 13 (Section 21099) of the Public Resources Code. Key provisions of SB 743 include reforming aesthetics and parking CEQA analyses for urban infill projects and eliminating the measurement of auto delay, including Level of Service (LOS), as a metric that can be used for measuring traffic impacts in transit priority areas. SB 743 provides that, "aesthetics and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment." This means that, effective January 1, 2014, aesthetics and parking will no longer be considered in determining if a project has the potential to result in significant environmental effects provided a project meets all of the following three criteria:

- a) The project is in a transit priority area;
- b) The project is on an infill site; and
- c) The project is residential, mixed-use residential, or an employment center.

CEQA Streamlining for Infill Projects Senate Bill 226 (SB 226)

The CEQA Streamlining for Infill Projects (SB 226) sets forth a streamlined review process for infill projects and includes performance standards that will be used to determine an infill project's eligibility for streamlined review. The purpose of SB 226 and updated *CEQA Guidelines* Section 15183.3 is to streamline the environmental review process by "limiting the topics subject to review at the project level where the effects of infill development have been addressed in a planning level decision or by uniformly applicable development policies." Residential, commercial and retail, public office buildings, transit stations, and schools are eligible for this streamlining provided they meet the following requirements: (1) are located in an urban area on a site that has been previously developed or adjoins existing qualified urban uses on at least 75 percent of the site's perimeter; (2) satisfy the performance standards provided in Appendix M [of CEQA]; and, (3) are consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in either a sustainable communities strategy or an alternative planning strategy, with some exceptions.

Under SB 226, some development and transportation projects assumed as a part of the proposed Plan may be eligible to use a streamlined version of the environmental review process.

Housing Element Law

Enacted in 1969, Housing element law (Government Code Section 65580-65589.8) mandates that local governments adequately plan to meet the existing and projected housing needs of all economic segments of the community. The law acknowledges that, in order for the private market to adequately address housing needs and demand, local governments must adopt land use plans and regulatory systems that provide opportunities for, and do not unduly constrain, housing development. As a result, housing policy in the State rests largely upon the effective implementation of local general plans and, in particular, local housing elements. Housing element law also requires HCD to review local housing elements for compliance with State law and to report its written findings to the local government.

Regional Housing Needs Assessment

The California Legislature developed the RHNA process (Govt. Code § 65580 *et seq.*) in 1977 to address the serious affordable housing shortage in California. The California Department of Housing and

Community Development (HCD) in consultation with each council of governments determines each region's existing and projected housing need.³⁵ HCD must meet and consult with each council of governments, including SCAG, regarding the assumptions and methodology to be used by HCD to determine the region's housing need.³⁶ HCD's determination is based on population projected produced by the Department of Finance and regional population forecasts used in preparing regional transportation plans.³⁷

In consultation with HCD, each council of governments must develop and adopt a methodology for distributing the existing and projected regional housing need to cities, counties, and cities and counties within the region.³⁸ The council of government then adopts a final regional housing need plan that allocates a share of the regional housing need to each city, county, or city and county.³⁹

Local government must address their allocated share of housing needs of all economic segments of the community through their housing elements.⁴⁰ Local governments must adopt a housing element as part of their general plan. Unlike the rest of the general plan, where updates sometimes occur at intervals of 20 years or longer, under previous law the housing element was required to be updated as frequently as needed and no less than every five years. Under SB 375, this period has been lengthened to eight years and timed so that the housing element period begins no less than 18 months after adoption of the regional transportation plan, to encourage closer coordination between housing and transportation planning. SB 375 also changes the implementation schedule required in each housing element. Previous law required the housing element to contain a program which set forth a five-year schedule to implement the goals and objectives of the housing element. The new law instead requires this schedule of actions to occur during the eight-year housing element planning period, and requires each action have a timetable for implementation.⁴¹

The purpose of the housing element is to identify the community's housing needs, state the community's goals and objectives with regard to housing production, rehabilitation, and conservation to meet those needs. In addition, the housing element defines the related policies and programs that the community

⁴¹ California Legislative Information. *Senate Bill No. 375*.

will implement in order to achieve the stated goals and objectives. This would be accomplished through the allocation of regional housing needs consistent with the Plan.⁴²

In prior cycles, factors such as household growth and household income distribution were the primary factors considered in determining a jurisdiction's RHNA allocation. For the 6th RHNA cycle, SCAG plans to consider other factors in addition to household growth. These factors include transit accessibility, job accessibility, and indicators that influence a community's environmental, educational, and economic resource accessibility.

As discussed above in the discussion of SB 375, state law requires preparation of a RHNA allocation plan every eight years. SCAG's 6th Cycle RHNA quantifies the regional need for housing and then allocates the regional need to each jurisdiction for a planning period between October 2021 and October 2029. Local jurisdictions are required to plan and zone to accommodate their respective RHNA allocation (housing units) by income categories through the process of updating the Housing Elements of their General Plans. The RHNA does not necessarily encourage or promote growth, but rather allows communities to anticipate growth and address existing need, so that they can grow in ways that enhance quality of life, improve access to jobs, transportation and housing, and not adversely impact the environment.⁴³

This region's 6th Cycle RHNA allocation plan consists of two measurements of housing need: (1) existing need and (2) future need for very-low income, low-income, moderate, and above-moderate income categories.

The existing need assessment is based on data from the most recent US Census to measure ways in which the housing market is not meeting the needs of current residents. These variables include the number of households paying more than 30 percent of their income for housing, as well as overcrowding.

The future need for housing is determined primarily by the forecasted growth in households in a community, based on historical growth patterns, job creation, household formation rates, and other factors to estimate how many households will be added to each community over the projection period. The housing need for new households is then adjusted to account for an ideal level of vacancy needed to promote housing choice, maintain price competition, and encourage acceptable levels of housing upkeep and repair. The RHNA also accounts for units expected to be lost due to demolition, natural disaster, or conversion to non-housing uses. The sum of these factors including household growth, vacancy need and replacement need form the "projected need" assigned to each community. Per SB 375, the projected

⁴² California Legislative Information. *Article 10.6. Housing Elements [65580-65589.11], Section 65580.*

⁴³ SCAG. *Regional Housing Needs Assessment (RHNA) & Housing.* Available online at: <https://www.scag.ca.gov/programs/Pages/Housing.aspx>, accessed August 29, 2019.

need's portion of the 6th Cycle RHNA will be consistent with the Connect SoCal for the comparable period.

SCAG's RHNA allocation plan considers how each jurisdiction might grow in ways that will decrease the over-concentration of low-income households. The need for new housing is distributed among income groups so that each community moves closer to the county income distribution.

Consistent with the state housing law, the primary objectives the 6th Cycle RHNA allocation plan are:

1. Increase the housing supply and mix of housing types, tenure and affordability within each region in an equitable manner
2. Promote infill development and socioeconomic equity, the projection of environmental and agricultural resources, and the encouragement of efficient development patterns
3. Promote an improved interregional relationship between jobs and housing
4. Allocating a lower proportion of housing need in income categories in jurisdictions that have a disproportionately high share in comparison to the county distribution
5. Affirmatively furthering fair housing

On October 15, 2019, SCAG received the Final Regional Determination from HCD. On November 7, 2019, SCAG Regional Council approved a Draft RHNA Allocation Methodology for HCD's review. The Regional Council is scheduled to approve the Final RHNA Methodology in March 2020 and release the Draft RHNA Allocation by jurisdiction prior to adopting Connect SoCal in April 2020.

Sustainable Communities and Climate Protection Act of 2008 (SB 375)

Senate Bill 375 focuses on aligning transportation, housing, and other land uses to achieve regional GHG emission reduction targets established under the California Global Warming Solutions Act, also known as Assembly Bill 32 (AB 32). SB 375 requires California Metropolitan Planning Organizations to develop an SCS as part of the Regional Transportation Plan (RTP), with the purposes of identifying policies and strategies to reduce per capita passenger vehicle-generated GHG emissions. The SCS must:

- identify the general location of land uses, residential densities, and building intensities within the region;
- identify areas within the region sufficient to house all the population of the region;

- identify areas within the region sufficient to house an eight-year projection of the regional housing need;
- identify a transportation network to service the regional transportation needs;
- gather and consider the best practically available scientific information regarding resources areas and farmland in the region;
- consider the state housing goals;
- set forth a forecasted development pattern for the region; and
- allow the regional transportation plan to comply with the federal Clean Air Act (CAA) of 1970 (42 USC § 7401 et seq.).

The development pattern in the SCS, when integrated with the transportation network and other transportation measures and policies, must reduce the GHG from automobiles and light duty trucks to achieve the GHG emission reduction targets approved by the California Air Resources Board (ARB). If the SCS does not achieve the GHG emission targets set by ARB, an Alternative Planning Strategy must be developed to demonstrate how the targets could be achieved. SB 375 also imposes a number of new requirements on the regional housing needs process. Before SB 375, the regional transportation plan and regional housing needs processes were not required to be coordinated.

SB 375 now synchronizes the schedules of the RHNA and regional transportation plan processes. The RHNA, which is developed after the regional transportation plan, must also allocate housing units within the region consistent with the development pattern included in the SCS. Previously, the RHNA determination was based on population projections produced by the Department of Finance. SB 375 requires the determination to be based upon population projections by the Department of Finance and regional population forecasts used in preparing the regional transportation plan. If the total regional population forecasted and used in the regional transportation plan is within a range of three percent of the regional population forecast completed by the Department of Finance for the same planning period, then the population forecast developed by the regional agency and used in the regional transportation plan shall be the basis for the determination. If the difference is greater than three percent, then the two agencies shall meet to discuss variances in methodology and seek agreement on a population projection for the region to use as the basis for the RHNA determination. If no agreement is reached, then the basis for the RHNA determination shall be the regional population projection created by the Department of Finance.

Existing law requires local governments to adopt a housing element as part of their general plan. Unlike the rest of the general plan, where updates sometimes occur at intervals of 20 years or longer, under previous law the housing element was required to be updated as frequently as needed and no less than every five years. Under SB 375, this period has been lengthened to eight years and timed so that the housing element period begins no less than 18 months after adoption of the regional transportation plan to encourage closer coordination between the housing and transportation planning done by local governments and MPOs. SB 375 also changes the implementation schedule required in each housing element. Previous law required the housing element to contain a program which set forth a 5-year schedule of to implement the goals and objectives of the housing element. The new law instead requires this schedule of actions to occur during the eight-year housing element planning period, and requires each action have a timetable for implementation.

Regional Conservation Investment Strategy Program

On September 22, 2016, the Governor signed Assembly Bill 2087 which created CDFW's Regional Conservation Investment Strategy pilot program, and was amended by Senate Bill 103 on July 21, 2017. The program uses a science-based approach to identify conservation and enhancement opportunities that, if implemented, will help California's declining and vulnerable species by protecting, creating, restoring, and reconnecting habitat and may contribute to species recovery and adaptation to climate change and resiliency. The Program consists of three components: regional conservation assessments (RCAs), regional conservation investment strategies (RCISs), and mitigation credit agreements (MCAs). An RCA is a voluntary, non-regulatory, non-binding conservation assessment that includes information and analyses of important species, ecosystems, protected areas, and habitat linkages at the USDA ecoregion scale and may include more than one ecoregion. An RCIS is a voluntary, non-regulatory, and non-binding conservation assessment that includes information and analyses relating to the conservation of focal species, their associated habitats, and the conservation status of the RCIS land base. An RCIS establishes biological goals and objectives at the species level and describes conservation actions and habitat enhancement actions that, if implemented, will contribute to those goals and objectives. An MCA is a mitigation credit agreement developed under an approved RCIS. An MCA is developed in collaboration with CDFW to create mitigation credits by implementing the conservation or habitat enhancement actions identified in an RCIS.⁴⁴

Enhanced Infrastructure Financing Districts

Enacted on September 29, 2014, the new state law, Enhanced Infrastructure Financing Districts (SB 628; Chapter 2.99 [commencing with Section 53398.50] to Part 1 of Division 2 of Title 5 of the Government Code) allows the legislative body of a city or a county, defined to include a city and county, to establish an infrastructure financing district, adopt an infrastructure financing plan, and issue bonds to finance public facilities upon approval by two-thirds of a jurisdiction's voters. Additionally, a city or county is authorized to issue bonds upon approval by 55 percent of the voters, for which only the district is liable; to finance public capital facilities or other specified projects of communitywide significance, including, but not limited to, brownfield restoration and other environmental mitigation; the development of projects on a former military base; the repayment of the transfer of funds to a military base reuse authority; the acquisition, construction, or rehabilitation of housing for persons of low and moderate income for rent or purchase; the acquisition, construction, or repair of industrial structures for private use; transit priority projects; and projects to implement a sustainable communities strategy. The bill would also authorize an enhanced infrastructure financing district to utilize any powers under the Polanco Redevelopment Act.

3.11.2.3 Local

General Plans and Land Use Regulations

The legal framework in which California cities and counties exercise local planning and land use functions is provided in the California Planning and Zoning Law (California Code section 65000 et seq.) Under state planning law, each city and county is required to adopt a general plan "for the physical development of the county or city, and any land outside its boundaries which bears relation to its planning" (California Code section 65300 et seq.).

The general plan expresses the community's development goals and embodies public policy relative to the distribution of future land uses, both public and private. A general plan consists of a number of elements, including land use, circulation, housing, conservation, open space, noise, and safety; other elements may be included at the discretion of the jurisdiction that relate to the physical development of the county or city. The general plan must be comprehensive and internally consistent. Of particular importance is the consistency between the circulation and land use elements; the general location and extent of existing and proposed major thoroughfares, transportation routes, terminals, and other public utilities and facilities must be consistent with the general distribution and intensity of land used for housing, business, industry, open space, education, public areas, waste disposal facilities, agriculture, and other public and private uses.

In addition, every local jurisdiction within the region has land use regulations that implement the general plan. The zoning ordinance is the primary land use regulation used to implement the goals and policies of its general plan. Zoning ordinances, which are required to be consistent with the general plan, provide detailed direction related to development standards; permitted, conditionally permitted, and prohibited uses; and other regulations such as parking standards and sign regulations.

Local jurisdictions may also adopt specific plans, which are used to implement the general plan in particular geographic areas (California Code section 65450). Zoning ordinances and land use approvals must be consistent with applicable specific plans as well as the general plan.

Cities and counties are also required to comply with the Subdivision Map Act (California Code section 66410 et seq.). The Subdivision Map Act sets forth the conditions for approval of a subdivision map and requires enactment of subdivision ordinances by which local governments have direct control over the types of subdivision projects to be approved and the physical improvements to be installed.

Community Plans, Specific Plans, and Master Plans

A city or county may also provide land use planning by developing community or specific plans for smaller, more specific areas within their jurisdiction. These more localized plans provide for focused guidance for developing a specific area, with development standards tailored to the area, as well as systematic implementation of the general plan. Counties, cities, and private developers may also choose to partner in the development of a master plan that shows an overall development concept that includes urban design, landscaping, infrastructure, service provision, circulation, present and future land use and built form. It consists of three dimensional images, texts, diagrams, statistics, reports, maps and aerial photos that describe how a specific location will be developed. It provides a structured approach and creates a clear framework for developing an area.

Zoning

City and county zoning codes are the set of detailed requirements that implement the general plan policies at the level of the individual parcel. The zoning code presents standards for different uses and identifies which uses are allowed in the various zoning districts of the jurisdiction. Since 1971, state law has required the city or county zoning code to be consistent with the jurisdiction's general plan.

3.11.3 ENVIRONMENTAL IMPACTS

3.11.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the Plan could result in significant adverse impacts to land use, if the Plan would result in either of the following:

- Physically divide an established community.
- Cause a significant environmental impact due to conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

3.11.3.2 Methodology

The Plan includes transportation projects as well as transportation and land use strategies aimed to increase mobility, promote sustainability, and improve the regional economy. Although land use development is anticipated to occur within the region even without the Plan, the Plan includes policies and strategies that could influence growth, including distribution patterns. To address this, the analysis in the PEIR covers overall impacts of transportation projects and land use strategies described in the Plan and evaluates how conditions in 2045 under the Plan would differ from existing conditions. **Section 2.0, Project Description**, describes the Plan's vision, goals, guiding policies, performance measures, and land use and transportation strategies. A geographic information system (GIS) was used to analyze where major transportation (e.g., freeway, rail, and transit) projects would intersect areas used for residential development and business uses. A 500-foot potential impact zone was drawn around the freeway, rail, and transit projects in Connect SoCal to compute the number of acres that could potentially be affected by the construction and operation of transportation projects included in the Plan. **Table 3.11-6** shows the current land uses that are located within 500 feet of either side of Plan transportation projects.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.11.3.3 Impacts and Mitigation Measures

Impact LU-1 Potential for the Plan to physically divide an established community

Significant and Unavoidable Impact - Mitigation Required.

Physical division of an established community could occur as a result of real or perceived barriers to pedestrians, bicyclists, and motorists. Short-term construction related impacts could result from disturbances due to construction equipment; these impacts are discussed under other impact categories (e.g., Noise, Aesthetics, and Air Quality). Long-term impacts could result from the completion of new or expanded roadways or transit facilities in existing communities. Also, if freeway routes, particularly those that occur in rural areas, are widened, they can create a real or perceived barrier to pedestrians, bicyclists, and motorists. Freeway segments that would occur in rural areas, such as projects adding express lanes along I-15 in San Bernardino County connecting I-215 to US-395, also have the potential to create physical barriers. Such additions of new roadways or expansion of existing roadways may be perceived as a great distance to cross by a pedestrian (whereas it may not have been perceived as an issue previously), thereby dividing a community. Urban transportation projects, and the Plan's emphasis on expanded transit could expand urban uses into undeveloped areas and has the potential to physically divide established communities. For example, an elevated grade crossing may create a physical barrier in some locations.

The transportation strategies in the Plan, such as emphasis on complete streets and TDM strategies would have less of an ability to divide established communities because they are generally expected to occur in established communities. Further, many of these strategies (i.e., bike lanes, pedestrian access) improve connectivity.

Implementation of the Plan would affect land use patterns and the consumption of currently vacant and open space lands. As described above, the Plan would result in the conversion of 41,546 greenfield acres including 6,732 acres of agricultural land to urban uses. As land gets converted from urban or agricultural uses, there is the potential for infrastructure or land developments to divide existing communities. Anticipated significant impacts include substantial density increases in areas of the region adjacent to transit, or other rights-of-way that could separate residences from community facilities and services, and conversion of vacant lands, including agricultural lands, to transportation infrastructure and residential and commercial development.

A GIS analysis was performed to determine where major transportation projects in the Connect SoCal Plan intersected with different land uses to evaluate the potential for conflicts. For purposes of identifying potential land use conflicts, a 500-foot buffer was used around the Plan's major transportation

projects to identify the number of acres potentially affected. Highway and transit extensions and major interchange projects are assumed to have a higher potential to disrupt or divide existing communities since they would involve the creation of new roadways. Highway widening and other projects along established transportation rights-of-way were assumed to have a lower potential to divide or disrupt existing communities and neighborhoods. The analysis is based on general descriptions of transportation projects listed in the Plan and is regional and programmatic in nature. As shown in **Table 3.11-6, Potential Displacement of Existing Residential and Commercial Land Uses (in Acres)**, approximately 10,254 acres of land zoned for residential use (including multifamily and single family) could be affected by projects in the Plan. However, most projects in the Plan are modifications or expansions (e.g., HOV, widening) of existing facilities and would have less potential to divide an existing community than new projects.

**Table 3.11-6
Potential Displacement of Existing Residential and Commercial Land Uses (in Acres)**

Land Use	County						Total
	Imperial	Los Angeles	Orange	Riverside	San Bernardino	Ventura	
Commercial and services	64	1,369	635	821	874	532	4,295
General office	6	468	269	284	359	130	1,516
Industrial	3	2,203	208	719	570	193	3,894
Mixed commercial and industrial	-	8	0.7	131	30	7	179
Mixed residential	-	110	-	5	34	11	160
Mixed residential and commercial	-	237	78	59	75	133	581
Mobile homes and trailer parks	13	157	62	199	71	53	555
Multi-family residential	3	697	391	389	222	121	1,823
Rural residential	-	208	-	301	192	0.5	702
Single-family residential	35	3,258	1,018	983	880	260	6,434
Total	123	8,716	2,662	3,891	3,307	1,441	20,138

Source: SCAG, 2019

Nonetheless, because the Plan would result in the location of transportation infrastructure in residential areas, it is possible division of communities would occur. As such, impacts are considered significant.

Mitigation Measures

SCAG Mitigation Measures

SMM LU-1: SCAG shall coordinate with local County Transportation Commissions, Caltrans and other implementing agencies when siting new facilities in residential areas to facilitate minimizing future impacts of transportation projects on established communities, through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts to promote best planning practices.

Project Level Mitigation Measures

PMM LU-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects that physically divide a community, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Facilitate good design for land use projects that build upon and improve existing circulation patterns
- b) Encourage implementing agencies to orient transportation projects to minimize impacts on existing communities by:
 - Selecting alignments within or adjacent to existing public rights of way.
 - Design sections above or below-grade to maintain viable vehicular, cycling, and pedestrian connections between portions of communities where existing connections are disrupted by the transportation project.
 - Wherever feasible incorporate direct crossings, overcrossings, or under crossings at regular intervals for multiple modes of travel (e.g., pedestrians, bicyclists, vehicles).
- c) Where it has been determined that it is infeasible to avoid creating a barrier in an established community, consider other measures to reduce impacts, including but not limited to:
 - Alignment shifts to minimize the area affected.
 - Reduction of the proposed right-of-way take to minimize the overall area of impact.
 - Provisions for bicycle, pedestrian, and vehicle access across improved roadways.

Level of Significance After Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts that physically divide a communities could be significant and unavoidable even with implementation of mitigation.

Impact LU-2 Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect

Significant and Unavoidable Impact - Mitigation Required.

As part of the Plan, SCAG has developed a population, housing and employment growth forecast, land use and transportation strategies and forecasted land use patterns. The Plan seeks to integrate the forecasted land use patterns with the transportation network, in response to projected growth and housing needs, changing demographics, and transportation demands. Transportation strategies included in the Plan emphasize system preservation, active transportation, transportation safety, electrification, and transportation demand management measures. Land use strategies included in the Plan aim to focus most of the new housing and job growth in high-quality transit areas (HQTAs), with 60 percent of new homes and 73 percent of new jobs being located in these Priority Growth Areas (PGAs) which include existing main streets, downtowns, and commercial corridors. Land use strategies also seek to focus growth in other PGAs such as job centers and neighborhood mobility areas (NMAs) to maximize existing infrastructure and encourage infill development (**Figure 3.11-5, SCAG Region Proposed Job Centers**).

The development patterns encouraged by the Connect SoCal Plan, where implemented by local jurisdictions, would influence the distribution of growth in existing urbanized areas or suburban town centers and opportunity areas such as in HQTAs, including livable corridors and neighborhood mobility areas. As described in **Chapter 2.0, Project Description**, by 2045, the SCAG region is anticipated to add 3.2 million people with or without the Plan. To accommodate the growth, the Plan includes transportation and land use strategies that encourage higher densities in areas with infill potential and existing infrastructure (e.g., HQTAs, NMAs); emphasizes an increase in transportation mode choice such

as transit, walking and biking; promote diverse housing choices; support implementation of sustainability policies, promote a green region, and other benefits. In particular, the policies and strategies in the Plan support the development of local climate adaptation and hazard mitigation plans as well as project implementation that improves community resiliency to climate change and natural hazards; supports local policies for renewable energy production, reduction of urban heat islands and carbon sequestration; encourages the integration of local food production into the regional landscape; promotes more resource efficient development focused on conservation, recycling and reclamation; preserve, enhance and restore wildlife connectivity; reduce the consumption of resource areas, including agricultural lands; and identify ways to improve access to public park space.

In other areas, land use policies and strategies in the Plan would encourage development of underutilized areas (infill, etc.). As stated previously, development patterns, would be supported by transportation investments that emphasize system preservation and enhancement, active transportation, and land use integration, and are generally consistent with local land use plans, goals, and policies calling for higher density, compact, mixed-use development that may be served by high-quality transit, bicycle and pedestrian improvements. The Plan's transportation strategies would have less ability to result in conflicts with general plans as they are generally expected to be implemented in established communities where such strategies are often included at the local level.

The Plan contains strategies to guide anticipated population, households, and employment growth in the region by 2045. The land use strategies were developed as a result of SCAG's bottom-up planning process outlined in the Plan. This process involved extensive outreach to and input from local jurisdictions, including counties, subregions, and local city planners.

While the Plan was developed primarily from assumptions derived from local general plans and input from local governments and transportation agencies, SB 375 does not require local land use policies, regulations or general plans to be consistent with the Plan. Also, although the transportation projects and land use strategies included in the Plan are generally compatible with county- and regional-level general plans, local general plans may have not have been updated since SCAG's last adopted 2016 RTP/SCS. As such, it is likely that there could be incompatibilities with existing general plans in the region.

SCAG has no authority to adopt, approve, implement, or otherwise regulate local land use plans or projects that are listed in the Connect SoCal Plan. SB 375 specifically provides that a regional transportation plan does not supersede the land use authority of cities and counties. In addition, cities and counties are not required to change their land use plans and policies, including general plans, to be consistent with the Plan. Rather, SB 375 requires the projections of a regional land use pattern integrated with the transportation network and the provision of strategies and recommended policies to reduce per

capita GHG emissions from automobiles and light trucks. Local governments reserve their land use authority and may incorporate, as appropriate, the recommended land use strategies, guiding principles, and policies include in the Plan.

In addition, it is possible that many general plans do not include similar regional policies as they are focused on land uses within the local jurisdiction. For example, while the Plan includes strategies for compact development and higher densities as a means to accommodate increased population in an efficient manner, many jurisdictions are planning for smaller individual numbers and may assume smaller densities. The growth pattern in the Plan assumes 21 percent of new housing would be urban infill and 63 percent would be compact (walkable). It is possible that local general plans have not been updated to reflect the land use assumptions within the Plan, despite SCAG's outreach and bottom up planning process for the reasons stated above. As a result, there exists the potential for a local general plan to conflict with SCAG's projected land use pattern. While this conflict would not result in a direct physical impact, physical impacts could occur indirectly as other pressures for increased densities grow in the region. As density increases, consistent with SCAG's land use policies and strategies, these policies and strategies could facilitate higher density in areas not currently planned for such densities (at the local level). As such, there is the potential for inconsistencies between SCAG's land use strategies and local planning documents that could potentially lead to physical environmental impacts.

Implementation of the Plan would also have a potential to result in conflicts with the provisions of applicable adopted HCPs, NCCPs as well as other open space/parklands. The Plan's land use strategies seek to reduce conflicts with applicable HCPs, NCCPs and open spaces by focusing new growth in existing urban areas and urban opportunity areas to help preserve natural habitat areas. In addition, parklands are usually zoned as open space and SCAG does not allocate growth to lands designated for open space/parks. However, because some planned major transportation projects could occur in or adjacent to lands protected under these plans, there is the potential for a significant impact (See **Section 3.4, Biological Resources**, for further analysis of the Plan's potential to conflict with provisions of an adopted HCP or NCCPP).

As previously discussed, there are areas subject to general plans that would be impacted by transportation projects. In addition, since the Plan's planning horizon year is beyond the timeline of many of the most recent general plans, implementation of the Plan's transportation projects and land use strategies could potentially result in changes in the land use patterns in the region. Therefore, there is potential for inconsistencies with general plans as well as regional conservation plans, constituting potentially significant effects requiring the consideration of mitigation measures.

*Mitigation Measures*SCAG Mitigation Measures

- SMM LU-2:** SCAG shall continue to promote the Intergovernmental Review (IGR) Program as an internal and external informational tool by reviewing and monitoring all projects submitted to SCAG for review and working with local jurisdictions to ensure that submitted projects support the most currently adopted Connect SoCal Plan. SCAG shall provide comment letters on regionally significant projects to recommend additional resources to help the lead agency support or develop a projects that are consistent with the Plan, as appropriate. The IGR Mapping Tool can also be utilized by local jurisdictions to assess regional impacts. To visit the IGR Mapping tool, please go to: <https://maps.scag.ca.gov/IGR/>. For more information on SCAG's IGR Program, please visit: <http://www.scag.ca.gov/programs/Pages/IGR.aspx>.
- SMM LU-3:** SCAG shall encourage cities and counties in the region to provide SCAG with electronic versions of their most recent general plan (and associated environmental document) and any updates as they are produced.
- SMM LU-4:** SCAG shall continue to provide targeted technical services such as GIS and data support for cities and counties to update their general plans at least every ten years, as recommended by the Governor's Office of Planning and Research.
- SMM LU-5:** SCAG shall provide technical assistance and regional leadership to encourage implementation of the Plan goals and strategies that integrate growth and land use planning with the existing and planned transportation network.

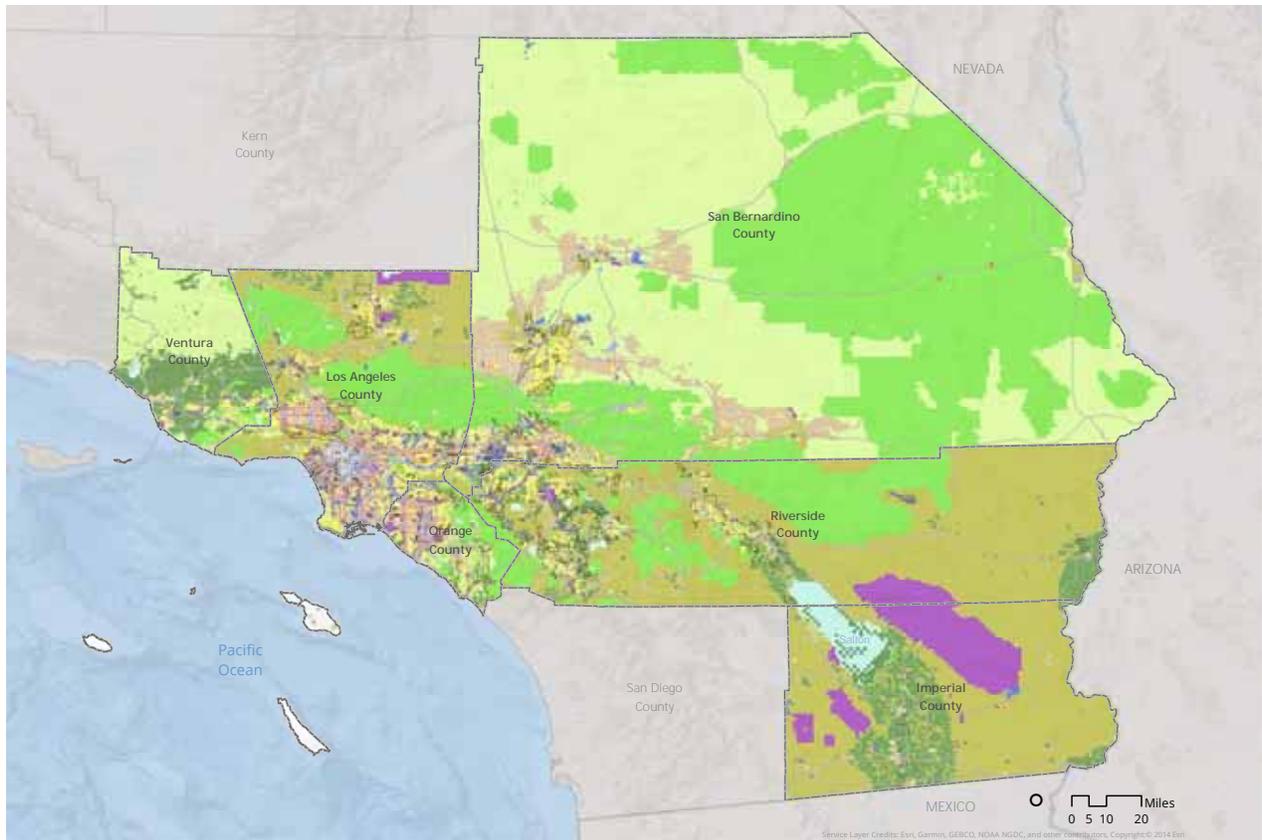

Project Level Mitigation Measures

- PMM LU-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects that physically divide a community, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:
- a) When an inconsistency with the adopted general plan policy or land use regulation (adopted for the purpose of avoiding or mitigating an impact) is identified modify the transportation or land use project to eliminate the conflict;

or, determine if the environmental, social, economic, and engineering benefits of the project warrant an amendment to the general plan or land use regulation.

Level of Significance After Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to potential lack of consistency with land use plans, policies and regulations and potential to result in environmental impact could be significant and unavoidable even with implementation of mitigation.

3.12 MINERAL RESOURCES

This section of the Program Environmental Impact Report (PEIR) describes mineral resources in the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect mineral resources, and analyzes the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”) In addition, this PEIR provides regional-scale mitigation measures, as well as project-level mitigation measures for subsequent, site-specific environmental review documents prepared by lead agencies to reduce identified impacts as appropriate and feasible.

3.12.1 ENVIRONMENTAL SETTING

A mineral resource is a pure inorganic substance occurring in Earth’s crust in such form, quantity or quality that there are reasonable prospects for economic extraction. With over 1,200 mines in California, the state relies on mineral resources as a continuous supply of construction aggregate materials (sand, gravel, and crushed stone) for urban infrastructure and essential to the economy of Southern California. Construction minerals, such as aggregate, constitute the state’s most important mineral commodity in terms of tonnage, value, and societal infrastructure. California is number one in the United States (U.S.) for the production of sand and gravel, and fourth in the U.S. for total non-fuel mineral production. As of 2017, there were 663 active non-fuel mines in the state with a total market value of production valuing \$3.6 billion.¹

Mineral Resource Zones (MRZs) were initially mapped in 1980 as a result of the Surface Mining and Reclamation Act (SMARA) of 1975. MRZs are designated into four classes that indicate the potential for a specific area to contain significant mineral resources:

- **MRZ-1:** Areas where available geological information indicated there is little or no likelihood for presence of significant mineral resources.
- **MRZ-2:** Areas underlain by mineral deposits where geological data indicate that significant measured or indicated resources are present or where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists.
- **MRZ-3:** Areas containing known mineral occurrences of undetermined mineral resources significance.

¹ California Department of Conservation (DOC). 2017. California’s Non-Fuel Mineral Production in 2017. Available online at: <https://www.conservation.ca.gov/cgs/Documents/california-non-fuel-mineral-production-2017.pdf>, accessed June 12, 2019.

- **MRZ-4:** Areas of known mineral occurrences where geological information does not rule out the presence or absence of significant mineral resources.²

3.12.1.1 Mineral Resources Project

To organize active and historic mining data as mandated by the Surface Mining and Reclamation Act of 1975 (SMARA), the California Department of Conservation created the Mineral Resources Project, to provide information about California's non-fuel mineral resources. Under the project, the California Geological Survey (CGS) classifies lands that contain regionally significant mineral resources and then develops objective maps and reports to be used by mining companies and consultants, government agencies, and the public to recognize, utilize, and protect California's mineral resources.

The Mineral Resources Project divides non-fuel mineral resources into three categories: metals (include gold, silver, iron and copper), industrial minerals (like clays, limestone, and gypsum), and construction aggregate (sand, gravel, and crushed stone).³

3.12.2 ENVIRONMENTAL SETTING

3.12.2.1 Mineral Resources of Regional Significance

County and city general plans are required to identify significant mineral resource areas and apply appropriate land use designations to ensure their future availability. Many city and county general plans in the SCAG region reference and map local mineral resources. Most of the comprehensive mineral resource mapping in California has been completed for urban areas where there is a high probability that converted land uses would be incompatible with mining. Gold, sand, and gravel are the primary mineral resources still extracted throughout the SCAG region. As shown in **Figure 3.12-1, Mineral Resources in the SCAG Region**, other mineral resources in the SCAG region consist of bentonite, boron, cement, common clay, crushed stone, dimension stone, feldspar, gemstones, gypsum, lime, perlite, salt, silver, soda ash, sodium sulfate, sulfur, talc, and zeolites.

³ California Department of Conservation (DOC). 2017. *California's Non-Fuel Mineral Production in 2017*. Available online at: <https://www.conservation.ca.gov/cgs/Documents/california-non-fuel-mineral-production-2017.pdf>, accessed June 12, 2019.

Imperial County

A number of mineral resources in Imperial County are currently being extracted. These mineral resources include gold, gypsum, sand, gravel, lime, clay, stone, kyanite, limestone, sericite, mica, tuff, salt, potash, and manganese. Several issues influence the extraction of mineral deposits in Imperial County, including the location of geologic deposition, the potential for impacts to the environment, and land use conflicts. As a result, the extraction of mineral resources is limited to a relatively small number of sites throughout the County.⁴

Los Angeles County

In Los Angeles County, four major MRZ-2s are identified in, or partially within the unincorporated areas; Little Rock Creek Fan, Soledad Production Area, Sun Valley Production Area, and Irwindale Production Area. The Soledad and Little Rock Creek MRZ-2s contain significant commercially-viable aggregate or mineral deposits, such as sand, gravel, and other construction aggregate that are estimated to contain mineral resources through the year 2046.^{5,6}

Orange County

In 1994, the California Department of Conservation, Division of Mines and Geology, published an updated report identifying significant sand and gravel resources for the Orange County region. These resource areas are located in portions of the Santa Ana River, Santiago Creek, San Juan Creek, Arroyo Trabuco and other areas.⁷

Riverside County

Mineral extraction is an important component of Riverside County's economy. The County of Riverside has extensive deposits of clay, limestone, iron, sand, and aggregates. Mineral deposits in the county are important to many industries, including construction, transportation and chemical processing. The value

⁵ Little Rock Creek Fan, Soledad Production Area, Sun Valley Production Area, and Irwindale Production Area. The Soledad and Little Rock Creek MRZ-2s contain significant deposits that are estimated to provide for future needs through the year 2046.

⁶ Los Angeles County. 2015. Los Angeles County General Plan Chapter 9: Conservation and Natural Resources Element. Available at: http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan.pdf, accessed September 10 2019.

⁷ Orange County Public Works. *General Plan Chapter VI: Resources Element*. Available online at: <https://www.ocgov.com/civicax/filebank/blobdload.aspx?blobid=40235>, accessed June 24, 2019.

of mineral deposits within the county is enhanced by their close proximity to urban areas. However, increasing urbanization also encroaches on the mineral resources within the county.⁸

San Bernardino County

The Desert Region Habitat, which covers approximately 93 percent of the San Bernardino County land area, contains mountain ranges which support exposed bedrock, mineral deposits in granite rock.⁹

Ventura County

The two principal mineral resources located in Ventura County are petroleum (oil and gas) and aggregate (principally sand and gravel). Other minerals of commercial value within Ventura County are: asphalt, clay, expansible shale, gypsum, limestone, and phosphate. Although many sand and gravel sites exist throughout the County, most of the extraction sites are located in and along the Santa Clara River bed.¹⁰

Construction Aggregate in the SCAG Region

Mapping information assists planners and decision-makers balance the need for construction aggregate with many other competing land use issues in their jurisdictions. It is estimated that in the next 50 years, California will need approximately 11 billion tons of aggregate, while current permits only allow for 7.6 billion tons, or 69 percent of the total need.¹¹

Table 3.12-1, Permitted Aggregate Resources and 50-Year Demand in the SCAG Region, shows the forecasted demand as well as the permitted aggregate reserves within the SCAG region. The Temescal Valley-Orange County area has the highest projected demand over the next 50 years, with an estimated 1,079 million tons demanded. In contrast, Ventura County has a future demand of approximately 241 million tons of aggregate. All of the aggregate study areas within the SCAG region have less permitted aggregate reserves than they are projected to need for the next 50 years. The projected total 50-year

demand for the SCAG region is 4.4 billion tons ¹² (It should be noted that although there are aggregate mines in Imperial County, the CGS does not provide permit and demand data for Imperial County).

**Table 3.12-1

Current non-permitted aggregate resources are the most likely future sources of construction aggregate potentially available to meet California's continuing demand. Non-permitted aggregate resources are deposits that may meet specifications for construction aggregate, are recoverable with existing technology, have no land overlying them that is incompatible with mining, and currently are not permitted for mining. These resource areas include areas that are known to contain aggregate resources and have compatible land uses such as agricultural land, open space lands (not designated as parks), and forest lands. Uses that are considered incompatible with mining include urban areas, county and state parks, national parks, and golf courses. It is unlikely that all of these resources would ever be mined as many are located in proximity to urban or environmentally sensitive areas or remote from a potential market to be economically viable. Land uses that are considered incompatible with mining include urban areas, county and state parks, national parks, and golf courses.

¹² Ibid.

The estimated amount of non-permitted resources in the region is not easily quantifiable; California's non-permitted aggregate resources have been estimated to be approximately 74 billion tons.¹³ While the estimated amount of nonpermitted resources is large, it is unlikely that all of these resources would ever be mined because of social, environmental, or economic factors. For example, aggregate resources located in proximity to urban or environmentally sensitive areas can limit or stop the development of mining operations, as such these sites are unlikely to be mined. These resources may also be located remote from a potential market to be economically viable, due to the cost of transporting such resources. In spite of such possible constraints, current nonpermitted aggregate resources are the most likely future sources of construction aggregate potentially available to meet California's continuing demand.

3.12.3 REGULATORY FRAMEWORK

3.12.3.1 Federal

Indian Mineral Development Act of 1982

The Indian Mineral Development Act of 1982 (25 U.S. Code [USC] 2101–2108) permits Indian tribes, through the Secretary of the Interior, to enter into a Minerals Agreement for the disposition of tribal mineral resources. A Minerals Agreement provides for the exploration for or extraction of oil, gas, uranium, coal, geothermal, or other energy or non-energy mineral resources for tribes that own a beneficial or restricted interest or provide for the sale or production of tribal mineral resources.¹⁴

3.12.3.2 State

Surface Mining and Reclamation Act (SMARA) of 1975

The SMARA (Public Resources Code [PRC] 2710–2796) requires that the State Department of Mines and Geology Board map areas throughout the state that contain regionally significant mineral resources. Construction aggregate resources (sand and gravel) deposits were the first commodity selected for classification by the Board. Once mapped, the Mines and Geology Board is required to designate for future use those areas that contain aggregate deposits that are of prime importance in meeting the region's future need for construction-quality aggregates. The primary objective of SMARA is for each jurisdiction to develop policies that would conserve important mineral resources, where feasible, that

¹³ California Geological Survey (CGS). 2018. *Aggregate Sustainability in California*. Available online at: https://www.conservation.ca.gov/cgs/Documents/MS_052_California_Aggregates_Report_201807.pdf, accessed September 10, 2019.

¹⁴ U.S. Congress. S. 1894 – *Indian Mineral Development Act of 1982*. Available online at: <https://www.congress.gov/bill/97th-congress/senate-bill/1894>, accessed August 19, 2019.

might otherwise be unavailable when needed. SMARA requires that once policies are adopted, local agency land use decisions must be in accordance with its mineral resource management policies. These decisions must also balance the mineral value of the resource to the market region as a whole, not just their importance to the local jurisdiction.¹⁵

Government Code Section 65302(d)

Government Code Section 65302(d) states that a conservation element of the general plan shall address minerals and other natural resources.¹⁶

3.12.3.3 Local

County and City General Plans

For the most part, local planning guidelines have been developed in county and city general plans to identify and encourage the utilization and conservation of mineral and energy resources, encourage sustainable management of resources, prevent or minimize adverse effects to the environment, and protect public health and safety. Pursuant to Government Code Section 65302, a general plan must include “A conservation element for the conservation, development, and utilization of natural resources including water and its hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, *minerals*, and other natural resources” (emphasis added).¹⁷

3.12.4 ENVIRONMENTAL IMPACTS

3.12.4.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of Connect SoCal could result in significant adverse impacts to mineral resources if the Plan would result in any of the following:

- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.

¹⁵ California Department of Conservation. 2018. *Surface Mining and Reclamation Act of 1975 Statutes and Regulations*. Available online at: <https://www.conservation.ca.gov/smg/Regulations/Documents/SMARA-statutes-regs-7-2018.pdf>, accessed August 19, 2019.

¹⁶ California Legislative Information. 1965. *ARTICLE 5. Authority for and Scope of General Plans [65300-65303.4]*.

¹⁷ *Ibid.*

- Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

3.12.4.2 Methodology

The methodology for determining the significance of impacts on mineral resources impacts compares the existing conditions (2019) to the future 2045 conditions under the Plan, as required by *CEQA Guidelines* Section 15126.2(a). Specifically, the volume of aggregate material likely to be required to support the transportation projects and urban development encouraged by land use strategies in the Plan was evaluated in relation to availability of permitted mineral resources, and other potential mineral resource recovery sites in the SCAG region. Mineral resources within the SCAG region were evaluated at the programmatic level of detail, in relation to the general plans of the six counties and 191 cities within the six-county area, a review of *California Minerals and Mines*, and a review of related literature germane to the SCAG region.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in **Chapter 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.12.4.3 Impacts and Mitigation Measures

Impact MIN-1: Potential to result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.

Significant and Unavoidable Impact – Mitigation Required.

Transportation projects contained in the Plan and development projects anticipated to occur under the Plan would require substantial amounts of aggregate resources for construction purposes, constituting a significant impact. The six-county and 191-city SCAG region has approximately 1,832 million tons of permitted aggregate reserves (**Table 3.12-1**). The CGS estimates that the SCAG region would need

approximately 4,406 million tons of aggregate over the next 50 years.¹⁸ The difference of 2,574 million tons would need to be permitted over the next 50 years to meet the projected demand. **Table 3.12-1** indicates that, of the eight areas of permitted aggregate resources, one is projected to have less than 10 years remaining (San Fernando Valley/Saugus-Newhall) and three have 11 to 20 years left (Palmdale P-C Region, San Bernardino P-C Region, and Ventura County). The SCAG region's construction industry is greatly dependent on readily available aggregate deposits that are within a reasonable distance to market regions. Aggregate is a low-unit-value, high-bulk-weight commodity or material required for construction of most transportation projects and development projects that must be obtained from nearby sources in order to minimize costs to the consumer. If nearby sources do not exist, then transportation costs quickly could exceed the value of the aggregate.

Table 3.12-1 shows that just under 42 percent of the projected 50-year demand is currently permitted in the SCAG region (excluding mines in Imperial County). The Plan includes transportation system improvements, such as new or expanded highway/arterials, high-occupancy vehicle (HOV) lanes and connectors, new light and heavy rail, goods movement projects, and infrastructure that would require substantial amounts of aggregate resources. In addition, the regional land use strategies identified in the Plan would influence population distribution by focusing growth in HQTAs, existing suburban town centers, and more walkable, mixed-use communities. The development projects encouraged by these land use strategies included in the Plan would also result in a demand for aggregate resources for construction.

As a programmatic, long-range planning document, the Plan does not include specific construction information related to transportation projects or potential land use development. However, transportation projects included in the Plan and potential development could require substantial amounts of aggregate resources for construction. Therefore, impacts would be significant, requiring mitigation.

Mitigation Measures

SCAG Mitigation Measures

SMM MIN-1: SCAG shall coordinate with the Department of Conservation, California Geological Survey to maintain a database of (1) available mineral resources in the SCAG region including permitted and unpermitted aggregate resources and (2) the anticipated 50-year demand for aggregate and other mineral resources. Based on the results of this survey,

¹⁸ California Geological Survey (CGS). 2018. *Aggregate Sustainability in California*. Available online at: https://www.conservation.ca.gov/cgs/Documents/MS_052_California_Aggregates_Map_201807.pdf accessed August 19, 2019.

SCAG shall work with local agencies on strategies to address anticipated demand, including identifying future sites that may seek permitting and working with industry experts to identify ways to encourage and increase recycling to reduce the demand for aggregate.

Project Level Mitigation Measures

PMM MIN-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce the use of mineral resources that could be of value to the region, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Provide for the efficient use of known aggregate and mineral resources or locally important mineral resource recovery sites, by ensuring that the consumptive use of aggregate resources is minimized and that access to recoverable sources of aggregate is not precluded, as a result of construction, operation and maintenance of projects.
- b) Where avoidance is infeasible, minimize impacts to the efficient and effective use of recoverable sources of aggregate through measures that have been identified in county and city general plans, or other comparable measures such as:
 - 1) Recycle and reuse building materials resulting from demolition, particularly aggregate resources, to the maximum extent practicable.
 - 2) Identify and use building materials, particularly aggregate materials, resulting from demolition at other construction sites in the SCAG region, or within a reasonable hauling distance of the project site.
 - 3) Design transportation network improvements in a manner (such as buffer zones or the use of screening) that does not preclude adjacent or nearby extraction of known mineral and aggregate resources following completion of the improvement and during long-term operations.
 - 4) Avoid or reduce impacts on known aggregate and mineral resources and mineral resource recovery sites through the evaluation and selection of project sites and design features (e.g., buffers) that minimize impacts on land suitable for aggregate and mineral resource extraction by maintaining portions of MRZ-2

areas in open space or other general plan land use categories and zoning that allow for mining of mineral resources.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to the loss of availability of known mineral resources that could be of value to the region and the residents of the state could be significant and unavoidable even with implementation of mitigation.

IMPACT MIN-2: Potential to result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

Significant and Unavoidable Impact – Mitigation Required.

Transportation projects contained in the Plan and development projects anticipated to occur under the Plan have the potential to impact availability of mineral resources if they are constructed in mineral resource zones. Improvements and modifications to existing rights-of-way, such as HOV lanes, high-occupancy toll (HOT) lanes, new bus-ways and capacity enhancement facilities, mixed flow lanes, and right-of-way maintenance would have less potential to impact mineral resources because these transportation projects improve facilities that already exist and are already impeding access to resources. Construction of new transportation projects, like new freeways, and even additional lanes, have the potential to impact availability of aggregate and mineral resources.

As noted in **Section 3.12.1.2** above, each county within the SCAG region contains mineral resources of local importance as noted in their respective general plans. These mineral resources generally include aggregate resources that are used in construction activities throughout the region. The Plan's transportation projects and anticipated development have the potential to reduce the availability of these resources, either directly by locating projects within mineral resource zones or indirectly through the use of aggregate and mineral resources in project development that may result in depletion of aggregate supply. Therefore, impacts would be significant, requiring mitigation.

Mitigation Measures

SCAG Mitigation Measure

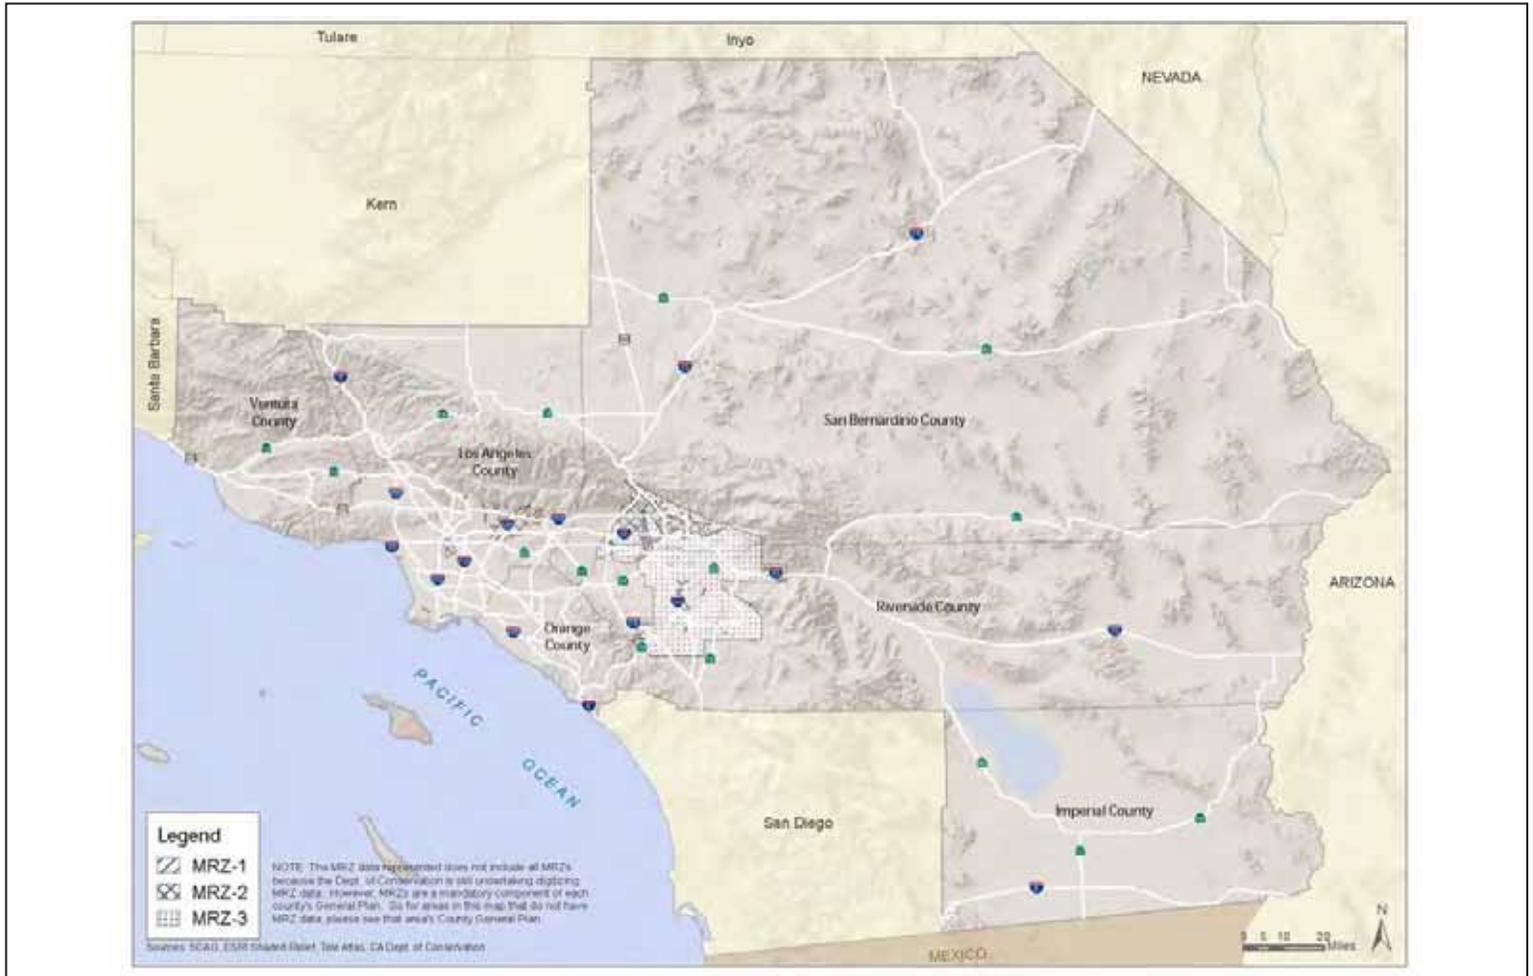

See **SMM MIN-1**.

Project Level Mitigation Measure

See **PMM-MIN-1**.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project-specific detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to loss of availability of delineated locally important mineral resource recovery sites could be significant and unavoidable even with implementation of mitigation.

This section of the Program Environmental Impact Report (PEIR) describes the ambient noise characteristics in the SCAG region, identifies the regulatory framework with respect to laws and regulations that govern noise, and evaluates and discusses the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.13.1 ENVIRONMENTAL SETTING

3.13.1.1 Definitions

Terms and criteria used in the assessment of noise impacts are described below.

A-weighting: This is the method commonly used to quantify environmental noise that involves evaluation of all frequencies of sound, with an adjustment to reflect the constraints of human hearing. Because the human ear is less sensitive to low and high frequencies than to midrange frequencies, noise measurements are weighted more heavily within those frequencies of maximum human sensitivity in a process called A-weighting (dBA).

Ambient: Ambient is the total noise in the environment, excluding noise from the source of interest.

Community noise equivalent level (CNEL): CNEL represents the average daytime noise level during a 24-hour day, adjusted to an equivalent level to account for people’s lower tolerance of noise during the evening and nighttime hours. Because community receptors are more sensitive to unwanted noise intrusion during the evening and night, an artificial decibel increment is added to quiet-time noise levels. Sound levels are increased by 5 dBA during the evening, from 7:00 p.m. to 10:00 p.m. and by 10 dBA during the nighttime, from 10:00 p.m. to 7:00 a.m. during this quiet time period.

Day-night equivalent level (L_{dn}): L_{dn} is a measure of the 24-hour average noise level at a given location. It is based on a measure of the L_{eq} noise level over a given time period. The L_{dn} is calculated by averaging the L_{eq} for each hour of the day at a given location after penalizing the “sleeping hours” (defined as 10:00 p.m. to 7:00 a.m.), by 10 dBA to account for the increased sensitivity of people to noises that occur at night. L_{dn} is also referred to as day-night average (DNL) sound level in some cases.

Decibel (dB): dB is a unitless measure of sound on a logarithmic scale that indicates the squared ratio of sound pressure amplitude to a reference sound pressure amplitude. The reference pressure is 20 micropascals.

Equivalent sound level (L_{eq}): L_{eq} is a term typically used to express time averages. It is a steady-state energy level that is equivalent to the energy content of a varying sound level over a stated period of time, which means that the L_{eq} represents the noise level experienced over a stated period of time averaged as a single noise level.

Frequency: Frequency is the number of cycles per unit of time (seconds), expressed in hertz (Hz).

Noise: Noise is any sound that annoys or disturbs humans or that causes or tends to cause an adverse psychological or physiological effect on humans. Any unwanted sound.

Noise level (L_N): Another measure used to characterize noise exposure, L_N is the variation in sound levels over time, measured by the percentage exceedance level. L_{10} is the A-weighted sound level that is exceeded for 10 percent of the measurement period, and L_{90} is the level that is exceeded for 90 percent of the measurement period. L_{50} is the median sound level. Additional statistical measures include L_{min} and L_{max} , the minimum and maximum sound levels, respectively, measured during a stated measurement period.

Peak Particle Velocity (PPV): Defined as the maximum instantaneous positive or negative peak of the vibration signal, usually measured in inches per second (in/sec).

Sound: A vibratory disturbance created by vibrating objects, which, when transmitted by pressure waves through a medium such as air, is capable of being detected by a receiving mechanism, such as the human ear or a microphone.

Sound Exposure Level (SEL): This metric represents all the acoustic energy (a.k.a. sound pressure) of an individual noise event as if that event had occurred within a one-second time period. SEL captures both the level (magnitude) and the duration of a sound event in a single numerical quantity, by "squeezing" all the noise energy from an event into one second. This provides a uniform way to make comparisons among noise events of various durations.

Vibration: Vibration is the mechanical motion of earth or ground, building, or other type of structure, induced by the operation of any mechanical device or equipment located upon or affixed thereto. For purposes of this report, the magnitude of the vibration shall be stated as the acceleration in "g" units (1 g is equal to 32.2 feet/second², or 9.81 meters/second²).

Noise Fundamentals

Noise is defined as unexpected and unwanted sound. Unlike other linear measures, such as weight and time, noise levels are measured in decibels (dB) on a logarithmic scale. Thus, doubling a noise source, such as traffic volumes, does not double the noise level, but instead increases the resultant noise level by 3 dB.^{1,2} Conversely, reducing a noise source in half results in a 3 dB decrease.³ Thus, due to the logarithmic scale of the decibel unit, sound levels are not added or subtracted arithmetically. Moreover, in cases where existing ambient noise levels are already relatively high, there will be a small change in overall noise levels when a newer and lesser noise source is added. For example, when 70 dB ambient noise levels are combined with a 60 dB noise source, the resulting noise level equals 70.4 dB.⁴

A significant challenge in managing and mitigating noise is that not every person or community perceives and responds to noise in the same way. From an individual to the neighborhood level, there are different thresholds and tolerances for sound. Furthermore, one community (e.g. urban environment) may deem a land use (e.g. airport expansion) acceptable within a certain noise level, while another (e.g. suburban) might not. Moreover, sensitive receptors, such as residential areas, convalescent homes, schools, auditoriums, and other similar land uses, may be affected to a greater degree by increased noise levels than industrial, manufacturing, or commercial facilities. The effects of noise can range from interference with sleep, concentration, and communication, to the causation of physiological and psychological stress, and at the highest intensity levels, hearing loss.⁵

The method commonly used to quantify environmental noise involves evaluation of all frequencies of sound, with an adjustment to reflect the constraints of human hearing. Since the human ear is less sensitive to low and high frequencies than to midrange frequencies, noise measurements are weighted more heavily within those frequencies of maximum human sensitivity in a process called “A-weighting,” written as dBA.⁶ In practice, environmental noise is measured using a sound level meter that includes an electronic filter corresponding to the A-weighted frequency spectrum. Typical examples can be used to

illustrate sound sources that correlate to measure A-weighted sound levels and the subjective loudness to a person (Table 3.13-1, Common Sound Levels and Loudness).

**Table 3.13-1
Common Sound Levels and Loudness**

Decibel (dB)	Subjective Loudness	Source of Sound
130	Threshold of pain	Military jet aircraft take-off from aircraft carrier with afterburner at 50 feet
120	Uncomfortably loud	Turbo-fan aircraft at takeoff power at 200 feet; rock band
110		
100	Very loud	Boeing 707 or DC-8 aircraft at 1 nautical mile (6,080 feet) before landing; jet flyover at 1,000 feet; Bell J-2A helicopter at 100 feet
90		Boeing 737 or DC-9 aircraft at 1 nautical mile before landing; power mower; motorcycle at 25 feet; car wash at 20 feet
80		High urban ambient sound; diesel truck at 40 mph at 50 feet; diesel train at 45 mph at 100 feet; passenger car at 65 mph at 25 feet; food blender; garbage disposal
70	Moderately loud	Living room music; radio or TV audio; vacuum cleaner
60		Air conditioning unit at 100 feet; dishwasher (rinse) at 10 feet; conversation
50	Quiet	Large transformers at 100 feet
40		Bird calls; lowest limit of urban ambient sound
30		
20		Quiet living room
10	Just audible	Average whisper
0	Threshold of hearing

Vibration Measurement

Vibration is an oscillatory motion in terms of displacement, velocity, or acceleration. Vibration is typically measured as peak particle velocity (PPV) in inches per second. In this context, vibration refers to the minimum ground- or structure-borne motion that causes a normal person to be aware of the vibration by means such as, but not limited to, sensation by touch or visual observation of moving objects. The effects of ground-borne vibration include movements of the building floors that can be felt, rattling of windows, and shaking of items on shelves or hangings on the walls. In extreme cases, vibration can cause damage to buildings. The noise radiated from the motion of the room surfaces is called ground-borne noise (Table 3.13-2, Typical Levels of Ground-Borne Vibration). The vibration motion normally does not provoke the same adverse human reactions as the noise unless there is an effect associated with the shaking of the

building. In addition, the vibration noise can only occur inside buildings. Similar to the propagation of noise, vibration propagated from the source to the receptor depends on the receiving building (i.e., the weight of the building), soil conditions, layering of the soils, the depth of groundwater table, and so forth.

**Table 3.13-2
Typical Levels of Ground-Borne Vibration**

Response	Velocity Level*	Typical Sources (at 50 feet)
Minor cosmetic damage of fragile buildings	100	Blasting from construction projects
Difficulty with tasks such as reading a videodisplay terminal (VDT) screen	90	Bulldozers and other heavy tracked construction equipment
Residential annoyance, infrequent events	80	Rapid transit, upper range
Residential annoyance, frequent events	70	High speed rail, typical
Approximate threshold for human perception	60	Bus or truck, typical
	50	Typical background vibration

Note:

* Root mean square (RMS) vibration velocity level in VdB relative to 10^{-6} inches/second

Ambient Noise Level

The 38,000-square-mile SCAG region includes 6 counties and 191 cities. It covers a diverse array of land uses that range from quiet, undeveloped rural areas to loud, dense, urban areas. Ambient noise levels for areas where sensitive receptors may be located can range from 46 dBA for a small town or quiet suburban area to greater than 87 dBA for an urban area next to a freeway.⁷ Given the size of the SCAG region and the variation in sources, it is not useful to complete a detailed noise monitoring study for this PEIR.

⁷ U.S. Environmental Protection Agency, Office of Noise Abatement and Control. 1974. *Information on Levels of Environmental Noise Requisite to Protect Public Health with an Adequate Margin of Safety*. Available online at: <https://nepis.epa.gov/Exe/ZyPDF.cgi/2000L3LN.PDF?Dockey=2000L3LN.PDF>, accessed March 27, 2019.

Rather, this PEIR presents a discussion of noise levels associated with different noise sources, thereby allowing the reader to infer the noise level at different locations depending on the proximity of a location to a noise source. Since the range of ambient noise levels is so vast, a variety of land uses and locations was sampled in order to characterize their ambient noise levels. Six locations were selected within the SCAG region to represent the range of ambient noise conditions by land use types (**Table 3.13-3, Ambient Noise Sampling Data**).

**Table 3.13-3
Ambient Noise Sampling Data**

Location	Land Use	Peak Hour Noise Level (dBA, Leq)
City of Los Angeles (Mission Hills)	Cemetery	62
City of Los Angeles (Baldwin Hills)	Residential (Multi-Family/Industrial Adjacent)	60
City of Riverside	Institutional (University)	56
City of Pasadena	Mixed-Use (Multi-Family Residential and Retail)	63
City of Los Angeles (Del Rey)	Residential (Single Family)	63
City of Moorpark	Recreational (City Park)	48
City of Los Angeles (Boyle Heights)	Institutional (High School/Middle School Adjacent)	57

Source: Impact Sciences, 2019

The most common noise sources within the SCAG region is traffic on highways and on arterial roadways. Higher levels of noise from traffic are generally due to higher traffic volumes and faster travel speeds. Aircraft noise is also present in many areas of the SCAG region, with higher noise levels generated during takeoff and landing. Rail traffic and industrial and commercial activities also contribute to the noise level. Other contributors may also include construction, garbage collecting trucks, helicopters (news, police activity and tourism) and sporting/special events.

Transportation

Many principal noise generators within the SCAG region are associated with transportation (i.e., airports, freeways, arterial roadways, seaports, and railroads). However, local collector streets are not considered to be a significant source of noise since traffic volumes and travel speeds are generally much lower than for freeways and arterial roadways.

Airports and Aviation

The six-county SCAG region is home to an expansive multiple airport system that includes seven commercial airports with scheduled passenger service, seven government/military air fields, and more

than 30 reliever and general aviation airports. The seven commercial service airports in the region with scheduled passenger service are: Hollywood-Burbank (BUR), Imperial (IPL), Long Beach (LGB), Los Angeles (LAX), Ontario (ONT), Palm Springs (PSP), and Santa Ana (SNA). Sixteen of the airports in the region are designated by the Federal Aviation Administration (FAA) as reliever airports, which means that those airports could provide congestion relief for any of the commercial service airports in the region if needed. With such a large and versatile transportation system, the SCAG region airports support a significant amount of passenger and goods movement, and the subsequent volume of air traffic. See **Table 3.13-4, Major Commercial Airports within the SCAG Region.**⁸

**Table 3.13-4
Major Commercial Airports within the SCAG Region**

Airport	Location	Airport Land Use Plan	Noise Contour Available?

Imperial County Airport	Imperial	Airport Land Use Compatibility Plan for Imperial County Airports	Yes

Source:

Southern California Association of Governments. 2019. Connect SoCal: Aviation and Airport Ground Access Technical Report.

Noise associated with aviation arise primarily from aircraft operations. Specifically, aircraft operations can generate substantial levels of noise exposure when one is in the immediate vicinity of airport runways, or when one is near the flight path of an aircraft departure or approach at lower altitudes. In addition to proximity to runways and departure/approach flight paths, other contributing factors to noise impacts include duration of noise exposure, the type of aircraft operated, number of aircraft operations (e.g. take-offs, landings, flyovers), altitude of the aircraft, and atmospheric conditions, which may influence the direction of aircraft operations and affect noise propagation.

⁸ Southern California Association of Governments. 2008. *SCAG Commercial Airport System Map*. Available at: http://www.scag.ca.gov/Documents/commercialairport_2008.pdf, accessed March 27, 2019.

Typically, most major public airports will have an airport land use plan that provides guidance on noise levels and land use in adjacent areas. The FAA measures airport-related noise in communities in terms of overall exposure rather than single events such as takeoffs and landings since overall exposure would account for the overall number of noise events and the time when these events occur. The day night average sound level (L_{dn}) is the standard federal (FAA and EPA) metric for this measurement; however, the FAA also accepts the CNEL when a state requires that metric to assess noise effects. The State of California Department of Transportation Division of Aeronautics adopted the CNEL as their methodology for describing airport noise exposure.⁹ Noise levels computed by these two methods typically differ by less than 1 dBA. The resulting noise contour map identifies geographic areas that are exposed to various levels of impacts from airport noise. Areas that are within the noise contours of 65 dBA CNEL and above, associated with airport activities, are considered to be incompatible with certain land uses, including residences, schools, hospitals, and childcare facilities.¹⁰

Freeways, Highways, and Arterial Roadways

The SCAG region has more than 73,000 lane miles.¹¹ Regionally significant arterials provide access to the freeway system and often serve as parallel alternate routes; in some cases, they are the only major system of transportation available to travelers. Typical arterial roadways have one or two lanes of traffic in each direction, with some containing as many as four lanes in each direction. Traffic noise is generated primarily from vehicles and dominated by trucks. In general, higher traffic volumes, higher speeds, and greater numbers of trucks will increase the noise level. Vehicle noise comes from noises generated by the engine, exhaust, and tires, and is often exacerbated by vehicles in a state of disrepair, such as defective mufflers or struts.

There are also environmental factors that affect noise from highway and roads. The level of traffic noise can be reduced by distance, terrain, vegetation, and intervening obstructions. However, unlike construction noise, traffic noise is a line source, not a point source. Therefore, the attenuation with distance is not as great as for traffic noise. In comparison, a point source such as stationary construction equipment attenuates by 6 dB with every doubling of the distance, whereas a line source such as traffic attenuates only by 3 dB with every doubling of the distance.

⁹ California Department of Transportation. *Airport Noise Program*. Available online at: <https://dot.ca.gov/programs/aeronautics/airport-noise-program>, accessed September 4, 2019.

¹⁰ Federal Aviation Administration. 2007. *Environmental Desk Reference for Airport Actions*. Chapter 17, Noise. Washington, DC. October.

¹¹ Southern California Association of Governments (SCAG). 2019. Model Output, September 10, 2019.

Traffic noise can therefore be a significant environmental concern where buffers (e.g., buildings, landscaping, etc.) are inadequate or where the distance to sensitive receptors is relatively short. Given typical daily traffic volumes of 10,000 to 40,000 vehicle trips, noise levels along arterial roadways typically range from L_{dn} 65 to 70 dB at a distance of 50 feet from the roadway centerlines.

In addition to distance, the line of sight also affects the extent to which traffic noise can affect sensitive receptors. Line of sight can be interrupted by roadways that are elevated above grade or depressed below grade; by intervening structures such as buildings, landscaping, and sound walls; or by terrain such as hills. For example, measurements show that depressing a freeway by approximately 12 feet yields a reduction in traffic noise relative to an at-grade freeway of 7 to 10 dB at all distances from the freeway due to the interrupted line of sight. Traffic noise from an elevated freeway is typically 2 to 10 dB less than the noise from an equivalent at-grade facility within 300 feet of the freeway, but beyond 300 feet, the noise radiated by an elevated and at-grade freeway (assuming equal traffic volumes, fleet mix, and vehicle speed) is the same because at short distances, the elevated structure of the freeway itself interrupts the line of sight between the traffic and the sensitive receptor, but that line of sight is reestablished at greater distances.¹² Caltrans also has an extensive sound wall program for areas with residential property built prior to the freeway or prior to a major widening and has hourly noise levels that exceed the 67-dB (L_{eq}) threshold, and where the wall would be able to achieve at least a 5-dB reduction and the cost would not exceed \$35,000 per residential unit (1987 dollars).¹³ A typical wall that interrupts the line of sight is capable of reducing noise levels by 10 dB to 15 dB.

Railroad Operations

Railroad operations generate high, relatively brief, intermittent noise events. These noise events are an environmental concern for sensitive receptors located along rail lines and in the vicinities of switching yards. Locomotive engines; the interaction of steel wheels and rails from rolling noise, impact noise when a wheel encounters a rail joint, turnout, or crossover, and squeal generated by friction on tight curves; and warning devices such as air horns and crossing bell gates are the primary sources of rail noise. Noise levels vary widely for different types of rail operations (**Table 3.13-5, Reference Noise Levels for Various Rail Operations**).

Freight Trains

Locomotive engine noise and wheel-to-rail interactions are the primary source of noise generated by freight train pass-by events. Engine noise increases when the train is being pulled uphill. Wheel noise increases approximately 6 dB for each doubling of train velocity. A rail line supporting 40 freight trains per day generates approximately L_{dn} 75 dB at 200 feet from the tracks. Freight trains also generate substantial amounts of ground-borne noise and vibration in the vicinity of the tracks. Ground-borne noise and vibration is a function of both the quality of the track and the operating speed of the train.

The SCAG region is served by two Class I railroads: Union Pacific Railroad (UP) and Burlington Northern/Santa Fe Railway (BNSF).¹⁴ BNSF rail lines extend south from switching yards in eastern Los Angeles to the Los Angeles and Long Beach ports complex and east to Arizona and points beyond via San Bernardino County. In addition, there are three Class III railroads (short lines) serving the region, the Pacific Harbor Line (which handles all rail coordination in the Ports of Los Angeles and Long Beach), the

¹⁴ Southern California Association of Governments. 2012. *On the Move: Southern California Delivers the Goods*. Summary Report. December.

Los Angeles Junction Railway (which provides switching service in the Vernon area for the two main line railroads), and the Ventura County Railroad (which serves the Port of Hueneme).

Completed in 2002, the Alameda Corridor provides a substantial long-term reduction in noise and vibration associated with rail operations in the vicinities of the Ports of Long Beach and Los Angeles by eliminating over 200 grade-level street/rail crossings.¹⁵ The Alameda Corridor consolidates the operations of UP and BNSF on 90 miles of existing branch line tracks into one 20-mile corridor along Alameda Street. This corridor provides a direct connection between the ports of Long Beach and Los Angeles and the UP and BSNF switching yards in eastern Los Angeles. The project includes four overpasses and three underpasses at intersections south of SR-91 that allow vehicles to pass above the trains. North of SR-91, trains pass through a 10-mile, 33-foot-deep trench.¹⁶ The construction of tracks in a below-grade trench, track construction on new base materials, and the use of continuous welded track reduce noise impacts on adjacent uses from trains associated with the ports. The project also includes sound walls in certain locations to mitigate vehicle noise along Alameda Street in residential neighborhoods and other sensitive areas.

Commuter Rail

In general, the noise generated by commuter rail facilities (powered by either diesel or electric locomotives) is from the locomotives themselves. In the SCAG region, there are two commuter and intercity passenger train operators: Amtrak and the Southern California Regional Rail Authority (SCRRA).

Amtrak operates five routes that travel through the SCAG region: Texas Eagle, Coast Starlight, Pacific Surfliner, Southwest Chief, and Sunset Limited. These routes serve Chicago, St. Louis, Dallas, San Antonio, Los Angeles, Portland, Seattle, San Luis Obispo, Santa Barbara, San Diego, Albuquerque, and New Orleans.¹⁷ A typical Amtrak pass-by event generates SEL 107 dB at 50 feet; two such events during the daytime or evening periods generate approximately L_{dn} 61 dB at 50 feet and approximately L_{dn} 52 dB at 200 feet. Nine such events generate approximately L_{dn} 67 dB at 50 feet and 58 L_{dn} dB at 200 feet.

¹⁶ Ibid.

¹⁷ Amtrak. *California Train Routes*. Available online at: <http://www.amtrak.com/california-train-routes>, accessed January 9, 2019.

The SCRRA operates the Metrolink commuter rail system. This system currently includes 59 stations and 7 rail lines: Antelope Valley, Inland Empire–Orange County, Orange County, Riverside, San Bernardino, Ventura, and 91.¹⁸ Noise levels generated by Metrolink are similar to those associated with Amtrak.

Urban Rail Transit

This category includes both heavy and light rail transit. Heavy rail is generally defined as electrified rapid transit trains with dedicated guideways, and light rail as electrified transit trains that do not require dedicated guideways. In general, noise increases with speed and train length. Sensitivity to rail noise generally arises when there is less than 50 feet between the rail and sensitive receptors. Individual urban rail transit pass-by events generate substantially less noise than commuter rail events, but the aggregate noise impact for sensitive uses along the line can be similar or greater due to the much higher frequency of pass-by events. Complaints about ground-borne vibration from surface track are more common than complaints about ground-borne noise. A significant percentage of complaints about noise can be attributed to the proximity of switches, rough or corrugated track, or wheel flats.

In the SCAG region, the Los Angeles County Metropolitan Transportation Authority (Metro) provides urban rail transit for their 1,479-square-mile service area. Metro operates 98 miles of rail service on two subway lines (Purple and Red) and four light rail lines (Blue, Expo, Gold, and Green).¹⁹ The Purple Line extends from downtown Los Angeles west to the Koreatown neighborhood with 8 existing stations. The Red Line extends from downtown Los Angeles west to the Koreatown neighborhood and then north to North Hollywood with 14 existing stations. The Blue Line extends from Long Beach to downtown Los Angeles with 22 existing stations. The Expo Line extends from downtown Los Angeles to Santa Monica with 19 existing stations. The Gold Line extends from East Los Angeles to Azusa with 27 existing stations. The Green Line extends from Norwalk west to El Segundo and south to Redondo Beach with 14 existing stations. In addition, Metro has two (Orange and Silver) bus rapid transit ways (BRTs). The Orange Line extends from North Hollywood, travels west to Woodland Hills, and then north to Chatsworth, with 18 existing stations. The Silver Line extends from El Monte west to downtown Los Angeles and then south to San Pedro with 11 existing stations.

Port Operations

The three major ports in the SCAG region, Port of Los Angeles, Port of Long Beach, and Port of Hueneme in Ventura County, provide a major link between the United States and the Pacific Rim countries. Noise associated with port operations is typically generated from three sources: ships using the port facilities, equipment associated with cargo activity within the port, and truck and rail traffic that move cargo to and from the ports. These sources affect the ambient noise levels in the port areas. Residential areas in San Pedro, Wilmington, and West Long Beach are affected most by truck and rail traffic related to the ports.

Since 2000, the Port of Los Angeles has handled more container volume of cargo than any other port in the United States. In fiscal year 2017, the Port of Los Angeles handled 198 million metric revenue tons (MMRT) of cargo,²⁰ Port of Long Beach handled 168.1 MMRT,²¹ and Port of Hueneme handled 1.4 MMRT.²² When combined together, the Port of Los Angeles and the Port of Long Beach rank ninth in the world for container volume. The Ports of Los Angeles, Long Beach, and Hueneme are major regional economic development centers. The San Pedro Bay Ports, which include the Los Angeles and Long Beach Ports, currently handle approximately 32 percent of the cargo volume in the country;²³ the Port of Hueneme in Ventura County is a major shipping point for automobiles, non-automotive roll-on roll off cargo, project cargo, fresh produce, and liquid bulk.²⁴

Industrial and Manufacturing Noise

Noise from industrial complexes and manufacturing plants are characterized as stationary point sources of noise even though they may include mobile sources such as forklifts. Local governments typically regulate noise from industrial and manufacturing equipment and activities through enforcement of noise ordinance standards and implementation of general plan policies. Industrial complexes and manufacturing plants are generally located away from sensitive land uses, and, as such, noise generated from these sources generally has less effect on the local community.

²⁴ Port of Hueneme. 2017. *Comprehensive Annual Financial Report: Fiscal Year Ended June 30, 2017*. November.

Construction Noise

Noise from construction sites are characterized as stationary point sources of even though they may include mobile sources, such as graders, they generally move slowly. Local governments typically regulate noise from construction equipment and activities through enforcement of noise ordinance standards and imposition of conditions of approval for building or grading permits.

Construction noise related to transportation projects is typically addressed in each project's noise analysis report and related environmental document. Most projects will not require modeling or any form of analysis associated with construction-related noise. Some projects may require basic noise calculations. For projects that require compliance with local ordinances, more detailed analysis techniques may be required.

Construction-related noise levels generally fluctuate depending on the construction phase, equipment type and duration of use, distance between noise source and receptor, and line of sight between the noise source and the receptor (temporary barriers can block the line of sight to reduce noise levels). The Federal Transit Administration has established typical noise levels associated with various types of construction-related machinery (**Table 3.13-6, Construction Equipment Noise Levels**). In contrast to industrial and manufacturing plants, construction sites are located throughout the region and are often located within, or adjacent to, residential districts and other sensitive receptors. While individual construction sites come and go (as buildings are constructed and completed), there is generally on-going construction activity in the region.

In general, construction activities generate high noise levels intermittently on and adjacent to the construction sites, and the related noise impacts are short-term in nature for individual sites but on-going throughout the region. The dominant source of noise from most construction equipment is the engine, usually a diesel engine, with inadequate muffling. In a few cases, however, such as impact pile driving or pavement breaking, noise generated by the process dominates. Construction equipment can be considered to operate in two modes, stationary and mobile. Stationary equipment operates in one location for one or more days at a time, with either a fixed-power operation (pumps, generators, compressors) or a variable noise operation (pile drivers, pavement breakers). Mobile equipment moves around the construction site with power applied in cyclic fashion (bulldozers, loaders), or movement to and from the site (trucks). The noise levels of these point sources decrease by approximately 6 dB with each doubling of distance from the noise source (e.g., noise levels from excavation might be approximately 83 dB at 100 feet from the site, and about 77 dB at 200 feet from the site). Interior noise levels from construction are approximately 10 dB (open windows) to 20 dB (closed windows) less than exterior noise levels due to the attenuation provided by building walls.

Construction projects often create activities that extend beyond project limits. These can include activities such as trucks supplying material (stone, concrete, steel, etc.) to a project, trucks hauling soil and/or demolition materials from a project site, activity associated with off-site operations such as materials storage areas, and effects of detoured or rerouted traffic due to construction activities. Haul routes may be specifically designated for use by construction-related traffic when supplying and hauling excess material from the project site, potentially creating a high source of noise depending on the number and frequency of trucks utilizing the route.

Sensitive Receptors

Some land uses are considered more sensitive to ambient noise levels than others due to noise exposure (in terms of both exposure time and “insulation” from noise) and the types of activities typically involved. Residences, motels, and hotels; schools; libraries; churches; hospitals; nursing homes and senior centers; and natural areas, parks, and outdoor recreation areas are generally more sensitive to noise than are commercial and industrial land uses. The 38,000-square-mile SCAG region contains a large number of these sensitive land uses. The noise-sensitive areas of residences, schools, libraries, churches, hospitals, nursing homes, natural areas, and parks are generally more sensitive to noise than are commercial and industrial land uses. Increases in noise near these sensitive receptors are more likely to cause an adverse community response.

As such, the noise standards for sensitive land uses are more stringent than those for less sensitive uses. To protect various human activities and sensitive land uses (e.g., residences, schools, and hospitals) lower noise levels are needed. An exterior noise level of L_{dn} 55 to 60 dB is the upper limit for intelligible speech communication inside a typical home. In addition, social surveys and case studies have shown that complaints and community annoyance in residential areas begin to occur at L_{dn} 55 dB. Sporadic complaints associated with the L_{dn} 55 to 60 dB range give way to widespread complaints and individual threats of legal action within the L_{dn} 60 to 70 dB range. At L_{dn} 70 dB and above, residential community reaction typically involves threats of legal action and strong appeals to local officials to stop the noise.

Sensitive receptors for vibration are the same as for noise, with one exception. Historic structures are potentially sensitive to excessive vibration because ground vibration will excite building structures, and if the vibration levels are high, there is a potential for structural damage. The Caltrans Transportation and Construction Vibration Manual references the National Cooperative Highway Research Program report for a summary of construction effects on historic buildings.²⁵ Using the most conservative values in the report, historic buildings may be damaged when a single vibration event exceeds 0.20 ppv or frequent

²⁵ Caltrans. 2013. *Transportation and Construction Guidance Manual*. Page 26. September.

vibration events exceed 0.13 ppv, whereas extremely fragile historic buildings may be damaged when a single vibration event exceeds 0.12 ppv or frequent vibration events exceed 0.08 ppv.²⁶

3.13.2 REGULATORY FRAMEWORK

The federal government sets noise standards for transportation-related noise sources that are closely linked to interstate commerce, such as aircraft, locomotives, and trucks; and, for those noise sources, the state government is preempted from establishing more stringent standards. The state sets noise standards for those transportation noise sources that are not preempted from regulation, such as automobiles, light trucks, and motorcycles. Noise sources associated with industrial, commercial, and construction activities are generally subject to local control through noise ordinances and general plan policies.

3.13.2.1 Federal

Noise Control Act of 1972

The Noise Control Act of 1972, as codified in 42 U.S. Code §4901 et seq., establishes a means for effective coordination of federal research and activities in noise control, authorizes the establishment of federal noise emission standards for products distributed in commerce, and provides information to the public with respect to the noise emission and noise reduction characteristics of such products.²⁷

Noise Emission Standards for Interstate Rail Carriers, Motor Carriers, Construction Equipment, and Medium and Heavy Duty Trucks (Title 40 of the Code of Federal Regulations Parts 201, 202, 204, and 205)

The Federal Highway Administration sets federal regulations related to noise limits for locomotives, and medium and heavy trucks, and standards for noise studies and studies for federal and federal-aid highway projects.

Part 201

Federal regulations for railroad noise are contained in Title 40 of the Code of Federal Regulations (CFR) Part 201 and 49 CFR Part 210. The regulations set noise limits for locomotives and are implemented through regulatory controls on locomotive manufacturers.^{28,29}

²⁶ National Cooperative Highway Research Program. 2012. *Current Practices to Address Construction Vibration and Potential Effects to Historic Buildings Adjacent to Transportation Projects*. Table 1. September.

²⁷ U.S. Environmental Protection Agency. 2017. *Summary of the Noise Control Act, 42 U.S.C §4901 et seq. (1972)*

²⁸ Code of Federal Regulations. 2018. *Title 40 Protection of the Environment, Parts 190 to 259*.

Part 202

Federal regulations regarding motor carriers engaged in interstate commerce are contained in Title 40 of the CFR Part 202. The regulations set noise limits for motor carriers engaged in interstate commerce, including setting standards for highway operations.³⁰

Part 204

Title 40 of the CFR Part 204 sets noise emission standards for construction equipment. The regulations set noise standards and requirements as well as testing, for construction equipment including air compressors.³¹

Part 205

Federal regulations also establish noise limits for medium and heavy trucks (more than 4.5 tons, gross vehicle weight rating) under 40 CFR Part 205, Subpart B. The federal truck pass-by noise standard is 80 decibels (dB) at 15 meters from the vehicle pathway centerline. These controls are implemented through regulatory controls on truck manufacturers. The Federal Highway Administration (FHWA) regulations for noise abatement must be considered for federal or federally funded projects involving the construction of a new highway or significant modification of an existing freeway when the project would result in a substantial noise increase or when the predicted noise levels approach or exceed the Noise Abatement Criteria (NAC).³²

Abatement of Highway Traffic Noise and Construction Noise (Title 23 of the Code of Federal Regulations Part 772)

Title 23 CFR § 772.1 *et seq.* provides procedures for preparing operational and construction noise studies and evaluating noise abatement considered for federal and federal-aid highway projects. Under 23 CFR §772.7, projects are categorized as Type I or Type II projects. FHWA defines a Type I project as a proposed federal or federal-aid highway project for the construction of a highway on a new location, or the physical alteration of an existing highway that significantly changes either the horizontal or vertical alignment, or increases the number of through-traffic lanes. A Type II project is a noise barrier retrofit project that involves no changes to highway capacity or alignment.

²⁹ Code of Federal Regulations. 2018. *Title 49 Transportation, Parts 200 to 299.*

³⁰ Code of Federal Regulations. 2018. *Title 40 Protection of the Environment, Parts 190 to 259.*

³¹ *Ibid.*

³² Code of Federal Regulations. 2018. *Title 40 Protection of the Environment, Volume 27.*

Type I projects include those that create a completely new noise source, as well as those that increase the volume or speed of traffic or move the traffic closer to a receiver. Type I projects include the addition of an interchange, ramp, auxiliary lane, or truck-climbing lane to an existing highway, or the widening an existing ramp by a full lane width for its entire length. Projects unrelated to increased noise levels such as striping, lighting, signing, and landscaping projects are not considered Type I projects.

Under Title 23 CFR § 772.11, noise abatement must be considered for Type I projects if the project is predicted to result in a traffic noise impact. In such cases, 23 CFR § 772 requires that the project sponsor consider noise abatement before adoption of the environmental document. This process involves identification of noise abatement measures that are reasonable, feasible, and likely to be incorporated into the project, and of noise impacts for which no apparent solution is available.

Traffic noise impacts, as defined in 23 CFR § 772.5, occur when the predicted noise level in the design year approaches or exceeds the NAC specified in 23 CFR § 772, or a predicted noise level substantially exceeds the existing noise level (a substantial noise increase). Under these regulations, an impact could result unrelated to the plan if existing noise levels already exceed the NAC. A substantial increase is defined as when an increase in L_{eq} of 12 dB during the peak hour of traffic noise occurs. For sensitive uses, such as residences, schools, churches, parks, and playgrounds, the NAC for interior and exterior spaces is L_{eq} 57 and 66 dB, respectively, during the peak hour of traffic noise.³³

Aircraft Noise Standards (Title 14 Code of Federal Regulations, Part 36)

The Federal Aviation Administration (FAA) has federal regulatory authority over noise emissions levels by aircraft operated in the United States. These requirements are set forth in Title 14 CFR, Part 36. Part 36 establishes maximum acceptable noise levels for specific aircraft types, taking into account the model year, aircraft weight, and number of engines. Pursuant to the federal Airport Noise and Capacity Act of 1990, the FAA established a schedule for complete transition to Part 36 “Stage 3” standards by year 2000. This transition schedule applies to jet aircraft with a maximum takeoff weight in excess of 75,000 pounds, and thus applies to passenger and cargo airlines, but not to operators of business jets or other general aviation aircraft.³⁴

Airport Noise Compatibility Planning (Title 14 Code of Federal Regulations Part 150)

Part 150 applies to airport noise compatibility planning and provides the procedures, standards, and methodology governing the development, submission, and review of airport noise exposure maps and

³³ Code of Federal Regulations. 2018. *Title 23 Highways*.

³⁴ Code of Federal Regulations. 2018. *Title 14 Aeronautics and Space Parts 1 to 59*.

airport noise compatibility programs, including the process for evaluating and approving or disapproving those programs. It provides guidance for measuring noise at airports and surrounding areas and for determining exposure of individuals to noise from the operations of an airport. Part 150 also identifies land uses that are normally compatible with various levels of exposure to noise by individuals. It provides guidance on the preparation and execution of noise compatibility planning and implementation programs.³⁵

Noise Abatement and Control (Title 24 Code of Federal Regulations, Part 51, Subpart B)

The mission of the Department of Housing and Urban Development (HUD) includes fostering “a decent, safe, and sanitary home and suitable living environment for every American.” Accounting for acoustics is intrinsic to this mission, as an environment’s safety and comfort can be compromised by excessive noise. In order to facilitate the creation of suitable living environments, HUD has developed a standard for noise criteria. The basic foundation of the HUD noise program is set out in the noise regulation 24 CFR Part 51 Subpart B, Noise Abatement and Control.

HUD’s noise policy clearly requires noise attenuation measures be provided when proposed projects are located in high noise areas. Within the HUD Noise Assessment Guidelines, potential noise sources are examined for projects located within 15 miles of a military or civilian airport, 1,000 feet from a road, or 3,000 feet from a railroad.

HUD exterior noise regulations state that 65 dBA DNL noise levels or less are acceptable for residential land uses and noise levels exceeding 75 dBA DNL are unacceptable. HUD’s regulations do not contain standards for interior noise levels. Rather, a goal of 45 dBA is set forth, and the attenuation requirements are geared toward achieving that goal. It is assumed that, with standard construction, any building will provide sufficient attenuation so that if the exterior level is 65 dBA DNL or less, the interior level will be 45 dBA DNL or less.³⁶

Federal Transit Administration Noise and Vibration Guidance

The Federal Transit Administration (FTA) has published the Transit Noise and Vibration Impact Assessment Manual to provide guidance on procedures for assessing impacts at different stages of transit project development.³⁷ The report covers both construction and operational noise impacts, and describes

³⁵ Code of Federal Regulations. 2018. *Title 14 Aeronautics and Space, Parts 110 to 199*.

³⁶ Code of Federal Regulation. 2018. *Title 24 Housing and Urban Development, Parts 0 to 199*.

³⁷ Federal Transit Administration. 2018. *Transit Noise and Vibration Impact Assessment Manual*. September.

a range of measures for controlling excessive noise and vibration. The specified noise criteria are an earlier version of the criteria provided by the Federal Railroad Administration's High-Speed Ground Transportation Noise and Vibration Impact Assessment (**Table 3.13-8, Construction Vibration Damage Criteria**). In general, the primary concern regarding vibration relates to potential damage from construction. The guidance document establishes criteria for evaluating the potential for damage for various structural categories from vibration (**Table 3.13-8, Construction Vibration Damage Criteria**).

**Table 3.13-8
Construction Vibration Damage Criteria**

Building Category	PPV (in/sec)
I. Reinforced-concrete, steel or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

Federal Railroad Administration. September 2012. High-Speed Ground Transportation Noise and Vibration Impact Assessment. Final Report. Table 3-1.

Table 3.13-10
Land Use Categories and Metrics for High-Speed Train Noise Impact Criteria

Land-Use Category	Noise Metric (dBA)	Description of Land-Use Category
1	Outdoor $L_{eq}(h)^*$	Tracts of land where quiet is an essential element in their intended purpose. This category includes lands set aside for serenity and quiet, and such land uses as outdoor amphitheaters and concert pavilions, as well as national historic landmarks with significant outdoor use. Also included are recording studios and concert halls.
2	Outdoor L_{dn}	Residences and buildings where people normally sleep. This category includes homes, hospitals, and hotels where a nighttime sensitivity to noise is assumed to be of utmost importance.
3	Outdoor $L_{eq}(h)^*$	Institutional land uses with primarily daytime and evening use. This category includes schools, libraries, theaters, and churches, where it is important to avoid interference with such activities as speech, meditation, and concentration on reading material. Places for meditation or study associated with cemeteries, monuments, and museums can also be considered to be in this category. Certain historical sites, parks, campgrounds, and recreational facilities are also included.

Note:

* L_{eq} for the noisiest hour of transit-related activity during hours of noise sensitivity.

Federal Railroad Administration. September 2012. High-Speed Ground Transportation Noise and Vibration Impact Assessment. Final Report. Table 3-2. Washington, DC.

3.13.2.2 State

California Government Code Section 65302

Section 65302 of California Government Code provides a framework for general plans and their content. It requires that the noise element include implementation measures and possible solutions that address

existing and foreseeable noise problems, if any. The adopted noise element shall serve as a guideline for compliance with the state's noise insulation standards. The noise element shall also identify and appraise noise problems in the community, analyze and quantify current and projected noise levels for (a) highways and freeways; (b) primary arterials and major local streets; (c) passenger and freight online railroad operations and ground rapid transit systems; (d) commercial, general aviation, heliport, helistop, and military airport operations, aircraft overflights, jet engine test stands, and all other ground facilities and maintenance functions related to airport operation; (e) local industrial plants, including, but not limited to, railroad classification yards; and (f) other ground stationary noise sources, including, but not limited to, military installations, identified by local agencies as contributing to the community noise environment.

Section 65302 also specifies that noise contours be shown for all of the above listed sources and be stated in terms of community noise equivalent level (CNEL) or day-night average level (L_{dn}). The noise contours shall be prepared on the basis of noise monitoring or following generally accepted noise modeling techniques for the various sources identified above. The noise contours shall be used as a guide for establishing a pattern of land uses in the land use element that minimizes the exposure of community residents to excessive noise.³⁹

California Noise Control Act of 1973

The California Noise Control Act (California Health and Safety Code, Division 28, § 46000 et seq), as found in the California Health and Safety Code, Division 28, § 46000 et seq., declares that excessive noise is a serious hazard to public health and welfare, and establishes the Office of Noise Control with responsibility to set standards for noise exposure in cooperation with local governments or the state legislature.⁴⁰

Airport Noise Standards (Title 21, CCR Section 5000 et seq.)

The State of California has the authority to establish regulations requiring airports to address aircraft noise impacts on land uses in their vicinities. The State of California's Airport Noise Standards, found in Title 21 of the California Code of Regulations, identify a noise exposure level of CNEL 65 dB as the noise impact boundary around airports. Within the noise impact boundary, airport proprietors are required to

³⁹ California Legislative Information. *Article 5. Authority for and Scope of General Plans [65300-65303.4], Section 65302.*

⁴⁰ California Legislative Information. *Division 28. Noise Control Act, 46000-46080.*

ensure that all land uses are compatible with the aircraft noise environment or the airport proprietor must secure a variance from the California Department of Transportation (Caltrans).⁴¹

Noise Insulation Standards (Health & Safety Code § 17922.6)

California Health and Safety Code § 17922.6 requires noise insulation standards for new multi-family residential units, hotels, and motels that may be subject to relatively high levels of transportation-related noise. For exterior noise, the noise insulation standard is DNL 45 dB in any habitable room and requires an acoustical analysis demonstrating how dwelling units have been designed to meet this interior standard where such units are proposed in areas subject to noise levels greater than DNL 60 dB.⁴²

Freeway Noise Attenuation (Streets and Highways Code, Article 6 and Vehicle Code, Article 2.5)

The State of California establishes noise limits for vehicles licensed to operate on public roads. For heavy trucks, the state pass-by standard is consistent with the federal limit of 80 dB.⁴³ The state pass-by standard for light trucks and passenger cars (less than 4.5 tons gross vehicle rating) is also 80 dB at 15 meters from the centerline.⁴⁴ Additionally, for a motor vehicle weighing more than 5 tons the pass-by standard is 88dB at 15 feet from the centerline of the vehicle.⁴⁵ For new roadway projects, Caltrans employs the NAC, promulgated by Title 40 of the Code of Federal Regulations (CFR), as administered by the FHWA.⁴⁶

Section 216 of the California Streets and Highways Code relates to the noise effects of a proposed freeway project on public and private elementary and secondary schools. Under this code, a noise impact occurs if, as a result of a proposed freeway project, noise levels exceed 52 dBA Leq in the interior of public or private elementary or secondary classrooms, libraries, multipurpose rooms, or spaces. If a project results in a noise impact under this code, noise abatement must be provided to reduce classroom noise to a level that is at or below 52 dBA Leq. If the noise levels generated from freeway and non-freeway sources exceed 52 dBA Leq prior to the construction of the proposed freeway project, then noise abatement must be provided to reduce the noise to the level that existed prior to construction of the project.⁴⁷

⁴¹ California Code of Regulations. *21 CCR § 5012. Airport Noise Standard.*

⁴² California Legislative Information. *Chapter 2. Rules and Regulations [17920-17928], Section 17922.6.*

⁴³ California Legislative Information. *Vehicle Code, Article 2.5 Noise Limits [27200-27207].*

⁴⁴ Government Publishing Office. *40 CFR 205, Subpart B Medium and Heavy Trucks.*

⁴⁵ California Legislative Information. *Vehicle Code, Article 2.5 Noise Limits [27200-27207].*

⁴⁶ Government Publishing Office. 2019. *Electronic Code of Federal Regulations, §202.20 Standards for highway operations.*

⁴⁷ California Legislative Information. *Article 6. Freeway Noise Attenuation [215.5-216.5], Section 216.*

Section 215.5 of the Streets and Highways Code implements a priority system to determine the need for the installation of noise attenuation barriers (i.e. soundwalls) along freeways and expressways. The highest consideration is given to residential areas developed prior to the opening of the freeway or where alterations have been made to the freeway which resulting in a significant increase in ambient noise levels. Other criteria for determining priorities includes the existing and future sound intensity generated by the freeway, the increase in traffic flow since the freeway originally opened, the cost of constructing a soundwall related to expected noise reduction, and the number of nearby residents included whether they lived there prior to the opening of the freeway.⁴⁸ Pursuant to Section 215.6, a city or county can accelerate the priority of a noise attenuation project by contributing at least 33 percent of the estimated cost of a soundwall project.⁴⁹

California Department of Health Services Land Use Guidelines for Community Noise Exposure

The state has published guidance for locating land uses in areas compatible with the existing noise environment (**Table 3.13-11, Community Noise Exposure**).⁵⁰ For example, it would normally be acceptable for a single-family residence to be located in an area with an existing noise level of 60 dBA CNEL or less.

⁴⁸ California Legislative Information. *Streets and Highways Code, Article 6. Freeway Noise Attenuation [215.5-216.5]*.

⁴⁹ *Ibid.*

⁵⁰ Governor's Office of Planning and Research. 2017. *State of California General Plan Guidelines*.

**Table 3.13-11
Community Noise Exposure**

Land Use Category	Community Noise Exposure (dB, Ldn or CNEL)					
	55	60	65	70	75	80
Residential - Low Density Single-Family, Duplex, Mobile Homes	Light Gray	Dark Gray	Dark Gray	Dark Gray	Dark Gray	Black
Residential - Multi-Family	Light Gray	Dark Gray	Dark Gray	Dark Gray	Dark Gray	Black
Transient Lodging - Motels Hotels	Light Gray	Dark Gray	Dark Gray	Dark Gray	Dark Gray	Black
Schools, Libraries, Churches, Hospitals, Nursing Homes	Light Gray	Dark Gray	Dark Gray	Dark Gray	Dark Gray	Black
Auditoriums, Concert Halls, Amphitheaters	Dark Gray	Dark Gray	Dark Gray	Dark Gray	Dark Gray	Black
Sports Arena, Outdoor Spectator Sports	Dark Gray	Dark Gray	Dark Gray	Dark Gray	Dark Gray	Black
Playgrounds, Neighborhood Parks	Light Gray	Light Gray	Light Gray	Light Gray	Light Gray	Black
Golf Courses, Riding Stables, Water Recreation, Cemeteries	Light Gray	Light Gray	Light Gray	Light Gray	Light Gray	Black
Office Buildings, Business Commercial and Professional	Light Gray	Light Gray	Light Gray	Light Gray	Light Gray	Black
Industrial, Manufacturing, Utilities, Agriculture	Light Gray	Light Gray	Light Gray	Light Gray	Light Gray	Black

-  Normally Acceptable - Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.
-  Conditionally Acceptable - New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply system or air conditioning will normally suffice.
-  Normally Unacceptable - New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
-  Clearly Unacceptable - New construction or development should generally not be undertaken.

Caltrans Guidance

Traffic Noise. Chapter 30 of the *Caltrans Project Development Procedures Manual* offers guidance on highway traffic noise abatement criteria (NAC), corresponding to various land use activity categories.⁵¹ However, the NAC in Chapter 30 has been superseded by the Caltrans *Traffic Noise Analysis Protocol for New Highway Construction, Reconstruction, and Retrofit Barrier Projects* (**Table 3.13-12, Activity Categories and Noise Abatement Criteria**).⁵² Activity categories and related traffic noise impacts are determined based on the actual land use in a given area. The Caltrans *Technical Noise Supplement to the Traffic Noise Analysis Protocol* provides additional details on noise analysis procedures, practices, and other useful technical background information related to the analysis and reporting of highway and construction noise impacts and abatement.⁵³ It supplements and expands on concepts and procedures referred to in the *Traffic Noise Analysis Protocol for New Highway Construction, Reconstruction, and Retrofit Barrier Projects*.

**Table 3.13-12
Activity Categories and Noise Abatement Criteria**

Activity Category	Hourly A-Weighted Sound Level, Leq(h)*	Evaluation Location	Description of Activities
A	57	Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B**	67	Exterior	Residential.
C**	67	Exterior	Active sport areas, amphitheatres, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings.
D	52	Interior	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.
E	72	Exterior	Hotels, motels, offices, restaurants/bars, and other developed lands, properties, or activities not included in A–D or F.
F			Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing.
G			Undeveloped lands that are not permitted.

Notes: The $L_{eq}(h)$ activity criteria values are for impact determination only and are not design standards for noise abatement measures. All values are A-weighted decibels (dBA). ** Includes undeveloped lands permitted for this activity category.

Airport Noise. The Caltrans Division of Aeronautics California Airport Land Use Planning Handbook offers guidance on airport planning and developing compatible land use policies.⁵⁴ It also provides suggested criteria for the CNEL values commonly used as the limit for acceptable residential noise exposure (**Table 3.13-13, Noise Compatibility Criteria**).

**Table 3.13-13
Noise Compatibility Criteria**

CNEL (dB)	Criteria	Suggested Applicability
65	Set by the FAA and other federal agencies as the level above which residential land uses may be incompatible if not acoustically treated. Established by California state regulations as the maximum normally acceptable noise level for residential and certain other land uses at county-designated noise-problem airports.	Generally not appropriate for most new development. May be acceptable in noisy urban locations and/or in hot climates where most buildings are air conditioned.
60	The contour within which California Building Code (Section 1207.11) requires an acoustical analysis of proposed residential structures, other than detached single-family dwellings. Suggested by the California Governor's Office of Planning and Research General Plan Guidelines as the maximum "normally acceptable" noise exposure for residential areas. [Note: Individual noise events will occasionally cause significant interference with residential land use activities, particularly outdoor activities, in quiet suburban/rural communities.]	Suitable for new development around most airports. Particularly appropriate in mild climates where windows are often open.
55	Identified by the EPA as the level below which "undue interference with activity and annoyance" will not occur. [Note: Individual noise events will seldom significantly interfere with residential land use activities (e.g., interference with speech). In urban areas, aircraft contribution to this noise level may be less than that of other noise sources.]	Suitable for airports in quiet, rural locations.

Note:

When setting criteria for a specific airport, other characteristics of the airport and its environs also need to be considered.

Source:

California Department of Transportation. October 2011. California Airport Land Use Planning Handbook. Table 4B.

Construction Noise. Section 14-8.02, Noise Control, of Caltrans standard specifications provides guidance on preventing construction noise impacts. The specification states:

- Do not exceed 86 dBA at 50 feet from the job site activities from 9 p.m. to 6 a.m.
- Equip an internal combustion engine with the manufacturer recommended muffler. Do not operate an internal combustion engine on the job site without the appropriate muffler.

If adverse construction noise impacts are anticipated, project plans and specifications must identify abatement measures that would minimize or eliminate adverse construction noise impacts on the community.

⁵⁴ California Department of Transportation. *California Airport Land Use Planning Handbook*. October 2011.

Construction Vibration. The *Transportation and Construction Vibration Guidance Manual* presents a variety of criteria for vibration impacts based on previously completed studies.⁵⁵ Caltrans recommends that extreme care be taken when sustained pile driving occurs within 7.5 meters (25 feet) of any building and 15 to 30 meters (50 to 100 feet) of a historic building or a building in poor condition.

3.13.2.3 Local

To identify, appraise, and remedy noise problems in local communities, each county and city in the SCAG region is required to adopt a noise element as part of its General Plan. Each noise element is required to analyze and quantify current and projected noise levels associated with local noise sources, including, but not limited to, highways and freeways, primary arterials and major local streets, rail operations, air traffic associated with the airports, local industrial plants, and other ground stationary sources that contribute to the community noise environment. Beyond statutory requirements, local jurisdictions are free to adopt their own goals and policies in their noise elements, although most jurisdictions have chosen to adopt noise/land use compatibility guidelines that are similar to those recommended by the state. The overlapping DNL ranges indicate that local conditions (existing noise levels and community attitudes toward dominant noise sources) should be considered in evaluating land use compatibility at specific locations.

In addition to regulating noise through noise element policies, local jurisdictions regulate noise through enforcement of local ordinance standards. These standards generally relate to noisy activities (e.g., use of loudspeakers and construction) and stationary noise sources and facilities (e.g., air conditioning units and industrial activities). Three cities in the SCAG region, Los Angeles, Long Beach, and Port Hueneme, operate port facilities. Noise from the Ports of Los Angeles, Long Beach, and Hueneme are regulated by the noise ordinances and noise elements of the Los Angeles, Long Beach, and Port Hueneme General Plans.

In terms of airport noise, airport operators have addressed local community noise concerns through a variety of methods changes including runway use and flight routing changes, aircraft operational procedure changes, and engine run-up restrictions. These actions generally are subject to approval by the FAA, which has the authority and responsibility to control aircraft noise sources, implement and enforce flight operational procedures, and manage the air traffic control system. Airport operators also consider limitations on airport use, but such restrictions can be overridden by the Federal Aviation Administration if it is determined that they unjustly discriminate against any user, impede the federal interest in safety and management of the air navigation system, or unreasonably interfere with interstate commerce. In

⁵⁵ California Department of Transportation. 2013. *Transportation and Construction Vibration Guidance Manual*. Sacramento, CA. September.

addition airport operators have addressed community concerns by retrofitting homes under flight paths to provide additional noise insulation.

Some local jurisdictions regulate vibration through enforcement of local ordinance standards. These standards generally relate to preventing perceptible vibration from being generated past the property line of the source location.

3.13.3 ENVIRONMENTAL IMPACTS

3.13.3.1 Thresholds of Significance

The impacts related to noise from the Plan would be considered significant if they would exceed the following significance criteria, in accordance with Appendix G of the *State CEQA Guidelines*:

- Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Generation or excessive groundborne vibration or groundborne noise levels;
- For a project within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

3.13.3.2 Methodology

This section evaluates the potential impacts of the proposed Connect SoCal Plan on ambient noise levels, identifies mitigation measures for the impacts, and evaluates the residual impacts in accordance with Appendix G of the 2019 State California Environmental Quality Act (CEQA) Guidelines. Noise within the SCAG region was evaluated at the programmatic level of detail, in relation to federal noise and vibration impacts guidelines; *State of California General Plan Guidelines for Noise Elements*; California Department of Transportation guidance documents; the general plans of the six counties and 191 cities within the SCAG region; and a review of related literature germane to the SCAG region, as well as a review of Connect SoCal.^{56,57,58,59,60,61,62,63,64,65,66,67}

⁵⁶ Federal Interagency Committee on Noise. 1992. *Federal Agency Review of Selected Airport Noise Analysis Issues*. August.

⁵⁷ Cowan, James P. 1993. *Handbook of Environmental Acoustics*.

Ambient noise levels in the SCAG region vary widely as a function of the dramatic physical environment, land use, and density of people. Noise levels for various areas are identified according to the use of the area. Maximum allowable noise levels associated with various sensitive land uses are provided. Exposure of people to noise levels and ground borne vibration from transportation and transit infrastructure varies in relation to noise level at the source, density of the source, distance from the source, and sound modulating or attenuating structures between the source and the receptor.

The methodology for determining the significance of noise and vibration impacts compares the existing conditions to the conditions as a result of implementing the transportation projects and growth under the Plan.⁶⁸

Permanent increases in operational noise associated with highway traffic is dependent on several variables:

- Traffic volume (the greater the number of vehicles passing through an area within a specified period result in greater noise)
- Vehicle speed (greater speed results in greater noise from tire and aerodynamic noise)

⁵⁸ Nelson, J.T., and H.J. Saurenman. 1983. *State-of-the-Art Review: Prediction and Control of Ground-Borne Noise and Vibration from Rail Transit Trains*. U.S. Department of Transportation, Urban Mass Transportation Administration, Report Number UMTA-MA-06-0049-83-4, DOT-TSC-UMTA-83-3.

⁶⁵ California Department of Transportation, Division of Aeronautics. 2011. *California Airport Land Use Planning Handbook*.

⁶⁶ U.S. Department of Transportation, Federal Transit Administration. 2006. *Transit Noise and Vibration Assessment*.

⁶⁷ U.S. Department of Transportation, Federal Highway Administration. 2006. *FHWA Highway Construction Noise Handbook*.

⁶⁸ Note that ambient noise from the existing transportation network, including freeways, are generally not considered impacts under CEQA unless the project exacerbates the existing environmental conditions. *See* Cal. Building Industry Assn. v. Bay Area Air Quality Management District (2015) 62 Cal.4th 369 (California Supreme Court ruled that agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents unless the proposed project risks exacerbating those environmental hazards or conditions that already exist.); *see also* Cal. Building Industry Assn. v. Bay Area Air Quality Management District (2016) 2 Cal.App.5th 1067.

- Vehicle types such as cars, trucks, and motorcycles (different engine and exhaust combinations, different tires, and different aerodynamic profiles result in different noise levels)
- Location of the roadway with respect to sensitive receptors (distance and intervening objects or topography will reduce noise levels).

The noise impacts analysis was based on the Project List (See **Appendix 2.0, Connect SoCal Project List**) located throughout the six counties and 38,000 square miles of the SCAG region.⁶⁹ Project types range from projects with substantial ground disturbance such as rail projects, mixed flow lane projects, and grade separation projects, to operations and maintenance projects with minimal ground disturbance such as traffic signal synchronization or lane-restriping projects.⁷⁰

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in **Section 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.13.3.3 Impacts and Mitigation Measures

Impact NOISE-1 Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Significant and Unavoidable Impact – Mitigation Required.

Implementation of transportation projects and development projects anticipated to occur under the Plan would likely result in exposure of persons to or generation of noise levels in excess of standards

⁶⁹ SCAG. 2019. *Connect SoCal Transportation System Project List Technical Report*. November.

⁷⁰ Note that as discussed in **Section 3.15.3, Public Services – Schools**, CEQA review of school construction generally does require an evaluation of the effects of existing air quality exposure on pupils, and to the extent the health risk is unacceptable, the school would not be built. CEQA also provides limited protection and requires analysis of impacts of the existing environment on certain housing development projects exercising exemptions under Pub. Res. Code § 21096.

established in the local general plan or noise ordinance, or applicable standards of other agencies, constituting a significant impact. Grading and construction activities would generate temporary increases in noise levels, and operational activities would generate permanent increases in noise levels in excess of standards established in the local general plan or noise ordinance, constituting a significant impact, requiring the consideration of mitigation measures.

As noted above, noise impacts are experienced locally and cannot be quantified at a regional level. Land uses support various noise environments depending on multiple factors. For example, urban environments tend to be louder than suburban environments due to denser, multi-use land use patterns. Urban environments also typically support higher volumes of traffic as well as other transportation modes that generate sound such as trains, light rail, and buses. Suburban environments, where land uses are often more segregated, have more moderate noise levels. Agricultural areas also have a unique noise environment as compared to urban and suburban environments. Agricultural operations require the use of heavy-duty equipment (e.g., mechanized plows, tractors) that produce high noise levels. However, because agricultural areas are sparsely populated, noise generally does not have the same adverse effect on surrounding land uses and may be protected by right-to-farm regulations or other local land use policies.

Construction. Impacts to sensitive receptors resulting from the construction of transportation projects as well as the implementation of land use strategies would depend on several factors, such as the type of project, adjacent land use, and duration and intensity of the construction activity. Construction noise levels would fluctuate depending on how the construction is phased, the equipment mix, the distance between the construction and the nearest sensitive receptor, and the presence of intervening objects. Furthermore, anticipated development to accommodate the forecast population, household, and employment would take a variety of forms, with a substantial number (60 percent of housing units and 73 percent of jobs) focused in Growth Priority Areas including in and around high-quality transit areas (HQTAs), as well as development in existing urbanized areas, and opportunity areas. Because development would be focused in HQTAs and urbanized areas, residents in and around those areas would be subject to increased frequency of construction noise.

Operations. Impacts to sensitive receptors resulting from the operation of transportation projects as well as increases in traffic due to anticipated development projects under the Plan would depend on several factors, such as the type of project and adjacent land use. Operational noise levels would fluctuate depending on traffic volume, vehicle speed, vehicle mix, location and distance of the roadway with respect to sensitive receptors, and the presence of intervening objects. A doubling of traffic generally corresponds to a 3 dB increase in noise level, which is only just perceptible to the human ear. Most major facilities do not have the capacity to allow a doubling of traffic and therefore this increase is generally not

expected.

Similar to construction impacts, anticipated development to accommodate the forecast population, household, and employment growth would take a variety of forms, with a substantial fraction focused in and around HQTAs, existing urbanized areas, and opportunity areas as reflected under Connect SoCal's land use strategies. As traffic volumes increase, the duration of the peak hour noise levels extend as well. Operation of transportation and transit projects in these HQTAs, existing urbanized areas, and opportunity areas would have the potential to increase noise level in excess of standards established in county and city general plans and noise ordinances.

Heavy rail would increase the number of passenger and freight trains in the region. Because of the number of existing passenger and freight trains that use the existing heavy rail tracks, additional trains are not expected to increase daily noise (CNEL) along any given track by more than 3 dB relative to baseline conditions. Light rail improvements will include increasing frequency on and making improvements to existing corridors and adding new corridors. In general, the proposed transit improvements along existing corridors will occur in developed urban areas where noise levels are already high from existing sources. In areas that do not currently have light rail operations, implementation of the Plan could increase noise levels above 65 dB CNEL and increase daily noise (CNEL) by more than 3 dB relative to baseline conditions. Increases in operational mobile source noise from the projected land use pattern and planned transportation improvements would result in new vehicles trips on existing roadways generating increases in noise. In locations where noise would exceed the CNEL threshold of 65 dB following the implementation of the Plan, a significant noise impact would occur.

Land use strategies in the Plan would encourage development in HQTA's and other urbanized areas. Urban areas experience noise from a number of sources associated with living in proximity to other people and among different land uses. Typical community noise sources include small mechanical devices (e.g., lawn mowers, leaf blowers), parks and playgrounds, restaurants and bars, commercial uses, events, and industrial plants. Traffic and other transportation-related noise is also a dominant noise source in urban areas. Light rails, passenger trains, and other forms of public transit generate noise from the contact of wheels on railways as well as loud bells that signal to cars, cyclists, and pedestrians of their arrival. Implementation of the Plan is likely to increase the amount of noise experienced in HQTAs because of the increased density in these areas as well as from improved transportation infrastructure.

In suburban and rural areas, noise sources are fewer and the addition of new stationary or mobile noise sources could result in an increase in ambient noise. As the Plan is expected to result in the conversion of 41,546 greenfield acres, there is the potential for increased ambient noise in suburban and rural areas.

Because of the nature of noise impacts (noise dissipates with distance from the source), new transportation operations may cause noise impacts, and those impacts may exceed applicable noise thresholds for determining significance within a localized area, but those impacts cannot be quantified at a regional level. Therefore, implementation of transportation projects and land use strategies in Connect SoCal would result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, which constitutes a significant impact requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

SMM-NOISE-1: SCAG shall coordinate with CTCs and member agencies as part of SCAG's outreach and technical assistance to local governments to encourage transportation projects and projects involving residential and commercial land uses to mitigate noise and vibration or be developed in areas that are normally acceptable or conditionally acceptable, consistent with applicable guidelines (i.e., OPR, Caltrans, etc.).

Project Level Mitigation Measures

PMM NOISE-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects that physically divide a community, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a. Install temporary noise barriers during construction.
- b. Include permanent noise barriers and sound-attenuating features as part of the project design. Barriers could be in the form of outdoor barriers, sound walls, buildings, or earth berms to attenuate noise at adjacent sensitive uses.
- c. Schedule construction activities consistent with the allowable hours pursuant to applicable general plan noise element or noise ordinance
- d. Post procedures and phone numbers at the construction site for notifying the Lead Agency staff, local Police Department, and construction contractor (during regular construction hours and off-hours), along with permitted

construction days and hours, complaint procedures, and who to notify in the event of a problem.

- e. Notify neighbors and occupants within 300 feet of the project construction area at least 30 days in advance of anticipated times when noise levels are expected to exceed limits established in the noise element of the general plan or noise ordinance.
- f. Designate an on-site construction complaint and enforcement manager for the project.
- g. Ensure that construction equipment are properly maintained per manufacturers' specifications and fitted with the best available noise suppression devices (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds silencers, wraps). All intake and exhaust ports on power equipment shall be muffled or shielded.
- h. Use hydraulically or electrically powered tools (e.g., jack hammers, pavement breakers, and rock drills) for project construction to avoid noise associated with compressed air exhaust from pneumatically powered tools. However, where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust should be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves should be used, if such jackets are commercially available, and this could achieve a further reduction of 5 dBA. Quieter procedures should be used, such as drills rather than impact equipment, whenever such procedures are available and consistent with construction procedures.
- i. Where feasible, design projects so that they are depressed below the grade of the existing noise-sensitive receptor, creating an effective barrier between the roadway and sensitive receptors.
- j. Where feasible, improve the acoustical insulation of dwelling units where setbacks and sound barriers do not provide sufficient noise reduction.
- k. Using rubberized asphalt or "quiet pavement" to reduce road noise for new roadway segments, roadways in which widening or other modifications

require re-pavement, or normal reconstruction of roadways where re-pavement is planned

- l. Projects that require pile driving or other construction noise above 90 dBA in proximity to sensitive receptors, should reduce potential pier drilling, pile driving and/or other extreme noise generating construction impacts greater than 90 dBA; a set of site-specific noise attenuation measures should be completed under the supervision of a qualified acoustical consultant.
- m. Use land use planning measures, such as zoning, restrictions on development, site design, and buffers to ensure that future development is compatible with adjacent transportation facilities and land uses;
- n. Monitor the effectiveness of noise reduction measures by taking noise measurements and installing adaptive mitigation measures to achieve the standards for ambient noise levels established by the noise element of the general plan or noise ordinance.
- o. Use equipment and trucks with the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds, wherever feasible) for project construction.
- p. Stationary noise sources can and should be located as far from adjacent sensitive receptors as possible and they should be muffled and enclosed within temporary sheds, incorporate insulation barriers, or use other measures as determined by the Lead Agency (or other appropriate government agency) to provide equivalent noise reduction.
- q. Use of portable barriers in the vicinity of sensitive receptors during construction.
- r. Implement noise control at the receivers by temporarily improving the noise reduction capability of adjacent buildings (for instance by the use of sound blankets), and implement if such measures are feasible and would noticeably reduce noise impacts.

- s. Monitor the effectiveness of noise attenuation measures by taking noise measurements.
- t. Maximize the distance between noise-sensitive land uses and new roadway lanes, roadways, rail lines, transit centers, park-and-ride lots, and other new noise-generating facilities.
- u. Construct sound reducing barriers between noise sources and noise-sensitive land uses.
- v. Stationary noise sources can and should be located as far from adjacent sensitive receptors as possible and they should be muffled and enclosed within temporary sheds, incorporate insulation barriers, or use other measures as determined by the Lead Agency (or other appropriate government agency) to provide equivalent noise reduction.
- w. Use techniques such as grade separation, buffer zones, landscaped berms, dense plantings, sound walls, reduced-noise paving materials, and traffic calming measures.
- x. Locate transit-related passenger stations, central maintenance facilities, decentralized maintenance facilities, and electric substations away from sensitive receptors to the maximum extent feasible.

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including the inability to quantify noise impacts at the regional level, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to substantial temporary or permanent increases in ambient noise levels in excess of standards established in local general plans or noise ordinances, or applicable standards of other agencies, to be significant and unavoidable even with implementation of mitigation.

Impact NOISE-2 Generation of excessive groundborne vibration or groundborne noise levels.*Significant and Unavoidable Impact – Mitigation Required.*

Implementation of the transportation projects and the construction of land use development projects anticipated to occur under the Plan would generate varying levels of vibration and groundborne noise. As noted above, urban environments tend to be louder than suburban environments due to denser, multi-use land use patterns. Urban environments also typically support higher volumes of traffic as well as other transportation modes that generate groundborne vibration and sound such as trains, light rail, and buses. Suburban environments, where land uses are often more segregated, have more moderate noise levels. Agricultural areas also have a unique noise environment as compared to urban and suburban environments. Agricultural operations require the use of heavy-duty equipment (e.g., mechanized plows, tractors) that produce high noise levels. However, because agricultural areas are sparsely populated, noise generally does not have the same adverse effect on surrounding land uses and may be protected by right-to-farm regulations or other local land use policies.

Traffic, especially heavy truck traffic, can be a source of vibration and groundborne noise. Rail operations, including freight and light rail trains, can also be a source of vibration. **Table 3.13-14** contains reference to vibration levels associated with heavy-duty equipment.

Construction. Transportation projects and development anticipated to occur under the Plan could result in temporary noise and vibration impacts from grading, paving, clearing, landscaping, staging, excavation, earthmoving, and other related construction activities. Such construction activities would require the use of heavy construction equipment (e.g., pile drivers, back hoes, jackhammers) and vehicles that generate significant amounts of noise and vibration in the immediate vicinity of the source, often resulting in noise and vibration levels substantially higher than existing conditions. **Table 3.13-14, Construction Equipment Source Noise Levels**, summarizes typical construction noise levels for various construction activities.

**Table 3.13-14
Construction Equipment Source Noise Levels**

Equipment	Levels in dB(A) at 50 feet
Front Loader	73-86
Trucks	82-95
Cranes (Moveable)	75-88
Cranes (Derrick)	86-89
Vibrator	68-82
Saws	77-82
Pneumatic Impact Equipment	83-88
Jackhammers	81-98
Pumps	68-72
Generators	71-83
Compressors	75-87
Concrete Mixers	75-88
Concrete Pumps	81-85
Back Hoe	73-85
Pile Driving (Peaks)	95-107
Tractor	77-98
Scraper/Grader	80-93
Paver	85-88

Source: US Environmental Protection Agency, Noise From Construction Equipment and Operations, Building Equipment and Home Appliances, PB 206717, 1971.

Noise impacts from construction activities depend on several factors including the types of surrounding land uses, duration and type of construction activities, distance between source and receptor, and the presence or absence of barriers between source and receptor. Construction impacts are considered temporary and localized in nature, as they are limited to the time during which the project is being constructed and confined to areas adjacent to the construction site. After construction is completed, all construction equipment and vehicles are removed. In urban areas, where most of the development takes place, construction is a frequent occurrence, and although construction can be a nuisance, it may not result in a significant impact. In rural and suburban areas, where ambient noise levels are lower, it may rise to the level of an impact. However, land uses are also further apart, thereby reducing the potential for conflicts. Further, many local jurisdictions have policies specifically dealing with construction noise including restrictions on hauling and hours of construction.

Transportation projects and anticipated development projects under the Plan have the potential to result in construction-related impacts that increase noise levels above the noise thresholds identified in **Table 3.13-14** and substantially increase noise levels in locations currently in exceedance of a CNEL threshold;

as well as the potential to result in excessive levels of vibration and groundborne noise from increased traffic and congestion, at the local level (see **Section 3.17, Transportation, Traffic and Safety**, for further discussion of how the Plan affects the transportation network). Although construction noise is short-term for individual project sites, it can nonetheless result in substantial increases in ambient noise levels in the immediate vicinity of each construction site. Construction activities would occur in accordance with applicable city or county standards. Most such standards address acceptable hours of operation, while some standards address allowable noise levels. If sensitive receptors are in the immediate vicinity of construction activities, they could be temporarily adversely affected. Land use strategies which would encourage more dense development near a sensitive receptor would result in increased temporary construction noise for those receptors. Construction activity, and associated groundborne vibration or noise levels, is a routine part of the urban environment. While construction of individual projects is considered to have a less than significant impact, construction activities are likely to be ongoing throughout the region and therefore impacts are considered significant.

As previously discussed, there are sensitive receptors such as residences, schools, libraries, churches, hospitals, nursing homes, natural areas, and parks in the SCAG region that could be affected by construction or operation of Plan projects. As such, impacts are considered significant.

Construction-related vibration has the potential to damage structures and be a source of annoyance to individuals who live or work near these construction activities. Pile drivers can generate vibrations in excess of 0.5 PPV at a distance of 25 feet, see **Table 3.13-15, Construction Equipment Vibration Levels**, which can result in damage to reinforced concrete. Vibration levels generated by pile driving vary depending on soil conditions, construction methods, and equipment used. Depending on the proximity of existing structures to the pile driving, the structural condition of the existing structures, and the methods of construction used, vibration levels caused by pile driving or other foundation work with a substantial impact component such as blasting, rock or caisson drilling, and site excavation or compaction may be high enough to damage existing structures. A vibration analysis completed by Caltrans indicated that “extreme care must be taken when sustained pile driving occurs within 7.5 m (25 ft) of any building, and 15–30 m (50–100 ft) of a historical building or building in poor condition.”⁷¹

Operation. Normal operation of residential, office and commercial, and mixed-use buildings are unlikely to generate substantial vibration or groundborne noise. Industrial and public buildings could generate vibration and groundborne noise during operations that involve the use of machinery or other vibration-inducing equipment. However, the amount of vibration produced is not anticipated to be excessive, as workplace vibration is typically addressed from an occupational health and safety perspective. As with noise, vibration dissipates with distance from the source, therefore surrounding land uses would unlikely be affected. **Table 3.13-15** indicates that, even at close distances, vibration levels for most heavy-duty equipment are below 0.1 inches per second.

Traffic, especially heavy truck traffic, can be a source of vibration and groundborne noise. However, such vibration is rarely high enough to cause annoyance to surrounding uses, as vehicles are supported on spring suspensions and pneumatic tires, which reduce the amount of vibration and groundborne noise generated from vehicular traffic. Rail operations, including freight and light rail trains, can also be a source of vibration. Under the Plan there would be increases in both heavy rail and light rail. Existing and future growth and development near existing or planned light rail or heavy rail lines could result in excessive levels of vibration and groundborne noise as compared to existing conditions.

Impacts associated with transportation strategies such as complete streets and TSM would be minimal and they would generally improve overall traffic flow and would not be expected to increase noise or

vibration. Land use strategies would encourage compact development which would encourage more people in urbanized areas where vibration impacts would occur. Operation-related vibration would be a source of annoyance to individuals who live or work near new infrastructure associated with heavy duty truck and bus traffic along roadways and train traffic along rail lines. The amplitude of vibration generated by heavy trucks, buses, or trains has the potential to result in structural or cosmetic damage if the route is adjacent or in close proximity to fragile older buildings.

Based on vibration measurements throughout California, Caltrans determined the maximum traffic vibration levels from truck traffic drop below the threshold of perception at a distance of 42.5 meters (140 feet) from the source and that vibration level from truck traffic are unlikely to cause architectural damage to fragile historic buildings unless the building was adjacent or within 5 meters or 17 feet from the source.⁷² Therefore, it is anticipated that operational activities would result in a significant impact related to the exposure of people to excess groundborne vibration or groundborne noise levels.

Furthermore, Caltrans measured a peak train vibration level of 0.36 in/sec PPV at 3 meters (10 feet).⁷³ A vibration level of 0.36 in/sec PPV at 3 meters or 10 feet would fall below the threshold of perception at a distance of 80 meters (263 feet) from the source. Therefore, it is anticipated that operational activities would result in a significant impact related to the exposure of people in excess groundborne vibration or groundborne noise levels.

As a result, implementation Connect SoCal would result in the exposure of persons to generation of excessive groundborne vibration or groundborne noise levels, which constitutes a significant impact requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

See **SMM NOISE-1**.

⁷² Ibid.

⁷³ Ibid.

Project Level Mitigation Measures

See PMM-NOISE-1.

PMM NOISE-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a. For projects that require pile driving or other construction techniques that result in excessive vibration, such as blasting, determine the potential vibration impacts to the structural integrity of the adjacent buildings within 50 feet of pile driving locations.
- b. For projects that require pile driving or other construction techniques that result in excessive vibration, such as blasting, determine the threshold levels of vibration and cracking that could damage adjacent historic or other structure, and design means and construction methods to not exceed the thresholds.
- c. For projects where pile driving would be necessary for construction due to geological conditions, utilize quiet pile driving techniques such as predrilling the piles to the maximum feasible depth, where feasible. Predrilling pile holes will reduce the number of blows required to completely seat the pile and will concentrate the pile driving activity closer to the ground where pile driving noise can be shielded more effectively by a noise barrier/curtain.
- d. Restrict construction activities to permitted hours in accordance with local jurisdiction regulation.
- e. Properly maintain construction equipment and outfit construction equipment with the best available noise suppression devices (e.g., mufflers, silences, wraps).
- f. Prohibit idling of construction equipment for extended periods of time in the vicinity of sensitive receptors.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to excessive groundborne vibration or groundborne noise levels to be significant and unavoidable even with implementation of mitigation.

Impact NOI-3 For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

Significant and Unavoidable – Mitigation Required.

Implementation of transportation projects and development anticipated to occur under the Plan may result in exposure of persons to or generation of significant noise levels from aircrafts and other airport activity (including ground transportation) constituting a significant impact.

The SCAG region contains an expansive multiple airport system with seven commercial airports, seven government/military fields, and more than 30 reliever and general aviation airports. California's Airport Noise Standards identify a noise exposure level of CNEL 65 dB as the noise impact boundary around airports. Airport proprietors are required to ensure all land uses are compatible with the aircraft noise environment or secure a variance from the California Department of Transportation.

Note that SCAG has no authority over airport development. Rather SCAG includes aviation planning information within each RTP/SCS in order to facilitate ground transportation access planning. Development authority of airports rests with each airport (i.e. airport sponsors retain authority over planning and development decisions) and the Federal Aviation Administration (FAA), which makes airport funding decisions based on national priorities. Moreover, airports are not required to incorporate MPO planning recommendations into their capital plans, and FAA funding decisions are not necessarily tied to MPO RTP recommendations.

Despite some downturns, air passenger traffic in the region has increased at a steady rate over the past two decades, with a particularly high growth rate in recent years. In 2017, the six-county SCAG region was one of the most active and fastest growing regions for air passenger traffic in the United States. In 2017, at 110.17 million annual passengers, SCAG was second only to the New York/New Jersey region for air passenger traffic. The SCAG region saw a passenger growth rate of 5.12 percent from 2012 to 2017.⁷⁴

As noted above, SCAG does not have any regulatory, developmental, operational, or planning authority over the airports. Rather, SCAG is primarily a regional surface transportation planning agency that maintains a list of airport ground access projects and a consultative relationship with the airports. Therefore, SCAG is focused on air and passenger cargo activity from the perspective of how the traffic coming and going from the airports affects the region's roads, highways, and transit system. SCAG also prepares an Aviation Technical Report to the Plan.

The Connect SoCal Aviation Technical Report references a comprehensive review of various forecasts for aviation growth in the SCAG region:⁷⁵

- Regional air passenger transportation is anticipated to grow by an average of 2.1% annually; from 110.17 MAP in 2017 to 197.1 MAP in 2045
- Regional air cargo transportation is anticipated to grow by an average of 3.3% annually, from 3.14 million in 2017 to 7.77 million tons in 2045
- Total regional aircraft operations are not anticipated to grow as fast as passenger and/or cargo growth. Regional aircraft operations are anticipated to grow by an average of 0.74% annually, from 3.7 million operations in 2017 to 4.58 million operations in 2045

As mentioned above, LAX is the only regional large-hub primary airport, and the operational data listed for each regional airport indicates most regional airport operations are associated with LAX. Recent statistics show that while passenger traffic has increased by approximately 1% in 2019, aircraft operations have reduced by approximately 2%. The LAWA department of the City of Los Angeles is currently constructing an Automated People Mover (APM) electric train to reduce ground traffic congestion, accommodate future operational growth, and provide a direct rail connection to Los Angeles and adjacent cities.⁷⁶ The APM is planned to open for passenger services in 2023, and APM operation will reduce ground traffic and could incrementally reduce associated ground traffic noise.

⁷⁴ Connect SoCal. 2019. *Aviation and Airport Ground Access Technical Report*.

⁷⁵ Ibid.

⁷⁶ <https://www.lawa.org/en/connectinglax/automated-people-mover; 8/30/2019>

The following information was obtained from the Airport Noise Overview Technical Report prepared as part of the PEIR. The full report is provided in **Appendix 3.13**. Region-wide growth between 2017 to mid-year 2019 is estimated to be up to approximately 2% for air passengers and less than 0.5% for aircraft operations. For the purposes of assessing regional noise impacts from aviation, the above bulleted forecasts reasonably approximate the 2019 to 2045 time period.

As noted above, the aircraft operations growth forecast is significantly smaller than the air passenger and air cargo percentages. This is anticipated because newer aircraft carry a higher volume of passengers and carriers are running at a higher load factor than in the past. When the airlines carry more passengers per flight, the flights are more profitable and fewer flights are needed to carry the same volume of passengers to a specific location. This allows the airlines to schedule some of these flights to other locations and/or reduce their airport operations.

The noise from airports is directly related to the number of aircraft operations as well as the size, aircraft type, and number and type of engines, with additional contributions from other airport activities and ground transportation (noise from ground transportation is as part of the overall transportation projects in the Plan).

In general, if the mix of aircraft remains constant, the aviation noise contours grow larger or shrink smaller as the operations increase or decrease. Noise levels do not increase algebraically as the noise sources increase but increase in a logarithmic fashion. For example, two noise sources each emitting a noise level of 60 dB add together to produce noise of 63 dB, not 120 dB. Doubling the number of noise sources increases the overall noise level by 3 dB and doubling the number of aircraft operations would also increase the overall airport noise level by 3 dB and expand the area inside the noise contours, assuming all other factors such as aircraft type, engines, flight tracks, etc., remain the same.

Considering the growth in airport operations from 3.7 million to 4.58 million, if all aircraft types and operational characteristics were to remain equal, the forecasted increase in noise would equate to 0.9 decibels. However, this average increase in aircraft operations would not occur at all airports, as different airports will experience different changes and noise contours may grow or shrink independently. Airport noise levels are expected to increase at the busiest airports such as LAX, ONT, PSP and BUR, while noise levels at airports with noise and/or operations constraints would not be expected to increase as much. The details needed to model airport noise level changes over the forecast period are not available to provide specific changes. Additionally, airports across the nation have received an increase in noise complaints since implementation in 2015 of FAA's *NextGen* program to modernize the nation's air

transportation system.⁷⁷ One aspect of *NextGen* utilizes satellite navigation that precisely direct aircraft flight tracks for more efficient performance, reducing fuel costs and associated carbon emissions, and to increase overall flight capacity.⁷⁸ Aircraft flight track changes in some cases moved flights over areas that previously did not experience overflights or concentrated aircraft over areas that already experienced overflights, and airport noise complaints increased.⁷⁹ As the FAA and airports such as LAX and BUR⁸⁰ wrestle with the contending issues of an efficient airspace and noise complaints, it is unclear whether aircraft flight tracks will remain constant, further complicating the details needed for forecasting airport noise level changes over the lifetime of the Plan.

Technological changes also play a role in understanding airport noise impacts. The aircraft industry continues to develop aircraft with higher capacity, lower fuel consumption, and lower carbon emissions, but as it does, the industry must also comply with FAA and international aircraft compliance requirements regarding noise. Aircraft noise is classified into various Stages, with current Stage 3 and 4 aircraft operating quieter than previously used Stage 2 aircraft. Stage 3 aircraft measure between 7 and 20 EPNdB (Effective Perceived Noise Level, decibels) quieter than Stage 2 aircraft, while Stage 4 aircraft are an additional 10 EPNdB quieter than Stage 3 aircraft. Stage 2 aircraft no longer fly in the U.S., with some exceptions for lighter weight aircraft, taking the noisiest aircraft out of service. As airlines replace older and noisier Stage 3 aircraft with quieter Stage 4 aircraft, the aircraft fleet becomes quieter. As a recent example, American Airlines retired the last of its Stage 3 compliant McDonnell Douglas MD-80 aircraft in September 2019 and looks to replace the aircraft with more fuel-efficient aircraft with lower maintenance costs.⁸¹ Even as newer aircraft have more powerful engines, the requirements to comply with the quieter Stage 4 noise levels will result in a quieter fleet overall. In 2018, the FAA adopted regulations requiring newly designed aircraft to meet even quieter Stage 5 requirements with a reduction of 7 EPNdB,⁸² and as these aircraft come into service (and some aircraft currently in operation already meet this standard), this will lower the aircraft noise level further.

It is possible that in the long term, as aircraft operations grow over the next 25 years, the lower noise levels of aircraft will offset the increased operations to maintain or even reduce the aircraft noise contour

⁸² Federal Aviation Administration, Stage 5 Airplane Noise Standards, published October 4, 2017. Accessible: <https://www.federalregister.gov/documents/2017/10/04/2017-21092/stage-5-airplane-noise-standards>

footprints around airports, as this has been the general trend in aviation noise over the previous 40 years. It may also be possible that the growth in operations at some airports may overtake the trend toward a quieter aircraft fleet and cause aircraft noise and the noise contours to increase.

In addition, most major public airports have an airport land use plan that provides guidance on safety and land use in adjacent areas. State law mandates the creation of an Airport Land Use Compatibility Plan. The Airport Land Use Commissions (ALUC) coordinates planning for areas that surround public use airports. The ALUC is tasked with preparing airport land use plans to protect the public by minimizing their exposure to excessive noise and safety hazards within these areas.

Furthermore, the development of Airport Land Use Plans are guided by three federal regulations and two state codes:

- Title 14 Code of Federal Regulations, Part 36, establishes maximum acceptable noise levels for specific aircraft types.
- Title 14 Code of Federal Regulations, Part 150, provides guidance for measuring noise at airports and surrounding areas, determining exposure of individuals to noise from the operations of an airport, identifying land uses that are normally compatible, and preparing and executing noise compatibility planning and implementation programs.
- As part of Title 24 Code of Federal Regulations, Part 51, Subpart B, the HUD exterior noise regulations state that noise levels of 65 dBA DNL or less are acceptable for residential land uses and noise levels exceeding 75 dBA DNL are unacceptable.
- California Government Code Section 65302 specifies that noise contours be shown for all facilities related to airport operations and be stated in terms of CNEL or Ldn. These noise contours are intended to guide how patterns of land uses are established in the land use element in order to minimize the exposure of community residents to excessive noise.
- Title 21, California Code of Regulations Section 5000 et seq., identifies a noise exposure level of CNEL 65 dB as the noise impact boundary around airports. Within this noise impact boundary, airport proprietors are required to ensure that all land uses are compatible with the aircraft noise environment or the airport proprietor must secure a variance from Caltrans.

Additionally, each county and city in the SCAG region is required to adopt safety and noise elements as part of their General Plans. It is expected that local jurisdictions would conduct environmental review for projects that are within or near sensitive airport zones, and are expected to implement best management

practices and mitigation measures on a project-by-project basis, to minimize potential noise risks associated with air traffic.

Nevertheless, due to the regional scale of aviation operations and because the noise profiles of future aircraft types and their engines are unknown, as is the timeframe for phasing out older aircraft and replacing them with newer aircraft, impacts cannot be accurately determined at this time. Conservatively it is assumed sensitive receptors may experience greater noise impacts than at present in the vicinity of airports resulting in significant impacts.

Mitigation Measures

SCAG Mitigation Measures

See **SMM NOISE-1**.

Project Level Mitigation Measures

See **PMM NOISE-1**.

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, the unknown noise profiles of future aircraft types and their engines and the timeframe for phasing out older aircraft and replacing them with newer aircraft, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to aviation noise to be significant and unavoidable even with implementation of mitigation.

3.14 POPULATION AND HOUSING

This section of the Program Environmental Impact Report (PEIR) describes the existing land use characteristics within the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect population and housing, and analyzes the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.14.1 ENVIRONMENTAL SETTING

3.14.1.1 Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for population, housing, and employment are provided.

Employment: Paid employment consists of full- and part-time employees, including salaried officers and executives of corporations, who were on the payroll in the pay period. Included are employees on sick leave, holidays, and vacations; not included are proprietors and partners of unincorporated businesses.

Household: A household consists of all the people who occupy a housing unit. A household includes the related family members and all the unrelated people, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated people sharing a housing unit such as partners or roomers, is also counted as a household.

Householder: The householder refers to the person (or one of the people) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly the householder may be either party. The person designated as the householder is the “reference person” to whom the relationship of all other household members, if any, is recorded.

Housing: As used in this analysis, *housing* is data available from the U.S. Census for the SCAG region for the period of 2000 through 2035. Housing is a general term used to describe multiple housing units.

Housing Unit: A house, an apartment or other group of rooms, or a single room are regarded as housing units when occupied or intended for occupancy as separate living quarters. Different jurisdictions have slightly different definitions of what constitutes a housing unit.

Population: As used in this analysis, *population* is data available from the U.S. Census for the SCAG region for the period of 1900 through 2010, with population projections available from SCAG in 2019 for the projected population growth through 2045.

Regional Housing Needs Assessment (RHNA): As discussed in more detail in the Regulatory Background, the RHNA quantifies the need for housing within each jurisdiction during specified planning periods. The RHNA is mandated by state housing law as part of the periodic process of updating local housing elements of the General Plan. The California Department of Housing and Community Development (HCD) provides a regional determination of housing need, and then SCAG allocates this housing need to jurisdictions in the region. The intention of the RHNA process is to create a better balance of jobs and housing in communities, ensure the availability of decent affordable housing for all income groups, and achieve sustainability through long-term strategic land use planning.

3.14.1.2. Existing Population, Housing, and Employment

Population

The six-county SCAG region encompasses 38,000 square miles in area (almost 25 million acres) and is home to approximately 19 million people as of 2019, making it the second most populous metropolitan region in the U.S.¹ Approximately 6 percent of the national population lives in the SCAG region, and for over half a century the region has been home to approximately half the population of California. At the turn of the 20th Century, the SCAG region comprised less than 1 percent of the U.S. population and less than 30 percent of the state population. By 1960, the region grew to represent nearly 5 percent of the national population.² Historically, population within the SCAG region was heavily influenced by net migration, or the difference between people coming into an area (immigrating) and the people leaving an area (emigrating) as opposed to the increase of births over deaths. However, since about 2000, net migration has slowed and has resulted in slower population growth across the SCAG region. The population growth within the SCAG region is similar to that of California and the U.S. as a whole.

As shown below in **Table 3.14-1, Population Growth in the SCAG Region (2000-2019 for Incorporated Cities and Unincorporated Areas)**, existing populations have increased in every county within the SCAG region from 2000 to 2019. However, while increasing in population, the SCAG region's overall growth rate is slowing. The change is largely attributed to four key factors: (1) lower birth rates (fewer children),

¹ American FactFinder. 2017. *2017 Population Estimates*. Available online at: <https://factfinder.census.gov/faces/nav/jsf/pages/index.xhtml>, accessed January 29, 2018.

² Southern California Association of Governments (SCAG). 2016. *2016 RTP/SCS Program Draft Environmental Impact Report*.

(2) lower immigration rates (fewer immigrants), (3) aging population (fewer at childbearing age), and (4) high housing costs (lack of housing).³

Table 3.14-1
Population Growth in the SCAG Region
(2000-2019 for Incorporated Cities and Unincorporated Areas)

County	Population 2000 ¹	Population 2010 ²	Population 2019 ³	Growth Rate 2000-2010	Growth Rate (2010-2019)
Imperial	142,361	174,528	207,682	22.6%	19%
Los Angeles	9,519,338	9,818,605	10,333,540	3.1%	5.2%
Orange	2,846,289	3,010,232	3,250,121	5.8%	8%
Riverside	1,545,387	2,189,641	2,462,592	41.7%	12.5%
San Bernardino	1,709,434	2,035,210	2,217,205	19.1%	8.9%
Ventura	753,197	823,318	868,622	9.3%	5.5%
SCAG Region	16,516,006	18,051,534	19,339,762	9.3%	7.1%

Sources:

- 1 SCAG. 2016 Draft RTP.SCS. 3.14 Population, Housing, and Employment. Table 3.14.2-3 "Population Growth in the SCAG Region for 2000-2014." Available online at: <http://scagrtpscs.net/Pages/DRAFT2016PEIR.aspx>, accessed September 3, 2019.
- 2 California Department of Finance (DOF). 2010. E-5 Population and Housing Estimates for Cities, Counties, and the State. January. Available online at: <http://www.dof.ca.gov/Forecasting/Demographics/Estimates/E-5/>, accessed August 30, 2019.
- 3 Southern California Association of Governments (SCAG). 2019. 2019 Local Profiles. Available online at: <https://www.scag.ca.gov/DataAndTools/Pages/LocalProfiles.aspx>, accessed September 3, 2019.

From the 1980s into the 2000s, the region was in a housing and economic boom, which led to increased immigration and household size, and a surge in population growth in all six SCAG counties. When the market slowed, beginning in 2006, growth slowed as well, and from the years 2010-2019, Imperial, Riverside, San Bernardino and Ventura counties all showed a significant decrease in population growth. During the same period, Los Angeles and Orange counties maintained similar growth rates for the years 2010-2019 compared to the years 2000-2010. This is not surprising, as the counties of Los Angeles and Orange contain coastal areas and metropolitan cities, which make them attractive destinations regardless of job and housing creation.

Housing

As shown in **Table 3.14-2, Households in the SCAG Region**, there were approximately 6.2 million households in the SCAG region in 2019, an increase from 2010. More than half of the households in the region are located in Los Angeles County. Unfortunately, California, like many other places in the U.S., is

³ Ibid.

experiencing a housing crisis. At a fundamental level, there is simply not enough housing for everyone who wants to live in the state.

Table 3.14-2
Households in the SCAG Region

County	Number of Households (2010)	Number of Households (2019)
Imperial	79,126	58,000
Los Angeles	3,239,280	3,409,500
Orange	990,019	1,053,500
Riverside	686,260	758,300
San Bernardino	611,618	656,500
Ventura	266,920	276,100
SCAG	5,873,223	6,211,900

Source: SCAG, 2019

Household Income

Median household income in the SCAG region in 2018 varies widely, from \$44,779 in Imperial County (incorporated cities) to \$81,972 in Ventura County (incorporated cities). The county with the second highest median income is Orange County (\$81,851) (incorporated cities). Across the SCAG region, the average income was \$64,597 (incorporated cities). Homeownership rates also vary, from a low of 45.9 percent in Los Angeles County (incorporated cities) to a high of 65 percent in Riverside County (incorporated cities). The average homeownership rate in the SCAG region is 57.9 percent (incorporated cities).⁴

Household Size

Household size in the SCAG region (Incorporated Cities) increased between 2000 and 2018, from 3.16 persons per household to 3.2 persons per household, or an increase of the equivalent of an average of 0.04 persons per household (**Table 3.14-3, Household Size in the SCAG Region [Persons]**). In descending order, San Bernardino, Riverside, Imperial, and Orange Counties' household size grew, while Ventura and Los Angeles Counties' household size declined between 2000 and 2018.

⁴ Southern California Association of Governments (SCAG). 2019. *2019 Local Profiles*. Available online at: <https://www.scag.ca.gov/DataAndTools/Pages/LocalProfiles.aspx>, accessed September 3, 2019.

Table 3.14-3
Household Size in the SCAG Region (Persons)

County	2000 ¹	2018 ²	2000–2018 Change
Imperial	3.42	3.6	0.18
Los Angeles	3.14	3.0	-0.14
Orange	3.06	3.1	0.04
Riverside	3.09	3.3	0.21
San Bernardino	3.17	3.3	0.13

Poverty

The U.S. Census Bureau reported 2.5 million people in the SCAG region were living in poverty in 2018, down from 2.9 million people in 2010 (**Table 3.14-4, Poverty Rates in the SCAG Region [1990–2018]**).⁵ The average poverty rate in the SCAG region has remained above the state and national averages since 1990. Imperial County has the highest poverty rate, followed by San Bernardino County, and Los Angeles County, which are above the state and national averages, and then Riverside County which has fallen below the state and national averages in recent years. Orange County and Ventura County have consistently had poverty rates below state and national averages between 1990 and 2018.

⁵ U.S. Census Bureau. 2018. Poverty Status in the Past 12 Months. Available online at: <https://data.census.gov/>, accessed October 29, 2019.

Table 3.14-4
Poverty Rates in the SCAG Region (1990-2018)

County	1990	2000	2010	2018

2 U.S. Census Bureau. 2018. Poverty Status in the Past 12 Months. Available online at: <https://data.census.gov/>, accessed October 29, 2019.

Using U.S. Census Bureau American Community Survey Data, SCAG has identified underserved communities in the SCAG region. See Connect SoCal Technical Report, Environmental Justice, for discussion and analysis of environmental justice communities relative to the Plan. Disadvantaged communities in the SCAG region include census tracts that have been identified by the California Environmental Protection Agency (Cal/EPA) as Disadvantaged Communities (DACs) based on the requirements set forth in SB 535, which seek to identify areas disproportionately burdened by and vulnerable to multiple sources of pollution. Environmental justice areas of concern include those areas where there are issues of public health, housing, impacts on racial and ethnic minority groups, and environmental impacts.

Note that while socioeconomic issues do not in and of themselves constitute physical environmental impacts, they do have the potential to lead to physical environmental impacts. For example, as gentrification occurs near urban job centers, increased housing costs could outpace income growth leading to households moving toward more affordable suburbs. This would increase commute times, resulting in increases in vehicle miles traveled and air pollution.

Employment

Throughout the SCAG region, jobs are frequently co-located along major transportation intersections and transportation corridors. **Figure 3.14-1, Employment Density in the SCAG Region**, depicts the employment density across the region. Employment trends in Southern California have long followed a “boom and bust” cycle. Much of the 2000s saw a boom of housing development, particularly in the Inland Empire, only to be followed by a bust starting in 2008 which affected employment, particularly in

the housing construction and service sectors. In 2019, there were approximately 8.7 million jobs in the SCAG region (**Table 3.14-5, 2019 Employment by County**). Based on available SCAG data (2019), the economy experienced a net increase in jobs, between 2000 and 2019, for every county in the SCAG region (**Table 3.14-6, Employment Growth from 2000 to 2019**). As of 2019, Imperial County saw the largest relative increase in job generation, growing by 67.1 percent (31,048 jobs), followed by Riverside with 26.2% growth (168,593 jobs). The largest increase in jobs overall occurred in Los Angeles County with nearly 401,695 jobs and in Orange County with more than 336,543 jobs. Overall, the SCAG region gained approximately 1,033,738 jobs (or 13.6 percent) between 2000 and 2019.

**Table 3.14-5
2019 Employment by County**

County	Total County Employment
Imperial	77,348
Los Angeles	4,826,595
Orange	1,765,643
Riverside	812,793
San Bernardino	828,342
Ventura	346,417
SCAG Region	8,657,138

**Table 3.14-6
Employment Growth for 2000 to 2019**

County	2000 (Jobs) ¹	2019 (Jobs) ²	2000- 2019 Growth (Jobs)	Percent Change (2000- 2019)
Imperial	46,300	77,348	31,048	67.1%
Los Angeles	4,424,900	4,826,595	401,695	9.1%
Orange	1,429,100	1,765,643	336,543	23.5%
Riverside	644,200	812,793	168,593	26.2%
San Bernardino	704,000	828,342	124,342	17.7%
Ventura	374,900	346,417	-28,483	-7.6%
SCAG	7,623,400	8,657,138	1,033,738	13.6%

Unemployment

Although unemployment rates declined between 2010 and 2018 for all counties in the SCAG region, rates of unemployment remain slightly above the national and state average (3.7 percent⁶ and 4.1 percent,⁷ respectively, as of August 2019) in Imperial, Los Angeles, and Riverside Counties (**Table 3.14-7, Unemployment Rates**). In 2018, Imperial County had the highest unemployment rate in the SCAG region (18.1 percent), while Orange County had the lowest in the SCAG region (2.9 percent, below the national and state averages). In 2018, the average unemployment rate in the SCAG region was 6.3 percent.

**Table 3.14-7
Unemployment Rates**

County	2000 Unemployment Rate ¹	2010 Unemployment Rate ¹	2018 Unemployment Rate ²
Imperial	17.5%	29.9%	18.1%

Growth Forecasts

In order to develop growth forecasts, SCAG encourages and utilizes the participation and cooperation of all local government partners within the SCAG region. SCAG uses a bottom-up planning process by which all local governments are informed of the Connect SoCal planning process and have clear and adequate opportunities to provide input. Growth forecasts and land use updates for development under the Plan have been developed through this bottom-up local input process, reflecting the following guiding principles approved by SCAG's Regional Council on August 1, 2019 .

⁶ Bureau of Labor Statistics, *The Employment Situation—August 2019*. Available online at: <https://www.bls.gov/news.release/pdf/empsit.pdf>, accessed September 16, 2019.

⁷ State of California Employment Development Department, *California Unemployment rate dips to record low 4.1 percent in July*. Available online at: <https://www.edd.ca.gov/newsroom/unemployment-august-2019.htm>, accessed September 16, 2019.

- Principle #1: The draft plan forecast for Connect SoCal shall be adopted by the Regional Council at the jurisdictional level, thus directly reflecting the employment, population and household growth projections derived from local input and previously reviewed and approved by SCAG's local jurisdictions. The draft plan growth forecast maintains these projected jurisdictional growth totals, meaning further growth is not reallocated from one local jurisdiction to another.
- Principle #2: The draft plan forecast at the Transportation Analysis Zone (TAZ) level is controlled to be within the density ranges of local general plans or input received from local jurisdictional in this most recent round of review.
- Principle #3: For the purpose of determining consistency for California Environmental Quality Act (CEQA) streamlining, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the Plan.
- Principle #4: TAZ level data or any data at a geography smaller than the jurisdiction is included in the draft plan forecast only to conduct the required modeling analytical work and is therefore, only advisory and non-binding as SCAG's sub-jurisdictional forecasts are not formally adopted as part of the Plan.

3.14.2 REGULATORY FRAMEWORK

3.14.2.1 Federal

Federal Uniform Act (URA) (1970)

The Federal Uniform Act (Uniform Relocation Assistance and Real Property Acquisition Policies Act; 42 U.S. Code [USC] 61), passed by Congress in 1970, is a federal law that establishes minimum standards for federally funded programs and projects that require the acquisition of real property (real estate) or displace persons from their homes, businesses, or farms. The Uniform Act's protections and assistance apply to the acquisition, rehabilitation, or demolition of real property for federal or federally funded projects.⁸

Department of Housing and Urban Development Act

The Department of Housing and Urban Development Act created the U.S. Department of Housing and Urban Development (HUD) as a Cabinet-level agency. HUD is responsible for national policy and programs that address housing needs in the U.S. HUD is responsible for enforcing fair housing laws. HUD plays a major role in supporting homeownership by underwriting homeownership for lower- and moderate-income families through its mortgage insurance programs.⁹

Fixing America's Transportation Act (FAST)

The Fixing America's Surface Transportation (FAST) Act (Pub. L. No. 114-94), enacted in 2015, builds on the changes to federal transportation planning law made by MAP-21.¹⁰ It was the first long-term surface transportation authorization enacted in a decade that provides long-term funding certainty for surface transportation. The FAST Act authorizes \$305 billion over fiscal years 2016 through 2020 for highway improvements, highway and motor vehicle safety, public transportation, motor carrier safety, hazardous materials safety, rail, and research, technology, and statistics programs. The FAST Act maintains the focus on safety, keeps intact the established structure of the various highway-related programs, continues

efforts to streamline project delivery, and provides a dedicated source of federal dollars for freight projects.¹¹

Federal Planning Regulations, Title 23 CFR 450.322(e)

This federal regulation requires that in development of the regional transportation plan that the related local Metropolitan Planning Organization (MPO) validate data utilized in preparing other existing modal plans (such as transit providers long range plans) for providing input to the regional transportation plan. In updating the plan, the MPO shall base the update on the latest available estimates and assumptions for population, land use, travel, employment, congestion, and economic activity. The MPO shall approve transportation plan contents and supporting analyses produced by a transportation plan update.¹²

3.14.2.2 State

SB 375- The Sustainable Communities and Climate Protection Act of 2008

Senate Bill 375 (SB 375) focuses on aligning transportation, housing, and other land uses to achieve regional greenhouse gas (GHG) emission reduction targets established under the California Global Warming Solutions Act, also known as Assembly Bill No. 32 (AB 32). SB 375 requires California MPOs to develop a Sustainable Communities Strategy (SCS) as part of its Regional Transportation Plan (RTP), with the purposes of identifying policies and strategies to reduce per capita passenger vehicle-generated GHG emissions. In application, the SCS must identify the general location of land uses, residential densities, and building intensities within the region; identify areas within the region sufficient to house all the population of the region; identify areas within the region sufficient to house an eight-year projection of the regional housing need; identify a transportation network to service the regional transportation needs; gather and consider the best practically available scientific information regarding resources areas and farmland in the region; consider the state housing goals; set forth a forecasted development pattern for the region; and allow the regional transportation plan to comply with the federal Clean Air Act (CAA) of 1970 (42 USC. § 7401 *et seq.*) (Gov. Code, § 65080, subd. (b)(F)(2)(B)), of which, when integrated with the transportation network, and other transportation measures and policies will reduce the GHG from automobiles and light duty trucks to achieve, if there is a reasonable way to do so, the GHG emission reduction targets approved by the California Air Resources Board (ARB). If the SCS does not achieve the

GHG emission targets set by ARB, an Alternative Planning Strategy (APS) must be developed to demonstrate how the targets could be achieved.

SB 375 also imposes a number of new requirements on the regional housing needs process. Prior to SB 375, the regional transportation plan and regional housing needs processes were not required to be coordinated. SB 375 now synchronizes the schedules of the RHNA (as discussed in more detail below) and RTP processes every eight years. The RHNA also allocates housing units within the region consistent with the development pattern included in the SCS.

Regional Housing Needs Assessment

The California Legislature developed the RHNA process (Govt. Code § 65580 *et seq.*) in 1977 to address the serious affordable housing shortage in California. The California Department of Housing and Community Development (HCD) in consultation with each council of governments determines each region's existing and projected housing need.¹³ HCD must meet and consult with each council of governments, including SCAG, regarding the assumptions and methodology to be used by HCD to determine the region's housing need.¹⁴ HCD's determination is based on population projected produced by the Department of Finance and regional population forecasts used in preparing regional transportation plans.¹⁵

In consultation with HCD, each council of governments must develop and adopt a methodology for distributing the existing and projected regional housing need to cities, counties, and cities and counties within the region.¹⁶ The council of government then adopts a final regional housing need plan that allocates a share of the regional housing need to each city, county, or city and county.¹⁷

Local government must address their allocated share of housing needs of all economic segments of the community through their housing elements.¹⁸ Local governments must adopt a housing element as part of their general plan. Unlike the rest of the general plan, where updates sometimes occur at intervals of 20 years or longer, under previous law the housing element was required to be updated as frequently as needed and no less than every five years. Under SB 375, this period has been lengthened to eight years and timed so that the housing element period begins no less than 18 months after adoption of the

¹³ Govt. Code § 65584(b).

¹⁴ Govt. Code § 65584.01(b).

¹⁵ Govt. Code § 65584.01(a).

¹⁶ Govt. Code § 65584.04.

¹⁷ Govt. Code § 65584(b).

¹⁸ California Legislative Information. *Article 10.6. Housing Elements [65580 – 65589.11]*.

regional transportation plan, to encourage closer coordination between housing and transportation planning. SB 375 also changes the implementation schedule required in each housing element. Previous law required the housing element to contain a program which set forth a five-year schedule to implement the goals and objectives of the housing element. The new law instead requires this schedule of actions to occur during the eight-year housing element planning period, and requires each action have a timetable for implementation.¹⁹

The purpose of the housing element is to identify the community's housing needs, state the community's goals and objectives with regard to housing production, rehabilitation, and conservation to meet those needs. In addition, the housing element defines the related policies and programs that the community will implement in order to achieve the stated goals and objectives. This would be accomplished through the allocation of regional housing needs consistent with the Plan.²⁰

In prior cycles, factors such as household growth and household income distribution were the primary factors considered in determining a jurisdiction's RHNA allocation. For the 6th RHNA cycle, SCAG plans to consider other factors in addition to household growth. These factors include transit accessibility, job accessibility, and indicators that influence a community's environmental, educational, and economic resource accessibility.

As discussed above in the discussion of SB 375, state law requires preparation of a RHNA allocation plan every eight years. SCAG's 6th Cycle RHNA quantifies the regional need for housing and then allocates the regional need to each jurisdiction for a planning period between October 2021 and October 2029. Local jurisdictions are required to plan and zone to accommodate their respective RHNA allocation (housing units) by income categories through the process of updating the Housing Elements of their General Plans. The RHNA does not necessarily encourage or promote growth, but rather allows communities to anticipate growth and address existing need, so that they can grow in ways that enhance quality of life, improve access to jobs, transportation and housing, and not adversely impact the environment.²¹

This region's 6th Cycle RHNA allocation plan consists of two measurements of housing need: (1) existing need and (2) future need for very-low income, low-income, moderate, and above-moderate income categories.

¹⁹ California Legislative Information. *Senate Bill No. 375*.

²⁰ California Legislative Information. *Article 10.6. Housing Elements [65580-65589.11], Section 65580*.

²¹ SCAG. *Regional Housing Needs Assessment (RHNA) & Housing*. Available online at: <https://www.scag.ca.gov/programs/Pages/Housing.aspx>, accessed August 29, 2019.

The existing need assessment is based on data from the most recent US Census to measure ways in which the housing market is not meeting the needs of current residents. These variables include the number of households paying more than 30 percent of their income for housing, as well as overcrowding.

The future need for housing is determined primarily by the forecasted growth in households in a community, based on historical growth patterns, job creation, household formation rates, and other factors to estimate how many households will be added to each community over the projection period. The housing need for new households is then adjusted to account for an ideal level of vacancy needed to promote housing choice, maintain price competition, and encourage acceptable levels of housing upkeep and repair. The RHNA also accounts for units expected to be lost due to demolition, natural disaster, or conversion to non-housing uses. The sum of these factors including household growth, vacancy need and replacement need form the “projected need” assigned to each community. Per SB 375, the projected need’s portion of the 6th Cycle RHNA will be consistent with the Connect SoCal for the comparable period.

SCAG’s RHNA allocation plan considers how each jurisdiction might grow in ways that will decrease the over-concentration of low-income households. The need for new housing is distributed among income groups so that each community moves closer to the county income distribution.

Consistent with the state housing law, the primary objectives the 6th Cycle RHNA allocation plan are:

1. Increase the housing supply and mix of housing types, tenure and affordability within each region in an equitable manner
2. Promote infill development and socioeconomic equity, the projection of environmental and agricultural resources, and the encouragement of efficient development patterns
3. Promote an improved interregional relationship between jobs and housing
4. Allocating a lower proportion of housing need in income categories in jurisdictions that have a disproportionately high share in comparison to the county distribution
5. Affirmatively furthering fair housing

On October 15, 2019, SCAG received the Final Regional Determination from HCD.²² On November 7, 2019, SCAG Regional Council approved a Draft RHNA Allocation Methodology for HCD’s review. The Regional Council is scheduled to approve the Final RHNA Methodology in March 2020 and release the Draft RHNA Allocation by jurisdictions prior to adopt the Connect SoCal in April 2020.

²² HCD issued its final RHNA determination for the SCAG region of 1.34 million total housing units among four income categories for SCAG to distribute among its jurisdictions from 2021-2029. As discussed above, this total need includes both existing need and projected need.

As discussed above, under Government Code Section 65080(b)(2)(B)(iii), the SCS element of Connect SoCal must identify areas within the region sufficient to house an eight-year projection of SCAG's regional housing need. SCAG's regional housing need for the 6th Cycle RHNA as determined by HCD captures existing and projected need. As such, the SCS must accommodate the projected need portion of the 6th Cycle RHNA. SCAG satisfies this requirement by using local input (including projected households) which projects growth at the jurisdictional level in the SCS as further discussed in the Plan's Demographics and Growth Forecast Technical Report. Therefore, the projected housing need's portion of the 6th Cycle RHNA is consistent with Connect SoCal for the RHNA planning period (October 2021 to October 2029) per SB 375 requirements. In addition, while the existing housing need portion of the 6th cycle RHNA is not included in the SCS growth forecast, the existing need portion will be allocated in a manner to support the goals of Connect SoCal through the RHNA process.²³

Senate Bill No. 2

SB 2 (Chapter 633, Statutes of 2007) strengthens state housing element law (Government Code Section 65583) by ensuring that every jurisdiction identifies potential sites where new emergency shelters can be located without discretionary review by the local government. It also increases protections for providers seeking to open a new emergency shelter, transitional housing or supportive housing development, by limiting the instances in which local governments can deny such developments.²⁴

California Relocation Assistance Act

The California Relocation Assistance Act (Government Code Section 7260 *et seq.*) establishes uniform policies to provide for the fair and equitable treatment of people displaced from their homes or businesses as a direct result of state and/or local government projects or programs. The California Relocation Assistance Act requires that comparable replacement housing be made available to displaced persons within a reasonable period of time prior to the displacement. Displaced persons or businesses are assured payment for their acquired property at fair market value. Relocation assistance in the form of

²³ Connect SoCal and this PEIR address reasonably foreseeable households in the SCAG region. The population and households are distributed in accordance with the growth forecast as described in Demographics and Growth Forecast Technical Report in the Plan. The RHNA is a separate planning requirement. It addresses the mandate to plan for housing units to implement planning policies. The difference between households and housing units is that households are occupied housing units. While HCD has issued its final RHNA determination for the SCAG region of 1.34 million total housing units, which includes both existing need and projected need, these units do not translate to households. As discussed above, SCAG has not yet approved the Final RHNA Methodology or developed its RHNA allocation. Furthermore, it is infeasible to predict if/when and how such housing units would be incorporated into housing elements and whether the housing elements will be implemented and converted to forecast growth.

²⁴ California Legislative Information. *Senate Bill No. 2*.

advisory assistance and financial benefits would be provided at the local level. This includes aid in finding a new home location, payments to help cover moving costs, and additional payments for certain other costs.

Senate Bill 535: California Global Warming Solutions Act of 2006: Greenhouse Gas Reduction Fund (GGRF)

SB 535 was signed into law by Governor Brown on September 30, 2012. This bill sets aside cap and trade revenues to mitigate climate change in disadvantaged communities. The California EPA is the responsible agency for identifying disadvantaged communities for potential investment. The California Department of Finance must allocate 25 percent of the available moneys in the GGRF to projects that benefit disadvantaged communities and a minimum of 10 percent to projects located within disadvantaged communities.²⁵

Homeowners and Private Property Protection Act

In 2008, California voters approved Proposition 99, the Homeowners and Private Property Protection Act, which amended the California Constitution so that local governments are prohibited from using eminent domain authority to acquire an owner-occupied residence for the purposes of conveying it to a private recipient, with limited exceptions. Proposition 99 applies only to owner-occupied residences but cities may still use eminent domain authority to convey multi-family and non-residential property to other private parties.²⁶

3.14.2.3 Local

Housing Elements of County and City General Plans

The most comprehensive and detailed land use planning, including that for population, housing, and employment in the SCAG region, is provided by city and county General Plans, which local governments are required by state law to prepare as a guide for future development. As noted above, state law mandates that local governments adequately plan to meet the existing and projected housing needs of all economic segments of the community as discussed above. The housing element of a general plan illustrates strategies for future development and improvements to the area's housing stock, with specific goals for the short-term (see **Table 3.14-9, Summary of Housing Goals by County in the SCAG Region**). The housing element often includes programs to improve neighborhoods, provide adequate housing

²⁵ California Legislative Information. *Senate Bill No. 535*.

Local Coastal Programs

The Local Coastal Programs (LCPs) are local planning tools to monitor development and permitting in coastal areas. There are three counties and 27 cities within the SCAG region with coastlines that are mandated to prepare LCPs as a result of the California Coastal Act of 1976.²⁷ The LCPs prepared by these local jurisdictions may contain goals and policies related to housing type, location, and affordability.²⁸

3.14.3 ENVIRONMENTAL IMPACTS

3.14.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the Plan would result in significant impacts to the region's population and housing resources, if either of the following would occur:

- Induce substantial unplanned population growth to areas of the region either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., by extending roads and other infrastructure); and/or
- Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

3.14.3.2 Methodology

The methodology for determining the significance of population and housing impacts compares the existing conditions to future (2045) conditions, as required in CEQA Section 15126.2(a).

The Plan includes transportation projects as well as land use and transportation strategies that may influence population, housing and employment growth and distribution. Forecasted land use patterns are developed to accommodate growth projections by identifying distribution and anticipated land uses that may allow for well-planned growth. SCAG holds growth projection numbers constant at the county and regional level, meaning that as the distribution of population, housing and employment changes, the total numbers remain constant. In sum, the Plan includes a growth forecast, land use and transportation strategies, and projected land use patterns which are integrated with the transportation network and

²⁷ California Legislative Information. *AB-976*.

²⁸ California Coastal Commission. *Local Coastal Programs*. Available online at: <https://www.coastal.ca.gov/lcps.html>, accessed August 29, 2019.

investments (see Section 2.0, Project Description). This PEIR evaluates a range of feasible alternatives that consider the possibility of different growth patterns (see **Chapter 4.0, Alternatives**).

Although land use development would occur with or without the Plan, Connect SoCal has the potential to influence growth distribution patterns throughout the region, partially by encouraging new growth in existing urbanized areas and high-quality transit areas (HQTAs). To address this, the analysis in the PEIR covered overall impacts of transportation projects and anticipated land development patterns described in the Plan.

Transportation projects in the Plan were reviewed to identify those that may involve right-of-way (ROW) acquisition and the potential for displacement of homes and businesses. These projects that might require acquisition of right of way (ROW) were analyzed with a 500-foot buffer with a geographic information system (GIS) to generally identify locations within areas of residential land use that had the potential for large displacement of existing homes and businesses.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.14.3.3 Impacts and Mitigation Measures

Impact POP-1 Induce substantial unplanned population growth to areas of the region either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., by extending roads and other infrastructure).

Significant and Unavoidable Impact – Mitigation Required.

The Plan includes land use strategies and transportation projects and supporting strategies that generally encourage population growth in urbanized areas and HQTAs. Land use strategies in the Plan include focusing growth near destinations and mobility options, promoting diverse housing choices, leveraging technology innovations, supporting implementation of sustainability policies, and promoting a green region. Implementation of these strategies may result in increased population densities in some urban

Due to the Plan's land use strategies that focus on compact development, there is potential to induce growth in some areas of the region although overall the Plan accommodates anticipated growth rather than inducing growth.

Transportation strategies included in the Plan such as TSM and complete streets would support increased density in existing urban areas by facilitating travel and would not be expected to induce population growth as these projects are growth accommodating and generally are aimed at improving the existing transportation networks.

Transportation projects such as new and expanded light and heavy rail projects, while not adding new homes or businesses directly, have the potential to create demand for new development around transit stations. However, many communities foresee these types of development, and plan for them accordingly.

Generally, most jurisdictions have started planning for this increase in density in urban areas and the Plan builds on local input (and is not intended to result in re-designation of areas where such re-designation is not approved by the local agency). However, there remains the potential for the Plan's strategies to influence population growth in areas where local general plans have not yet been updated to reflect such growth. Therefore, implementation of the Plan would have the potential to induce unplanned growth in some areas of the region resulting in a significant impact, requiring mitigation measures.

As discussed in **Section 2.0, Project Description**, as well as earlier in this section, the Plan's population, housing and employment growth forecast includes the projected population distribution that would occur in 2045 if the policies and investments included in the Plan were to be implemented. The growth forecast is based on local input, with a distribution of growth in urbanized areas, and within and around HQTAs, and other minor modifications at a regional policy level. The total SCAG region population is expected to increase by approximately 3.2 million persons by 2045. The land use development pattern of the Plan assumes a significant increase in small-lot, single-family, and multi-family housing that is expected to mainly occur in infill locations near transit infrastructure within HQTAs, including livable corridors²⁹ and neighborhood mobility areas.³⁰ In 2018, 55 percent of total housing units were single-family units and 45 percent were multi-family units. The Plan projects that in 2045, 39 percent of new homes in the SCAG region will be single-family units and 61 percent multi-family units.³¹

²⁹ Most Livable Corridors would be located within HQTAs.

³⁰ Neighborhood mobility areas are conducive to active transportation and include a "complete streets" approach to roadway improvements to encourage replacing single- and multi-occupant automobile use with biking, walking, skateboarding, neighborhood electric vehicles and senior mobility device.

³¹ SCAG modeling SPM Output, September 13, 2019.

In 2045, 27 percent of households are anticipated to be large-lot single-family units, 23 percent small-lot single-family units, 8 percent townhome units, and 42 percent multi-family units.³² Government Code Section 65080(b)(2)(B)(ii) requires that the RTP/SCS must accommodate all the population of the region, including all economic segments of the population, over the course of the planning period of the regional transportation plan. In accordance with requirement, this projected housing mix would help the region accommodate the projected housing needs over the life of the Plan, especially housing at the lower income categories.

As mandated by State Housing Law as part of the periodic (every eight years) process of updating local housing elements of the General Plan, SCAG is responsible for the allocation of regional housing need to jurisdictions in the region. As discussed in the Regulatory Framework above, SCAG is in the process of developing its 6th cycle RHNA Allocation Plan, which is expected to be adopted in 2020. The current RHNA Allocation Plan, which will cover the planning period from October 2021 through October 2029, is planned for adoption by SCAG's governing body, Regional Council, in October 2020.³³ As discussed above, local jurisdictions are required to plan and zone to accommodate their respective RHNA allocation (housing units). Communities may use the RHNA in land use planning, prioritizing local resource allocation, and in deciding how to address identified existing and future housing needs resulting from population, employment, and household growth.³⁴

Implementation of the Plan's land use development pattern would accommodate 48 percent of the region's future household growth and 59 percent of the future employment growth in HQTAs,³⁵ while keeping jurisdictional totals consistent with local input. It moves the region towards more compact, mixed-use development with a variety of housing types leading to more opportunities for walking and biking, more transit use, and shorter auto trips. Additionally, the integrated transportation investments and land use strategies in the Plan would influence economic (jobs) and household growth in some areas, such as HQTAs, and could remove some obstacles to growth in other parts of the region. Specifically, improved accessibility and connectivity potentially gained from transportation investments in the Plan could facilitate population and economic growth in areas of the region that are currently not developed or underdeveloped. Therefore, implementation of the Plan would have a potential to indirectly induce unplanned growth in some areas of the SCAG region, requiring the consideration of mitigation measures.

*Mitigation Measures*SCAG Mitigation Measures

- SMM-POP-1:** SCAG shall promote the Sustainability Program which will provide technical assistance to local jurisdictions that support local planning and implementation of the Connect SoCal Plan. The program recognizes sustainable solutions to local growth challenges and will result in local plans that promote sustainability through the integration of transportation and land use. For more information please visit: <http://sustain.scag.ca.gov/Documents/Sustainable%20Communities%20Program%20Guidelines.pdf>.
- SMM-POP-2:** SCAG shall provide technical assistance to local governments, transit agencies and developers within the region to build housing capacity to compete in the statewide Affordable Housing Sustainable Communities (AHSC) grants program. The AHSC program is one of the few state funding opportunities to address housing shortages within the state. For more information please visit: <http://ahsc.scag.ca.gov/Pages/Home.aspx>.
- SMM-POP-3:** SCAG shall host summits that addresses the housing crisis and provides solutions to build more housing. Examples include the 2016 Housing Summit (<http://www.scag.ca.gov/SiteAssets/HousingSummit/index.html>) and the Eighth Annual Economic Summit (<https://www.scag.ca.gov/calendar/Pages/8thEconomicSummit.aspx>).
- SMM-POP-4:** SCAG shall continue to produce the biennial Local Profile reports for all member jurisdictions in the SCAG region for the purpose of data and information sharing. The Local Profiles reports provide a variety of demographic, economic, education, housing, and transportation information that local jurisdictions can utilize like project and program planning. For more information about the most recently release 2019 Local Profiles, please visit: <http://www.scag.ca.gov/DataAndTools/Pages/LocalProfiles.aspx>.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and

feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts to induce unplanned growth could be significant and unavoidable even with implementation of mitigation.

Impact POP-2 Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

Significant and Unavoidable Impact – Mitigation Required.

The construction of transportation projects that require expansion of existing or designation of new ROWs have the potential to result in the displacement of existing people and housing, necessitating the construction of replacement housing, thereby constituting a potentially significant impact. In general, transportation projects included in the Plan would attempt to use existing ROWs to the maximum extent feasible. However, the development of some highway, arterial, transit and rail projects included in the Plan would result in the disturbance and/or loss of residential and business uses. Connect SoCal includes system expansion projects, such as new freeway lane miles and new transit track miles, which have the potential to result in the loss of land currently used for residential and business purposes. In past regional transportation plans, SCAG has envisioned a system of truck-only lanes extending from the San Pedro Bay Ports to downtown Los Angeles along the I-710, connecting to an east-west segment, and finally reaching the I-15 in San Bernardino County (the East-West Freight Corridor). However, in March 2018, Metro Board of Directors selected Alternative 5C as the Locally Preferred Alternative for the I-710 Corridor project. This alternative reduced the extent of the truck-only lanes of the project, terminating at Del Amo Boulevard, south of SR-91 and well short of downtown Los Angeles connection to the East-West Freight Corridor along SR-60. Overall, the I-710 corridor project would add one lane in each direction between Long Beach and the SR-60 Freeway.³⁶ Based on analysis by Metro and Caltrans, Alternative 5C would acquire 109 homes and 158 businesses to expand the freeway, resulting in the displacement of an estimated 436 people.³⁷ Additional goods movement projects included in the Plan, such as grade separations, also have the potential to displace homes or businesses, as many of the areas where grade separations are proposed would be in developed urban areas.

³⁶ Metro The Source. *710 project OK'd but widening deferred*. March 1, 2018. Available online at: <https://thesource.metro.net/2018/03/01/board-approves-alternative-for-710-but-defers-decision-on-widening/>, accessed October 28, 2019.

³⁷ Los Angeles Times. *Metro staff support a \$6-billion widening of the 710 Freeway*. February 13, 2018. Available online at: <https://www.latimes.com/local/lanow/la-me-710-freeway-south-20180213-story.html>, accessed October 28, 2019.

Geographic information systems (GIS) was used to analyze where major freeway, rail, and transit projects, such as those described above, would intersect areas used for residential development. A 500-foot potential impact zone was drawn around the freeway, rail and transit projects in the Plan to compute the number of acres that could potentially be affected by the construction and operation of major transportation projects in the Plan.

Table 3.14-10, Potential Displacement of Existing Residential and Commercial Land Uses (in Acres), shows the results of the analysis with the potential acreage of these affected areas by county.

Displacement of housing was assessed by evaluating the location of major transportation projects in relation to surrounding land uses and community development. Highway and transit/rail extensions and major interchange projects were assumed to have a higher potential to disrupt or divide existing communities since they would involve the creation of new roadways. Highway widening and other projects along established transportation rights-of-way were assumed to have a lower potential to divide or disrupt existing communities and neighborhoods. As shown in the table, a total of 20,138 homes or businesses could be affected by the Plan's transportation projects. The analysis is based on general descriptions of transportation projects listed in the Plan and is regional and programmatic in nature.

**Table 3.14-10
Potential Displacement of Existing Residential and Commercial Land Uses (in Acres)**

Land Use	County						Total
	Imperial	Los Angeles	Orange	Riverside	San Bernardino	Ventura	
Commercial and services	64	1,369	635	821	874	532	4,295
General office	6	468	269	284	359	130	1,516
Industrial	3	2,203	208	719	570	193	3,895
Mixed commercial and industrial	-	8	0.7	131	30	7	179
Mixed residential	-	111	-	5	34	11	160

Multi-family residential	3	697	391	389	222	121	1,823
Rural residential	-	208	-	301	192	0.5	702
Single-family residential	35	3,258	1,018	983	880	260	6,434
Total	123	8,716	2,662	3,890	3,307	1,441	20,138

Source: SCAG, 2019

In total, the Plan includes approximately 6,346 new lane miles including freeways, toll roads, major and minor arterials, collectors, high-occupancy toll (HOT), and high-occupancy vehicle (HOV) lanes.³⁸ These transportation facilities including freeways, toll roads, major and minor arterials, collectors, high-occupancy toll (HOT), and high-occupancy vehicle (HOV) lanes could displace homes and businesses in the region, constituting a significant impact requiring the consideration of mitigation measures.

Communities may be affected by the implementation of land use strategies included in Connect SoCal, that may influence infill development with the potential for displacement of substantial amounts of existing housing necessitating the construction of replacement housing elsewhere. The Plan includes land use strategies that would target the region's growth in the next 25 years into HQTAs, urban areas, and more walkable, mixed-use communities. Supported by other public amenities and transit services, housing in these areas tends to command higher premiums and may be attractive to more affluent residents and unaffordable to current residents in these areas. This phenomenon contributes to gentrification and displacement³⁹ that has occurred in parts of Los Angeles in recent years, including Hollywood, Venice, Echo Park, and Koreatown. As a result, existing housing in some communities in the region may be displaced and replaced with higher density housing, in particular within HQTAs. The proposed land use patterns are anticipated to accommodate 48 percent of the region's future household growth in HQTAs.⁴⁰

As local governments seek to provide the region's population with housing and jobs in areas with active transportation opportunities or transit amenities, it is anticipated that changes would occur in existing communities. As such, the potential for "gentrification," or the displacement of lower-income residents, could occur if new development brings higher-income residents into a neighborhood. Neighborhood residents in areas of low income and/or enclaves of marginalized minorities may not benefit from planned transit investment, stations, and other amenities (e.g., walkways and bikeways) that come with this new neighborhood revitalization. More affluent and less diverse residents have the potential to displace them because new development near transit areas could be popular and unaffordable. Hence, the potential to directly or indirectly induce substantial population growth and displace a community in such an area could occur.

Concerns about indirect displacement of people have been raised regionwide, even where no changes to land use designations or zoning are planned. The rising cost of housing is currently a concern throughout much of the SCAG region and is reflective of the shortage of housing and stagnant incomes. The Los

³⁸ Southern California Association of Governments, 2019

³⁹ Southern California Association of Governments, Connect SoCal, 2019 p. 54.

⁴⁰ SCAG modeling, 2019.

Angeles-Long Beach-Anaheim metro area is considered the most cost-burdened housing market in the nation with 46 percent of renters and owners being cost burdened. As set forth by the Department of Housing and Urban Development, those who spend between 30 to 49 percent of their income on housing costs are considered cost-burdened.⁴¹ As population growth continues to outpace the production of housing units, the existing supply of housing is in higher demand which leads to higher rents/prices. This occurrence may result in displacement of renters and the need for people to move from their present location to an area further from their jobs. But there is no substantial evidence that there is a reasonable method to predict how many people may potentially be displaced over the Plan horizon. Additionally, there is no industry standard methodology available to forecast transportation, air, noise or other impacts associated with people who relocate as result of pricing pressures.

Local jurisdictions, including the City of Los Angeles, are evaluating and implementing responses to help relieve pressures on housing supply (e.g., Affordable Housing Linkage Fee, Accessory Dwelling Units Ordinance, Unapproved Dwelling Unit Ordinance, etc.). As properties are redeveloped, there could be temporary displacement of housing units due to the separation of time between removal and replacement of housing. This impact would be temporary, is expected to be spread over the timeframe of the Plan and would be offset by overall increases in housing development under the Plan.

Displacement of low-income renters is also a concern but it is generally a social and economic impact, which is not an impact analyzed under CEQA unless it results in an indirect physical impact.⁴² An impact from displacement and/or gentrification is only an impact under CEQA if it results in a physical impact to the environment. As identified in Appendix G, those physical impacts could be from construction of new housing. It may also be from transportation or other impacts related to people driving longer distances. As noted above, there is currently no methodology for estimating the number of people who would relocate and identifying where they would relocate to.

In conclusion, despite the proposed land use strategies that could influence more housing development in urbanized areas, the Plan would have the potential to displace substantial amounts of existing housing, necessitating the construction or replacement of housing elsewhere, requiring the consideration of mitigation measures.

⁴¹ Long Beach Post. *Harvard: LA-Long Beach-Anaheim metro is most cost-burdened housing market in the nation.* Available online at: <https://lbpost.com/longbeachize/addison-harvard-metro-housing-cost-burdened-2019>, accessed October 28, 2019.

Mitigation Measures

SCAG Level Mitigation Measure

See **SMM-POP-4**.

SMM-POP-5: SCAG shall assist cities to identify funding and financing opportunities and potential partnerships for public infrastructure improvements for transit-oriented development and other smart growth projects.

Project Level Mitigation Measures

PMM-POP-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce the displacement of existing housing, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Evaluate alternate route alignments and transportation facilities that minimize the displacement of homes and businesses. Use an iterative design and impact analysis where impacts to homes or businesses are involved to minimize the potential of impacts on housing and displacement of people.
- b) Prioritize the use existing ROWs, wherever feasible.
- c) Develop a construction schedule that minimizes potential neighborhood deterioration from protracted waiting periods between right-of-way acquisition and construction.
- d) Review capacities of available urban infrastructure and augment capacities as needed to accommodate demand in locations where growth is desirable to the local lead Agency and encouraged by the SCS (primarily TPAs, where applicable).
- e) When General Plans and other local land use regulations are amended or updated, use the most recent growth projections and RHNA allocation plan.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts, but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing

regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and SCAG's inability to require project-level mitigation measures, this PEIR finds impacts related to displacement of existing housing to be significant and unavoidable.

3.15 PUBLIC SERVICES

This section of the Program Environmental Impact Report (PEIR) describes the existing public services within the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect public services, and analyzes the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible. Other fire protection considerations are addressed in **Section 3.20, Wildfire**, in addition emergency access is addressed in **Section 3.17, Transportation, Traffic, and Safety**, and emergency response and evacuation plans are addressed in **Section 3.9, Hazards and Hazardous Materials**.

3.15.1 DEFINITIONS

County Offices of Emergency Services (OES): The County OESs provide emergency management and preparedness services to the unincorporated areas of the six counties within the SCAG region. Each OES is responsible for alerting and notifying appropriate agencies when disaster strikes, coordinating all agencies that respond, ensuring resources are available and mobilized in times of disaster, developing plans and procedures for response to and recovery from disasters, and developing and providing preparedness materials for the public. These responders include fire departments, police and sheriff department, hospitals, ambulance services, and transportation agencies. Coordination among public and private agencies within various cities and counties make the most use of all available resources in the event of any emergency. While each city and county has its own security procedures, the policies are generally similar. Mutual Aid agreements between cities, counties, and private organizations help to maximize resources and reduce the human suffering associated with disaster situations.

Federal Emergency Management Agency (FEMA): FEMA is a federal agency that has served America since 1979 to support U.S. citizens and first responders to ensure that the nation works together to build, sustain, and improve its capacity to prepare for, protect against, respond to, recover from, and mitigate all hazards.¹ FEMA coordinates the federal government's role in preparing for, preventing, mitigating the effects of, responding to, and recovering from all domestic disasters, whether natural or man-made, including acts of terror. FEMA is part of the DHS.

Governor’s Office of Emergency Services (Cal OES): Cal OES is the state agency charged with the responsibility to assist local government in preparing for and responding to any type of natural or

¹ Federal Emergency Management Agency. *About the Agency*. Available online at: <http://www.fema.gov/about-agency>, accessed March 27, 2019.

manmade disaster in California. Cal OES protects the lives and property, build capabilities, and supports communities for a resilient California. Cal OES has six goals relevant to public services: (1) anticipate and enhance prevention and detection capabilities to protect the state from all hazards and threats; (2) strengthen California’s ability to plan, prepare for, and provide resources to mitigate the impacts of disasters, emergencies, crimes, and terrorist events; (3) effectively respond to and recover from both human-caused and natural disasters; (4) enhance the administration and delivery of all state and federal funding, and maintain fiscal and program integrity; (5) develop a united and innovative workforce that is trained, experienced, knowledgeable, and ready to adapt and respond; and (6) strengthen capabilities in public safety communication services and technology enhancements.²

Joint Field Office (JFO): A temporary Federal facility established locally to provide a central point for Federal, State, local, and tribal executives with responsibility for incident oversight, direction, and/or assistance to effectively coordinate protection, prevention, preparedness, response, and recovery actions. In the event of multiple incidents, multiple JFOs may be established at the discretion of the Secretary of Homeland Security.

Master Mutual Aid Agreements (MAA): FEMA encourages federal, state, local, and tribal governments to enter into agreements to assist one another. Immediately following the 1994 Northridge earthquake, city and county emergency managers in the CalOES coastal, southern, and inland regions developed a coordinated emergency management concept called the Emergency Managers Mutual Aid (EMMA) system. The purpose of EMMA is to support disaster operations in affected jurisdictions by providing professional emergency management personnel from unaffected areas to support local jurisdictions, Operational Areas, and regional emergency operations during proclaimed emergencies; providing a system, including an organization, information, and forms necessary to coordinate the formal request, reception, assignment, and training of assigned personnel; establishing a structure to maintain this document (the Emergency Managers Mutual Aid Plan) and its procedures; providing for the coordination of training for emergency managers, including Standardized Emergency Management System (SEMS/NIMS) training, emergency management course work, exercises, and disaster response procedures; and promoting professionalism in emergency management.³

² Governor’s Office of Emergency Services. *About Cal OES*. Available online at: <https://www.caloes.ca.gov/Cal-OES-Divisions/About-Cal-OES>, accessed August 20, 2019.

³ Governor’s Office of Emergency Services. 2012. *State of California Emergency Management Mutual Aid Plan*. Available online at: <https://www.caloes.ca.gov/PlanningPreparednessSite/Documents/EMMA%20PlanAnnexes%20A-F,%202012.pdf>, accessed August 20, 2019.

National Incident Management System/Standardized Emergency Management System (NIMS): The NIMS is a tool for states, counties and local jurisdictions to respond to catastrophic events through better communication and coordination. NIMS provides a consistent nationwide template to enable federal, state, local, and tribal governments and private sector and nongovernmental organizations to work together effectively and efficiently to prepare for, prevent, respond to, and recover from domestic incidents, regardless of cause, size, or complexity, including acts of catastrophic terrorism.⁴

National Preparedness System (NPS): The NPS, also a part of FEMA, is a part of NIM. The NPS is intended to be used by individuals, families, communities, the private and nonprofit sectors, faith-based organizations, and local, state, tribal, territorial, insular area, and federal governments to achieve the National Preparedness Goal.⁵

Transportation Management Centers (TMCs): The California Department of Transportation (Caltrans), in conjunction with the California Highway Patrol (CHP), has created TMCs to rapidly detect and respond to incidents while managing the resulting congestion. For the SCAG region, Caltrans Districts 7, 8, 11, and 12 all have TMCs.⁶

Transportation Security Administration (TSA): The TSA is a component of the DHS and is responsible for security of the nation's transportation systems. The TSA is responsible for security at airports in the SCAG region. With state, local, and regional partners, the TSA oversees security for highways, railroads, buses, mass transit systems, and ports.⁷ A vast majority of its resources are dedicated to aviation security and is primarily tasked with screening passengers and baggage.

Unified Coordination Group (UCG): Unified Coordination Group (UCG) is a temporary federal multi-agency coordination center established locally to facilitate field-level domestic incident management activities related to prevention, preparedness, response and recovery when activated by the Secretary of Homeland Security. The JFO provides a central location for coordination of federal, state, local, tribal, nongovernmental and private-sector organizations with primary responsibility for activities associated with threat response and incident support.⁸

United States Coast Guard: The Coast Guard is both a federal law enforcement agency and a military force that operates as part of the DHS in times of peace to enforce the nation's laws at sea, protecting the marine environment, guarding the nation's vast coastlines and ports, and performing vital lifesaving missions. In times of war, or at the direction of the president, the Coast Guard serves as part of the Navy Department, defending the nation against terrorism and foreign threats. Since September 2001, the United States Coast Guard has assumed a dynamic role in protecting major ports. In addition, more than 3,500 volunteer Coast Guard Auxiliary members assist in many Coast Guard mission areas, including Boating Safety and Search and Rescue.⁹

United States Department of Defense (DOD): In the case of a large-scale emergency, the DOD is authorized to provide resources when response and recovery requirements are beyond the capabilities of civilian authorities and these efforts do not interfere with the DOD's core mission or ability to respond to operational contingencies. Requests for Defense Support to Civilian Authorities (DSCA) are made through the local, county, and state authorities as a request for assistance to the federal coordinating official in the appropriate lead federal agency and is normally accompanied by, or submitted after a request from the governor for a disaster declaration from the president. The California National Guard may be activated as part of the DSCA and can provide law enforcement support, crisis management, and consequence management services. Activation of the National Guard for local support during emergencies is done by the governor via CalOES.¹⁰

United States Department of Homeland Security (DHS): The DHS was established after the September 11, 2001, terrorist attacks as an office to oversee and coordinate a comprehensive national strategy to safeguard the country against terrorism and respond to any future attacks.¹¹ In 2003, DHS formally became a Cabinet-level department to further coordinate and unify national homeland security efforts. The vision of DHS is to ensure a homeland that is safe, secure, and resilient against terrorism and other hazards.

3.15.1.1 ENVIRONMENTAL SETTING

3.15.1.1.1 Fire Protection Services

Fire protection within the SCAG region includes a variety of federal, state, county, city and local fire protection agencies. The primary fire protection services occur at the community level with city and county fire departments and fire protection districts providing this service. Also serving as fire protection services are a variety of volunteer fire companies. In addition, there are fire protection agencies that provide fire protection services within state and federal lands. These agencies include but are not limited to federal fire agencies (Bureau of Land Management, National Park Service, National Forest Service, Department of Defense, etc.), state forestry department, airport and harbor fire departments, and in some instances business sponsored fire departments (i.e., refineries). Each agency provides fire protection services within their own area of responsibilities, but they can call upon other agencies for fire support through mutual aid agreements. Generally, fire departments take proactive and preventative measures to provide fire suppression and emergency response services for all private, institutional, and public facilities within their area of responsibility.

Wildfires

Section 3.20, Wildfire, discusses in more detail the wildfire hazards and existing conditions within the SCAG region, as well as identifies the regulatory framework with respect to regulations that address wildfire and evaluates the significance of impacts that could result from the proposed Plan.

The wildfire season in southern California typically lasts six to eight months from summer to fall (although climate change has resulted in drier, hotter weather and longer fire seasons). Hazards arise from a combination of hot weather, the accumulation of dried vegetation, and low moisture content in the air. These conditions, if coupled with high winds and drought, can compound the risk and potential impact of a fire. Fires are usually classified as either urban fires or wildland fires. However, growth into rural areas has increased the number of people living in heavily-vegetated areas where wildlands meet urban development, also referred to as the wildland-urban interface. This trend is spawning a third classification of fires: the urban wildfire. A fire along the wildland-urban interface (as was seen recently in Ventura and Los Angeles counties with the Woolsey Fire) can result in major losses of property and structures.

Three major factors sustain wildfires and allow for predictions of a given area's potential to burn. These factors include fuel, topography, and weather. Certain areas in and surrounding the region are extremely

vulnerable to fires as a result of dense, grassy vegetation combined with a growing number of structures being built near and within rural areas. CAL FIRE has developed maps indicating fire hazard severity zones in each county across California.

Urban Fires

Urban fires occur in developed areas and include structural, chemical, and vehicular-related fires. Structural fires can result from mechanical failures, accidental occurrences, or arson. The building materials used in various structures can limit or be a catalyst for the spread of structural fires. Although structural fires can occur in any developed area, non-sprinklered commercial buildings in downtown areas and dwelling units in lower socio-economic areas appear to be more susceptible to fires, namely due to the age of the structures. Older structures are more susceptible to fire because they were built under older building standards and fire codes, are made from non-fire-resistive construction materials, and do not have internal sprinklers or other fire safety systems.

Urban-Wildland Fire

CAL FIRE has compiled a list of cities with Very High Fire Hazard Severity zones and has developed recommendations to local agencies for proper fire management within those areas. Within the SCAG region, Los Angeles County has 38 cities with such zones, Riverside County has 22, Orange County has 20, San Bernardino County has 15 and Ventura County has eight cities that CAL FIRE has recommended establishing Very High Fire Hazard Severity zones.¹

Fire Protection Agencies

Fire suppression is the responsibility of various fire departments and districts, which often also employ paramedics for emergency medical services. The SCAG region has more than 100 county, city, or independent fire entities that provide fire prevention/suppression and emergency services throughout the area. Response times vary amongst the agencies, however urban areas usually maintain a standard around 6-minutes or less while response times in rural areas are around 10 minutes. County service covers unincorporated areas, independent fire districts, and municipalities that contract for fire protection and emergency services.

¹ CAL FIRE. 2019. *Fire Hazard Severity Zones Maps*. Available online at: <https://osfm.fire.ca.gov/divisions/wildfire-prevention-planning-engineering/wildland-hazards-building-codes/fire-hazard-severity-zones-maps/> , accessed August 20, 2019.

Bureau of Land Management

The Bureau of Land Management (BLM) is a federal agency that manages the nation's subsurface mineral resources under the U.S. Department of the Interior. The land and minerals under BLM authority include, but are not limited to, forests, mountains, and rangelands.

BLM operates the Fire and Aviation program which works with state and field offices to provide a fire and aviation management program. BLM provides coordination with state offices to provide effective interagency activities and policy through the National Interagency Fire Center (NIFC) in Boise, Idaho. BLM's fire and aviation program has three organizational levels: (1) the national office which provides leadership and oversight, and develops policy, procedures and budgets for the fire and aviation program; (2) state offices which are responsible for coordinating policies and interagency activities within their state; and (3) field offices which are responsible for on-the-ground fire management and aviation activities, often partnering with other agencies to maximize rapid initial attack.²

BLM plays a primary role in the nation's wildland fire management efforts and undertakes a broad range of activities to protect the public, natural landscape, wildlife habitat, and recreational areas. BLM trains firefighters in fire suppression, preparedness, predictive services, vegetative fuels management, prescribed fire, community assistance and protection, and education.³

National Park Service

The National Park Service (NPS), a federal agency under the U.S. Department of the Interior, helps manage wildland fires in designated National Parks, such as Joshua Tree National Park. The NPS finds wildfires beneficial to ecosystems, but NPS fire staff are trained and equipped to aggressively put out an unwanted fire when it is necessary for resource protection or public safety.⁴

U.S. Forest Service

The National Forest Service (USFS) is a federal agency under the U.S. Department of Agriculture. Similarly, to the National Park Service, the USFS works with other agencies to manage wildland fires that

² U.S. Bureau of Land Management (BLM). *Fire and Aviation Program*. Available online at: <https://www.blm.gov/programs/public-safety-and-fire/fire-and-aviation>, accessed December 17, 2018.

threaten lives, homes, communities, and natural and cultural resources.⁵ The USFS provides assistance with fire protective services in wildland areas, including Angeles National Forest.

California Department of Forestry and Fire Protection (CAL FIRE)

CAL FIRE is an emergency response and resource protection department that protects lives, property, and natural resources from fire; responds to emergencies of all types, and protects and preserves timberlands, wildlands, and urban forests throughout the State of California, through cooperative efforts via contracts and agreements between state, federal, and local agencies to respond to emergencies including wildland and structure fires, earthquakes, floods, hazardous material spills, medical aids, and terrorist attacks.⁶ CAL FIRE provides fire protection services to California's privately-owned wildlands and works in collaboration with counties and local governments to provide emergency services. CAL FIRE responds to medical aids; hazardous material spills; swiftwater rescues; search and rescue missions; civil disturbances; train wrecks; floods; earthquakes and more.⁷

Office of Emergency Services (OES)

The OES leads the Department of the Interior's emergency management efforts. The OES develops guidelines for emergency preparedness, response, recovery and mitigation to natural, man-made and technological disasters. The State of California has its own OES (Cal OES), which allows for similar efforts of emergency management on a relatively smaller scale.

CAL OES has three administrative regions, Inland, Coastal, and Southern. All of the counties within the SCAG region are located within the Southern Region. Cal OES coordinates disaster response between state agencies and local governments, and offers guidance and assistance for emergency preparedness, response and recovery. In addition, Cal OES manages Emergency Operations Centers (EOC) in various counties across the state and assists local governments in developing emergency plans.⁸

SCAG County Agencies

Imperial County

Fire protection in Imperial County is managed by the Imperial County Fire Department and OES. The County Fire Department maintains eight stations; these stations are located in the communities of Heber, Seeley, Ocotillo, Palo Verde, Niland, Winterhaven, and the City of the Imperial. Additionally, it contracts fire service with the cities of Brawley, Calipatria, Holtville, Westmorland, Salton City and Salton Sea Beach. Each County station is staffed with a captain, firefighter, and reserve firefighter, and has at least a Type I engine. Average response times are between 8 and 10 minutes.⁹ In addition, the OES provides emergency management services for the County/Operational Area including its seven cities/towns and special districts.¹⁰ Six cities in the county maintain their own fire departments.¹¹

Los Angeles County

The Los Angeles County Fire Department (LACoFD) serves unincorporated areas of the County as well as 59 cities. In addition to emergency response, the LACoFD also conducts field and business inspections, maintains prevention data systems, reviews new plans and projects, and even serves filming and special events industries. The County is divided into three regions, further split into nine divisions and 22 battalions.¹² Response time goals for LACoFD are five minutes or less for urban areas, 8 minutes for suburban areas, and 12 minutes for rural areas. In addition to the County Fire Department, 20 cities in the County maintain their own fire departments.¹³

Orange County

The Orange County Fire Authority (OCFA) was created in 1995, under a Joint Power Authority established among the cities of Buena Park, Cypress, Dana Point, Irvine, Laguna Hills, Laguna Niguel, Lake Forest, La Palma, Los Alamos, Mission Viejo, Placentia, San Clemente, San Juan Capistrano, Seal beach, Stanton, Tustin, Villa Park, and Yorba Linda to provide fire prevention and emergency services to them and unincorporated areas within the County. The cities of Westminster, Laguna Woods, Rancho

¹³ Ibid.

Santa Margarita, and Aliso Viejo also contract with the OCFA. There are 79 OCFA stations across the County and 12 cities maintain their own departments.^{14,15}

Riverside County

Riverside County contracts with CAL FIRE for management of the Riverside County Fire Department (RCFD). The RCFD operates 94 fire stations across six service areas including 21 cities, although more than half of the stations are located in unincorporated areas. Additionally, the CalFire Riverside Unit serves portions of San Diego and Orange counties, and also operates 18 city fire departments and one community services district (CSD) fire department within Riverside County. The RCFD also assists various cities and communities under mutual and automatic aid agreements.¹⁶

San Bernardino County

The San Bernardino County Fire Department has a service area of more than 19,000 square miles and provides fire services to all 24 incorporated cities. The Fire Department maintains 65 active stations across six divisions and provides emergency response and fire protection and prevention services. The San Bernardino County Fire Department also manages hazardous waste programs, performs inspections and plan reviews, and assists with safety procedures at special events. The department is comprised of more than 1,000 personnel and maintains a variety of equipment such as boats, ambulances, Snow Cats, and a helicopter.¹⁷

Ventura County

The Ventura County Fire Protection District (VCFPD) provides fire prevention and suppression and rescue services. The VCFPD serves Camarillo, Moorpark, Ojai, Port Hueneme, Simi Valley and Thousand Oaks, as well as the unincorporated regions, including 860 square miles of forest reserve. The VCFPD is divided into four battalion areas and operates 31 fire stations across the County. The goal for average

response time for the District is under five minutes in urban areas and under seven minutes in rural areas.¹⁸

3.15.1.2 REGULATORY FRAMEWORK

3.15.1.2.1 Federal

Federal Emergency Management Act (FEMA)

FEMA's mission is to lead the effort to prepare the nation for all hazards and effectively manage federal response and recovery efforts following any national incident. FEMA also initiates proactive mitigation activities, trains first responders, and manages the National Flood Insurance Program and the U.S. Fire Administration.¹⁹

Disaster Mitigation Act of 2000

The Disaster Mitigation Act of 2000 (42 U.S.C. § 5121 note) was signed into law to amend the Robert T. Stafford Disaster Relief Act of 1988 (42 U.S.C. §5121-5207). Among other things, this new legislation reinforces the importance of pre-disaster infrastructure mitigation planning to reduce disaster losses nationwide, and is aimed primarily at the control and streamlining of the administration of federal disaster relief and programs to promote mitigation activities. Some of the major provisions of the Act include:

- funding pre-disaster mitigation activities;
- developing experimental multi-hazard maps to better understand risk;
- establishing state and local government infrastructure mitigation planning requirements;
- defining how states can assume more responsibility in managing the Hazard Mitigation Grant Program (HMGP); and
- adjusting ways in which management costs for projects are funded.

The mitigation planning provisions outlined in Section 322 of the Act establish performance based standards for mitigation plans and requires states to have a public assistance program (Advance Infrastructure Mitigation—AIM) to develop county government plans. The consequence for counties that

¹⁸ Ventura County. 2005. *Draft Environmental Impact Report for Focused General Plan Update*. June. Available online at: <https://www.cityofventura.ca.gov/DocumentCenter/View/2303/Final-EIR-for-the-2005-General-Plan-PDF?bidId=> accessed August 20, 2019.

fail to develop an infrastructure mitigation plan is the chance of a reduced federal share of damage assistance from 75 percent to 25 percent if the damaged facility has been damaged on more than one occasion in the preceding ten-year period by the same type of event.²⁰

3.15.1.2.2 State

California Constitution Article XIII Section 35

Section 35 of Article III of the California Constitution at subdivision (a)(2) provides: “The protection of the public safety is the first responsibility of local government and local officials have an obligation to give priority to the provision of adequate public safety services.” Public safety services include fire protection. Section 35 of Article XIII of the California Constitution was adopted by the voters in 1993 under Proposition 172. Proposition 172 directed the proceeds of a 0.50 percent sales tax to be used exclusively for local public safety services. California Government Code (CGC) Sections 30051-30056 provide rules to implement Proposition 172. Section 30056 provides that cities are not allowed to spend less of their own financial resources on their combined public safety services in any given year compared to the 1992-93 fiscal year. Therefore, an agency is required to use Proposition 172 to supplement its local funds used on fire protection, as well as other public safety services. In *City of Hayward v. Trustee of California State University* (2015) 242 Cal. App. 4th 833, the court found that, Section 35 of Article XIII of the California Constitution requires local agencies to provide fire services and that it is reasonable to conclude that a lead agency will comply with that provision and ensure that public services are provided. (See *City of Hayward v. Trustee of California State University* [2015] 242 Cal. App. 4th 833, 847, stating “the city has a constitutional obligation to provide adequate fire protection services”.)

California Fire Code

Title 24, Part 9 of the California Code of Regulations (CCR) is the California Fire Code. Title 24, Part 9 of the CCR sets forth regulations regarding building standards, fire protection and notification systems, fire protection devices such as fire extinguishers and smoke alarms, high-rise building standards, and fire suppression training. The 2019 California Fire Code is the incorporation of the 2018 International Fire Code of the International Code Council with necessary California amendments. Development under the proposed project would be subject to applicable regulations of the California Fire Code.²¹

²⁰ FEMA. 2000. *Disaster Mitigation Act of 2000*. Available online at: <https://www.fema.gov/media-library-data/20130726-1524-20490-1678/dma2000.txt>, accessed August 20, 2019.

²¹ International Code Council. *2019 California Fire Code, Title 24, Part 9*. Available online at: <https://codes.iccsafe.org/content/CAFC2019>, accessed August 20, 2019.

Title 8 California Code of Regulations Sections 1270 and 6773. In accordance with C.C.R., Title 8 Sections 1270 “Fire Prevention” and 6773 “Fire Protection and Fire Equipment,” the California Occupational Safety and Health Administration (Cal OSHA) has established minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials, fire hose sizing requirements, restrictions on the use of compressed air, access roads, and the testing, maintenance, and use of all firefighting and emergency medical equipment.²²

Title 14 California Code of Regulations Division 1.5. These regulations constitute the basic wildland fire protection standards of the California Board of Forestry. They have been prepared and adopted for the purpose of establishing minimum wildfire protection standards in conjunction with building, construction, and development in state recreation areas. Title 14 regulates that the future design and construction of structures, subdivisions, and developments in a state recreation area shall provide for basic emergency access and perimeter wildfire protection measures.²³

Uniform Fire Code

The Uniform Fire Code (UFC) contains regulations relating to construction, maintenance, and use of buildings. Topics addressed in the code include fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire-safety requirements for new and existing buildings and the surrounding premises.

California Health and Safety Code

State fire regulations are set forth in Sections 13000 *et seq.* of the California Health and Safety Code, which includes regulations for building standards (as set forth in the California Building Code), fire protection and notification systems, fire protection devices, and fire suppression training.²⁴

Mutual Aid Agreements (MAA)

The Emergency Managers Mutual Aid (EMMA) system is a collaborated effort between city and county emergency managers in the OES in the coastal, southern, and inland regions of the state. EMMA provides service in the emergency response and recovery efforts at the Southern Regional Emergency Operations Center (REOC), local Emergency Operations Centers (EOCs), the Disaster Field Office (DFO), and community service centers. The purpose of EMMA is to support disaster operations in affected in affected jurisdictions by providing professional emergency management personnel. In accordance with the Master Mutual Aid Agreement, local and state emergency managers have responded in support of each other under a variety of plans and procedures.²⁵

California Code of Regulations Division 2 Section 16

The State of California passed legislation creating the California Emergency Management Agency (Cal EMA) and authorizing it to prepare a Standard Emergency Management System (SEMS) program, which sets forth measures by which a jurisdiction should handle emergency disasters. Non-compliance with SEMS could result in the State withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster.

Cal EMA serves as the lead state agency for emergency management in the state. Cal EMA coordinates the state response to major emergencies in support of local government. The primary responsibility for emergency management resides with local government. Local jurisdictions first use their own resources and, as they are exhausted, obtain more from neighboring cities and special districts, the county in which they are located, and other counties throughout the state through the statewide mutual aid system. In California, the Standardized Emergency Management System (SEMS) provides the mechanism by which local government requests assistance. Cal EMA serves as the lead agency for mobilizing the state's resources and obtaining federal resources; it also maintains oversight of the state's mutual aid system.²⁶

2018 Strategic Fire Plan for California

Strategic Fire Plans in California have been developed since the 1930s by the Board of Forestry and Fire Protection. The Plan is periodically updated to guide CAL FIRE in providing statewide fire protection of state responsibility areas. The 2018 Plan, an update to the 2010 Plan, reflects the effects of climate change and other environmental changes in the State. The 2018 Plan focuses on fire prevention and suppression, natural resource management, and the collaboration of fire protection and emergency service providers.²⁷

California Vehicle Code 21806 VC

California Vehicle Code 21806 VC states that drivers in California must yield to emergency vehicles when they are using sirens and have at least one visible red light. This is to ensure that emergency vehicles safe and timely access for emergency vehicles as they respond to emergency calls.

3.15.1.2.3 Local

County and City General Plan Safety Elements and Public Services and Facilities Elements

In addition to federal and state regulations, cities and counties in the SCAG region also provide regulatory protection and advisement regarding public safety and associated public services. California law requires that a general plan include seven elements (land use, open space, conservation, housing, circulation, noise, and safety). Many jurisdictions incorporate policies related to public services into the Safety Element. Other jurisdictions choose to prepare a separate (optional) element dealing with public services and facilities issues.

California Code of Regulation Section 65302(g) specifically provides that a city may adopt the county's safety element if the county's element "is sufficiently detailed containing appropriate policies and programs for adoption by a city." The safety element must include methods to reduce the potential risk of fires, floods, earthquakes, landslides, and other hazards. Other locally relevant safety issues, such as emergency response, hazardous materials spills, and crime reduction, may also be included.²⁸ Some local jurisdictions have also incorporated their hazardous waste management plans into their safety elements. In addition, the safety element may be used to establish programs and policies that promote

²⁷ State Board of Forestry and Fire Protection. 2018. *2018 Strategic Fire Plan for California*. Available online at: https://osfm.fire.ca.gov/media/5590/2018-strategic-fire-plan-approved-08_22_18.pdf, accessed August 20, 2019.

²⁸ California Legislative Information. 1965. *ARTICLE 5. Authority for and Scope of General Plan [65300-65303.4]*.

neighborhood, institutional, governmental, and business safety. The safety element must identify and map urban fringe and rural-residential areas that are prone to wildfires, adequate evacuation routes and peak load water supplies to reduce fire hazards. The policies of the safety element form the basis of adopted fire safe ordinances and strategic fire defense system zoning. Several jurisdictions have also adopted a Public Services and Facilities Element that establishes goals, objectives, policies and standards for public services and utilities, including emergency response standards.

The safety elements and public services and facilities elements of the county general plans within the six-county SCAG region establish the following fire protection service standards at a County level:

Imperial County

Fire Response Standards: The Imperial County General Plan does not establish fire response standards for unincorporated areas.²⁹ Incorporated cities within Imperial County have established fire response standards. For instance, the City of El Centro's standard fire response time is approximately 7 to 10 minutes for emergencies and 10 to 15 minutes for non-emergencies.³⁰

Los Angeles County

Fire Response Standards: According to the Safety Element of the Santa Clarita Valley Area Plan, the Los Angeles County Fire Department (LACFD) has adopted a goal of responding to calls in urban areas within five minutes, in suburban areas within eight minutes, and in rural areas within 12 minutes (Policy S3.3.1).³¹ Incorporated cities within Los Angeles County have also established fire response standards.

Orange County

Fire Response Standards: In accordance with the Insurance Services Office (ISO) suggested standards, ultimate fire protection rating shall be maintained by Orange County's General Plan land use categories as follows: (1) ISO 3 for all urban developments including Residential (1C and 1B), Commercial (2A and 2B), Employment (3.0) and Public Facilities (4.0) which are within 5 miles from a fire station and less than 1,000 feet from a hydrant; and (2) ISO 4 for Rural Residential (1A) which are within 5 miles from a fire station and less than 100 feet from a hydrant. For areas greater than 5 miles or 1,000 feet, the ISO

suggested standard is 9. Fire/paramedic facilities shall be sited in locations so as to assure efficient fire rescue and paramedic response for the service area. General criteria for site selection shall include:³²

- Call response time: for 80 percent of the service area, first fire engine to reach the emergency scene within 5 minutes and paramedic to reach the scene within 8 minutes
- Land use compatibility: stations shall be located in commercial or industrial, or open space zones in order to avoid disturbance to residential areas wherever possible
- Street access: stations shall be located adjacent to arterial highways with controlled traffic signalization

Incorporated cities within Orange County have also established fire response standards.

Riverside County

Fire Response Standards: According to the Riverside County Fire Department Strategic Plan 2009-2029, the Riverside County Fire Department considers National Fire Protection Association (NFPA) Standard 1710 as a guideline for fire station location methodology, which calls for an engine company within 4 minutes of travel time to fire incidents and EMS calls, and a full first-alarm group within 8 minutes, all for a minimum of 90 percent of annual incidents.³³ Incorporated cities within Riverside County have also established fire response standards.

San Bernardino County

Fire Response Standards: The San Bernardino County Fire Department established fire response standards for unincorporated areas, depending on service area type. For example, the response goal for urban areas is less than 4 minutes for the first arriving unit and for rural areas the response goal is 10 minutes for the first arriving unit.³⁴ Incorporated cities within San Bernardino County have established fire response standards.

³² OC Development Services. *Orange County General Plan: Chapter V. Public Services & Facilities Element*. Available at: <http://www.ocpublicworks.com/ds/planning/generalplan>, accessed November 5, 2018.

³⁴ San Bernardino County Fire Department. 2009. *Service Level and Deployment Goal Report*.

Ventura County

Fire Response Standards: The Ventura County Fire Protection District’s goal is to maintain an average emergency response time under five minutes in urban areas and under seven minutes in rural areas.³⁵ Incorporated cities within Ventura County have also established fire response standards.

3.15.1.3 ENVIRONMENTAL IMPACTS

3.15.1.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the Connect SoCal Plan would result in significant impacts to fire protection services, if the following could occur:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities, need for new or physically altered fire protection facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.

3.15.1.3.2 Methodology

The methodology for determining the significance of impacts on fire services compares existing conditions to the expected future use of fire service under the Plan. The criteria above were applied to compare current conditions to future 2045 Plan conditions. The analysis of these impacts is programmatic at the regional level.

The need for or deficiency in adequate fire and emergency response services in and of itself is not a CEQA impact, but a social or economic impact. (*City of Hayward v. B'd of Trustees* (2015) 242 Cal.App. 4th 833, 843. In accordance with CEQA, this PEIR analysis focuses on the extent to which the Plan promotes growth patterns resulting in a need for additional fire protection services that results in the construction of new facilities or additions to existing facilities. The impact from that construction and/or facilities operation would result in a potential impact to the environment. An increase in population, by itself, would not increase demand for fire protection services and associated facilities. Fire protection service needs are dependent on various factors, including the size of the service population and the geographic area served, the number and types of calls for service, the characteristics of a project and its surrounding community as well as available existing facilities and staffing in an area. This PEIR, analyzes the potential for the Plan to result in the need for new fire protection service facilities (i.e., fire stations) and

³⁵ Ventura County Planning Division. *Ventura County General Plan: Public Facilities & Services Appendix*. Available at: <https://cdm16255.contentdm.oclc.org/digital/collection/p266301ccp2/id/546>, accessed November 5, 2018.

the associated potential for construction and subsequent operation of such facilities to cause physical environmental impacts.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in **Chapter 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.15.1.3.3 Impacts and Mitigation Measures

Impact PSF-1 Result in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities, need for new or physically altered fire protection facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.

Significant and Unavoidable Impacts - Mitigation Required.

Impacts to fire protection services are associated with the physical impacts that would occur as a result of construction and operation of new facilities. Service ratios and response times are tools jurisdictions use to determine the need for such facilities, but do not necessarily indicate a significant impact under CEQA. The ability to provide adequate fire protection services is dependent on numerous factors including staffing levels, mutual aid agreements, deployment strategies, and technological advances in equipment. In conformance with California Constitution Article XIII Section 35(a)(2), existing policies, procedures, and practices related to fire protection and emergency services, fire departments would maintain acceptable emergency response times through the provision of additional personnel and equipment as needed, as well as potentially constructing new or expanding existing fire and emergency response facilities.

As described above, fire and emergency services in the SCAG region are provided by numerous agencies within multiple jurisdictions. Depending upon the timing, location, and duration of construction activities, several of the proposed projects, including grade crossings, arterials, interchanges, and

auxiliary lanes, as well as development project construction could delay emergency vehicle response times or otherwise disrupt delivery of emergency services.

Each jurisdiction has a methodology for determining appropriate response times, service ratios and needed facilities. As transportation projects and development projects are constructed, depending upon the timing, location, and duration of construction activities, projects, including grade crossings, arterials, interchanges, widenings, HOV and HOT lanes, as well as development projects could result in temporary changes in demand for fire services and fire vehicle response times.

The transportation projects included in the Plan that involve transit, passenger rail, and active transportation are concentrated in urban and suburban areas, including Palm Springs, Riverside, San Bernardino, Anaheim, Irvine, the Los Angeles Basin, the San Gabriel Valley, the San Fernando Valley, Santa Clarita, Palmdale, and Lancaster. As these urban and suburban areas increase in density, additional fire protection and emergency response services and associated facilities would be required to meet emergency response standards. Such increased density in these areas would have the potential to exceed the capacity of existing fire stations to provide adequate response, thus requiring either the expansion of existing stations to accommodate additional equipment and greater number of personnel or the construction of new stations, which are more strategically located and capable of reducing response time within a denser urban pattern of development. In addition, fire protection and emergency response services may need to be able to expand where development occurs in the wildland/urban interface in response to increased wildfire risk.

Construction activities associated with transportation and development projects may temporarily increase demand on fire protection and emergency medical services. Construction activities could potentially expose combustible materials (e.g., wood, plastics, sawdust, coverings, and coatings) to fire risks from machinery and equipment sparks, exposed electrical lines, chemical reactions in combustible materials and coatings and lighted cigarettes. However, in compliance with Cal-OSHA requirements, construction managers and personnel for individual development projects would be trained in emergency response and fire safety operations. Additionally, fire suppression equipment (e.g., fire extinguishers) specific to construction are required to be maintained on individual development sites.

By closing off one or more lanes of a roadway, response times could temporarily and intermittently increase as fire vehicles take longer routes due to construction activity. The closure of lanes could also potentially cause traffic delays and inhibit access when responding to service calls. Generally, impacts to emergency response vehicles during construction activities are reduced through adherence to roadway encroachment permits. Traffic control plans are typically required to further reduce impacts on traffic which would also reduce impacts to fire and emergency response vehicles. Refer to **Section 3.17**,

Transportation, Traffic, and Safety, for Mitigation Measures **SMM-TRA-1**, **PMM-TRA-1**, and **PMM-TRA-2**, which pertain to issues of this nature. These impacts would be brief in nature and would be unlikely to result in a determination by a jurisdiction that new facilities would be required. Therefore, construction impacts would be less than significant.

By 2045, the Plan area would grow by approximately 3.2 million people with 60 percent of new homes and 73 percent of new jobs in Growth Priority Areas which are primarily areas that are currently developed. As such, existing facilities and services could become overburdened during the lifetime of the Plan.

While the Plan would increase traffic on local roadways, there is no direct relationship between increased travel delay and emergency response times; California State law requires that drivers yield the right-of-way to emergency vehicles and remain stopped until the emergency vehicles have passed (CVC 21806). The impact on response times and overall fire service is not proportional to increasing traffic (see **Section 3.17, Transportation, Traffic and Safety**). Generally, multi-lane arterial roadways allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle. On congested roadways, multi-lane arterial roadways with continuous center left-turn lanes facilitate emergency access when the thru lanes experience delays.

In some cases, depending on the pattern of development, it could be necessary to construct new facilities to maintain adequate response times, equipment, and personnel. While construction of fire protection facilities does not typically result in substantial environmental impacts,³⁶ the location, size, design, and proximity to sensitive receptors of new facilities are currently unknown. Construction and operation of fire stations could have impacts similar to other development projects analyzed throughout this PEIR, including impacts to aesthetics, air quality, noise, cultural resources, and utilities. Noise impacts of emergency service provider facilities, which are unique to this type of operation, can affect nearby sensitive receptors but such impacts are unpredictable at this time. In any event, construction of these facilities would comply with all applicable laws, regulations, and ordinances, and mitigation measures would be required to address any potentially significant impacts.

³⁶ Fire protection facilities are generally anticipated to be located on infill lots that are between 0.5 and 1 acre in size. In urbanized areas new facilities would not involve expansion of the urban sphere beyond current boundaries and, thus, there would be no need for new or expanded infrastructure. As an example, in the City of Los Angeles, there are four basic configurations for fire stations, the typical standard fire/paramedic station consists of a 15,250-square foot building on a parcel that is approximately one acre. Based on the urban location and the relatively small size of typical facilities, the construction of a new fire facility or expansion of an existing facility would likely qualify for an infill exemption or result in less-than-significant impacts with standard regulatory compliance measures and design features.

While the PEIR analyzes anticipated effects of regional transportation projects and growth related to air quality, noise, traffic, utilities, and other environmental impact areas, given the increased growth as well as densified development (e.g., more families living and/or working there), implementation of Connect SoCal could affect the need for construction of new or physically altered fire protection and emergency response facilities in order to maintain acceptable service ratios. Although the location and size of such facilities is not yet known, impacts could occur, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM PSP-1** through **SMM PSP-4**.

SMM PSF-1): SCAG shall assist planners, first responders, and recovery teams in a supporting role, in three key areas, before a major emergency and during the recovery period:

- Provide a policy forum to help develop regional consensus and education on security policies and emergency responses.
- Assist in expediting the planning and programming of transportation infrastructure repairs from major disasters.
- Encourage integration of transportation security measures into transportation projects early in the project development process by leveraging SCAG's relevant plans, programs, and processes, including regional ITS architecture. An example includes SCAG's participation in the development of the Southern California Catastrophic Earthquake Preparedness Plan.³⁷

SMM PSF-2: SCAG shall facilitate minimizing future impacts to fire protection services through information sharing regarding Fire-wise Land Management (data regarding fire-resistant vegetation, fire-resistant materials, locations where development is potentially hazardous in regard to wildfire, and management of brush and other fire risks in the immediate vicinity of development in areas with high fire threat) with county and city planning departments.

³⁷ California Emergency Management Agency, *Southern California Catastrophic Earthquake Response Plan*, December 2010
[https://www.caloes.ca.gov/PlanningPreparednessSite/Documents/SoCalCatastrophicConops\(Public\)2010.pdf](https://www.caloes.ca.gov/PlanningPreparednessSite/Documents/SoCalCatastrophicConops(Public)2010.pdf),
 accessed October 31, 2019.

Project Mitigation Measures

See PMM-PSP-1.

Level of Significance After Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to the need for new or physically altered fire protection facilities could be significant and unavoidable even with implementation of mitigation.

3.15.2.1 ENVIRONMENTAL SETTING

3.15.2.1.1 Police Protection Services

Law enforcement is provided by a variety of federal, state, county, city, and other local law enforcement agencies. Primary law enforcement is at the community level, with city police and County Sheriff's departments providing this service. Additionally, there are more specialized law enforcement agencies that assist in law enforcement at the community or resource level. These specialized agencies include, but are not limited to State Highway Patrol, School Police, Airport Police, Transit Police, Park Rangers (federal, state, County, and City), and a wide variety of federal agencies (FBI, ATF, etc.). In general, law enforcement agencies provide first response to all emergencies, perform preliminary investigations, and provide basic patrol services in their service area.

California Highway Patrol (CHP)

The California Highway Patrol (CHP) is a statewide law enforcement agency with jurisdiction over all highways and city roads. CHP officers are responsible for responding to car crashes, disabled vehicles, and other impediments to traffic flow. Although its primary mission is related to transportation, the CHP has broad enforcement power over state law.

Imperial County

Imperial County receives police protection from the Imperial County Sheriff's Office (ICSO), headquartered in El Centro. Substations are located in Niland, Ocotillo, Palo Verde, Salton City, and Winterhaven. The ICSO employs approximately 125 sworn officers and 95 personnel for an officer-to-resident ratio of about 1.5 sworn officers per 1,000 persons. The response time for priority and non-priority calls is approximately 10 to 12 minutes.¹ Additionally, each city in the County maintains its own police departments to serve their incorporated areas.

Los Angeles County

Law enforcement in Los Angeles County is provided by the Los Angeles Sheriff's Department (LASD), which is headquartered in the City of Los Angeles. With nearly 18,000 employees, LASD is the largest

¹ Imperial County. 1993. *Imperial County General Plan Environmental Impact Report*. Available at: <http://www.icpds.com/CMS/Media/I-References,-Persons,-Agencies-Consulted.pdf>, accessed September 18, 2019.

sheriff's department in the U.S. LASD provides general law enforcement services to unincorporated Los Angeles County as well as contracted cities. Of the County's 88 municipalities, 42 contract with LASD for local police protection. LASD also provides services to 216 facilities, hospitals, and clinics, nine community college, the Metropolitan Transit Authority, and 37 Superior Courts. LASD desired officer-to-population ratio is one officer per 1,000 residents. The LASD's goal response time for emergency calls is 10 minutes or less.²

Orange County

The Orange County Sheriff-Coroner Department (OCSD) provides police services to unincorporated areas of Orange County as well as contracting cities of Aliso Viejo, Dana Point, Laguna Hills, Laguna Niguel, Laguna Woods, Lake Forest, Mission Viejo, Rancho Santa Margarita, San Clemente, San Juan Capistrano, Stanton and Villa Park. The OCSD headquarters are located in the City of Santa Ana. The department is split into five divisions: North, South, and West Operations Divisions, the Airport Division, and the Harbor Patrol division. The OCSD is a large, multi-faceted law enforcement agency served by approximately 3,800 sworn and professional staff members and over 800 reserve personnel.³ The OCSD provides first responder patrol services and hazardous devices services to all law enforcement agencies in the County.

Riverside County

The Riverside County Sheriff's Department provides community policing and operates the County's correctional facilities. The Department is headquartered in the City of Riverside and provides services to the unincorporated areas of the County as well as the cities of Calimesa, Canyon Lake, Coachella, Eastvale, Indian Wells, Jurupa Valley, Lake Elsinore, La Quinta, Menifee, Moreno Valley, Morongo Indian Reserve, Norco, Palm Desert, Perris, Rancho Mirage, San Jacinto, Temecula, Wildomar. The Department employs approximately 4,500 people, roughly 2,300 of which are sworn personnel. There are nine Sheriff Department stations throughout the County and five adult correction or detention centers. The Department has established a staffing requirement of one sworn officer per 1,000 population.⁴

⁴ County of Riverside. 2014. *County of Riverside Environmental Impact Report for the 2014 General Plan*. March.

San Bernardino County

The San Bernardino County Sheriff's Department (SBCSD) polices the largest geographical county in the nation. It serves over 2.1 million residents across 15 patrol stations. SBCSD employs over 3,800 employees and utilizes over 1,800 volunteers. The SBCSD also maintains three correctional facilities: the West Valley Detention Center in Rancho Cucamonga; the Glen Helen Rehabilitation Center, a two unit, male and female-inmate facility in Devore; and, the Central Rehabilitation Center that houses federal inmates for the United States Marshall Service located in the City of San Bernardino.⁵

Ventura County

The Ventura County Sheriff's Office provides primary law enforcement services in unincorporated areas of Ventura County and the contract cities of Ojai, Thousand Oaks, Camarillo, Moorpark and Fillmore. This jurisdiction makes up almost 95 percent of the County's land area and approximately half of the population. The Department is divided into seven divisions, based on location, and is headquartered at 800 South Victoria Avenue in the City of Ventura. The Sheriff's Office employees approximately 1,250 personnel, including allocations for more than 740 sworn positions.

3.15.2.2 REGULATORY FRAMEWORK

3.15.2.2.1 State

All law enforcement agencies within the State of California are organized and operate in accordance with the applicable provisions of the California Penal Code. This code sets forth the authority, rules of conduct, and training for peace officers. Under state law, all sworn municipal and county officers are state peace officers.

California Constitution, Article XIII Section 35.

Section 35 of Article XIII of the California Constitution was adopted by the voters in 1993 under Proposition 172. It directed the proceeds of a 0.50 percent sales tax to be used exclusively for local public safety services, including police. CGC §§30051-30056 provide rules to implement Proposition 172. Section 30056 provides that a city is not allowed to spend less of its own financial resources on its combined public safety services in any given year compared to its 1992-93 fiscal year. Therefore, an agency is required to use Proposition 172 to supplement its local funds used on police protection, as well as other

⁵ San Bernardino County Sheriff's Department. 2017. *2017 Annual Report* Available online at: http://wp.sbcounty.gov/sheriff/wp-content/uploads/sites/17/2017-annual-report_reduced.pdf, accessed August 28, 2019.

public safety services. As discussed in the Regulatory Framework” for Fire Protection and Emergency Services, in the *City of Hayward v. Trustee of California State University* (2015) 242 Cal. App. 4th 833, the court found that, Section 35 of Article XIII of the California Constitution requires local agencies to provide fire services and that it is reasonable to conclude that a lead agency will comply with that provision and ensure that public services are provided. It is reasonable to analogize that a similar analysis would apply to police services as Section 35 of Article XIII includes a responsibility for cities to give priority to public safety services, which includes police services. See the “Regulatory Framework” for Fire Protection and Emergency Services, above, for further discussion.

California Penal Code

All law enforcement agencies within the State of California are organized and operated in accordance with the applicable provisions of the California Penal Code. This code sets forth the authority, rules of conduct, and training for peace officers. Under state law, all sworn municipal and county officers are state peace officers.

California Emergency Services Act

In 2008, Governor Schwarzenegger signed AB 38, the California Emergency Services Act, which merged the duties, powers, purposes, and responsibilities of the Governor’s Office of Emergency Services and the Governor’s Office of Homeland Security into a new cabinet-level agency, the California Emergency Management Agency (Cal EMA).⁶ Cal EMA is responsible for assuring the state’s readiness to respond to and recover from natural, human-made, and war-caused emergencies, and for assisting local governments in their emergency preparedness, response, and recovery efforts. The legislation authorizes Cal EMA to prepare a Standard Emergency Management System (SEMS) program, which sets forth measures by which a jurisdiction should handle emergency disasters.⁷ Non-compliance with SEMS could result in the State withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster.

Cal EMA serves as the central contact point in the state for any emergency or imminent disaster. It coordinates the notification of appropriate state administering agencies that may be required to respond, as well as the emergency activities of all state agencies in the event of an emergency. In doing so, Cal EMA does not focus on security specifically, but rather more broadly on addressing all potential incidents

⁶ California Legislative Information. *Assembly Bill No. 38*.

⁷ California Emergency Management Agency. *SEMS Guidelines*. Available online at: <https://www.caloes.ca.gov/PlanningPreparednessSite/Documents/12%20SEMS%20Guidelines%20Complete.pdf>, accessed August 28, 2019.

that could impact the state, such as earthquakes, fires, floods, and terrorist attacks. Furthermore, Cal EMA coordinates with federal agencies, such as the DHS and FEMA, as well as other state and local agencies such as the CHP. California’s vision, mission, and principles for emergency management, as well as goals and objectives are located in its publication “Strategic Plan 2010-2015 – Keeping California Safe.”⁸

While Cal EMA serves as the lead State agency for emergency management and coordinates the State response to major emergencies in support of local government. The primary responsibility for emergency management resides with local government. SEMS provides the mechanism by which local government requests assistance from Cal EMA, and as such, Cal EMA maintains oversight of the State’s mutual aid system. Cal EMA may task State agencies to perform work outside their day-to-day and statutory responsibilities and serves as the lead agency for obtaining federal resources.

13 California Code Regulations Division 2

Division 2 of Title 13 of the California Code Regulations (CCR) governs the operations of the California Highway Patrol.⁹

California Vehicle Code 21806 VC

California Vehicle Code 21806 VC states that drivers in California must yield to emergency vehicles when they are using sirens and have at least one visible red light. This is to ensure that emergency vehicles safe and timely access for emergency vehicles as they respond to emergency calls.

3.15.2.2.2 Local

County and Cities General Plan and Safety Elements

Local planning policies related to public services and recreation are established in each jurisdiction’s general plan. In general, jurisdictions have policies in place that state that public services must be provided at the same time (or in advance of) need for that service. In addition to these general policies,

⁸ California Emergency Management Agency. 2015. *Strategic Plan 2014-2018*. jurisdictions may have more specific policies tailored to performance objectives, such as those outlined below.

Policies and strategies for police protection services generally include language pertaining to the development of law enforcement programs to reduce and control crime, the planning of future law enforcement facilities concurrently with growth, and the prevention of crime through education. Many jurisdictions also have specific goals, such as a maintaining a certain ratio of sworn officers to citizens, reducing response times, or reducing the overall number of crimes in the community.

Applicable County General Plan elements regarding police protection are identified below.

Imperial County

Police Response Standards: The Imperial County General Plan does not establish police response standards for unincorporated areas.¹⁰ However, individual jurisdictions have set standards, for instance, the El Centro Police Department's goal is to have 1.75 police officers per 1,000 population.¹¹

Los Angeles County

Police Response Standards: To effectively and efficiently fulfill all of its functions, the Sheriff's Department requires a staff level of one deputy sheriff per each 1,000 population.¹² Incorporated cities within Los Angeles County have also established police response standards.

Orange County

Police Response Standards: The adequacy of Sheriff service for land use proposals is determined through the Environmental Impact Report (EIR), Fiscal Impact Report (FIR), and Annual Monitoring Report (AMR) review processes.¹³ Incorporated cities within Orange County have also established police response standards.

¹⁰ County of Imperial Planning & Development Services. *General Plan: Seismic and Public Safety Element*. Available online at: <http://www.icpds.com/?pid=837>, accessed November 5, 2018.

¹³ OC Development Services. *Orange County General Plan: Chapter V. Public Services & Facilities Element*. Available online at: <http://www.ocpublicworks.com/ds/planning/generalplan>, accessed November 5, 2018.

Riverside County

Police Response Standards: The Riverside County Sheriff's Department has established a goal of maintaining 1.5 sworn officers per 1,000 population, as recommended by the International City Managers' Association (Riverside County Integrated Project (RCIP)).^{14,15} According to EIR No. 441 for the 2003 RCIP General Plan, the Riverside County Sheriff's Department has established the following criteria for its staffing requirements in unincorporated areas of Riverside County:¹⁶

- One sworn officer per 1,000 population (Mitigation Measure 4.15.C for EIR No. 441 specifies the use of a 1.5-officer per 1,000 population standard for new development mitigation purposes)
- One supervisor and one support staff employee per seven officers
- One patrol vehicle per three sworn officers
- One school resource officer per school

Incorporated cities within Riverside County have also established police response standards. For instance, the City of Riverside endeavors to provide minimum response times of seven minutes on all Priority 1 calls and 12 minutes on all Priority 2 calls (Policy PS-7.5).¹⁷

San Bernardino County

Police Response Standards: The San Bernardino County General Plan does not establish police response standards for unincorporated areas.¹⁸ Incorporated cities within San Bernardino County have established police response standards. For example, the City of Redlands desires a response time of 4-5 minutes.¹⁹

¹⁴ California Public Utilities Commission. *Devers-Mirage 115 kV Subtransmission System Split Project (A.08-01-029) Draft Environmental Impact Report*. Available online at: <https://www.cpuc.ca.gov/Environment/info/esa/devers-mirage/deir/Devers-MirageDEIR.pdf>, accessed November 5, 2018.

Ventura County

Police Response Standards: The Ventura County General Plan does not establish police response standards for unincorporated areas.²⁰ Incorporated cities within Ventura County have established police response standards. For instance, the City of Fillmore has established a desired level of one patrol officer per 1,000 population.²¹

3.15.2.3 ENVIRONMENTAL IMPACTS

3.15.2.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the Plan would result in significant impacts to police protection services, if any of the following would occur:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered police facilities, need for new or physically altered police facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.

3.15.2.3.2 Methodology

The methodology for determining the significance of impacts on public services compares existing conditions to the expected future use of police services under the Plan. A review of existing police facilities was conducted to determine the potential need for new or expanded facilities. This analysis was undertaken at the regional level and appropriately does not include details for each jurisdiction within the region. The criteria above were applied to compare current conditions to future 2045 Plan conditions. The analysis of these impacts is programmatic at the regional level.

The need for or deficiency in adequate police services in and of itself is not a CEQA impact, but a social or economic impact (*City of Hayward v. Bd of Trustees* [2015] 242 Cal.App. 4th 833, 843). In accordance with CEQA, this PEIR analysis focuses on the extent to which the Plan promotes growth patterns resulting in a need for additional police services that results in the construction of new facilities or additions to existing facilities. The impact from that construction and/or facilities operation would result in a potential impact to the environment. An increase in population, by itself, would not increase demand for police protection

²⁰ Ventura County Planning Division. 2015. *Ventura County General Plan: Public Facilities & Services Appendix*. Available online at: <https://docs.vcrma.org/images/pdf/planning/plans/GENERAL-PLAN-Public-Facilities-Services-Appendix.pdf>, accessed November 5, 2018

²¹ City of Fillmore, California. 1998. *General Plan 1988-2010 – Chapter VII: Public Facilities Element*. Available at: <http://www.fillmoreca.com/home/showdocument?id=187>, accessed November 5, 2018.

services and associated facilities. Police service needs are dependent on various factors, including the size of the service population and the geographic area served, the number and types of calls for service, the characteristics of a project and its surrounding community as well as available existing facilities and staffing in an area. This PEIR, analyzes the potential for the Plan to result in the need for new police protection facilities (i.e., police stations) and the associated potential for construction and subsequent operation of such facilities to cause physical environmental impacts.

The mitigation measures in the PEIR are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.15.2.3.3 Impact and Mitigation Measures

Impact PSP-1 **Result in substantial adverse physical impacts associated with the provision of new or physically altered police facilities, need for new or physically altered police facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.**

Significant and Unavoidable Impacts - Mitigation Required.

Impacts to police protection services are associated with the physical impacts that could occur as a result of construction and operation of new facilities. Service ratios and response times are one tool jurisdictions use to determine the need for such facilities, but do not necessarily indicate a significant impact under CEQA.

New LRT and commuter rail routes/extensions in Los Angeles, Orange, Riverside, and San Bernardino counties, as well as transit-related projects, would involve the development of new transit stations. Operation of these new transit stations would require public protective security services. In some cases, such as with Metro, the governing transit authority, provides security as an element of the project, which would reduce the need for public protective security services. Overall, the Plan's strategies to encourage increased transit use could also result in an increased need for protective security services.

The Plan also includes transportation projects and land use strategies that focus new growth in HQTAs and encourage more walkable, mixed-use communities. According to the Plan, it is projected that approximately 48 percent of the new household growth and 59 percent of the new employment growth would be planned in HQTAs. These HQTAs are concentrated in suburban and urban areas, including Palm Springs, Riverside, San Bernardino, Anaheim, Irvine, the Los Angeles Basin, the San Gabriel Valley, the San Fernando Valley, Santa Clarita, Palmdale, and Lancaster. As these areas experience more people working and living there, additional police services would be required. As a result, the Plan would have a potential to increase the need for public protective services, usually in proportion to densified environment. This would likely increase the staffing of sworn officers and create a potential need to construct new stations to ensure acceptable levels of service that would have the potential to result in physical alterations and related significant effects on the environment. As discussed in **Section 3.15.1 Public Services, Fire**, it is also the case that the construction of police protection facilities does not typically result in substantial environmental impacts, however the location, size, design, and proximity to sensitive receptors of new facilities are currently unknown.

Police services are provided by several agencies within multiple jurisdictions. Local agencies are required to determine the degree of impact to police services and comply with county and city requirements to protect public safety.

While the Plan would increase traffic on local roadways, there is not a direct relationship between predicted travel delay and emergency response times as California State law requires that drivers yield the right-of-way to emergency vehicles and remain stopped until the emergency vehicles have passed (CVC 21806). Generally, multi-lane arterial roadways allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle. On congested roadways, multi-lane arterial roadways with continuous center left-turn lanes facilitate emergency access when the thru lanes experience delays. Additionally, several jurisdictions can re-signal timing remotely for police operations during planned events, such as special events.

In some cases, depending on the pattern of development, it could be necessary to construct new facilities to maintain adequate response times, equipment, and personnel. Construction of police protection facilities themselves may not result in environmental impacts (depending on the size of the facility). In planning new facilities, local jurisdictions take in to account growth projections.

Construction sites can pose an attractive nuisance with respect to vandalism and theft. Depending upon the timing, location, and duration of construction activities, several of the proposed transportation projects, including grade crossings, arterials, interchanges, HOT lanes, HOV lanes, and auxiliary lanes, as well as development project construction, could delay police vehicle response times or otherwise delay

the response of police services. By closing off one or more lanes of a roadway, response times could temporarily and intermittently increase as police vehicles take longer routes due to construction activity. The closure of lanes could also potentially cause traffic delays and ultimately inhibit access when responding to service calls. Generally, police response times during project construction are reduced through adherence to road encroachment permits. Traffic control plans are typically required to further reduce impacts on traffic which would also reduce impacts to police response.

Noise impacts of police stations, which are unique to this type of operation, can affect nearby sensitive receptors but such impacts are unpredictable at this time since the location and design of new police stations, as well as the proximity to sensitive receptors, are currently unknown. In any event, construction of these facilities would comply with all applicable laws, regulations, and ordinances, and mitigation measures would be required to address any potentially significant impacts.

While the PEIR analyzes anticipated effects of regional transportation and growth related to air quality, noise, traffic, utilities, and other environmental impact areas, given the increased growth as well as densified development, the Plan could contribute to the need for construction of new or physically altered police facilities in order to maintain acceptable service ratios. Although the location and size of such facilities is not yet known, and impacts could occur, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM PSF-1**.

SMM PSP-1 SCAG shall facilitate minimizing future impacts to library services through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to Map Gallery, GIS library, and GIS applications, and promote acceptable service ratios regarding library services.

SMM PSP-2: SCAG shall help to enhance the region's ability to deter and respond to acts of terrorism, human-caused or natural disasters through regionally cooperative and collaborative strategies. SCAG shall work with local officials to develop regional consensus on regional transportation safety, security, and safety security policies.

SMM PSP-3: SCAG shall help to enhance the region's ability to deter and respond to terrorist incidents, human-caused or natural disasters by strengthening relationship and coordination with transportation. This will be accomplished by the following:

- SCAG shall work with local officials to develop regional consensus on regional transportation safety, security, and safety security policies.
- SCAG shall encourage all SCAG elected officials are educated in NIMS.
- SCAG shall work with partner agencies, federal, state and local jurisdictions to improve communications and interoperability and to find opportunities to leverage and effectively utilize transportation and public safety/security resources in support of this effort.

SMM PSP-4: SCAG shall encourage and provide a forum for local jurisdictions to develop mutual aid agreements for essential government services during any incident recovery.

Project Mitigation Measures

PMM PSP-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects of constructing new emergency response facilities, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Coordinate with emergency response agencies to ensure that there are adequate governmental facilities to maintain acceptable service ratios, response times or other performance objectives for emergency response services and that any required additional construction of buildings is incorporated in to the project description.
- b) Where current levels of services at the project site are found to be inadequate, provide fair share contributions towards infrastructure improvements, as appropriate and applicable, to mitigate identified CEQA impacts.
- c) Project sponsors can and should develop traffic control plans for individual projects. Traffic control plans should include information on lane closures and the anticipated flow of traffic during the construction period. The basic objective of each traffic control plan (TCP) is to permit the contractor to work within the public right of way efficiently and effectively while maintaining a safe, uniform flow of traffic. The construction work and the public traveling through the work zone in vehicles,

bicycles or as pedestrians must be given equal consideration when developing a traffic control plan.

Level of Significance After Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and SCAG's inability to require project-level mitigation measures, this PEIR finds impacts related to the need for new or physically altered police facilities could be significant and unavoidable even with implementation of mitigation.

3.15.3.1 ENVIRONMENTAL SETTING

Counties and cities within the SCAG region provide public education facilities and services to residents including elementary schools, middle schools, secondary schools, postsecondary schools, and colleges/universities, as well as special and adult education. Additional discussion of schools is provided in **Sections 3.3, Air Quality, and 3.11, Land Use and Planning.**

3.15.3.1.1 California Department of Education

The California Department of Education (CDE) oversees the state’s public school system, which provides education to more than six million children and young adults in more than 10,000 schools. CDE and the State Superintendent of Public Instruction are responsible for enforcing education law and regulations; and for continuing to reform and improve public elementary school programs, secondary school programs, adult education, some preschool programs, and child care programs.

Although the California public school system is subject to state requirements, the CDE relies on local control for the management of school districts. In allocating resources among the schools of the district, school district governing boards and district administrators must follow the law, but also set the educational priorities for their schools. As of the 2018-2019 school year, there were more than 1,030 school districts in California.¹

3.15.3.1.2 Educational Facilities

According to the California Department of Education, there are approximately three million students enrolled in schools in the SCAG region, ranging from kindergarten to 12th grade, with over 141,000 teachers (see **Table 3.15.3-1, Kindergarten through Grade 12 Enrollment and Teachers in the SCAG Region for the 2017–2018 School Year**). The number of public K–12 school districts range from a low of 19 in Imperial County to a high of 80 in Los Angeles County, with a corresponding range of schools from a low of 74 in Imperial County to over 2,300 in Los Angeles County (see **Table 3.15.3-2, Public and Private Schools in the SCAG Region**). Three counties have University of California campuses, and all but one county have one or more California State University campuses (see **Table 3.15.3-2**).

Imperial County

Imperial County has 19 school districts, 11 private schools, three charter academies, and a community college, Imperial Valley College. Enrollment within the districts ranges from 9,200 students to 81 students. Within the County, 11 school districts have recently passed bond measures that will support new gymnasiums, classrooms, science labs, swimming pools, and three entirely new schools.² Additionally, San Diego State University has a satellite campus in Imperial County, located in Calexico.

Los Angeles County

Los Angeles County Office of Education is the largest regional education agency in the U.S. and serves as an intermediary between the local school districts and the California Department of Education. The County is served by 80 school districts.³ As with all of California, the districts operate independently of the County government and elected governing school boards are responsible for budgeting and decision-making.

Orange County

The Orange County Department of Education is comprised of 27 K-12 school districts, four community college districts, one alternative school, and a special education school. There are more than 600 public schools and 20,000 educators serving more than 500,000 students. Although almost all of the Orange County schools are experiencing growth, the fastest growing districts are within South County: Saddleback Valley Unified School District and Capistrano Unified School District. The Orange County Department of Education also promotes a childcare program, offering before- and after school care for children of working parents, as well as youth and teen programs.⁴

Riverside County

Within Riverside County, the Riverside County Office of Education (RCOE) provides educational and administrative support services to the 23 school districts and nearly 430,000 students living in the County. Beyond acting as an intermediary between the State and local school districts, the RCOE also supports or directly provides a variety of specialized needs, such as Special Education for the severely handicapped,

Head Start, Migrant Education, Alternative Education through independent study, Community Schools and Juvenile Court Schools and Career Technical Education programs designed to teach workforce skills aiding future employment. The RCOE reports 515 school sites, including 18 charter schools, and employs approximately 19,000 teachers and non-teaching school employees.⁵

San Bernardino County

The San Bernardino County Superintendent of Schools manages approximately 403,000 students across more than 500 schools in 35 districts.^{6,7,8} The County also has six Special Education Local Plan Areas, and five regional occupational programs.^{9,10} The County Board of Supervisors exercises direct control over the County School System, which is under the jurisdiction of the State Board of Education.

Ventura County

The Ventura County Office of Education (VCOE) oversees the County's 20 public school districts, which serve nearly 138,000 K-12 students. The VCOE also promotes court and community schools, as well as special education facilities. The primary role of the office is to promote quality educational services to all students by providing leadership, support, assistance, and coordination to school districts and County operated programs through the provisions of administrative, educational, fiscal and clerical services. In addition, the District provides professional development opportunities for teaching staff and hosts countywide academic competitions including the spelling bee, mock trial, and academic decathlon.¹¹

3.15.3.2 REGULATORY FRAMEWORK

3.15.3.2.1 Federal

Elementary and Secondary Education Act of 1965 (ESEA) and Every Student Succeeds Act (ESSA) of 2015

Since the Elementary and Secondary Education Act (ESEA) of 1965 (Public Law 89-10) was signed into law by President Lyndon B. Johnson, local school districts throughout the nation have received federal monies through grants to state educational agencies to improve the quality of elementary and secondary education. ESEA also offered new grants to districts serving low-income students and for text and library books, created special education centers, and created scholarships for low-income collect students. In 2002, Congress reauthorized ESEA and President George W. Bush signed the law under a new name: No Child Left Behind (NCLB). In 2015, President Obama reauthorized ESEA and improved upon the NCLB to focus on fully preparing all students for success in college and careers. The ESSA upholds critical protections for disadvantaged students, includes statewide assessments to measure progress, increases access to high-quality preschool and furthers goals to close achievement gaps and increase equity and positive outcomes for all students.¹²

3.15.3.2.2 State

California Government Code Section 65995

California Government Code Section 65995 is found in Title 7, Chapter 4.9 of the California Government Code. California Government Code Section 65995 authorizes school districts to collect impact fees from developers of new residential and commercial/industrial building space. Senate Bill 50 (SB 50) amended Government Code Section 65995 in 1998. Under the provisions of SB 50 schools can collect fees to offset costs associated with increasing school capacity as a result of development. The development that would occur within the SCAG region between now and 2044 would be subject to applicable fees determined by the local school districts per California Government Code Section 65995. The local school districts determine fees in accordance with California Government Code Section 65995 which can be adjusted every two years. The maximum fees authorized under SB 50 apply to zone changes, general plan amendments, zoning permits and subdivisions. The provisions of SB 50 are deemed to provide full and

¹² Social Welfare History Project. *Elementary and Secondary Education Act of 1965*. Available online at: <https://socialwelfare.library.vcu.edu/programs/education/elementary-and-secondary-education-act-of-1965/>, accessed August 28, 2019.

complete mitigation of school facilities impacts, notwithstanding any contrary provisions in CEQA or other State or local laws.¹³

Assembly Bill 2926

In 1986, Assembly Bill No. 2926 (Statutes of 1986, ch. 887) (AB 2926) authorized the levy of statutory development fees, as well as placed a cap on the number of fees that could be levied, on new residential and commercial/industrial development in order to pay for school facilities. Its overall purpose was to enable school districts to impose developer fees to pay for new school construction (Government Code 53080).¹⁴

California Education Code

School facilities and services are subject to the rules and regulations of the California Education Code and governance of the State Board of Education (SBE). The SBE is the 11-member governing and policymaking body of the California Department of Education (CDE) that sets K–12 education policy in the areas of standards, instructional materials, assessment, and accountability.¹⁵ The CDE and the State Superintendent of Public Instruction are responsible for enforcing education law and regulations; and for continuing to reform and improve public elementary school, secondary school, and childcare programs, as well as adult education and some preschool programs. The CDE’s mission is to provide leadership, assistance, oversight, and resources so that every Californian has access to an education that meets world-class standards. The core purpose of the CDE is to lead and support the continuous improvement of student achievement, with a specific focus on closing achievement gaps.¹⁶

California Department of Education

The CDE is the government agency responsible for public education throughout the state. The department oversees funding, and student testing and achievement levels for all state schools. A sector of the CDE, the California State Board of Education is the governing and policy making sector

responsible for education policies regarding standards, instructional materials, assessment, and accountability. CDE's mission is to provide leadership, assistance, oversight, and resources so that every Californian has access to an education that meets world-class standards. The core purpose of CDE is to lead and support the continuous improvement of student achievement, with a specific focus on closing achievement gaps.

Class Size Reduction Kindergarten-University Public Education Facilities Bond Act of 1998

Proposition 1A, the Class Size Reduction Kindergarten-University Public Education Facilities Bond Act of 1998 (Ed. Code, §§ 100400–100405) is a school construction funding measure that was approved by the voters on the November 3, 1998 ballot. The Act created the School Facility Program where eligible school districts may obtain state bond funds.¹⁷

Leroy Greene School Facilities Act of 1998

The Leroy Greene School Facilities Act of 1998 (Ed. Code, §§ 17070.10-17079.30) eliminated the ability of cities and counties to require full mitigation of school impacts and replaced it with the ability for school districts to assess fees directly to offset the costs associated with increasing school capacity as a result of new development. The Act states that payment of developer fees is “deemed to be complete and full mitigation” of the impacts of new development.¹⁸

Community Facilities Act of 1982, as amended

The Community Facilities Act of 1982 (Section 53324 of the Government Code), also commonly known as the Mello-Roos Act, enables certain public agencies to designate a Mello-Roos Community Facilities District, which allows for the financing of public improvements and services. These include basic infrastructure, police protection, fire protection, ambulance services, schools, parks, libraries, museums, and other cultural facilities. Mello-Roos Community Facilities Districts are usually created to finance improvements and services when no other funding sources are available and require a two-thirds majority vote of residents living within the proposed boundaries. They are used especially often (but not exclusively) in new development areas. Upon approval, a special tax lien is placed against each property

¹⁷ Legislative Analyst's Office. 1998. *Proposition 1A Class Size Reduction Kindergarten – University Public Education Facilities Bond Act of 1998*. Available online at: https://lao.ca.gov/ballot/1998/1A_11_1998.htm, accessed August 28, 2019.

¹⁸ California Legislative Information. *Chapter 12.5. Leroy F. Greene School Facilities Act of 1998*. Available online at: https://leginfo.ca.gov/faces/codes_displayexpandedbranch.xhtml?tocCode=EDC&division=1.&title=1.&part=10.&chapter=12.5.&article=, accessed August 28, 2019.

in the district, and residents pay a special tax each year. This tax is not based on property value, but on formulas that take into account physical characteristics such as square footage and structure size.¹⁹

3.15.3.2.3 Local

School Districts

Although the California public school system is under the policy direction of the Legislature, the California Department of Education relies on local control for the management of school districts. In allocating resources among the schools of the district, school district governing boards and district administrators must follow the law, but also set the educational priorities for their schools. In addition, some jurisdictions issue bonds to finance school construction.

General Plans

Local planning policies related to education services are established in each jurisdiction's general plan. In general, jurisdictions have policies in place that state that public services must be provided at the same time (or in advance of) need for that service. In addition to these general policies, jurisdictions may have more specific policies tailored to performance objectives.

3.15.3.3 ENVIRONMENTAL IMPACTS

3.15.3.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the proposed Plan would result in significant impacts to educational facilities, if the following could occur:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered school facilities the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios or other educational performance factors.

3.15.3.3.2 Methodology

The methodology for determining the significance of impacts on public services compares existing conditions to the expected future use of schools under the Plan. The criteria above were applied to compare current conditions to future 2045 Plan conditions. The analysis of these impacts is programmatic at the regional level, as such impacts for individual schools or school districts is not determined.

¹⁹ California Tax Data. *What is Mello-Roos?* Available online at: <https://www.californiataxdata.com/pdf/Mello-Roos2.pdf>, accessed November 5, 2018.

In *Goleta Union School District v Regents of University of California* (1995) 37 CA 4th 1025, the court held that school overcrowding is a social impact and does not require analysis in an EIR and mitigation, unless the overcrowding is linked to physical environmental effects (such as new school construction). However, the law is somewhat unclear on how to analyze impacts from school facilities. The legal practice guide, "Practice under the California Environmental Quality Act" by the Continuing Education of the Bar, provides the following discussion on impacts to schools:

State and local agencies may not deny either legislative or adjudicative approvals on the basis of a refusal to pay fees in excess of those limits (Government Code Section 65995).

The statutes also significantly limit the application of CEQA to school facilities impact issues. The fees set forth in Government Code Section 65996 constitute the exclusive means of both "considering" and "mitigating" school facilities impacts of projects (Government Code Section 5996(a)).

Because the statute states that the statutory fees are the exclusive means of considering, as well as mitigating, school impacts, it limits not only the mitigation that may be required but also the scope of impact review in CEQA documents and the findings for school impacts.

In *Chawanakee Unified School District v County of Madera* (2011) 196 CA 4th 1016, the court held that because the methods in the statute are the exclusive means of "considering" impacts on schools, an EIR need not describe and analyze a development's impacts on schools. Consistent with this view:

- Once the statutory fee is imposed, the impact should be determined to be mitigated because of the provision that the statutory fees constitute full and complete mitigation (Government Code Section 65995(b)); and
- It should not be necessary to adopt a statement of overriding considerations for school facilities impacts when the statutory fee is assessed, because the impact is deemed as a matter of law to be adequately mitigated (Government Code Section 65995(b)).

The *Chawanakee* court also ruled that the reach of the statute is limited to impacts "on" schools and does not extend to impacts on the non-school physical environment, even though they may be "related" to schools in some way. The implications of this ruling are uncertain, however, because the court did not consider the effect of Government Code Section 65995(b), which states that the statute provides full school facilities mitigation notwithstanding CEQA, or of Government Code Section 65995(c), which defines a school facility as "any school-related consideration relating to a school district's ability to accommodate enrollment."

Based on the above and the uncertainty created by the *Chawanakee* decision related to impacts to non-school property from the construction of school facilities, for purposes of this PEIR, an impact on schools would occur if the Plan promotes growth patterns resulting in the need for and/or the provision of new or physically altered public school facilities, the construction of which would cause significant environmental impacts in order to maintain classroom sizes or other performance objectives. The determination of whether there is a significant impact related to schools is based on whether a significant impact would result from the construction of new or expanded school facilities on non-school property. This PEIR analyzes the potential for the Plan to result in the need for new school facilities and the associated potential for construction and subsequent operation of such facilities to cause physical environmental impacts.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.15.3.3.3 Impact and Mitigation Measures

Impact PSS-1 **Result in substantial adverse physical impacts associated with the provision of new or physically altered educational facilities, need for new or physically altered educational facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.**

Significant and Unavoidable Impacts - Mitigation Required.

Population is anticipated to increase by approximately 3.2 million people over the lifetime of the Plan (with or without the Plan); some of this population increase would include school age children.²⁰

²⁰ Southern California Association of Governments. Profiles of Imperial County, Los Angeles County, Orange County, Riverside County, San Bernardino County, and Ventura County. Available at: <http://www.scag.ca.gov/DataAndTools/Pages/LocalProfiles.aspx>

According to SCAG's Demographics and Growth Technical Report, the share of children will decline by 2.48 percent, but school age children will continue to make up a large share of the overall population.

Based on the 2018 enrollment of approximately 3 million students in the SCAG region (approximately 16 percent of an overall 2018 population of 19.1 million), and considering the projected growth scenario for 2045, the number of children enrolled in K-12 schools is anticipated to increase by approximately 558,000 students.^{21,22} The land use strategies included in the Plan direct new growth to existing urbanized communities within the SCAG region. For example, as projected by the Plan, HQTAs are planned to accommodate 48 percent of the region's future housing unit growth. It is anticipated that this increase in population and households in existing communities and HQTAs would require construction or expansion of new schools in the region to accommodate the increased growth and densified development (e.g., more families living and/or working there). However, it is important to note that some public schools have experienced declines in enrollment as a result of changing demographics and/or as a result of parents choosing a private education. For example, according to the Superintendent's 2019-20 Final Budget Report, the largest district in the region, Los Angeles Unified School District (LAUSD), is expecting enrollment to decrease across its schools; LAUSD states that this is due to several factors, including the reduced birth rate in Los Angeles County and the increasing cost of living, including housing, in southern California.²³

School standards, performance measures, and related policies are set for public schools in school district long-range plans. To meet increased demand, existing schools would likely need additional facilities and other resources to maintain adequate educational standards. In some cases, depending on the pattern of development, it could be necessary to construct new schools as has been the case in Orange County's Saddleback Valley Unified School District. Such construction could have impacts on aesthetics, air quality, cultural resources, noise, transportation, as well as public services and utilities.

It is assumed that if new or expanded schools are determined to be necessary at some point in the future, such facilities could occur in proximity to residential uses.²⁴ Depending on the location of new schools, if

²² Assuming the percent of school age children within the SCAG region remains constant at 15.5 percent, the increase in the number of students would be approximately 558,000 students, or 15.5 percent of the anticipated increase of 3.6 million people for the SCAG region over the lifetime of the Plan.

²³ Los Angeles Unified School District. 2019. *2019-20 Superintendent's Final Budget*. Available at: https://achieve.lausd.net/cms/lib/CA01000043/Centricity/Domain/123/19_2019-20%20District%20Enrollment%20Trends%2005-17-19%20combined%20rev.pdf, accessed October 30, 2019.

²⁴ As allowed under Section 53094 of the California Government Code, the LAUSD Board of Education has, by resolution, exempted many schools from complying with local zoning regulations.

they are determined to be needed, impacts related to particular locations could occur; however, such impacts are too speculative to assess without information as to design, location and proximity to the population to be served. Further, any significant impacts that could result from the unique characteristics of a specific project site, or specific characteristics of a given school (e.g. night lighting and performance spaces) would be speculative at this time. The construction of these facilities would be subject to project-specific CEQA review. While the PEIR analyzes anticipated effects of regional transportation and growth related to air quality, noise, traffic, utilities, and other environmental impact areas, given the increased growth as well as densified development the Plan could contribute to substantial adverse physical impacts associated with the construction and subsequent operation of new or physically altered school facilities in order to maintain acceptable service ratios. Although the location and size of such facilities is not yet known, impacts could occur, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

SMM PSS-1: SCAG shall facilitate minimizing future impacts to school services through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts to promote school planning efforts.

Project Mitigation Measures

PMM PSS-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects of constructing new or physically altered school facilities, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Where construction or expansion of school facilities is required to meet public school service ratios, require school district fees, as applicable.

Level of Significance After Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing

regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to the need for new or physically altered school facilities could be significant and unavoidable even with implementation of mitigation.

3.15.4.1 ENVIRONMENTAL SETTING

American Library Association

In the mid 1960's, the American Library Association (ALA) established library standards for public libraries. The ALA recommends service criteria of 0.5 square feet of library space and 2.5 volumes per capita. Many jurisdictions have not identified individual service criteria and utilize the ALA recommendations to meet the demand for library services in an area.

Imperial County

The County of the Imperial Free Library was founded in 1912 and serves County residents in unincorporated areas, as well as in the cities of Calipatria, Holtville, and Westmorland. There are currently four branches located in Salton City, Calipatria, Heber, and Holtville. The library facilities offer services for children and teens, such as homework assistance, education games, and college scholarship databases.¹ Many incorporated cities within Imperial County also provide library services.

Los Angeles County

The County of Los Angeles Public Library is one of the largest public library systems in the U.S. The system maintains 86 libraries across seven library planning areas. The system is equipped with 7.5 million books, in addition to magazines, newspapers, government publications, reference materials, audio-visual media, adult, teen and children programs, downloadable e-books, computers, and internet access. The County guidelines regarding facilities are a minimum of 0.5 gross square foot and 2.75 items (books and other library materials) per capita.² Many incorporated cities within Los Angeles County also provide their own library services.

Orange County

The Orange County Public Library provides library service to the unincorporated areas of Orange County plus the cities of Aliso Viejo, Brea, Costa Mesa, Cypress, Dana Point, Fountain Valley, Garden Grove, Irvine, Laguna Beach, Laguna Hills, Laguna Niguel, Laguna Woods, Lake Forest, La Habra, La Palma, Los Alamitos, Rancho Santa Margarita, San Clemente, San Juan Capistrano, Seal Beach, Stanton,

Tustin, Villa Park, and Westminster. The library system operates 33 branch library facilities, which contain approximately 2.5 million volumes, as well as periodicals, pamphlets, audio and video recordings, graphics, maps, etc. The library system has determined a service standard of 0.2 square foot of library space per capita and it strives to locate facilities within a three mile radius of the communities they serve.³ Within Orange County, many incorporated cities also provide library services.

Riverside County

Riverside County operates a library system of 36 libraries, two book mobiles, and a county museum. Library management offices are located in the City of Riverside while the bookmobiles travel to serve unincorporated communities in the Coachella Valley and in western Riverside County. In Fiscal Year 2018/2019, the County library had approximately 3.752 million visitors and issued 43,700 library cards.⁴ Many incorporated cities within Riverside County also provide library services.

San Bernardino County

The San Bernardino County Library System (SBCL) maintains 32 branches, two book mobiles, and has an administration building in the City of San Bernardino.⁵ The SBCL provides library resources such as books, internet, youth and adult literacy services, and braille institute services. The SBCL is available to unincorporated communities as well as 25 incorporated communities within the County. Combined, the branch facilities and administrative office total over 358,000 square feet of building area.⁶ In addition, many incorporated cities within San Bernardino provide library services.

Ventura County

The Ventura County Library maintains 12 community branches across the County. The various branches provide services such as book and document loans, computer labs, meeting rooms, homework assistance, and STEAM events. The County Library also provides an adult literacy program and tutors, as well as an eLibrary.⁷ The Ventura County Library maintains over 300,000 print books, as well as a variety of music,

movies, TV shows, magazines, toys, instruments, and sketch books.⁸ In the Fiscal Year 2018-2019, the County Library circulated over 554,000 physical and digital items, issued 12,000 library cards, and held over 5,000 events.⁹ Library services are also provided by many incorporated cities within Ventura County.

3.15.4.2 REGULATORY FRAMEWORK

3.15.4.2.1 State

Community Facilities Act of 1982, as amended

The Community Facilities Act of 1982 (Section 53324 of the Government Code), also commonly known as the Mello-Roos Act, enables certain public agencies to designate a Mello-Roos Community Facilities District, which allows for the financing of public improvements and services. These include basic infrastructure, police protection, fire protection, ambulance services, schools, parks, libraries, museums, and other cultural facilities. Mello-Roos Community Facilities Districts are usually created to finance improvements and services when no other funding sources are available, and require a two-thirds majority vote of residents living within the proposed boundaries. They are used especially often (but not exclusively) in new development areas. Upon approval, a special tax lien is placed against each property in the district, and residents pay a special tax each year. This tax is not based on property value, but on formulas that take into account physical characteristics such as square footage and structure size.¹⁰

3.15.4.2.2 Local

Developer Impact Fees

One primary source for financing library facilities within the SCAG region and across the state is developer impact fees. These fees reduce impacts of residential developments; generally, developers can construct new library facilities or pay impact fees to the library to mitigate the impacts from a specific project. Fees vary depending on the jurisdiction in which the project is located.

3.15.4.3 IMPACTS AND MITIGATION MEASURES

3.15.4.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the proposed Plan would result in significant impacts to library facilities, if the following could occur:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered library facilities, need for new or physically altered library facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.

3.15.4.3.2 Methodology

The methodology for determining the significance of impacts on public services compares existing conditions to the expected future use of libraries under the Plan. The criteria above were applied to compare current conditions to future 2045 Plan conditions. Due to the size of the region, a detailed analysis of individual libraries and their capacity is not feasible. As such, the analysis focuses on region wide capacity and impacts. The analysis of these impacts is programmatic at the regional level.

The need for, or deficiency in, library facilities to serve residents is not in and of itself a CEQA impact, but a social or economic impact. (*City of Hayward v. B'd of Trustees* (2015) 242 Cal.App. 4th 833, 843). In accordance with CEQA, this PEIR analysis focuses on the extent to which the Plan's growth patterns result in a need for additional library facilities and the associated potential for construction and subsequent operation of such facilities to cause physical environmental impacts.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.15.4.3.3 Impact and Mitigation Measures

Impact PSL-1 **Result in substantial adverse physical impacts associated with the provision of new or physically altered library facilities, need for new or physically altered library facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.**

Significant and Unavoidable Impacts - Mitigation Required.

Population in the SCAG region is anticipated to increase by approximately 3.2 million people over the next 25 years, with or without the Plan. As discussed above, the counties within the SCAG region all have different service criteria for library services, with some counties not having set any at the time of this PEIR. Across the nation, public libraries have experienced significant growth in programming since 2012. The number of public programs offered per capita has jumped 27.5% while the number of programs attended per capita has risen 16.9%. The Public Library Association (PLA) is responding to this trend by offering relevant initiatives designed to help public libraries offer targeted programs around issues that matter most to patrons, including access to on-line resources and e-books. Currently, 100% of public libraries offer access to the internet; 98% offer free Wi-Fi; 90% help patrons with basic internet skills; 97% help people complete online government forms; 90% offer access to e-books.¹¹

New transportation facilities, especially those in urban areas, could facilitate access to libraries and result in increased use of some libraries. In addition, the anticipated growth in population and households would increase the demand for library facilities, which may result in a need for new and/or expanded library facilities. As communities grow, the need for library facilities would be assessed by each local jurisdiction and additional facilities would be constructed as needed. Depending on the location of new libraries, if they are determined to be needed, impacts related to locations could occur; however, without information as to design, location and proximity to the population to be served, such impacts are too speculative to assess. The construction of these facilities would be subject to project-specific CEQA review. While the PEIR analyzes anticipated effects of regional transportation and growth related to air quality, noise, traffic, utilities, and other environmental impact areas, given the increased growth as well as densified development (e.g., more families living and/or working there), the Plan could contribute to substantial adverse physical impacts associated with the construction of library facilities in order to maintain acceptable service ratios. Although the location and size of such facilities is not yet known, impacts could occur, requiring the consideration of mitigation measures.

¹¹ American Library Association, State of America's Libraries Report 2019, website: <http://www.ala.org/news/state-americas-libraries-report-2019/public-libraries>, accessed October 30, 2019.

Mitigation Measures

SCAG Mitigation Measure

SMM PSL-1 SCAG shall facilitate minimizing future impacts to library services through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to Map Gallery, GIS library, and GIS applications, and promote acceptable service ratios regarding library services.

Project Mitigation Measure

PMM PSL-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects of construction of new or altered library facilities, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Where construction or expansion of library facilities is required to meet public library service ratios, require library fees, as appropriate and applicable, to mitigate identified CEQA impacts.

Level of Significance After Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to the need for new or physically altered library facilities could be significant and unavoidable even with implementation of mitigation.

3.16 PARKS AND RECREATION

This section of the Program Environmental Impact Report (PEIR) describes the existing recreational resources within the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect recreation resources, and analyzes the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.16.1 ENVIRONMENTAL SETTING

3.16.1.1 Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for recreation are provided.

Recreation Level of Service (LOS):¹ In the context of recreation of recreational service, LOS refers to the amount of “service” each park, open land, trail, or other facility provides to its constituents.² Conventional recreation and park LOS analysis—often called the “NRPA standards” method because it was published by the National Recreation and Parks Association (NRPA)—is based on capacity only. NRPA standards suggest providing a certain number of facilities or acres of parkland per 1,000 population. The County of Los Angeles General Plan³ and Orange County General Plan⁴ have established a standard for parklands of four acres of local parkland and six acres of regional parkland per 1,000 county residents in unincorporated areas; the Imperial County General Plan⁵ has established a standard of five net acres of overall parkland per 1,000 county residents in unincorporated areas; the San Bernardino County General Plan⁶ has established a standard of 14.5 acres of undeveloped lands and/or

¹ It should be noted that LOS may also refer to a transportation metric when discussing traffic impacts, however for the purposes of this section of the PEIR, LOS refers to the amount of “service” each park, open land, trail, or other facility provides to its constituents.

trails per 1,000 county residents and 2.5 acres of regional parkland per 1,000 county residents; and Ventura County has not established numeric parkland standards.

Because park needs and definitions vary among jurisdictions, the following description are provided for informational purposes. The definitions below are not intended to define all parkland in the region, but rather, are intended to provide general guidance about different types of parks that can be found in the region.

Local Park: According to the Los Angeles County General Plan, a park that is considered to serve the local community (within a two-mile service radius of the park) is generally 20 acres or less in size.^{7,8} Further, the Los Angeles County General Plan has refined local parks into the following categories:⁹

Park Node: Park nodes are small pieces of open space that serve as public destinations, connections, and community defining spaces. Examples include plazas, rest areas, playgrounds, landmarks, public art installations, etc.

Size: One-quarter acre or less

Service Area: No service radius area

Pocket Park: Pocket parks are less than three acres in size and serve residential or business areas within a quarter mile radius or within walking distance. Passive park amenities include picnic areas and seating areas. Active park amenities include children’s play apparatus.

Size: Less than three acres

Service Area: Up to one-quarter mile radius of the park

Neighborhood Park: The common objective of all neighborhood parks is to bring people together to recreate and socialize close to home. Passive park amenities include informal open play areas, children’s play apparatus, group picnic areas with overhead shelters, and barbecues. Active park amenities include practice sports fields, basketball, tennis, and

volleyball courts. Park facilities typically include public restrooms, and onsite parking and information kiosks.

Size: Three to 10 acres

Service Area: One-half mile radius of the park

Community Park: Community parks that are located in residential neighborhoods serve both the needs of the community park service radius and neighborhood park service radius. The amenities programmed into a community park are focused on meeting the needs of several neighborhoods or large sections of the community. Passive park amenities include informal open play areas, children’s play apparatus, family and group picnic areas with overhead shelters, and barbecues; active sports activities including light sports fields, basketball courts and tennis courts, aquatics complexes, skate parks, soccer arenas, roller hockey, community gardens, and dog parks; and park facilities including public restrooms, concession buildings, community buildings, maintenance buildings, and on-site parking and information kiosks.

Size: 10 to 20 acres

Service Area: 1 to 2-mile radius around the park

Regional Park: A park greater than 20 acres in size is generally considered a regional park. A regional park may have a service radius of over 25 miles.^{10,11} For instance, the Los Angeles County General Plan has refined regional parks into the following categories:¹²

Community Regional Park: Community regional parks protect and conserve natural resources, preserve open spaces, and provide recreational facilities that are not available in neighborhood or community parks. Passive park amenities include open play areas, children’s play apparatus, group picnic areas with overhead shelters, and barbecues. Active sports activities include lighted sports fields, basketball courts, and tennis courts. Additional amenities include multiple sports facilities, aquatics centers, fishing lakes, community buildings, gymnasiums, and scenic views and vistas. Park facilities typically include public restrooms, concession buildings, community buildings, maintenance buildings, and on-site parking and information kiosks.

¹¹ Orange County Public Works Development Services. 2015. *General Plan: Chapter VII. Recreation Element*. Available online at: <http://ocplanning.net/civicax/filebank/blobdownload.aspx?blobid=24960>, accessed March 27, 2019.

¹² Los Angeles County Department of Regional Planning. 2015. *Los Angeles County General Plan Adopted October 6, 2015: Chapter 10: Parks and Recreation Element*. Available online at: http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan.pdf, accessed July 7, 2019.

Size: 20 to 100 acres

Service Area: Up to 20-mile radius around the park

Regional Park: Regional Parks include unique areas such as lakes, wetlands, auditoriums, water bodies, and campgrounds, in addition to the active recreational facilities offered in community and community regional parks. Many of the recreation activities are associated with experiencing the natural environment. A regional park may also perform important ecological and environmental functions, including serving as wildlife habitats. Passive park amenities include group picnic areas with overhead shelters and barbecues. Additional park amenities include lakes, wetlands, auditoriums, water bodies for swimming, fishing and boating, and sports fields.

Size: Greater than 100 acres

Service Area: 25-mile or greater radius around the park

Special Use Facility: Special use facilities are generally single purpose facilities that serve greater regional recreational or cultural needs. Passive features include wilderness parks, nature preserves, botanical gardens, and nature centers. Active uses include performing arts, water parks, golf driving ranges, and golf courses.

Size: No size criteria

Service Area: No assigned service radius area

Trails/Linear Parks: SCAG,¹³ Los Angeles County,¹⁴ and San Bernardino County¹⁵ define trails as linear parks that provide community access to increased health and fitness activities in the increasingly urbanized region.

Multi-Benefit Parks: According the Los Angeles County General Plan, multi-benefit parks and open spaces are created through collaborative efforts among city, county, state, and federal agencies; private organizations; schools; private landowners; and industries. These parks are characterized as having more than one function and contributing to multiple program goals. There are a number of applications of multi-benefit parks including: utility corridors and flood protection basins that can serve as areas for active or passive recreation; school sites located adjacent to parks that can share facilities, such as parking

¹³ SCAG. 2016. *2016-2040 RTP: Active Transportation Appendix*. Available online at: http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS_ActiveTransportation.pdf, accessed September 4, 2019.

and park amenities; watershed areas that can protect critical wildlife habitats, preserve open space, provide trails for recreation, and contribute to water conservation objectives; and water districts, where trails can be located adjacent to flood protection channels and trailhead parks.¹⁶

School Sites: According the Los Angeles County General Plan, the County works with school districts to organize, promote, and conduct joint recreational and educational programs. These community recreation agreements are a form of joint-use agreement, where either a school or park facility may be put to some recreational use by the other party in exchange for some facility improvement and/or maintenance. A park does not have to be adjacent to a school (i.e., share a common boundary) for an agreement to be viable.¹⁷

City Parks and Facilities: According the Los Angeles County General Plan, city parks and facilities that are located close to the borders of the unincorporated areas are enjoyed by city and County residents alike. Similarly, local County parks that are located within or close to the borders of cities provide recreational amenities for both populations.¹⁸

Private Recreational Facilities: According the Los Angeles County General Plan, private recreational facilities play an important role in meeting recreational needs. The network of private recreational facilities consists of churches, health and fitness clubs, and other organizations that offer a variety of programs and facilities.¹⁹

Greenways: According the Los Angeles County General Plan, greenways provide a linear area along natural corridors, and often follow features such as rivers, man-made waterways, drainage channels, and utility easements. Greenways can accommodate various modes of uninterrupted pedestrian travel on pathways, including walking, jogging, and bicycling, and can include recreation areas and natural landscape features.²⁰

¹⁹ Ibid.

²⁰ Ibid.

Within the SCAG region, parks are classified into several subgroups: neighborhood, community, city, as well as specialized recreation areas, regional recreational areas, state and federal recreation areas, and open space areas.²¹

Neighborhood Park: A park or playground developed primarily to serve the recreational needs of citizens living within a 0.5-mile radius of the park. These facilities include pocket parks and neighborhood playgrounds.²²

Community Park: A larger park or facility developed to meet the park and recreational needs of those living or working within a one to two-mile radius. Community parks may have a variety of playing fields and community recreation facilities.²³

City Park: A park having a wide range of improvements not usually found in neighborhood and community parks and designed to meet the recreational needs of the entire city population. Recreational facilities might include a nature area, golf course, zoo, pool, skateboarding parks, playing fields, or structures like gymnasiums, community centers, and public or private educational institutions. Parks may also be themed, such as a park dedicated to the agricultural heritage of the area.

Specialized Recreation Area: A recreation area or facility devoted to a very specific activity or use, such as a linear park, golf courses, or soccer parks.

Regional Recreation Area: Regional recreation areas provide access to significant ecological, cultural, or historical features or unique facilities that attract visitors from throughout the entire region (including incorporated and unincorporated areas). Regional recreation areas may be composed of one large site or several sites located in proximity that together provide a significant recreation area for the region. These parks may include areas of significant natural resources, as well as more developed activity sites. Regional recreation areas may be supported by a wide variety of specialized facilities such as indoor recreation centers, large group picnic areas, special event facilities/festival space, and campgrounds.

State and Federal Recreation Areas: A park maintained by state or federal agencies and typically providing recreational opportunities like camping, hiking, bird watching, rafting, boating, and fishing. Many parts of the region have vast areas covered by state or federal parkland.

22 Los Angeles County Department of Regional Planning. 2015. *Los Angeles County General Plan Adopted October 6, 2015: Chapter 10: Parks and Recreation Element*. Available online at: http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan.pdf, accessed September 16, 2019.

23 Ibid.

Open Space Areas: Open space refers to lands that are generally unimproved and used for resource conservation and/or the managed production of resources. Open space is comprised of both designated open space and “de facto” open space. Designated open space is land that has been left undeveloped by design. Other land is deemed open space not by design, but because the land is not involved in a productive use, or in the case of agricultural lands, the land is consumed by a productive use that contributes to the visual quality of the land or provides wildlife habitat.

3.16.1.2 Existing Conditions

The diverse natural resources located in the six counties within SCAG’s jurisdiction provide a wide range of recreational opportunities for residents and tourists alike. Resources range from small neighborhood parks featuring playground equipment and sports fields to vast expanses of wilderness with hiking trails, rafting, and camping. In addition to parks for active recreation, the SCAG region also has a diversity of open space areas. The SCAG region contains approximately 150 miles of coastline, four national forests, two national parks, and several national wildlife refuges. There are 48 California state parks, 268 county parks, and over 3,300 city parks and open space areas in the SCAG region.^{24,25} These lands are governed by a variety of agencies, including municipal park departments, independent park districts, counties, cities, community service districts, and federal and state agencies.

Open Space and Recreation Lands in the SCAG Region

Public parks and open space serve all of the residents in the SCAG region, as well as tourists and visitors. The variety of landscapes within the SCAG region allows for a broad range of parks and recreational facilities, many of which are quite unique. The multitude of parks and associated facilities make the SCAG region an ideal area for outdoor exploration and draw many tourists and visitors to the area. An effective regional transportation system would increase accessibility to such destinations, for tourists and residents alike. Improved access to outdoor spaces would benefit the overall health and well-being of residents, as well as public education and environmental awareness. **Table 3.16-1, Recreational Areas and Protected Open Space by County (Acres)**, shows California Protected Areas (CPAs), lands owned in fee, from small parks to large wilderness areas, in each SCAG county by acreage.

Each city and county within the SCAG region has a general plan containing an open space and/or parks and recreation element. Each element describes specific rules, regulations, and current conditions of

²⁴ California Department of Parks and Recreation. *Find a Park by County*. Available online at: <http://www.parks.ca.gov/parkindex>, accessed October 24, 2018.

various local parks and recreation facilities to maximize recreational benefits within each jurisdiction. Based on the information found in the various county plans, Orange County and Los Angeles County have a deficiency in local parkland. Los Angeles, Orange, and San Bernardino counties have established regional parkland standards, which they currently meet. Imperial County also meets its combined local and regional parkland standard. Further detail regarding the condition of parks, recreation, and open space in counties within the SCAG region is described below.

**Table 3.16-1
Recreational Areas and Protected Open Space by County (Acres)**

County	Total Acres
Imperial County	1,575,196
Los Angeles County	906,082
Orange County	152,486
Riverside County	2,857,963
San Bernardino County	8,492,573
Ventura County	645,734
Total	14,630,034

Imperial County

Imperial County is a predominantly agricultural area and approximately 50 percent of County lands are undeveloped and under federal jurisdiction. A recreation designation covers the largest area of any land use in the County.²⁶ The County maintains approximately 1,575,196 acres of regional parkland and protected open space, 97 percent of which is open access land. Two and a half percent of protected land has no public access and less than one percent has restricted access, where the public can only enter with a permit. This total includes parkland owned by the federal, state, county, and city as well as special district, nonprofit, private, and joint parkland.²⁷ The Imperial County General Plan has established a standard of five net acres of overall parkland per 1,000 residents in unincorporated areas. With a total

²⁶ Imperial County. 1993. *General Plan Environmental Impact Report, Update*. Available online at: <http://www.icpds.com/?pid=829>, accessed March 27, 2019.

²⁷ Ibid.

population of 207,682 in 2019, there are approximately 7,585 protected acres per 1,000 inhabitants, which is significantly higher than the set overall standard.²⁸

Imperial County contains the Ocotillo Wells and Heber Dunes State Parks as well as eight County parks.²⁹ County parks maintain sports courts and recreational facilities, trails, barbecues, and playgrounds and space for activities such as camping, boating, and fishing. The Heber Community Center is also operated by the County and includes a library, event area, kitchen, and sports courts. Ocotillo Wells is a State Vehicular Recreation Area (SVRA) and contains more than 85,000 acres of desert open for off-road exploration, recreation, and camping. The Heber Dunes State Park is also an SVRA; it is mostly utilized by all-terrain vehicle (ATV) riders. The 323 acres of parkland are exclusively for day utilization and no camping, shooting or hunting is allowed.

Los Angeles County

Los Angeles County has 906,082 acres of parkland, a majority of which is under the jurisdiction of the federal government.³⁰ This total includes parkland owned by the federal, state, county, and city as well as special district, nonprofit, private, and joint parkland.³¹ The County maintains approximately 70,000 acres.³² Over 92 percent of the total parkland is open access and less than one percent allows no public access. The Los Angeles County General Plan has established a standard of 4 acres of local parkland per 1,000 residents in the unincorporated areas and 6 acres of regional parkland per 1,000 residents of the total population in Los Angeles County. According to the General Plan (2015), the County has a substantial deficit in local parkland, providing approximately 0.6 acres of local parkland per 1,000 unincorporated residents but 7.02 acres of regional parkland per 1,000 residents (total), which is above the regional standard.³³

³³ Ibid.

Los Angeles County has 177 County parks and 24 state parks, the most of any county in the SCAG region.³⁴ Parks in Los Angeles include beaches, picnic areas, sports fields and courts, and hiking and camping opportunities. There are also multiple special use facilities, single purpose facilities serving greater regional recreational or cultural needs, such as the Hollywood Bowl.³⁵ Prominent parks in Los Angeles County include Santa Catalina Island Regional Park, Griffith Park, Topanga State Park, and the Antelope Valley Poppy Reserve.

Orange County

Orange County contains 152,486 acres of protected parkland, the majority of which is controlled on a federal or county level.³⁶ This total includes parkland owned by the federal, state, county, and city as well as special district, nonprofit, private, and joint parkland.³⁷ Orange County General Plan (2014) established parkland standards of 2.5 acres of local parkland per 1,000 residents in unincorporated areas and 6 acres of regional parkland per 1,000 residents.³⁸ With a total population of approximately 3,250,000 people,³⁹ the County provides about 46.9 acres of parkland per 1,000 residents, far surpassing regional parkland standards.

Orange County maintains 25 urban and wilderness parks, comprised of 60,000 acres including historical sites, beaches and harbors, and 150 miles of paved regional trails and 350 miles of off-road trails. Additionally, there are a host of local parks, beaches, and nature preserves.⁴⁰ Prominent parks include Laguna Coast Wilderness Park, Carbon Canyon Regional Park and Irvine Regional Park.

Riverside County

Riverside County has 2,857,963 acres of protected parkland, over 2.8 million of which are open access.⁴¹ This total includes parkland owned by the federal, state, county, and city as well as special district,

nonprofit, private, and joint parkland.⁴² Regional parks in the area cover approximately 23,317 acres.⁴³ The County does not have set standards regarding parklands but the vast amount of open space, the second-most in the SCAG region, allow for approximately 1,161 acres of protected parkland per 1,000 residents based on a 2019 population of 2,460,000 people.⁴⁴ Riverside County parks include Joshua Tree National Park, Anza-Borrego State Park, and the Salton Sea State Recreation Area.

San Bernardino County

San Bernardino has the most open space and protected parkland out of all of the counties in the SCAG region. It maintains a total of 8,492,573 acres of protected parkland, 8,469,686 of which are open access.⁴⁵ This total includes parkland owned by the federal, state, county, and city as well as special district, nonprofit, private, and joint parkland.⁴⁶ The 2007 General Plan denotes a standard of 2.5 acres of regional parkland per 1,000 residents.⁴⁷ With a population of approximately 2,210,000 people,⁴⁸ the County provides about 3,830 acres of parkland per 1,000 residents, far surpassing regional parkland standards.

The San Bernardino Regional Parks Department operates a total of 8,515 acres of regional parks. Numerous County special districts operate local parks in many unincorporated communities of the County. These districts operate independently from the County government and are financed by local taxes within each respective district boundary. The County also includes wilderness areas that are mostly under the jurisdiction of the BLM, including the Sand to Snow National Monument and the Mojave Trails National Monument.⁴⁹

Ventura County

Ventura County is home to 645,734 acres of protected parkland and open space.⁵⁰ This total includes parkland owned by the federal, state, county, and city as well as special district, nonprofit, private, and joint parkland.⁵¹ The County maintains 13 regional parks, 23 county parks, and a multitude of beach front parks and marinas, and community parks. The County also operates the Hungry Valley SVRA, 18,780 acres between Los Angeles and Ventura counties that are open to vehicular use, trail use, and camping.⁵² Ventura County does not specify parkland and open space standards but with a population of approximately 868,000 persons⁵³, the County provides roughly 743 acres of total parkland and open space per 1,000 residents.

3.16.2 REGULATORY FRAMEWORK

The federal government sets public recreation standards for protection of publicly owned recreation areas; scenic, historic, and recreational trails; national forests, and recreational fisheries from conversion to non-compatible land uses that may include transportation projects through the recreational resource. The state sets recreation standards for protection of public parkland and establishment of new parkland to meet the needs of a growing population as a result of development project. The provision of new parkland and recreational facilities is generally subject to local general plan policies.

3.16.2.1 Federal

Section 4(f) of the U.S. Department of Transportation Act of 1966 (U.S. DOT Act)

Section 4(f) of the U.S. DOT Act (Public Law 89-670) was enacted as a means of protecting publicly owned public parks, recreation areas, and wildlife/waterfowl refuges as well as historic sites of local, state, or national significance, from conversion to transportation uses.

The provision states that the Secretary of the U.S. DOT may approve a transportation project requiring the use of publicly owned land of a public park, recreation area, or wildlife and waterfowl refuge, or land

⁵⁰ California Protected Areas (CPAD). 2018. *CPAD Statistics*. December. Available online at: <https://data.cnra.ca.gov/dataset/california-protected-areas-database-2018a>, accessed July 30, 2019.

from an historic site of national, state, or local significance (as determined by the federal, state, or local officials having jurisdiction over the park, recreation area, refuge or site) only if:⁵⁴

- There is no feasible and prudent avoidance alternative to the use of land; and the action includes all possible planning to minimize harm to the property resulting from such use; or
- The Administration determines that the use of the property will have a de minimis impact.

National Trails System Act

The National Trails System Act (Public Law 90-543) was established by Congress in 1968 to establish a network of scenic, historic, and recreational trails. The act defined four categories of national trails: recreation trails, scenic trails, historic trails, and connecting or side trails. Trails within park, forest, and other recreation areas administered by the Secretary of the Interior or the Secretary of Agriculture or in other federally administered areas may be established and designated as “National Recreation Trails” by the appropriate Secretary.⁵⁵ Since the National Trails System Act was enacted, the list of qualifying national scenic trails and national historic trails has grown from the initial two trails (the Application National Scenic Trail and Pacific Crest National Scenic Trail) to the current list, which includes 11 national scenic trails and 19 historic trails. In addition, more than 1,000 national recreation trails have been designated nationwide, 91 of which are located in California.^{56,57}

National Forests Land Management Plans

Each of the four Southern California national forests (Cleveland National Forest, Los Angeles National Forest, San Bernardino National Forest, and Los Padres National Forest) is included in the Southern California National Forests Vision. The Southern California National Forests Vision (forest plans) has created individual land management plans for each of the four Southern California national forests. The land management plans include strategic programmatic direction for managing the land in each national forest and its resources for the next 10 to 15 years. The plans include sections on resource management,

public use and enjoyment, facilities operation and maintenance, commodity and commercial uses, and fire management.⁵⁸

Executive Order 12962—Recreational Fisheries

The objective of Executive Order 12962, dated June 7, 1995, is the conservation, restoration and enhancement of aquatic systems to provide for increased recreational fishing. Under the executive order, federal agencies shall improve the quantity function, sustainable productivity and distribution of U.S. aquatic resources for recreational fishing opportunities by:⁵⁹

- Developing and encouraging government-private sector partnerships
- Identifying recreational fishing opportunities
- Implementing sound aquatic conservation and restoration practices
- Providing access and promoting awareness
- Supporting outreach programs
- Implementing laws
- Establishing cost-share programs
- Evaluating the effects of federally funded, permitted, or authorized actions on aquatic resources and recreational fishing
- Assisting private landowners to conserve and enhance aquatic resources

Land and Water Conservation Fund Act, Section 6(f)(3)

Section 6(f)(3) of the Land and Water Conservation Fund Act (LWCF Act) of 1965 (16 U.S.C. § 460l et seq.) contains provisions to protect federal investments in park and recreation resources and the quality of those assisted resources. The law recognizes the likelihood that changes in land use or development may make park use of some areas purchased with LWCF Act funds obsolete over time, particularly in rapidly changing urban areas, and provides for conversion to other use pursuant to certain specific conditions.

Section 6(f)(3) states that no property acquired or developed with assistance under Section 6(f)(3) shall, without the approval of the Secretary, be converted to other than public outdoor recreation uses. The

⁵⁸ USDA. 2005. *Land Management Plan: Part 1 Southern California National Forests Vision*. Available online at: https://www.fs.usda.gov/Internet/FSE_DOCUMENTS/stelprdb5166876.pdf, accessed August 20, 2019.

⁵⁹ Government Publishing Office. 1995. *Executive Order 12962 of June 7, 1995*. Available online at: <https://www.govinfo.gov/content/pkg/FR-1995-06-09/pdf/95-14407.pdf>, accessed August 20, 2019.

Secretary shall approve such conversion only if he or she finds it to be in accordance with the then existing comprehensive statewide outdoor recreation plan and only upon such conditions as he or she deems necessary to assure the substitution of other recreation properties of at least equal fair market value and of reasonably equivalent usefulness and location.

This requirement applies to all parks and other sites that have been the subject of LWCF Act grants of any type, and includes acquisition of park land and development or rehabilitation of park facilities. If a transportation project would have an effect upon a park or site that has received LWCF Act funds, the requirements of Section 6(f)(3) would apply.⁶⁰

3.16.2.2 State

Quimby Act of 1965

The Quimby Act was established by the California State Legislature in 1965 and codified as California Government Code Section 66477. The Quimby Act allows the legislative body of a city or county, by ordinance, to require the dedication of land or impose a requirement of the payment of fees in lieu thereof, or a combination of both, for park or recreational purposes as a condition to the approval of a tentative tract map or parcel map. Under the Quimby Act, requirements for parkland dedications are not to exceed three acres of parkland per 1,000 persons residing within a subdivision, and in-lieu fee payments shall not exceed the proportionate amount necessary to provide three acres of parkland, unless the amount of existing neighborhood and community parkland exceeds that limit.⁶¹

California Public Park Preservation Act of 1971

The primary instrument for protecting and preserving parkland is the State Public Park Preservation Act of 1971 (Pub. Resources Code, §§ 5400–5409). Under the Act, cities and counties may not acquire any real property that is in use as a public park for any non-park use unless compensation or land, or both, are provided to replace the parkland acquired. This provides no net loss of parkland and facilities.⁶²

California Recreational Trails Plan of 2002

The California Department of State Parks (California State Parks) is a trustee agency that owns and operates all state parks and participates in land use planning that affects state parklands. Pursuant to

⁶⁰ National Park Service. 2015. *Land and Water Conservation Fund*. Available online at: <https://www.nps.gov/subjects/lwcf/protection.htm>, accessed August 20, 2019.

⁶¹ California Legislative Information. *AB-1191 Quimby Act*.

⁶² California Legislative Information. 1971. *Chapter 2.5. Preservation of Public Parks [5400-5409]*.

California Public Resources Code Section 5070, the California Recreational Trails Act, California State Parks has prepared the California Recreational Trails Plan in 1978, which was updated in 2002, with reports highlighting progress on the plan that are submitted to the State Legislature every two years.⁶³ The California Recreational Trails Plan establishes 12 designated trail corridors that pass through the SCAG region with the intent of forming a statewide trail system that links mountain, valley, and coastal communities to recreational, cultural, and natural resources throughout the state.⁶⁴

State Open Space Standards

State planning law (Government Code Section 65560) provides a structure for the preservation of open space by requiring every city and county in the State to prepare, adopt, and submit to the Secretary of the Resources Agency a “local open-space plan for the comprehensive and long-range preservation and conservation of open space land within its jurisdiction.” The following open space categories are identified for preservation:⁶⁵

- **Open space for public health and safety**, including, but not limited to, areas that require special management or regulation due to hazardous or special conditions.
- **Open space for the preservation of natural resources**, including, but not limited to, natural vegetation, fish and wildlife, and water resources.
- **Open space for resource management and production**, including, but not limited to, agricultural and mineral resources, forests, rangeland, and areas required for the recharge of groundwater basins.
- **Open space for outdoor recreation**, including, but not limited to, parks and recreational facilities, areas that serve as links between major recreation and open space reservations (such as trails, easements, and scenic roadways), and areas of outstanding scenic and cultural value.
- **Open space for the protection of Native American sites**, including, but not limited to, places, features, and objects of historical, cultural, or sacred significance such as Native American sanctified

cemeteries, places of worship, religious or ceremonial sites, or sacred shrines located on public property (further defined in California Public Resources Code Sections 5097.9⁶⁶ and 5097.993⁶⁷).

Mitigation Fee Act

The California Mitigation Fee Act, Government Code sections 66000, *et seq.*, allows cities to establish fees to be imposed on development projects for the purpose of mitigating the impact of development on a city's ability to provide specified public facilities. In order to comply with the Mitigation Fee Act a City must follow the following primary requirements: (1) Make certain determinations regarding the purpose and use of a fee and establish a nexus or connection between a development project or class of project and the public improvement being financed with the fee; (2) Segregate fee revenue from the General Fund in order to avoid commingling of capital facilities fees and general funds; (3) For fees that have been in the possession of a City for five years or more and for which the dollars have not been spent or committed to a project, the City must make findings each fiscal year.⁶⁸

3.16.2.3 Local

Los Angeles County Significant Ecological Areas (SEAs)⁶⁹

The Hillside Management and Significant Ecological Areas Ordinance was originally adopted in 1982 and most recently amended in 2019. Significant Ecological Areas (or SEAs) in LA County are designated as such due to their biological resources. These areas include undisturbed (or lightly disturbed) habitat of threatened or valuable species, or areas that support species movement, and are appropriately sized to support sustainable populations of the local species. The program is designed to conserve the diversity of biological resources in LA County through conservation and more stringent development rules. The SEA Ordinance outlines the review process and development standards for these areas to ensure biodiversity and ecosystems will not be negatively impacted by development. There are 21 SEAs in LA County per the 2035 General Plan published in 2015.

Orange County Transportation Association Measure M2⁷⁰

Also known as “OC Go,” Measure M2 is a voter-approved sales tax extension of Measure M, which was approved in 1990. This program is the funding source for county transportation projects as well as the Freeway Environmental Mitigation Program in Orange County. The Freeway Environmental Mitigation Program funds natural lands acquisitions and in turn, qualifying transportation projects undergo a streamlined California Environmental Quality Act (CEQA) review process. Thirty million dollars for approximately 1,300 acres of land and \$10 million on 350 acres of habitat restorations have been funded through Measure M2.

Ventura County Habitat Connectivity and Wildlife Corridor Ordinance

Formally adopted in May 2019, this ordinance establishes regulations for development on lands where animals travel between the Santa Monica Mountains National Recreation Area and the Los Padres National Forest. The ordinance includes restrictions on elements detrimental to species movement, such as fencing, certain types of lighting and development in riparian areas. To provide flexibility for compliance, exemptions are allowed for agricultural activities.

Ventura County Save Open Space and Agricultural Resources (SOAR)⁷¹

SOAR is a collection of voter initiatives to create City Urban Restriction Boundaries (CURB) in eight of the county’s cities. With these initiatives, re-zoning natural or agricultural lands for development outside of a city’s sphere of influence requires a majority vote approval from residents. In 2016, voters approved all of the initiatives for renewal, which extends the expiration date until 2050.

County and City General Plans

The most comprehensive land use planning, including that for recreational facilities, in the SCAG region is provided by county and city general plans, which local governments are required by state law to prepare as a guide for future development. The SCAG region spans six counties and 191 cities, all of which have general plans containing policies related to provision of recreational resources. Open space and recreation resources are normally addressed in two mandatory elements of the general plan: land use and open space. The land use element normally focuses on the distribution of recreation facilities and

⁷⁰ OCTA. *OC GO Local Tax Dollars at Work*. Available online at: [http://octa.net/About-OC-Go/OC-Go-\(2011-2041\)/](http://octa.net/About-OC-Go/OC-Go-(2011-2041)/), accessed September 11, 2019.

⁷¹ Ventura County Resources Management Agency. *County of Ventura Measure (SOAR) Save Open space and Agricultural Resources Initiative – 2050*. Available online at: https://docs.vcrma.org/images/pdf/planning/ordinances/SOAR_Measure_C_2050.pdf

programs and an inventory of open space land, including those lands that provide opportunities for recreational activities. In contrast, the open space element focuses on open space for outdoor recreation including, but not limited to:

- Areas of outstanding scenic, historical, and cultural value
- Areas particularly suited for park and recreational purposes, including access to lakeshores, beaches, and rivers and streams
- Areas that serve as links between major recreational and open-space reservations, including utility easements, banks of rivers and streams, trails, and scenic highway corridors

The six county general plans address the majority of the regional open space, beyond that provided by the national forest, national parks, and wildlife refuges:

- **San Bernardino County:** Chapter VI. Open Space Element⁷⁹ of County General Plan
- **Ventura County:** Resources Appendix⁸⁰ and Public Services and Facilities Appendix⁸¹ of County General Plan

Each city in the SCAG region has its own respective general plan that helps provide guidance for the growth and development of the city and contains measures to maintain and/or enhance open space within each of the city's jurisdictions. Each city's general plan varies in level of detail and necessary measures to preserve open space. Although city general plans are not required to contain parks and recreation sections, cities often choose to include this section to provide measures to maintain and/or enhance city parks and recreation areas.

Additional plans and ordinances at the master plan level, city-level, and specific plan level may also apply within the SCAG region.

Zoning

City and county zoning codes provide the set of detailed requirements that implement general plan policies at the level of the individual parcel. Zoning codes present standards for different uses and identifies which uses are allowed in the various zoning districts of the jurisdiction. Since 1971, state law has required the city or county zoning code to be consistent with the jurisdiction's general plan.⁸²

3.16.3 ENVIRONMENTAL IMPACTS

3.16.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that the adoption and/or implementation of the Plan could result in significant adverse impacts to recreational resources, if the Plan would be considered to have the potential for significant impacts if it would:

- Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated;
- Result in substantial adverse physical impacts associated with the provision of new or physically altered park facilities, need for new or physically altered park facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, or other performance objectives;
- Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

3.16.3.2 Methodology

The Plan lists transportation projects and includes strategies for integrating land use development patterns with transportation investments that emphasize system preservation and enhancement, active transportation, mode choices, accessibility, and mobility. These land use distribution patterns are designed to accommodate the region's demographic growth projections. Although population growth and development are anticipated to occur even without Connect SoCal, this Plan includes regional transportation and land use strategies that may influence growth throughout the region. To address this, the analysis in this PEIR covers overall region-wide impacts of major transportation projects listed in the Plan as well as transportation and land use strategies described in the Plan.⁸³

The need for or deficiency in adequate park facilities or library facilities to serve residents in the SCAG region is not in and of itself a CEQA impact, but a social or economic impact (*City of Hayward v. B'd of Trustees* (2015) 242 Cal.App. 4th 833, 843). However, pursuant to Appendix G of the *State CEQA Guidelines*, the determination of whether there is a significant impact related to parks or other recreational facilities is based on whether a significant impact could result from the construction and subsequent

⁸³ Major transportation projects include but are not limited to projects that involve ground disturbing activities and projects outside of existing rights-of-way such as projects that require new rights-of-way, adding traffic lanes, and grade separation.

operation of new or altered parks and/or recreational facilities or where existing park and recreational facilities would be substantially physically deteriorated as a result of the implementation of the Plan.

The methodology for determining the significance of recreation impacts compares the existing conditions to future (2045) conditions, as required in CEQA Section 15126.2(a). To assess potential impacts to recreation within the SCAG region, geographic information system (GIS) was used to analyze whether major highway, transit, and freight rail projects documented in the Plan would directly impact existing recreation resources. Baseline conditions were established for the acreage of local and regional parkland per 1,000 population in each county to determine existing park level of service, and the 2045 anticipated population growth forecast was used to calculate the quantity of parkland needed to meet future recreation needs.

The results of the GIS analysis determine whether major transportation projects included in the Plan could directly affect existing local and regional parkland in the SCAG region. Indirect impacts were evaluated based on the land development patterns after a review of the Plan's transportation and land use strategies, as well as the assumptions that protected recreational areas (such as national forests) would remain protected and new development would be encouraged away from natural habitat areas to be concentrated in existing urbanized areas such as high-quality transit areas (HQTAs) (near transit).

The mitigation measures in the PEIR are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.16.3.3 Impacts and Mitigation Measures

Impact REC-1 Potential to increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

Significant and Unavoidable Impact – Mitigation Required.

Transportation projects and growth under the Plan would have the potential to increase use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration would occur, constituting a potentially significant impact. The Plan's transportation improvements aim to accommodate the anticipated population increase of approximately 3.2 million persons over the lifetime of the Plan. The Plan may influence new growth, primarily within urbanized areas such as HQTAs and other livable corridors and centers. Therefore, it is possible that existing neighborhood parks and other recreational facilities would see an increase in usage, which, in turn, may result in substantial physical deterioration of facilities. It is also possible that as population in urban centers increases, there may be more demand for parks outside of HQTAs, particularly if HQTAs are not well served. As such, the Plan's overall improvement of the transportation network could also result in increased accessibility and demand on regional parks.

Park accessibility is defined in the Plan as the share of the population within a one- and two-mile travel buffer from a regional park or school; also the share of park acreage that can be reached within 30 minutes by automobile or 45 minutes by bus or all transit modes during the evening peak period. As demonstrated in **Figure 3.16-1 Regional Recreation and Open Space Areas within a 45-Mile Radius of 2045 HQTAs** and **Table 3.16-2 Acres of Regional Recreation and Open Space Areas within a 45-Mile Radius of HQTAs in 2045**, based on the assumption that a 45-minute drive would provide access to regional parks within a 30-mile radius around HQTAs, most of the SCAG region would be adequately served by regional parks in 2045.

**Table 3.16-2
Acres of Regional Recreation and Open Space Areas within a 45-Mile Radius of HQTAs in 2045**

	Imperial County ¹	Los Angeles County ²	Orange County ³	Riverside County ⁴	San Bernardino County ⁵	Ventura County ⁶
Regional parkland standard (acres per 1,000 population)	n/a	6	6	n/a	2.5	n/a
2045 population ⁷	281,200	11,677,200	3,534,600	3,251,700	2,815,000	947,500

Local parks and urban areas are often overburdened in part because they are smaller and serve populated areas. As the land use strategies in the Plan emphasize compact development, it is possible that local parks could become overburdened. Accessibility to parks is also a public health concern and is addressed under Environmental Justice in the Plan. Urbanized areas, such as the low-income communities of Westlake and Southeast Los Angeles in the City of Los Angeles, are significantly park poor, with less than half an acre of park space per 1,000 residents.⁸⁴ Construction of transportation projects, as well as development in underutilized urban (opportunity) areas, as a result of land use strategies in the Plan would have the potential to impact recreational facilities both directly (through the acquisition of land)

⁸⁴ Los Angeles Department of City Planning. March 2015. *Plan for a Healthy Los Angeles: A Health and Wellness Element of the General Plan*. Available at: <http://planning.lacity.org/cwd/gnlpln/PlanforHealthyLA.pdf>, accessed June 24, 2019.

and indirectly (through development of transportation projects, urban uses, and increasing use of existing parks).

There may be sufficient parkland available in 2045 in some areas, while other areas may see a substantial increase in population and/or existing parks/recreational facilities may be transformed into development. As a result, by 2045 some areas and parks could have a lower LOS as a result of increasing population with no associated increase in park area, and some communities could have fewer parks. These impacts are expected to disproportionately affect urban centers where land prices are high. All of which is expected to result in existing parks and recreational facilities experiencing increased use and associated physical deterioration or accelerated physical deterioration.

Many of the transportation projects included in the Plan are located in urbanized areas, and therefore, are not likely to result in direct significant impacts to undisturbed lands or large tracts of land designated as open space. Additionally, as described in the regulatory framework, designated parklands are well protected at the local, state, and federal level.

Land use strategies described in the Plan would target growth in urbanized areas such as HQTAs that provide walkable, bikeable, and/or transit-oriented land patterns. Although HQTAs account for only 3 percent of total land areas, they are projected to accommodate 48 percent of the region's future households and 59 percent of the future jobs in 2045 under the Plan.⁸⁵ While land use strategies included in the Plan encourage additional parks and other regional and local biking and walking amenities, many of the areas where density would be expected to increase are areas without sufficient park space, resulting in increased use and the accelerated deterioration of existing neighborhood parks and recreational facilities.

The Plan includes strategies for active transportation, including expansion of the regional greenway network, regional and local bikeway network, and short-trip strategies to improve sidewalk quality and use of complete streets when making roadway improvements. These strategies are integrated with land use patterns such as HQTAs, livable corridors, neighborhood mobility areas, as well as with innovative technologies such as neighborhood electric micro-mobility vehicles through scooter and bike share programs. While the Plan has the potential to result in a significant impact on existing neighborhood and regional parks or other recreational facilities, implementation of such strategies can facilitate the creation of new neighborhood and regional recreational facilities and opportunities.

Overall, implementation of transportation projects as well as the transportation and land use strategies in the Plan would have the potential to increase the use of existing neighborhood and regional parks and

⁸⁵ SCAG SPM Model Output, September 13, 2019

other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated, resulting in a significant impact requiring mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

See **SMM USWS-1**.

SMM REC-1: SCAG shall continue the commitment to analyze public health outcomes as part of the Regional Transportation Plan/Sustainable Communities Strategy (Plan). As part of the public health analysis for the Plan, SCAG shall continue to analyze resident access to parks and recreational facilities from a county level to help local jurisdictions to improve resident access to parks. SCAG shall communicate the impacts of the Plan through its Public Health Working group, and continue to support policy changes at the city and county level through educational programs.

Project Level Mitigation Measures

PMM REC-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects on the use of existing neighborhood and regional parks or other recreational facilities, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Prior to the issuance of permits, where projects require the construction or expansion of recreational facilities or the payment of equivalent Quimby fees, consider increasing the accessibility to natural areas and lands for outdoor recreation from the proposed project area, in coordination with local and regional open space planning and/or responsible management agencies.
- b) Prior to the issuance of permits, where projects require the construction or expansion of recreational facilities or the payment of equivalent Quimby fees, encourage patterns of urban development and land use which reduce costs on infrastructure and make better use of existing facilities, using strategies such as:
 - i. Increasing the accessibility to natural areas for outdoor recreation
 - ii. Utilizing “green” development techniques

- iii. Promoting water-efficient land use and development
- iv. Encouraging multiple uses, such as the joint use of schools
- v. Including trail systems and trail segments in General Plan recreation standards

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts to existing park facilities could be significant and unavoidable even with implementation of mitigation.

Impact REC-2 Result in substantial adverse physical impacts associated with the provision of new or physically altered park facilities, need for new or physically altered park facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, or other performance objectives.

Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

Significant and Unavoidable Impact – Mitigation Required.

Implementation of the Plan would result in additional linear recreation facilities, including a regional greenway network, a regional bikeway network, and local bikeway networks, the construction of which might have an adverse physical effect on the environment. Furthermore, the Plan encourages increased residential and commercial development in HQTAs that may necessitate the construction or expansion of recreation facilities within or in nearby accessible locations to the HQTAs, which are typically urban areas. Development of recreation facilities benefits the community socially, economically and environmentally. Recreational facilities and programs can also promote public health. For example, San Bernardino County enacted the Vision 2B Active program to promote health and wellness in the county

by encouraging residents to increase their physical activity and connecting them to existing recreational programs, amenities, and activities.^{86, 87}

As discussed in **Section 3.14, Population and Housing**, the total population in the SCAG region is expected to increase by approximately 3.2 million people by 2045, independent of the Plan. The land use framework of the Plan assumes an increase in small-lot, single- and multi-family housing that is expected to mainly occur in infill locations near transit infrastructure (HQTAs and transit priority areas [TPAs]), and transit-oriented communities. This increased density in urban areas will increase demand for parks and recreational facilities in these areas. Larger parks become increasingly difficult to provide as space is limited and land is expensive. When park development and expansion in urban areas occurs, it is beneficial but can also result in environmental impacts associated with construction and operation. Park construction, including the linear recreational facilities considered in the Plan, can result in noise and air quality impacts and park and recreational facility operation can also result in long-term noise and night lighting impacts. See **Section 3.3, Air Quality**, and **Section 3.13, Noise**, for a discussion of air quality and noise impacts from construction and mitigation to reduce these impacts. Therefore, this PEIR finds that potential construction and/or expansion of recreational facilities that may result from implementation of the Plan has the potential to result in a significant adverse impact, and mitigation measures are required.

Mitigation Measures

SCAG Mitigation Measure

See **SMM REC-1**.

Project Level Mitigation Measures

See **PMM REC-1, PMM AQ-2, and PMM NOISE-1**.

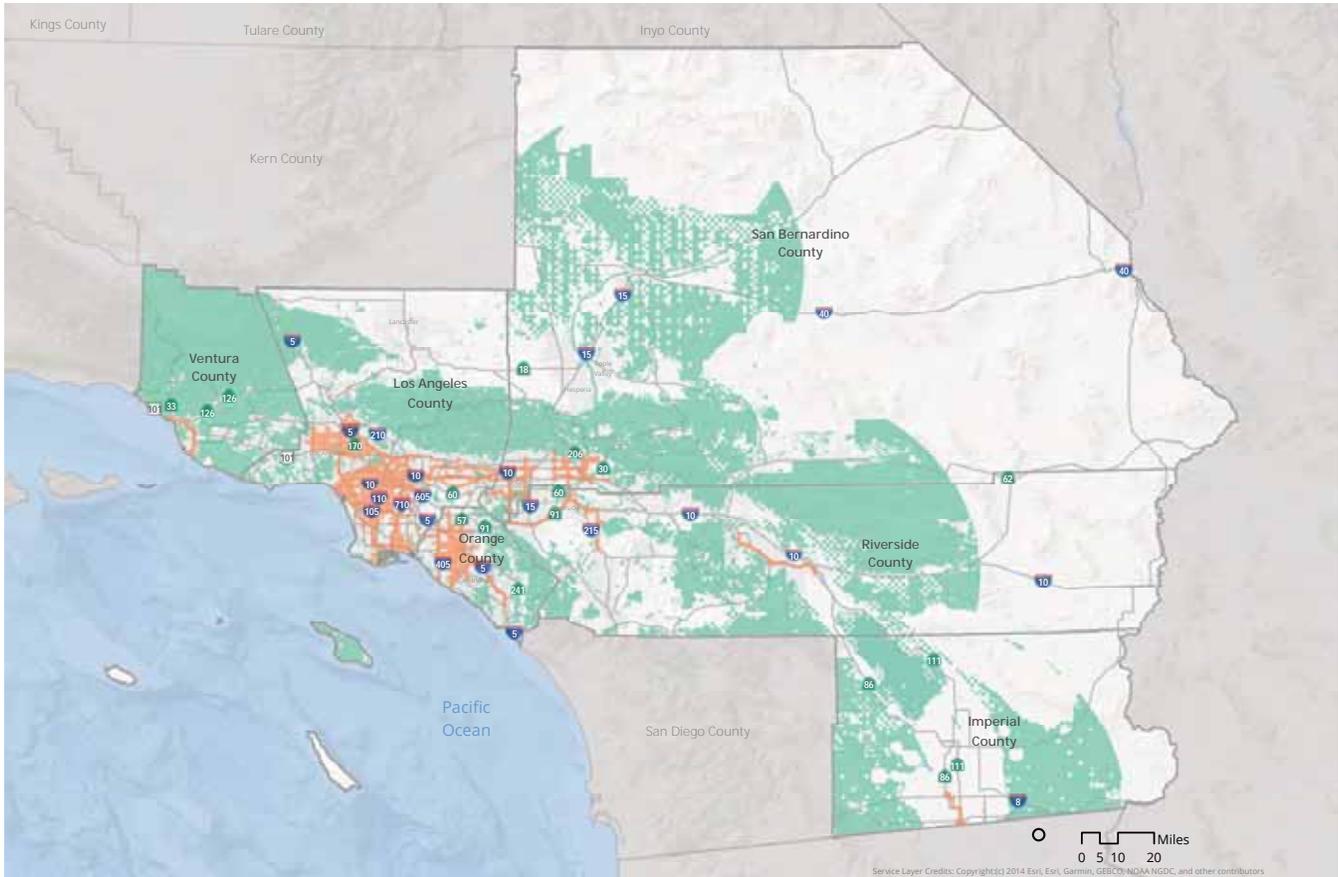

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include

⁸⁷ National Recreation and Park Association. *Why Parks and Recreation are Essential Public Services*. Available online at: <https://www.nrpa.org/uploadedFiles/nrpa.org/Advocacy/Resources/Parks-Recreation-Essential-Public-Services-January-2010.pdf>

project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts resulting from the construction and operation of parks could be significant and unavoidable even with implementation of mitigation.

3.17 TRANSPORTATION, TRAFFIC, AND SAFETY

This section of the Program Environmental Impact Report (PEIR) describes the existing traffic and transportation networks within the SCAG region, identifies the regulatory framework with respect to laws and regulations that address transportation, and analyzes the potential impacts of the Connect SoCal Plan (“Connect SoCal” or “Plan”). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.17.1 ENVIRONMENTAL SETTING

Southern California’s extensive roadway network facilitates the constant movement of people and goods throughout the area. The region’s complex intermodal network facilitates transportation via highways, transit, passenger and freight rail, airports, and seaports. The regional roadway system consists of an interconnected network of interstates, freeways, highway, toll roads, arterial streets, and local streets. This roadway network allows for the operation and movement of private vehicles, commercial vehicles, private and public buses, and heavy-duty trucks. Active transportation modes, such as biking and walking use non-motorized transportation facilities, including bikeways and walkways that often share spaces with roadway facilities. As traffic worsens and pressure to act on climate change mounts, local jurisdictions have placed an emphasis on the importance of the integration of active transportation modes in transportation planning.

The regional public transit system includes local shuttles, municipal and area-wide bus operations, light rail transit operations, regional commuter rail services, and interregional passenger rail service. The freight railroad network includes an extensive system of private railroads and several publicly owned freight rail lines serving industrial cargo and goods. The airport system consists of commercial, general, and military aviation facilities serving passenger, freight, business, recreational, and defense needs. The region’s seaports support substantial international and interregional freight movement and tourist travel. Intermodal terminals, consisting of freight processing facilities, transfer, store, and distribute goods across the region and the globe.

3.17.1.1 Definitions

Terms and criteria used in the assessment of traffic, transportation, and safety are described below.

California Transportation Plan (CTP): This is a statewide, long-range transportation plan to meet future mobility needs and reduce greenhouse gas emissions.¹ The CTP defines performance-based goals, policies, and strategies to achieve the collective vision for California's future, statewide, integrated, multimodal transportation system.

Congestion Management Plan (CMP): This is a state-mandated program enacted by the legislature to address the increasing concern that urban congestion is affecting economic vitality and diminishing quality of life in some communities. The CMP provides the analytical basis for transportation decisions through the State Transportation Improvement Program (STIP).

Congestion Management Agency (CMA): A CMA is a county-wide body comprised of local elected officials. The CMA administers the CMP to keep traffic levels manageable. In the past, state gas tax revenue had historically been used to fund road and highways. With the passage of Proposition 111 in the 1990s, state gas tax and directed revenue are provided to fund road, bicycle, pedestrian, and public transit projects in addition to highways to help manage congestion for multi-modal purposes. CMA is charged with coordinating land use, air quality, and transportation planning among the local jurisdictions, including monitoring the levels of congestion on major roads and analyzing the impacts that a proposed development will have on future traffic congestion.

Complete Streets: Planned, designed, operated and maintained for safe, convenient, and comfortable travel and access for users of all ages and abilities, will support people who are walking, bicycling, and using micro-mobility devices.

Complete Streets is a transportation policy and design approach that requires streets to be planned, designed, operated, and maintained to enable safe, convenient and comfortable travel and access for users of all ages and abilities regardless of their mode of transportation

Goods Movement: Refers to the transportation of for-sale products from the location of their manufacture or harvest to their final retail destination.

Level of Service (LOS): In the context of traffic analysis, this is a measure used to relate the quality of traffic service. LOS is used to analyze highways by categorizing traffic flow and assigning quality levels of traffic based on performance measures such as speed and density.

Million Annual Passengers (MAP): Number of people taking public transit, airline flight, bus, or train calculated expressed in the unit of 100,000 in terms of boarding counts.

¹ California Department of Transportation. 2013. *California Transportation Plan 2040: Fact Sheet*. April.

Peak Hour: The part of the day during which traffic congestion on roads and crowding on public transport is at its highest.

Safety: Protection of persons and property from unintentional damage or destruction caused by accidental or natural events.

Transportation Demand Management (TDM): Strategies and actions directed at influencing the mode, frequency, time, route, or length of travel in order to maximize the efficiency and sustainable use of transportation facilities. TDM strategies typically include providing information on travel choices; managing parking, marketing and communications, financial incentives, and disincentives; providing and operating facilities that make the use of non-solo driving more attractive; and encouraging telework and flexible work strategies.

Transportation System Management (TSM): Transportation system management refers to a set of strategies that largely aim to reduce greenhouse gas (GHG) emissions by reducing congestion, primarily by improving transportation system capacity and efficiency. TSM strategies may also address a wide range of other externalities associated with driving such as pedestrian/driver safety, efficiency, congestion, travel time, and driver satisfaction. Some TSM strategies are designed to reduce total and systemic congestion and improve system-wide efficiency, while other strategies target particularly problematic areas where improvements could greatly affect congestion, safety, efficiency, and GHG emissions.

Vehicle Miles Traveled (VMT): The number of VMT provides an indicator of the travel levels of the roadway system by motor vehicles in a given time period. This number is estimated based upon traffic volume counts and roadway length.

Vehicle Hours of Delay (VHD): The number of VHD provides an indicator of congestion levels of a roadway.

3.17.1.2 Circulation System

Commute Patterns and Travel Characteristics

The existing transportation network serving the SCAG region supports the movement of people and goods. On a typical weekday in the six-county region, the transportation network supports over 460 million vehicle miles of travel (VMT) and nearly 13 million vehicle hours of travel (VHT). Of this total, over half occur in Los Angeles County and less in Orange, San Bernardino, Riverside, Ventura, and

Imperial Counties, respectively (**Table 3.17-1, Summary of Existing Daily Vehicle Miles and Percentage Vehicle Hours of Travel**).

Much of the existing travel in the SCAG region takes place during periods of congestion, particularly during the morning (6:00 AM to 9:00 AM) and evening peak periods (3:00 PM to 7:00 PM). Congestion can be quantified as the amount of travel that takes place in delay (vehicle hours of delay or VHD) and, alternately, as the percentage of all travel time that occurs in delay (defined as the travel time spent on the highway due to congestion, which is the difference between VHT at free-flow speeds and VHT at congested speeds). Existing travel delays and percent of regional VHT in delay ranges from a low of 1 percent delay in Imperial County on freeways and arterials to 56 percent in Los Angeles County, with an average of approximately 17 percent in the SCAG region (see **Table 3.17-2, Summary of Existing Delay and Work Trip Length; Figure 3.17-1, 2019 AM Peak Period Congestion Delay on the Regional Freeway System; Figure 3.17-2, 2045 AM Peak Period Congestion Delay on the Regional Freeway System; Figure 3.17-3, 2019 PM Peak Period Congestion Delay on the Regional Freeway System; and Figure 3.17-4, Plan 2045 PM Peak Period Congestion Delay on the Regional Freeway System**). There is variation in average travel distance from home to work, from approximately 11 miles in Imperial County, to approximately 21 miles in Riverside and San Bernardino Counties, the difference in average travel time during the peak hours ranges from a low of approximately 15 minutes in the a.m. peak hour in Imperial County to a high of approximately 33 minutes in Riverside County (**Table 3.17-2**). Home-to-work trip duration and distance are both greater for the inland counties of Riverside and San Bernardino, reflecting regional housing and employment distribution patterns.

The characteristics of home-to-work trip and all daily trips vary widely among counties (**Table 3.17-3, Existing Travel Mode Split [Percentage of County Total]**). On average, vehicular trips account for approximately 93 percent of home to work/university trips, including 69.62 percent in single occupancy trips, 9.41 percent in two-person carpools, 6.7 percent in three-person carpools, and 7.64 percent in auto passenger trips. When accounting for all daily trips, on average vehicular trips account for approximately 88 percent of all daily trips, including 36.77 percent in single occupancy trips, 13.89 percent in two-person carpools, 8 percent in three-person carpools, and 29.39 percent in auto passenger trips. Public transit in all forms (including school buses) carries approximately 3.67 percent of all trips in the SCAG region. Of these, the greatest number of travelers is carried by buses, with lesser patronage on Metro Rail, paratransit, commuter rail, and other forms of public transit services. Trips made via public transit account for 3.9 percent of all home-to-work trips in the region and 3.67 percent of all daily trips (**Table 3.17-3**). Non-motorized trips account for 2.73 percent of all home-to-work trips in the region and 8.27 percent of all daily trips (**Table 3.17-3**).

Regional Freeway, Highway, and Arterial System

The regional freeway, highway, and arterial system is the primary means of person and freight movement for the region (Table 3.17-4, Existing Regional Freeway Route Miles and Lane Miles by County [2019]). This system provides for direct auto, bus and truck access to employment, services and goods. The network of freeways, interstates, and highways serves as the backbone of the system, offering very high capacity limited-access travel and the primary heavy-duty truck route system. Deferred maintenance on roadways within the SCAG region has contributed significantly to the poor condition of many roadways and many need costly repairs to improve security and efficiency. The Plan will focus on preserving the existing transportation network, including preservation of roads, highways, bridges, railways, bicycle and pedestrian facilities, and transit infrastructures that lead to maintain mobility and provide cost-efficiency without increasing capacity.

Table 3.17-4
Existing Regional Freeway Route Miles and Lane Miles by County (2019)

County	Freeway Route Miles	Freeway Lane Miles
Imperial	95	380
Los Angeles	656	4687
Orange	227	1661

Arterial Street System

The local street system provides access for local businesses and residents. Principal arterials account for more about 79 percent of the arterial (principal and minor) network (Table 3.17-5, Existing Regional Arterial Lane Miles by County [2019]) and carry a high percentage of total traffic. In many cases arterials serve as alternate parallel routes to congested freeway corridors. Peak period congestion on the arterial street system occurs generally in the vicinity of activity centers, at bottleneck intersections and near many freeway interchanges.

**Table 3.17-5

Regional High-Occupancy Vehicle (HOV) System and Park and Ride System

The regional HOV system consists of exclusive lanes on freeways and arterials, as well as busways and exclusive rights-of-way dedicated to the use of high-occupancy vehicles (HOVs). As described in **Table 3.17-6, Existing Regional High-Occupancy Vehicle Lane Miles by County (2019)**, the HOV system includes lanes on freeways, ramps and freeway-to-freeway connectors. The regional HOV system is designed to maximize the person-carrying capacity of the freeway system through the encouragement of shared-ride travel modes. HOV lanes operate at a minimum occupancy threshold of either two or three persons. Many include on-line and off-line park and ride facilities, and several HOV lanes are full “transitways” including on-line and off-line stations for buses to board passengers.

Park and ride facilities are generally located at the urban fringe along heavily traveled freeway and transit corridors and support shared-ride trips, either by transit or by carpool or vanpool. Most rail transit stations have park and ride lots nearby. Park and ride lots in the SCAG region include: 106 in Los

Angeles County, 25 in Orange County, 26 in Riverside County, 18 in San Bernardino County, and 20 in Ventura County.²

3.17.1.3 Public Transit

In Southern California public transit service is comprised of local and express buses, transitways, Rapid Bus, bus rapid transit (BRT), urban rail, including subway and light rail principally centered in the core of Los Angeles County, commuter rail that spans five counties and shuttles/circulators that feed all transportation modes and activity centers (**Table 3.17-7, SCAG Region Annual Fixed Route Transit Ridership**). Transit service is provided by approximately 67 separate public agencies. Twelve of these agencies provide 91 percent of the existing public bus transit service. Local service is supplemented by municipal lines and shuttle services while additional regional service is offered via private bus companies.

Many people depend on reliable transit service to participate in the economic, cultural, and social benefits of Southern California, and transit use is growing in the SCAG region (**Table 3.17-8, Statistics for Major Transit Operators for 2017**). According to data reported to the National Transit Database (NTD), transit agencies in the SCAG region experienced 655 million annual boardings and invested \$2.91 billion in operations and maintenance (O&M) in FY 2015–16. These services were operated by over 100 agencies, involving a wide variety of bus and rail transit modes.³

Metro Rail System

Existing urban rail lines (Metro Rail) are located in Los Angeles County and are operated by Metro. They include the Metro Blue Line from Long Beach to Downtown Los Angeles, the Metro Green Line from Redondo Beach to Norwalk, the Metro Expo Line from Downtown Los Angeles to Santa Monica, and the Metro Red Line subway from Union Station to North Hollywood. The Metro Purple Line subway follows the Red Line from Union Station to Wilshire and Vermont but branches off to Western Avenue, and the Metro Gold Line that runs from East Los Angeles (Atlantic station) to Azusa via Union Station (shown in **Figure 2.0-3, Existing Transit Network [2018]**). The Metro Rail system is operated seven days a week. A system total of 98 route miles serves a total of 93 stations. Ridership on the Metro Rail system is approximately 359,000 boardings every day.

Commuter Rail and Intercity Passenger Rail

Commuter rail service is operated by the Southern California Regional Rail Authority (SCRRA). In October of 1992, the SCRRA began initial operation of the Metrolink commuter rail system on three lines. Service on the initial system was greatly expanded after the 1994 Northridge earthquake. Currently SCRRA operates seven routes including five from Downtown Los Angeles to Ventura, Lancaster, San Bernardino, Riverside, and Oceanside, from San Bernardino to Oceanside, and from Riverside via Fullerton or City of Industry to Downtown Los Angeles. As of Q3 2018-19, the system operated 173 trains on weekdays, 48 on Saturdays, and 42 on Sundays to 62 stations on 538 route miles. Average weekday ridership is approximately 38,436 passengers.⁴

Amtrak provides significant regional and interregional service on the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Corridor (also known as Amtrak’s Pacific Surfliner corridor) operating 12 daily round-trip services, with service to Los Angeles Union Station (**Figure 3.17-5, Amtrak Railways**). Additionally, Amtrak operates four interstate routes within the region (Coast Starlight, Sunset Limited, Southwest Chief and Texas Eagle) that on average have one daily trip.⁵

Shuttles and Demand-Responsive Services

One component of the region’s public transit system consists of publicly operated or funded demand-response taxis and dial-a-ride services; some open to the general public, others limited to elderly and disabled use. It also includes locally operated or funded shuttle buses (e.g., Los Angeles DASH, Pasadena

4 Southern California Regional Rail Authority. 2018. *Facts and Numbers*. Available online at: <https://www.metrolinktrains.com/about/agency/facts--numbers/>, accessed September 24, 2019.

ARTS, Glendale Beeline, Cerritos on Wheels, El Monte Transit, Riverside Orange Blossom, etc.). Access Paratransit, the largest provider of transportation services for the disabled in the region, operates in the vicinity of fixed-route bus and rail lines in Los Angeles County and extends into portions of the surrounding counties of San Bernardino, Orange and Ventura. These systems serve as local shuttles, internal circulators, connectors to other public transit, or as shoppers' shuttles. Service on these systems is usually limited to a prescribed geographic area.⁶

3.17.1.4 Active Transportation and Non-Motorized Transport

The California Active Transportation Program (ATP) was created to ensure all active modes of transportation, such as biking and walking, was accounted to meet the development of active transportation plans in disadvantaged communities as well as the implementation of non-infrastructure projects (i.e. education, enforcement activities). The use of bicycle as a means of transportation has several appealing aspects for an increasing share of travelers.

Bicycle and Pedestrian Facilities

Biking and walking primarily constitute non-motorized transportation. Non-motorized transportation plays a bigger role in the densely-populated, mixed-land-use areas of the region. Bicycling has positive air quality, economic, and health impacts, and can reduce automobile-related congestion and energy use. Similar to bicycle use, walking can also reduce auto emissions of both criteria pollutants and greenhouse gases from auto trips. Health in communities improve when there are options to increase physical outcome of activities, lower body weight, lower rates of traffic injuries, lower air pollution, and improve mobility for nondrivers. Currently, 32 percent of all walking trips are less than half a mile, and 59 percent of walking trips are less than a mile. The average bicycle trip is 3.1 miles (the majority of bicycle trips are discretionary). Walking trips made up 3.4 percent of all commute trips and 8 percent of all trips for the SCAG region. Bicycles make up 1.3 percent of all trips and 0.8 percent of commute trips for the SCAG region.⁷

The region's bikeways encourage non-motorized travel, serve as recreational facilities, and provide inexpensive, environmentally friendly transportation opportunities. Some of the strategies to encourage active transportation currently being considered are focused on addressing concerns related to equity and public health, refining models to account for recent changes in shared mobility, improving first-last mile

⁶ Access Services. *About Us*. Available online at: https://accessla.org/about_us/overview.html, accessed September 24, 2019.

⁷ Southern California Association of Governments. November 2019. SCAG Active Transportation Technical Report.

infrastructure, and improving compact community development through targeted High Quality Transit Areas (HQTAs). The bikeways are also designated to provide for allowable use and to encourage active use. Class I bikeways are separate shared-use paths also used by pedestrians, Class II bikeways are striped lanes in streets, and Class III bikeways are signed routes. There are approximately 5,075 bikeway miles in the region, with the majority in Los Angeles County, followed by Riverside and Orange County. Bike rack, locker, and station programs are ongoing in a number of cities and transit operators. In addition, transit operators are integrating bicycle transportation with transit via bus bike racks, bike-on-train programs and bicycle lockers at transit centers. **Figure 3.17-6, Existing Regional Bikeways**, and **Figure 3.17-7, Existing and Proposed Regional Bikeways (2045)**, show the existing and proposed bikeways in the SCAG region.

Pedestrian access at and near public transit, in most major commercial areas, and many residential areas is facilitated by sidewalks, a number of pedestrian malls, and in some cases local jogging and pedestrian trails or paths.

Micro-transit

Micro-transit is more flexible than traditional bus service in that it either utilizes dynamic routing, smaller vehicles or on-demand service that allows greater efficiency and convenience. Some micro-transit services exist in Southern California, but it can and must expand in order to meet riders' shifting needs and expectations. While accommodations should be made for those who do not possess smartphones or other technology to hail a ride or research a route, most transit riders could benefit from micro-transit.

Los Angeles Metro and Orange County Transportation Authority have partnered with private companies to pilot micro-transit services in their respective counties. These are projects that could change the way people ride transit, giving riders more options.

Micro-mobility

Micro-mobility strategies provide shared technology infrastructure and regulation frameworks to ensure that new technologies (e.g. app-based e-scooters and e-bikes) can be used safely and responsibly. These strategies range from incentives for the purchase of e-bikes, to the distribution of private micro-mobility devices that help ensure access for low-income communities. While it is expected that many of these devices will be provided through the private sector, they will still use public streets and will likely increase demand for separated facilities that are safe for all ages and abilities. Local cities will likely be tasked with the regulation of these devices and will likely need to manage the locations where parking is allowed and where they can be ridden.

3.17.1.5 Goods Movement

Goods movement generally refers to the movement of raw, semi-finished, and finished materials and products used by businesses and residents across the transportation system. These goods move in myriad ways and through complex systems, often using multiple modes of transportation (e.g., ships, trucks, trains, planes, etc.). Products can be produced within the U.S. or another country, and make their way to a business, retail store, or directly to consumers versus traditional purchases by consumers at physical retail outlets. The efficient movement of these goods are critical to maintain a strong economy and ensure improvements in the quality of life of regional residents.

Goods movement supports industries and activities that provide jobs, tax revenue, and resources that bolster innovation, creativity, and access to local and world markets through trade. This movement depends directly on the infrastructure that comprises the transportation network such as highways, rail lines, ports, and networks of warehousing and other distribution facilities. Maintaining and improving existing infrastructure, and expanding infrastructure capacity where appropriate, is key to ensuring the competitiveness of a growing economy. However, goods movement also has negative impacts and externalities. Growing trade and increased volumes of goods moving across the transportation system have contributed to greater congestion, safety concerns, harmful emissions of dangerous pollutants, wear-and-tear on roadways and impacts on local neighborhoods. As the Metropolitan Planning Organization (MPO) for the region, SCAG has adopted a vision for the region's goods movement system.

Federal law (23 U.S.C. §§ 134-135) mandates that MPOs encourage and promote the safe and efficient management, operation, and development of surface transportation systems that will serve the mobility needs of people and freight and foster economic growth and development within and between States and urbanized areas. Specifically, MPOs should consider projects and strategies that will increase the accessibility and mobility of people and for freight and enhance the integration and connectivity of the transportation system, across and between modes, for people and freight.⁸

At the state level, MPOS are required to perform regional transportation planning to prepare and provide for the region's mobility in a fiscally and environmentally responsible manner, consistent with the needs, preferences, and sensibilities of the community. This coincides with California Government Code 65041.1 (Cal Civ. Code § 65041.1) and identifies planning considerations for freight that are consistent with federal requirements.

⁸ United States Code. 2019. §134. *Metropolitan transportation planning*. Available online at: https://www.govregs.com/uscode/title23_chapter1_section134, accessed September 16, 2019.

Wholesale and retail trade, transportation, and manufacturing support over approximately 6 million jobs in the SCAG region according to statistics provided by the State's Employment Development Department.⁹

Heavy-Duty Trucks

Figure 3.17-8, Existing Regional Goods Movement System displays the regional goods movement system. One of the key components of the region's goods movement system is the fleet of heavy-duty trucks, defined as cargo-carrying vehicles with a gross weight rating in excess of 8,500 pounds. Trucks provide a vital link in the distribution of all types of goods between the region's ports (sea and air), railroads, warehouses, factories, farms, construction sites and stores. The size and weight of heavy-duty trucks gives them unique operating characteristics; that is, they accelerate and decelerate more slowly than lighter vehicles and require more road space to maneuver. Dedicated truck lanes currently exist at two major freeway interchanges: the junction of Interstate 5 (I-5) with the I-210 and State Route 14 (SR-14) and at the junction of the I-405 with the I-110. In addition, truck climbing lanes are located on northbound I-5 in northern Los Angeles County.

The trucking industry, including common carrier, private carrier, contract carrier, drayage and owner-operator services, handles both line-haul and pick-up and delivery. The industry uses the public highway system for over-the-road and local service. However, it is also served by a considerable infrastructure of its own. This infrastructure includes truck terminals, warehousing, consolidation and trans-loading facilities, freight forwarders, truck stops and maintenance facilities. These various facilities are especially prevalent in the South Bay and Gateway Cities areas, including Wilmington and Carson and extending generally between Los Angeles International Airport (LAX) and the San Pedro Bay Ports, along the I-710 Corridor north to Vernon, Commerce, and Downtown Los Angeles, east through the San Gabriel Valley to Industry, Pomona, and Ontario and then to the Inland Empire in Fontana and Rialto as well as in Glendale and Burbank. Specialized facilities for trucking that provide air cargo ground transport are located around regional airport facilities, notably LAX and LA/Ontario International Airport.

Railroads

The SCAG region is served by two main line commercial freight railroads—the Burlington Northern/Santa Fe Railway Co. (BNSF) and the Union Pacific Railroad (UP). These railroads link Southern California with other United States regions, Mexico, and Canada either directly or via their

⁹ State of California Employment Development Department. 2019. *Employment by Industry Data*. January. Available online at: <https://www.labormarketinfo.edd.ca.gov/data/employment-by-industry.html>, accessed January 30, 2019.

connections with other railroads. They also provide freight rail service within California. In 2017, railroads moved approximately 162.3 million tons of cargo throughout California.¹⁰

The SCAG region is also served by three short line or switching railroads:

The Pacific Harbor Line (formerly the Harbor Belt Railroad), which handles all rail coordination involving the Ports of Los Angeles and Long Beach, including dispatching and local switching in the harbor area;

- Los Angeles Junction Railway Company, owned by BNSF, which provides switching service in the Vernon area for both the BNSF and UP;
- The Ventura County Railroad, owned by Rail America, Inc., which serves the Port of Hueneme and connects with the UP in Oxnard.

These railroads perform specific local functions and serve as feeder lines to the trunk line railroads for moving goods to and from Southern California.

The two main line railroads also maintain and serve major facilities in the SCAG region. Intermodal facilities in Commerce (BNSF-Hobart), East Los Angeles (UP), San Bernardino (BNSF), and Carson near the San Pedro Bay Ports (UP-ICTF), the Los Angeles Transportation Center (UP-LATC), and the UP-City of Industry yards serve on-dock rail capacity at the Ports of Los Angeles (UP/BNSF) and Long Beach (UP/BNSF).

All major rail freight corridors in the region have some degree of grade separation, but most still have a substantial number of at-grade crossings on major streets with high volumes of vehicular traffic. These crossings cause both safety and reliability problems for the railroads and for those in motor vehicles at the affected crossings. Trespassing on railroad rights of way by pedestrians is another safety issue affecting both freight and commuter railroads.

3.17.1.6 Regional Aviation System

The SCAG region supports the nation's largest regional airport system in terms of number of airports and aircraft operations, operating in a very complex airspace environment. The SCAG region contains seven commercial airports with scheduled passenger service, seven government/military air fields, and over 30 reliever and general aviation airports. The existing active commercial service airports handle the majority

¹⁰ Association of American Railroads. 2018. *U.S. Freight Railroad Industry Snapshot: California*. Available online at: <https://www.aar.org/data-center/railroads-states/#state/CA>, accessed January 30, 2019.

of passenger air traffic (see **Figure 3.9-1, Airports in the SCAG Region**, in **Section 3.9, Hazards and Hazardous Materials**).

- Los Angeles International Airport (LAX)
- Ontario International Airport (ONT)
- John Wayne/Orange County Airport (SNA)
- Hollywood Burbank Airport (BUR)
- Imperial County Airport (limited commercial service) (IPL)
- Long Beach Airport (LGB)
- Palm Springs International Airport (PSP)

In all, approximately 110.2 million annual passengers (MAP) were served in the region in 2017, a 28 percent increase over 2012. The level of regional aviation demand forecasts related to MAP has been decreasing, with approximately 165.3 MAP by 2035 in the 2008 RTP, 145.9 MAP by 2035 in the 2012 RTP/SCS, and 136.2 MAP by 2040 in the 2016 RTP/SCS.¹¹ In 2017, Los Angeles International Airport (LAX) led the largest share of air passengers with approximately 77%, followed by John Wayne Airport at 10%, Hollywood Burbank Airport at 4%, and Ontario International Airport at 4%.¹² The SCAG region is forecast to have 197.1 MAP by 2045. In 2017, the SCAG region was one of the most active and fastest growing regions for air passenger traffic in the United States, second only to the New York/New Jersey region for air passenger traffic. Moreover, the growth rate of 5.12 percent for the SCAG region from 2012 to 2017 was second only to the Bay Area. LAX accounts for the largest proportion of passenger volume, cargo, and annual operations. A brief discussion of the location, major access routes, and facilities at seven major airports is provided below.

Hollywood Burbank/Bob Hope Airport (BUR)

Located in the San Fernando Valley northwest of downtown Burbank, the Hollywood Burbank Airport (also known as Bob Hope Airport) is a publicly owned airport operated by the Burbank-Glendale-Pasadena Airport Authority. Major vehicular access is provided by I-5, Hollywood Way, San Fernando Road, and Vanowen Street. Burbank Airport is currently in the project planning process for a new, relocated terminal, which would enable faster processing while maintaining existing capacity. Burbank Airport has dedicated transit and rail facilities for passengers coming to and from the airport and is the only airport in the SCAG region with a direct rail connection to Downtown Los Angeles via Amtrak and Metrolink. Burbank Airport averages 354 aircraft operations per day, including 38 percent commercial and 29 percent transient general aviation. Burbank Airport served 4.7 MAP in 2017, a 20 percent increase over 2015.

¹¹ Southern California Association of Governments. November 2019. Aviation Technical Report.

¹² Ibid.

Imperial County Airport (IPL)

Imperial County Airport is located in the City of Imperial, approximately 12 miles north of the California-Mexico border. The airport provides limited scheduled air service and serves the general aviation needs of the surrounding communities. It is part of the Essential Air Service (EAS) program through the US Department of Transportation, providing residents of Imperial County a connection to the national aviation system by subsidizing air service to eligible small community airports. Currently, only one scheduled passenger airline operates out of IPL, carrying passengers to LAX or BUR. IPL averages 38 aircraft operations per day, including 43 percent general aviation and 25 percent military. IPL served 11,812 passengers in 2017, down from a peak of approximately 30,000 passengers in 2001.

Long Beach Airport/Daugherty Field (LGB)

Long Beach Airport is located approximately four miles northeast of downtown Long Beach. Built in 1941, the Long Beach Airport terminal is a Cultural Historic Landmark. In 2017, a new concourse was opened, and a new ground transportation center is currently being constructed. The arrival of low-cost carrier JetBlue in 2001 led to a rapid increase in air traffic and solidified the airport as an alternative to LAX for east coast destinations. The airport primarily serves general aviation aircraft. LGB averages 811 aircraft operations per day, including 51 percent local general aviation and 34 percent transient general aviation. LGB served 3.8 MAP in 2017 and averages approximately 25,000 tons of cargo per year.

Los Angeles International Airport (LAX)

Located 18 miles southwest of Downtown Los Angeles, LAX is the publicly owned primary airport serving the Greater Los Angeles Area. As the largest airport in the region and the fourth busiest in the world for passenger traffic, LAX plays a critical role in the movement of people and cargo throughout the region. When factoring out connecting flights, LAX is the busiest origin and destination airport in the world for passenger traffic. LAX is also the 13th busiest cargo airport in the world by tonnage. LAX is currently undergoing a major renovation known as the Landside Access Modernization Program, which will include an elevated Automated People Mover; two Intermodal Transportation Facilities with drop-off areas; a Consolidated Rental Car Facility; and a comprehensive series of roadway improvements. In addition, Metro's Crenshaw/LAX Line is set to open in summer 2020, providing a light rail connection from the Automated People Mover to destinations throughout South Los Angeles, ultimately connecting to the Expo and Green Lines. LAX averages 1,603 aircraft operations per day, including 92 percent commercial aviation. Passenger traffic at LAX has steadily increased since the 2008 Recession, from 59 MAP in 2010 to 84.6 MAP in 2017. LAX accommodates over 70 percent of the air passenger travel in the SCAG region.

Ontario International Airport (ONT)

Ontario International Airport is located in the City of Ontario in San Bernardino County. It is accessed primarily via I-10 and SR-60. Southwest Airlines is the largest carrier operating at the airport, and ONT is also a major cargo hub for UPS, due to its long runways and relatively limited noise restrictions. Ontario Airport averages 267 aircraft operations per day, including 63 percent commercial and 18 percent air taxi. Currently, ONT averages approximately 4 MAP, though at one point in the early 2000s, that number went as high as 7 MAP.

Palm Springs International Airport (PSP)

Palm Springs International Airport is located in the desert resort city of Palm Springs in the Coachella Valley of Riverside County. The airport primarily caters to seasonal leisure travelers visiting during the winter. PSP averages 142 aircraft operations per day, including 37 percent commercial and 34 percent transient general aviation. Peak travel occurs during the fall, and the airport served 2.1 MAP in 2017.

John Wayne Airport (SNA)

John Wayne Airport is owned and operated by the County of Orange and is not located in an incorporated city. However, it is surrounded by the cities of Santa Ana, Irvine, Newport Beach, and Costa Mesa and accessible by the I-405 and SR-73 freeways. SNA is 503 acres with 20 gates for commercial airlines and two commuter terminals, and general aviation outnumbered commercial operations. Strict noise regulations impact when flights can fly in and out of John Wayne Airport. Commercial departures between 10 PM and 7 AM (8 AM on Sundays) and arrivals between 11:00 PM and 7 AM (8 AM on Sundays) are prohibited. Additionally, special takeoff procedures for most aircraft require a steep climb followed by an abrupt power reduction at approximately 500 feet for quiet passage over Newport Beach. SNA served 10.4 MAP in 2017, making it the second busiest airport in the SCAG region.

3.17.1.7 Maritime Ports

Southern California is served by three major deep-water seaports. These ports—Hueneme, Long Beach, and Los Angeles—handle Asia–North America trade and are served by the two major railroads and numerous trucking companies in Southern California. The Port of Hueneme, with its recent expansion, ranks as one of the premier automobile and agricultural product-handling facilities in California. The Ports of Long Beach and Los Angeles are full-service ports with facilities for containers, autos and various

bulk cargoes. With an extensive landside transportation network, the three ports moved more than 370 million metric tons of cargo in 2017.^{13,14,15}

In particular, the San Pedro Bay Ports (Long Beach and Los Angeles) dominate the container trade in the Americas by shipping and receiving nearly 17 million 20-foot Equivalent Units (TEUs) of containers in 2018.^{16,17} Together these two ports rank third in the world, behind Rotterdam and Hong Kong, as the busiest maritime ports.

3.17.1.8 Transportation Hazards

Based on average accident rates provided by Caltrans, transportation-related fatalities in 2015 occurred at an overall rate of 1.01 fatalities per 100 million vehicle miles traveled, taking into account the varying accident rates on different facility types (freeway, arterials) and travel modes (bus transit, rail transit).¹⁸ In 2015, the most recent date for which data is available, more than 1,700 people died and nearly 160,000 were injured on roadways throughout the SCAG region (**Table 3.17-9, Total Vehicle Fatalities and Injuries in the SCAG Region (2016)**). On any given day in Southern California, six people are killed by a car or truck. In 2016, in the SCAG region, more than 1,700 people died including more than 70 cyclists and nearly 500 pedestrians. The problem is getting worse: the number of pedestrians killed in crashes grew 50 percent between 2011 and 2016. The leading cause of serious injuries and fatalities in collisions is unsafe speed.¹⁹

Safety, Security and Emergency Access

Southern California is home to significant natural disasters, including earthquakes, wildfires, flooding, and mudslides (discussed in **Section 3.7, Geology and Soils**, and **Section 3.20, Wildfire**). Although natural disasters, such as earthquakes and hurricanes, have produced significant regional casualties and property damage, none had the serious disruption to national travel and the national economy as the September 11, 2001, terrorist attacks. The 9/11 attacks created a new awareness of the vulnerabilities of transportation fleets and facilities. As concern about the threat of terrorism and consequences of natural disasters has grown, government (at all levels) has taken new measures to secure the welfare of its citizens. Transportation and transit agencies throughout the United States are taking increasing steps to protect their facilities against the threats of crime, terrorist activity, and natural disasters.

A large-scale evacuation would be difficult in the SCAG region. The region already has severe traffic congestion and mobility issues. The region encompasses 38,000 square miles with a diverse geography, ranging from dense urban areas, to mountain ranges, to vast deserts. The interdependency of the jurisdictions and organizations makes regional cooperation and coordination essential to security and emergency preparedness. Typically, no single agency is responsible for transportation security. At the local level, especially within transit agencies, safety may be handled within one office. However, it is far less likely that the security of a surface transportation mode is managed by one entity and that this entity is even controlled by the transportation organization. For example, highways and transit networks traverse multiple police jurisdictions, local fire departments generally fill the incident command role after terrorist events, regional command and control centers respond to both natural and intentional disasters,

and federal agencies intervene as needed and based on specific guidelines such as the crossing of state boundaries.

The complexity of the SCAG region, with a range of potential terrorism targets, presents significant challenges in coordinating and implementing effective homeland security programs. The unexpected and complex nature of these natural and human-caused incidents require extensive coordination, collaboration and flexibility among agencies and organizations involved in planning, mitigation, response and recovery.

As described above, the SCAG region has an extensive transportation system, with more than 73,800 miles of freeway and arterial lanes and 5,000 miles of bikeways. As of 2019, the region had 15.8 million licensed drivers and 12.7 million registered vehicles.²⁰ As of 2016 (most recent year data was available), 1,711 people died and 157,895 were injured in traffic collisions in the region. Therefore, safeguarding the Southern California transportation safety to minimize accidents on-road for vehicles and pedestrians is an important focus of the region.

The Transportation Research Board has classified emergency events that affect transportation agencies into several categories (**Table 3.17-10, Transportation Security Vulnerabilities**).

**Table 3.17-10
Transportation Security Vulnerabilities**

Roadways and Freeway	
Freeway Lanes Miles (excluding carpool)	11,642 miles
Carpool Lane Miles	935 miles
Road Lane Miles	135,578 miles
Public Transit	
Buses	5,851 vehicles
Metro Rail	98 miles and 93 stations
Metrolink	538 miles and 62 stations
Aviation/Ports	
Commercial/General Aviation Airports	56
Regional Airport Activity Levels	110.2 MAP to 200 nonstop destinations
Long Beach/Los Angeles rank among world container ports	9th
Share of United States Maritime Trade	40 percent

Rail and Mass Transit

The dispersed nature and the daily volume of passengers using public transportation services, which include intercity passenger rail, commuter rail, subway systems, and bus transportation, make it an attractive target for terrorists and criminals. **Table 3.17-10, Transportation Security Vulnerabilities**, provides a summary of the regional transit system.

- 105 miles of heavy and light rail
- 534 miles of commuter rail (Metrolink)
- 9,000 miles of bus routes
- 5,075 miles of bikeways
- 135,578 total lane miles of roadways
- 94 miles of express lanes

The numbers of customers using public transportation every day creates ongoing challenges for enhancing security within transit environments. Plans have been implemented to provide for basic protection. In the early 1990s, the California Public Utilities Commission required that transit agencies operating rail systems prepare a comprehensive System Safety Program Plan (SSPP) that also included a security component. Since 2004, all transit agencies are required to include a security and emergency management plan, which details how the agency would coordinate with first responder (law enforcement and fire) agencies, their respective County Office of Emergency Services and the Statewide Standardized Emergency Management System (SSEMS).

International Border Crossings

Within the SCAG region, there are three international ports of entry along the Mexico–Imperial County border: two at Calexico (Calexico and Calexico-East); and, one at Andrade (near Yuma, Arizona). Traffic from these ports enters California on the I-8 corridor. U.S. Customs and the Border Protection Agency within the Department of Homeland Security (DHS) are charged with the management and control of the official ports of entry. Security planning includes local emergency services, as well as the CHP.

Caltrans District 11 has developed the California–Baja California Border Master Plan, which establishes a process to institutionalize dialogue among local, state and federal stakeholders in the United States and Mexico. A key objective was to develop criteria that can be used in future studies to coordinate and prioritize projects related to existing and new Ports of Entry (POEs), as well as roads leading to the

California Mexico POEs. Security was a major consideration in the development of the Border Master Plan.

Security at Seaports

The DHS has designated the seaports of Long Beach, Los Angeles, and Port Hueneme as at risk for potential terrorist actions.²¹ Security at the ports is the joint responsibility of the U.S. Coast Guard, the U.S. Customs and Border Protection Agency, federal and State Homeland Security offices, Port police agencies, Harbor Patrols and emergency service agencies. The U.S. Coast Guard leads the local Area Maritime Security Commission, which coordinates activities and resources for all port stakeholders.

The Port of Los Angeles has a dedicated police force, the Los Angeles Port Police, to patrol the area within the jurisdiction of the Port of Los Angeles. The Port Police enforce federal, state, and local public safety statutes, as well as environmental and maritime safety regulations, in order to maintain the free flow of commerce and produce a safe, secure environment that promotes uninterrupted Port operations. In addition, the Port Police partner with other law enforcement agencies, such as the Los Angeles Police Department, CHP, and Customs and Border Protection in the Cargo Theft Interdiction Program (CTIP), which investigates cargo theft, and the High Intensity Drug Trafficking Area, which targets drug trafficking at the Ports of Los Angeles and Long Beach. Furthermore, per the Maritime Transportation Security Act of 2002, the Port of Los Angeles works with the Coast Guard to develop security plans for facilities at the port.

Similar to the Port of Los Angeles, security at the Port of Long Beach entails physical security enhancements, police patrols, coordination with federal, State, and local agencies to develop security plans for the port area and investigate suspicious incidents and obtaining federal funding to pay for these enhancements. As with the Port of Los Angeles, the Port of Long Beach works with the Coast Guard to develop security plans for facilities at the port. In contrast to the Port of Los Angeles, however, the Port of Long Beach does not have its own dedicated police force. Instead, the Long Beach Police Department is responsible for patrolling the port area. In doing so, the Port reimburses the Long Beach Police and Fire Departments for their port-related activities and expenses. The Port also funds its own Harbor Patrol to supplement law enforcement work conducted by other agencies such as the Coast Guard.

In addition to the above, several programs are in place to effectively monitor and screen seaport cargo. They include:

²¹ Maritime Logistics Professional. 2017. *Security and the Ports*. September. Available online at: <https://www.maritimeprofessional.com/blogs/post/security-and-the-ports-of-los-angeles-and-long-beach-15234>, accessed January 30, 2019.

Investigations

The federal Container Security Initiative (CSI) directs Customs agents, working with host governments, to inspect and examine all cargo containers deemed high-risk before they are loaded on U.S.-bound vessels. The CSI contains four core elements: identifying high-risk containers, pre-screening containers before they reach U.S. ports of entry, using technology to prescreen high-risk containers and developing and using smart and secure containers.

Inspections

The 24-hour rule requires manifest information on cargo containers to be delivered to U.S. Customs 24 hours before the container is loaded onto a vessel in a foreign port. Customs has the right to stop any container from being loaded, for any reason, while the container is still overseas.

Partnerships

Most of the largest U.S. importers and their trading partners participate in the Customs-Trade Partnership Against Terrorism (C-TPAT), a public-private partnership designed to improve security standards throughout the cargo supply chain.

Technology

U.S. Customs uses X-ray, gamma ray and radiation-detection devices to screen incoming cargo at U.S. ports.

3.17.2 REGULATORY FRAMEWORK

This regulatory framework focuses on the federal, state, and local statutes and regulations where the primary objective is improvement of transportation systems, standards, and travel demand measures. However, there are other regulations that are focused on increased energy efficiency and reduction of greenhouse gas emissions, that if accomplished would be expected to contribute to improvement in traffic levels. Those regulations have been addressed respectively in **Section 3.6, Energy**, and **Section 3.8, Greenhouse Gases**.

3.17.2.1 Federal

Federal Clean Air Act (CAA) Transportation Conformity

Congress passed the first major CAA (42 U.S. Code [USC] § 7506(c)) in the 1970s which gives EPA primary responsibility to regulate mobile and stationary sources of emissions and direct states to develop

SIPs and required conformity determinations for areas designated nonattainment against the NAAQS, which included all six counties in the SCAG region. Conformity analysis and determination can be done at a regional level. SCAG provides a regional transportation conformity analysis in the Plan to address all nonattainment areas within the six county- region. The regional conformity determination is updated every four years with the RTP and associated FTIP and is done as a part of the project-level conformity process for regionally significant projects as they occur. A hot spot analysis is provided to confirm that the project will not cause or worsen a localized violation of the standard for carbon monoxide (CO) or particulate matter (PM10 and/or PM2.5) in the existing nonattainment area. For more information, refer to Section 3.3 Air Quality.

Metropolitan Transportation Planning

The provisions of Title 23 USC Section 134 *et seq.* provides direct authority for Metropolitan Planning Organizations (MPOs) such as SCAG to act as a regional transportation planning organization with direct responsibility for carrying out the Regional Transportation Plan (RTP). SCAG is tasked with carrying out the transportation planning process and adopting long-range transportation plans. Collaborating with state and public transportation operators, SCAG undertakes a performance-driven, outcome-based approach to planning for the six county regions. SCAG must prepare a transportation plan to be updated every four years, including identification of transportation facilities and factors for each mode of non-motorized transport to major roadways, transit, multimodal and intermodal facilities, and connectors that should function as an integrated system serving regional transportation functions. The scope of transportation planning process is to provide consideration of projects and strategies that will achieve the following objectives (23 U.S.C. § 134(g)(3)(A)):²²

- Support the economic vitality of the metropolitan area, especially by enabling global competitiveness, productivity and efficiency;
- Increase the safety of the transportation system for motorized and non-motorized users;
- Increase the security of the transportation system for motorized and non-motorized users;
- Increase the accessibility and mobility of people and for freight;
- Protect and enhance the environment, promote energy conservation, improve the quality of life, and promote consistency between transportation improvements and State and local planned growth and

²² U.S. Code. 23 USC 134: Metropolitan transportation planning.

economic development patterns; Enhance the integration and connectivity of the transportation system, across and between modes, for people and freight;

- Promote efficient system management and operation;
- Emphasize the preservation of the existing transportation system;
- Improve the resiliency of and reliability of the transportation system, and reduce stormwater impacts of surface transportation; and
- Enhance travel and tourism

Fixing America's Surface Transportation Act (FAST)

The Fixing America's Surface Transportation (FAST) Act (Pub. L. No. 114-94), enacted in 2015, builds on the changes to federal transportation planning law made by MAP-21.²³ It was the first long-term surface transportation authorization enacted in a decade that provides long-term funding certainty for surface transportation.²⁴ The FAST Act authorizes \$305 billion over fiscal years 2016 through 2020 for highway improvements, highway and motor vehicle safety, public transportation, motor carrier safety, hazardous materials safety, rail, and research, technology, and statistics programs. The FAST Act maintains the focus on safety, keeps intact the established structure of the various highway-related programs, continues efforts to streamline project delivery, and provides a dedicated source of federal dollars for freight projects.

Under the FAST Act and its predecessors, MPOs such as SCAG must prepare long-range transportation plans and update them every four years if they are in areas designated as "nonattainment" or "maintenance" for federal air quality standards. Per federal requirements, long-range transportation plans must:²⁵

- be developed through an open and inclusive process, that ensures public input; seeks out and considers the needs of those traditionally underserved by existing transportation systems;
- consults with resource agencies to ensure potential problems are discovered early in the planning process;

²³ The Moving Ahead for Progress in the 21st Century Act (MAP-21) was enacted in 2012 (PL 112-141).

²⁴ Federal Highway Administration. *Fixing America's Surface Transportation Act*. Available at: <https://www.fhwa.dot.gov/fastact/>, accessed December 18, 2018.

²⁵ Government Publishing Office. *Fixing America's Surface Transportation Act*. Available online at: <https://www.govinfo.gov/content/pkg/PLAW-114publ94/pdf/PLAW-114publ94.pdf>, accessed August 29, 2019.

- be developed for a period of not less than 20 years into the future; long-range transportation plans must reflect the most recent assumptions for population, travel, land use, congestion, employment and economic activity;
- have a financially-constrained element, transportation revenue assumptions must be reasonable, and the long range financial estimate must take into account construction-related inflation costs;
- include a description of the performance measures and performance targets used in assessing the performance of the transportation system;
- include a system performance report evaluating the condition and performance of the system with respect to performance targets adopted by the state that detail progress over time;
- include multiple scenarios for consideration and evaluation relative to the state performance targets as well as locally-developed measures;
- conform to the applicable federal air quality plan, called the State Implementation Plan, for ozone and other pollutants for which an area is not in attainment; and
- consider planning factors and strategies in the local context.

Congestion Management Process (23 USC § 134(k))

A congestion management process (CMP) is a systematic and regionally-accepted approach for managing congestion that provides accurate, up-to-date information on transportation system performance and assesses alternative strategies for congestion management that meet state and local needs. A CMP is required in metropolitan areas with a population exceeding 200,000, known as Transportation Management Areas (TMAs). Federal requirements state that in all TMAs the CMP must be developed and implemented as an integrated part of the metropolitan transportation planning process.²⁶

Federal Highway Administration Congestion Management Process

23 CFR § 450.320 requires transportation management agencies like SCAG to address congestion management through a process that provides for safe and effective integrated management and operation of the multimodal transportation system, based on a cooperatively developed and implemented metropolitan-wide strategy, of new and existing transportation facilities through the use of travel demand reduction and operational management strategies. Federal guidance recommends use of

²⁶ U.S. Code. 23 USC 134: Metropolitan transportation planning.

performance measures that includes vehicle-to-capacity ratios and level of service on a selected network of significant routes in a region.²⁷

3.17.2.2 State

Regional Transportation Plan Requirements

MPOs are required to prepare RTPs that also meet state requirements. Pursuant to Government Code sections 65080 *et seq.* each MPO must prepare and adopt a regional transportation plan directed at achieving a coordinated and balanced regional transportation system, including, but not limited to, mass transportation, highway, railroad, maritime, bicycle, pedestrian, goods movement, and aviation facilities and services. The plan must be action-oriented and pragmatic, considering both the short-term and long-term future, and shall present clear, concise policy guidance to local and state officials.²⁸

Under California Code Section 14522, the California Transportation Commission (CTC) is authorized to prepare guidelines to assist in the preparation of RTPs. The CTC's RTP guidelines identify state and federal requirements for the development of RTPs, and methods to achieve these requirements. The guidelines suggest that projections used in the development of an RTP should be based upon available data (such as from the Bureau of the Census), use acceptable forecasting methodologies, and be consistent with the Department of Finance baseline projections for the region. The guidelines further state that the RTP should identify and discuss any differences between the agency projections and those of the Department of Finance. The RTP guidelines include provisions for complying with Senate Bill 375 (see below), as well as guidelines for regional travel demand modeling.²⁹

Sustainable Communities and Climate Protection Act of 2008 (Senate Bill 375)

The Sustainable Communities and Climate Protection Act of 2008 (Senate Bill [SB] 375, Chapter 728, Statutes of 2008) requires MPOs to prepare a Sustainable Communities Strategy (SCS) that demonstrates how the region will meet its GHG reduction targets through integrated land use, housing, and transportation planning. Specifically, the SCS must identify a transportation network that is integrated with the forecasted development pattern for the plan area and will reduce GHG emissions from automobiles and light duty trucks in accordance with targets set by the California Air Resources Board (California Govt. Code Section 65080(b)(2)(B)). The targets accepted by CARB for GHG quantification for

²⁷ Government Publishing Office. §450.320.

²⁸ California Legislative Information. *Chapter 2.5. Transportation Planning and Programming [65080-65086.5]*. Available online at:

²⁹ California Transportation Commission. *Regional Transportation Plan (RTP) Guideline*. Available online at: <https://catc.ca.gov/programs/transportation-planning>, accessed August 29, 2019.

SCAG are an 8 percent reduction in per capita GHG emissions by 2020, and a 19 percent per capita reduction by 2035, in both cases with 2005 as a base year.³⁰

While increasing the SB 375 targets, CARB also noted that the increase fell short of what was needed to fully achieve state goals on GHG emissions reduction and climate change mitigation. In combination, the staff report and presentation materials to the CARB Board show that in total, the revised SB 375 GHG emissions reduction targets for all of the state's MPOs would result in a statewide reduction of 19 percent (compared to 18 percent from the prior SCS achievement), but that a 25 percent reduction was needed to fully meet the GHG emissions reduction goals of the Scoping Plan. The difference between the 19 percent resulting from CARB's updated SB 375 targets and the 25 percent identified need is referred to in other various CARB documents as the "gap."

In the SB 375 target resetting, CARB recognized that additional state action was needed to close this gap. "The recommended targets also recognize that additional State policy and funding tools are being developed to support further VMT reduction that will both help the State overall in achieving needed emission reductions and support MPOs in their ability to achieve higher targets by 2035." The categories of state action to accomplish this, with help of MPOs and other organizations, were: funding mechanisms to incentivize infill development; improved performance analysis to assist agencies in funding supportive transportation projects; expanding investment in transit and active transportation; and pricing policies and programs. All focus on VMT reduction.

Two additional state documents provide context for understanding how these GHG emissions reduction targets relate to the transportation issues discussed in this section. One is the Scoping Plan itself, which also recognizes that statewide collaboration is needed to address the gap; and further, that the gap in GHG emissions reductions would be closed through VMT reduction strategies:

Discussions among a broad suite of stakeholders from transportation, the building community, financial institutions, housing advocates, environmental organizations, and community groups are needed to begin the process to pursue and develop the needed set of strategies to ensure that we can achieve necessary VMT reductions, and that the associated benefits are shared by all Californians.

³⁰ California Air Resources Board. *SB 375 Regional Plan Climate Targets*. Available online at: <https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/regional-plan-targets>, accessed December 18, 2018.

The second document, published by CARB in January 2019, provided additional detail on the scope of the challenge, and its relationship to CEQA:

An RTP/SCS that meets the applicable SB 375 targets alone will not produce the GHG emissions reductions necessary to meet state climate goals in 2030 nor in 2050. This means that SB 375 targets are not stand-alone CEQA thresholds for GHG or transportation impact analysis (though SCS compliance may nonetheless entitle projects to certain CEQA exemptions or streamlining procedures pursuant to statute). In other words, a project that is consistent with an SCS may be eligible for certain exemptions, but compliance does not necessarily more broadly imply consistency with state climate goals nor with science based GHG reduction targets, in CARB staff's non-binding view. Some land use development projects contemplated in an SCS that will be operational in 2030 and 2050 will be consistent with state climate goals, and SB 375 defines project circumstances under which CEQA streamlining is available to qualified projects consistent with an SCS. Other projects may need to consider additional mitigation measures to further reduce per capita light-duty transportation-related GHG emissions to levels that would not conflict with state climate goals. Likewise, certain transportation infrastructure projects that will be operational in 2030 and 2050 that substantially increase VMT may conflict with state climate goals, even if they are included in an SCS that meets the applicable SB 375 targets.

CARB focused on the VMT reductions needed over current conditions (2015-2018) to meet the state's 2030 and 2050 climate goals. CARB concluded (using assumptions a cleaner fuels and technologies scenario) that a 14.3 percent reduction in daily VMT per capita and a 16.8 percent reduction in light-duty VMT per capita was needed to meet these goals (see also discussion in **Section 3.8 Greenhouse Gases**).

Senate Bill 743

SB 743 (Steinberg) was signed into law by Governor Jerry Brown on September 27, 2013, and encourages development of mixed-use, transit-oriented infill projects by: (1) establishing new CEQA exemptions for transit-oriented developments located in Transit Priority Areas (TPAs) that are consistent with an adopted Specific Plan; (2) eliminating the requirement to evaluate aesthetic and parking impacts in those targeted development areas; and (3) directing the OPR to develop an alternative metric to evaluate transportation-related impacts under CEQA.³¹

SB 743 exempts from CEQA, a residential, employment center, or mixed-use development project, including any subdivision, or any zoning, change that meets all of the following criteria:

- 1) The project is proposed within a transit priority area.
- 2) The project is undertaken to implement and is consistent with a specific plan for which an environmental impact report has been certified.

³¹ California Legislative Information. 2013. *Senate Bill No. 743*.

- 3) The project is consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in either a sustainable communities strategy or an alternative planning strategy accepted by the State Air Resources Board.³²

Furthermore, “[a]esthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment.”³³ However, the exemption for aesthetic impacts does not include impacts to historic or cultural resources. Local governments retain their ability to regulate a project’s transportation, aesthetics, and parking impacts outside of the CEQA process pursuant to local design review ordinances or other discretionary powers.

A Transit Priority Area (TPA) is an area that is located within one-half mile of an existing or planned major transit stop. A “major transit stop” refers to a site containing an existing rail transit station or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. To qualify as a TPA, a planned major transit stop needs to be scheduled for completion within the planning horizon included in the adopted FTIP or RTP. A TPA is a subset of the High Quality Transit Areas (HQTA) described in the Plan, excluding the one-half-mile buffer area along the high-quality transit corridors (which are corridors with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours).

For infill development, including transit-oriented development (TODs), SB 743 provides a rationale for the development of a new metric to evaluate CEQA transportation impacts. Prior to SB 743, CEQA transportation impacts were primarily assessed (at least at the project level) through “Level of Service” (LOS) and other congestion or delay-based analyses, which focused exclusively on motor vehicle delay. This often penalizes infill and active transportation projects. SB 743 establishes that the new transportation impact analysis methodology should appropriately balance the needs of congestion management with statewide goals related to transit-oriented mixed-use infill development, promotion of public health through active transportation, and reduction of GHG emissions. These principles complement the goals and policies of the SCAG Plan outlined in **Section 2.0, Project Description**, of this PEIR.

SB 743 directed OPR to identify appropriate criteria for the evaluation of transportation impacts. OPR selected VMT as the preferred transportation impact metric and applied their discretion to require its use statewide. SB 743 also established that aesthetic and parking effects of a residential, mixed-use residential,

³² See Pub. Res. Code § 21155.4.

³³ Pub. Res. Code § 21099(d).

or employment center projects on an infill site within a TPA are not significant impacts on the environment. The revised *CEQA Guidelines* that implement SB 743 became effective on December 28, 2018, and indicate that VMT is the basis for evaluation of transportation impacts.³⁴ Vehicle LOS and similar measures related to delay are not identified as appropriate metrics for determining the significance of transportation impacts under CEQA, although they may still be appropriate for evaluation of projects as part of the planning process.

CEQA Guidelines section 15064.3(c) indicates that each jurisdiction throughout the state has until July 1, 2020, this requirement to adopt VMT as the metric for evaluation of transportation impacts shall apply statewide, but that until that date, lead agencies may elect to use VMT and/or LOS to analyze transportation impacts (although CEQA has already been revised to indicate VMT as the appropriate metric for evaluation of transportation impacts).

The following state guidance has been produced:

- Technical Advisory on Evaluating Transportation Impacts in CEQA (OPR 2018);³⁵
- The 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals (CARB 2019);³⁶
- Caltrans Strategic Management Plan (2015 – 2020);³⁷ and
- Local Development – Intergovernmental Review Program Interim Guidance, Implementing Caltrans Strategic Management Plan 2015-2020 Consistent with SB 743 (Caltrans 2016).³⁸

With respect to identifying what represents an appropriate threshold of significance for VMT impacts, the California Air Resources Board (CARB) published the *2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals* (CARB Report)³⁹ which includes non-binding technical information on

³⁴ *CEQA Guidelines* § 15064.3.

³⁸ Caltrans. 2016. Local Development – Intergovernmental Review Program Interim Guidance, Implementing Caltrans Strategic Management Plan 2015 – 2020 Consistent with SB 743

³⁹ California Air Resources Board 2017 Scoping Plan-Identified VMT Reductions And Relationship To State Climate Goals, January 2019 https://ww2.arb.ca.gov/sites/default/files/2019-01/2017_sp_vmt_reductions_jan19.pdf

what level of statewide VMT reduction, in the judgment of CARB staff, would promote achievement of statewide GHG emission reduction targets. CARB asserts that the currently adopted SCSs throughout the state “would achieve in aggregate, a nearly 18 percent reduction in statewide per capita on-road light-duty transportation-related GHG emissions relative to 2005 by 2035, if those SCSs were successfully implemented.” However, in order to meet the state goals, the full reduction needed is a 25 percent reduction in statewide per capita on-road light-duty transportation-related GHG emissions, however, CARB has “determined that those targets would be infeasible for MPOs to achieve with currently available resources.”

The CARB Report is based on modeling that incorporates cleaner technologies and fuels (CTF) assumptions consistent with the 2017 Scoping Plan Update and the 2016 Mobile Source Strategy (as discussed below and in **Section 3.8, Greenhouse Gases**) and provides an “alternate assessment tool for jurisdictions that choose to use them to complete analyses directed by the *CEQA Guidelines*.” The CARB Report finds that:

Certain land use development projects located in areas that would produce rates of total VMT per capita that are approximately 14.3 percent lower than existing conditions, or rates of light-duty VMT per capita that are approximately 16.8 percent lower than existing conditions (either lower than the regional average or other appropriate planning context) could be, by virtue of their location and land use context, interpreted to be consistent with the transportation assumptions embedded in the 2017 Scoping Plan and with 2050 State climate goals. (Emphasis in original).⁴⁰

However, CARB notes that the modeling used for the CTF forecast identifies ratios of total statewide VMT to population and that the suggested per capita reductions are not household generated VMT and that values are not directly comparable to output from a local or regional travel demand model.

The *Technical Advisory on Evaluating Transportation Impacts in CEQA* (OPR Technical Advisory) also provides non-binding recommendations regarding assessment of VMT, thresholds of significance, and mitigation measures. OPR cites to the CARB Report to reiterate that “at present, consistency with RTP/SCSs does not necessarily lead to a less-than-significant VMT impact.”⁴¹ OPR finds:

Based on OPR’s extensive review of the applicable research, and in light of an assessment by the California Air Resources Board quantifying the need for VMT reduction in order to meet the State’s long-term climate goals, OPR recommends that a per capita [residential] or per employee

⁴⁰ CARB Report at p. 11.

⁴¹ OPR Technical Advisory at p. 11.

[office] VMT that is fifteen percent below that of existing [2017] development may be a reasonable threshold.⁴²

OPR further recommends a net increase in total retail VMT compared to existing (2017) may indicate a significant transportation impact.⁴³

OPR goes on to indicate that:

Lead agencies can evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included (e.g., residential and retail). Alternatively, a lead agency may consider only the project's dominant use. In the analysis of each use, a project should take credit for internal capture. Combining different land uses and applying one threshold to those land uses may result in an inaccurate impact assessment.⁴⁴

Since the SCAG Regional Travel Demand Model generates VMT from all uses within the region, the estimated VMT cannot be compared to OPRs targets because it is not possible to separate out the land uses.

For roadway capacity projects, OPR also recommends developing a project-level threshold based on VMT levels required to achieve legally mandated GHG emission reduction targets as set forth in the CARB Scoping Plan and 2016 Mobile Source Strategy by applying the following approach:

1. Propose a fair-share allocation of those budgets to their jurisdiction (e.g., by population);
2. Determine the amount of VMT growth likely to result from background population growth, and subtract that from their "budget";
3. Allocate their jurisdiction's share between their various VMT-increasing transportation projects, using whatever criteria the lead agency prefers.⁴⁵

OPR also provides guidance on how to estimate VMT impacts from roadway expansion projects and suggests the following general mitigation and alternatives:

- Tolling new lanes to encourage carpools and fund transit improvements
- Converting existing general purpose lanes to HOV or HOT lanes

⁴² *Id.* at p.10.

⁴³ *Id.* at p. 16

⁴⁴ *Id.* at p. 17

⁴⁵ *Id.* at p. 22-23.

- Implementing or funding off-site travel demand management
- Implementing Intelligent Transportation Systems (ITS) strategies to improve passenger throughput on existing lanes⁴⁶

Additional project-level mitigation measures including in lieu mitigation fees to reduce VMTs are also provided.

CEQA Streamlining for Infill Projects Senate Bill (SB) 226

The CEQA Streamlining for Infill Projects (SB 226) sets forth a streamlined review process for infill projects and includes performance standards that will be used to determine an infill project's eligibility for streamlined review. The purpose of SB 226 and updated *CEQA Guidelines* Section 15183.3 is to streamline the environmental review process by "limiting the topics subject to review at the project level where the effects of infill development have been addressed in a planning level decision or by uniformly applicable development policies." Residential, commercial and retail, public office buildings, transit stations, and schools are eligible for this streamlining provided they meet the following requirements: (1) are located in an urban area on a site that has been previously developed or adjoins existing qualified urban uses on at least 75 percent of the site's perimeter; (2) satisfy the performance standards provided in Appendix M [of CEQA]; and, (3) are consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in either a sustainable communities strategy or an alternative planning strategy, with some exceptions.⁴⁷

Under SB 226, some development and transportation projects assumed as a part of the proposed Plan may be eligible to use a streamlined version of the environmental review process.

California Transportation Plan (CTP)

The CTP (SB 64; Chapter 711 Section 14536 amended 65073.1) is prepared by the California Department of Transportation every 5 years to provide a long-range policy framework to meet our future mobility needs and reduce greenhouse gas emissions. The CTP defines goals, performance-based policies, and strategies to achieve our collective vision for California's future statewide, integrated, multimodal transportation system by envisioning a sustainable system that improves mobility and enhances our quality of life. The CTP is developed in collaboration with transportation stakeholders such as SCAG. Through ongoing engagement, the CTP is intended to provide goals and visions to support a fully integrated, multimodal,

⁴⁶ *Id.* at p.25.

⁴⁷ California Natural Resources Agency. *Streamlined Review for Infill Projects (SB 226)*. Available online at: <http://resources.ca.gov/ceqa/guidelines-sb226/>, accessed August 29, 2019.

sustainable transportation system that supports the quality of life: prosperous economy, human and environmental health, and social equity. The CTP fulfills the state's goal to meet the Federal Transportation Improvement Program.⁴⁸

Senate Bill 391

Senate Bill 391 was signed into law in October 2009 by Governor Schwarzenegger and requires the CTP to support 80 percent reduction in GHGs below 1990 levels by 2050. The bill also requires Caltrans to update the CTP every five years and provide an assessment of how the implementation of sustainable communities strategies will influence the configuration of the statewide multimodal transportation system. The bill requires Caltrans to consult with and coordinate its planning activities with specified entities and to provide an opportunity for public input.

Assembly Bill 1358

AB 1358, also known as the Complete Streets Act of 2008, amended the California Government Code Section 65302 to require that any substantive revisions to a city or county's Circulation Element include provisions for accommodations of all roadway users, including bicyclists and pedestrians.⁴⁹

2016 Mobile Source Strategy

On May 16, 2016, the Air Resources Board (ARB or Board) released the updated Mobile Source Strategy that demonstrates how the State can simultaneously meet air quality standards, achieve greenhouse gas emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next fifteen years. The Mobile Source Strategy aims to deliver environmental and public health benefits as well as updates to transportation infrastructure, enhancements of systemwide efficiency, and clean growth in the mobile sector. The estimated benefits of the strategy in reducing emissions from mobile sources includes an 80 percent reduction of smog-forming emissions and a 45 percent reduction in diesel particulate matter from today's levels in the South Coast. CARB estimates statewide, the Mobile Source Strategy would also result in a 45 percent reduction in greenhouse gas emissions, and a 50 percent reduction in the consumption of petroleum-based fuels.

California Congestion Management Program

The Congestion Management Program (CMP) is the State mandated program (Government Code 65089) aimed at reducing congestion on highways and roads in California. The CMP establishes a designated

⁴⁸ California Legislative Information. *Senate Bill No. 64*.

⁴⁹ *Assembly Bill No. 1358*.

roadway network of regional significance, roadway service standards, multi-modal performance standards and a land use analysis element to identify and mitigate multijurisdictional transportation impacts resulting from local land use decisions. Federal, State and local transportation funding is contingent upon local agency compliance with the CMP.⁵⁰

California Vehicle Code (CVC)

The CVC provides requirements for ensuring emergency vehicle access regardless of traffic conditions. CVC sections 21806(a)(1), 21806(a)(2), and 21806(c) define how motorists and pedestrians are required to yield the right-of-way to emergency vehicles.⁵¹

Executive Order (EO) B-16-2012 on Zero Emission Vehicles

EO B-16-2-12 was signed by Governor Brown on March 23, 2012, to encourage development of the zero emission vehicles (ZEVs) to protect the environment, stimulate the economy, and improve the quality of life in the region. The goals that are promulgated include setting aggressive targets to meet goals in 2015, 2020, and 2025, supporting the rapid commercialization of clean vehicles, and pursuing policies to promote private sector investment and made-in California technologies. Executive Order B-16-2012 also sets a target for 2050 of a reduction of greenhouse gas emissions from the transportation sector equaling 80 percent less than 1990 levels.⁵²

In February 2013, an interagency working group developed the ZEV Action Plan which identifies specific strategies and actions that state agencies will take to meet the milestones of the Executive Order. The ZEV Action Plan states:⁵³

ZEVs are crucial to achieving the state's 2050 greenhouse gas goal of 80 percent emission reductions below 1990 levels, as well as meeting federal air quality standards. Achieving 1.5 million ZEVs by 2025 is essential to advance the market and put the state on a path to meet these requirements.

The ZEV Action Plan was updated in 2016, and highlights the following priorities for ZEVs:

- Raising consumer awareness and education about ZEVs;

⁵⁰ California Legislative Information. *Chapter 2.6. Congestion Management [65088-65089.10]*.

⁵² Office of Governor Edmund G. Brown Jr., *Executive Order B-16-2012*. Available online at: <https://www.ca.gov/archive/gov39/2012/03/23/news17472/index.html>, accessed August 29, 2019.

⁵³ Government Office of Planning and Research (OPR). *2013 ZEV Action Plan: A Roadmap toward 1.5 million zero-emissions vehicles on California roadways by 2025*. Available online at: [http://opr.ca.gov/docs/Governors_Office_ZEV_Action_Plan_\(02-13\).pdf](http://opr.ca.gov/docs/Governors_Office_ZEV_Action_Plan_(02-13).pdf), accessed August 29, 2019.

- Ensuring ZEVs are accessible to a broad range of Californians;
- Making ZEV technologies commercially viable in targeted applications the medium-duty, heavy-duty and freight sectors; and
- Aiding ZEV market growth beyond California.

The 2016 ZEV Action Plan introduces new actions to meet these priorities and build California's ZEV market, remove barriers to future market growth and ensure this transition benefits the state and its residents. The intent is to clearly communicate what state government will do to advance ZEVs and serve as a "to-do" list for the Governor's Office and state agencies to enhance interagency coordination.⁵⁴

EO B-32-15 Integrated Action Plan to Improve California's Freight System

On July 16, 2015, Governor Brown issued EO B-32-15, which orders the Secretary of the California State Transportation Agency, the Secretary of the California Environmental Protection Agency, and the Secretary of the Natural Resources Agency to lead other relevant state departments including the California Air Resources Board, the California Department of Transportation, the California Energy Commission, and the Governor's Office of Business and Economic Development to develop an integrated action plan by July 2016 that establishes clear targets to improve freight efficiency, transition to zero-emission technologies, and increase competitiveness of California's freight system. The action plan shall identify state policies, programs, and investments to achieve these targets, and be informed by existing state agency strategies, including the California Freight Mobility Plan, Sustainable Freight Pathways to Zero and Near-Zero Emissions, Integrated Energy Policy Report, as well as broad stakeholder input. The California Sustainable Freight Action Plan was adopted in July 2016.⁵⁵

Caltrans Strategic Management Plan, 2015 - 2020

The most recent Caltrans Strategic Management Plan⁵⁶ redefines the Caltrans mission statement and provides a vision statement. The Caltrans mission statement is: *Provide a safe, sustainable, integrated, and efficient transportation system to enhance California's economy and livability.* The Caltrans vision is: *A performance-driven, transparent, and accountable organization that values its people, resources, and partners and meets new challenges through leadership, innovation, and teamwork.* The document identifies five goals: 1)

⁵⁴ California Fuel Cell Partnership. *2016 ZEV Action Plan from the State of California*. Available online at: <https://cafcp.org/blog/2016-zev-action-plan-state-california>, accessed August 29, 2019.

⁵⁵ Office of Governor, Edmund G. Brown Jr. 2015. *Executive Order B-32-15*. Available online at: <https://www.ca.gov/archive/gov39/2015/07/17/news19046/index.html>, accessed August 29, 2019.

⁵⁶ Caltrans. *Strategic Management Plan 2015-2020*. Available online at: <https://dot.ca.gov/-/media/dot-media/programs/transportation-planning/documents/caltrans-strategic-mgmt-plan-033015-a11y.pdf>, accessed November 15, 2019.

Safety and Health, 2) Stewardship and Efficiency, 3) Sustainability, Livability and Economy, 4) System Performance, and 5) Organizational Excellence. The document identifies numerous performance measures and targets including the following target with respect to Sustainability, Livability and Economy: to increase non-auto modes (triple bicycles, double pedestrian and double transit (2010 – 12 California Household Travel survey is the baseline), achieve a 15 percent reduction in per capita VMT (3 percent per year) reported by each District relative to 2010 by 2020, 85 percent reduction in diesel particulate matter (relative to 2000), 80 percent reduction in NO_x in the South Coast Air Basin by 2023 (from 2010).⁵⁷

*Local Development – Intergovernmental Review Program Interim Guidance, Implementing Caltrans Strategic Management Plan 2015 – 2020 Consistent with SB 743*⁵⁸

Caltrans developed this guidance for Caltrans use in providing comments to local jurisdictions through the Intergovernmental Review process. This guidance document supports the implementation of the Strategic Management Plan including achieving the identified targets.

3.17.2.3 Regional

California Transportation Commission Active Transportation Program Guidelines

Under Senate Bill (SB) 99 (Chapter 359, Statutes 2013) and AB 101 (Chapter 354, Statutes of 2013), the CTC is authorized to prepare guidelines to assist in the preparation of Active Transportation Plans (ATPs). An ATP includes bicycle, pedestrian, safe-routes to-school, and other comprehensive criteria to be included in the circulation element of its general plan in compliance with Complete Streets Act. The CTC's RTP guidelines suggest that all projects within the SCAG region must be selected through a competitive process that meets the federal aid goals. These goals are included in the environmental, design, right-of-way, and construction phases of the infrastructure and non-infrastructure projects. All projects that are selected in the ATP are required to include a discussion of the estimated bicycle and pedestrian trips, facilities report, proposed land use and bicycle transportation facilities, and policies related to parking and ADA compliance.⁵⁹

⁵⁷ This document does not provide a detailed comparison to these targets because year 2000 and year 2010 comparable data is not available, and Caltrans VMT data for districts in the SCAG region is not available.

⁵⁸ Caltrans. 2016. Local Development – Intergovernmental Review Program Interim Guidance, Implementing Caltrans Strategic Management Plan 2015 – 2020 Consistent with SB 743

⁵⁹ California Transportation Commission. *Active Transportation Program (ATP)*. Available online at: <https://catc.ca.gov/programs/active-transportation-program>, accessed August 29, 2019.

Transit Development Plans

A Transportation Development Plan (TDP) updates a municipal or county operated transit system's goals and objectives, develops service alternatives, provides funding estimates, and produces a plan to implement recommended service improvements for a five-year period. A number of agencies within the SCAG have TDPs.

Plans and Policies Related to Complete Street Act of 2008 (AB 1358; S. 2686)

The Complete Streets Act of 2008 (AB 1358) required cities and counties to incorporate Complete Streets in their general plan updates to ensure that transportation plans meet the needs of all users, including pedestrians, bicyclists, and transit users as well as children, older individuals, and individuals with disabilities, to travel safely and conveniently on streets and highways. In the SCAG region, all six of the counties have developed their own bicycle and pedestrian plans. Majority of these bicycle pathways are part of existing Class II path which provides on-street bike lanes, although a few are in Class I category, which mean that the path is separate from automobile traffic, and some are categorized as Class III pathways with on-street bike lanes further designated by signs.⁶⁰

3.17.2.4 Local

County General Plans Circulation Element

Each of the six counties within the SCAG region has prepared a Transportation or Circulation Element, as a required component of the General Plan. The Transportation or Circulation Element provides a summary of the existing conditions in the planning area, major issues, goals, and policies, as well as pertinent action programs related to traffic and circulation related to a variety of transportation systems (highway and local road networks, bus, rail, high speed rail, aviation network, harbors, bicycles, pedestrians, and rideshare). The Transportation or Circulation Element describes the major locations and corridors for existing and future travel based on land use patterns in order to develop a comprehensive, coordinated, and continuing transportation system for the region. Relevant policies include encouraging provision of transit service at a reasonable cost to the users and the community, encouraging the efficient use and conservation of energy and ease congestion, and, where the land use would support, providing for development of a mass transportation system that will provide a viable alternative to the automobile, and support a balance in transportation modes with public transit system that provides accessible service, particularly to the transit dependent. A transportation system will operate at regional, countywide,

⁶⁰ California Legislative Information. *Assembly Bill No. 1358*.

community, and neighborhood scales to provide connectivity between communities and mobility between jobs, residences, and recreational opportunities.

County General Plans Safety Element

Each of the six counties in the SCAG region prepared a Safety Element as a required component of the General Plan. The Safety Element generally discusses measures to abate the impacts in case of catastrophe for maintenance of the transportation infrastructure. The Traffic and Transportation Division under each county is responsible for developing plans and guidelines for the maintenance of traffic control devices, emergency travel routes in the event of an emergency, placement of barricades, and control of traffic and coordination with other departments to promote integrated disaster planning, response and mitigation efforts. Included in the Safety Element discussion are strategies for continuation of adequate critical infrastructure systems and services to assure adequate circulation, communications, and transportation services for emergency response in the event of disaster related systems disruptions.

Orange County Bikeways Strategic Plan

The 2009 Orange County Commuter Bikeways Strategic Plan was developed “to encourage the enhancement of Orange County’s regional bikeways network, in order to make bicycle commuting a more viable and attractive travel option.”⁶¹ The plan identifies approximately 116 miles of priority bikeway projects. In 2012, the Orange County Transportation Authority provides an addendum to the existing Plan with a Commuter Bikeways Strategic Plan (CBSP) that refines the regional bikeway networks and specified which bikeways are connected to priority locations including major transit investment areas, employment centers, stations, colleges, and universities.⁶²

Riverside County Active Transportation Plans

The Western Riverside Council of Governments (WRCOG) and the Coachella Valley Association of Governments (CVAG) have developed Active Transportation Plans for their respective jurisdictions covering most of Riverside County. The Western Riverside County Active Transportation Plan builds on the Western Riverside County Non-Motorized Transportation Plan (NMTP), published in June 2010, by “updating active transportation network improvement projects, implementation strategies, and funding

⁶¹ Orange County Transportation Authority. *2009 OCTA Commuter Bikeways Strategic Plan*. Available at: <http://www.octa.net/pdf/bikeways09.pdf>, accessed December 18, 2018.

⁶² Orange County Transportation Authority. *Addendum 2009 OCTA Commuter Bikeways Strategic Plan*. Available at: <http://www.octa.net/pdf/2009CommuterBikewaysStrategicPlanAddendum.pdf>, accessed December 18, 2018.

opportunities found in that plan.”⁶³ The CVAG Active Transportation Plan recognizes the “value of providing opportunities for local residents and visitors to bicycle for transportation and recreation and to have attractive opportunities to walk to transit stops, as well as to encourage people to use neighborhood electric vehicles (NEVs).”⁶⁴

San Bernardino County Non-Motorized Transportation Plan

The Revised 2018 San Bernardino County Non-Motorized Transportation Plan’s goals include: (1) Increased bicycle and pedestrian access; (2) Increased travel by cycling and walking; (3) Routine accommodation in transportation and land use planning; and (4) Improved bicycle and pedestrian safety.⁶⁵

Ventura County Bicycle Master Plan

The 2007 Ventura County Bicycle Master Plan “provides a broad vision, strategies and actions for the improvement of bicycling” by maximizing funding sources for implementation; improving safety and encouraging cycling; expanding the network and support facilities; and enhancing the quality of life in and overall environmental benefits. Within the County of Ventura, many jurisdictions and municipalities also has a bicycle plan to encourage non-motorized commutes.

Active Transportation Plans/Mobility Plans

In addition to county plans, many local jurisdictions have developed their own active transportation plans or include active transportation components in the Circulation Element of their General Plan. Many street enhancement projects or capital improvement projects include active transportation elements as well. For example, many street improvement projects may include the striping of bikeways or new developments may include sidewalk enhancements.

⁶⁵ San Bernardino County Transportation Authority. *San Bernardino County Non-Motorized Transportation Plan March 2011 (Revised June 2018)*. Available at: <http://www.gosbcta.com/sbcta/plans-projects/plans/non-motorized-transportation/NMTP-RevJune2018.pdf>, accessed December 18, 2018.

Imperial County Bicycle Master Plan

In 2011, Imperial County updated a Bicycle Master Plan,⁶⁶ which was originally created in 2003. The guiding vision of the plan is to “encourage and promote bicycling as a safe and convenient form of transportation and recreation.” The Plan will implement 253.5 miles of bikeways with intent to replace vehicular trips with bicycle trips. Providing transportation options to reduce Vehicle Miles Traveled is an important feature of this plan that is supportive of SCAG’s overall goals and visions for limiting source pollution control such as carbon dioxide, nitrogen oxides, and hydrocarbon releases and an important component of decreasing greenhouse gas emissions and improving air quality.

Los Angeles County Bicycle Master Plan

Metro developed a Bicycle Transportation Strategic Plan (BTSP) in 2006⁶⁷ to be used by “the cities, the County of Los Angeles and transit agencies in planning bicycle facilities around transit and setting priorities that contribute to regional improvements. The goal is to integrate bicycle use in transportation projects.” In addition, Metro also created a Bicycle Transportation Account Compliance Document (BTA Document) to provide an “inventory and mapping of existing and proposed facilities, and an estimate of past and future expenditures for bicycle facilities.” In 2013, SCAG and Metro developed the Bike County Data Clearinghouse to assist LA County conduct bicycle counts. The Los Angeles County Department of Public Works adopted a Countywide Bicycle Master Plan in 2012, which was developed with the overarching goal of increasing “bicycling throughout the County of Los Angeles through the development and implementation of bicycle-friendly policies, programs, and infrastructure.” The plan recommends the development of an interconnected network of bicycle corridors, with approximately 695 miles of bikeway facilities. This plan looks at the ridership and air quality benefits from cycling and also includes a list of existing and proposed bikeways in LA County.⁶⁸

3.17.3 ENVIRONMENTAL IMPACTS

3.17.3.1 Thresholds of Significance

The impacts related to transportation, traffic and safety resulting from the implementation of the proposed project would be considered significant if they would exceed the following significance criteria, in accordance with Appendix G of the *State CEQA Guidelines*:

- Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.
- Conflict or be inconsistent with *CEQA Guidelines* section 15064.3(b).
- Substantially increase hazards due to geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
- Result in inadequate emergency access.

In addition, the following criterion from **Section 3.20, Wildfire**, is addressed along with emergency access:

- Substantially impair an adopted emergency response plan or emergency evacuation plan.

As discussed above, CARB and OPR have recommended VMT thresholds of significance in their guidance documents, however these thresholds are meant to apply at the project-level. CARB notes that the modeling used for the CTF forecast identifies ratios of total statewide VMT to population and that the suggested per capita reductions are not household generated VMT and that values are not directly comparable to output from a local or regional travel demand model. OPR notes that with respect to their recommended thresholds “combining different land uses and applying one threshold to those land uses may result in an inaccurate impact assessment.” Since SCAGs model generates trips from a variety of land uses and trips from each land use cannot be separated, comparison of SCAG VMT data to OPR thresholds is not recommended.

The objective of these thresholds is to meet statewide GHG emissions targets through VMT reductions from the transportation sector. Both CARB and OPR acknowledge that MPO’s are tasked with meeting SB 375 GHG emissions targets, and while CARB has determined that meeting these targets will not be sufficient to attain state climate goals, more can be done at the project level. At the project level, lead agencies may consider CARB, OPR and other recommended thresholds of significance and determine which ones are appropriate and feasible for the particular project, or apply alternative thresholds, consistent with *CEQA Guidelines* Section 15064.3 which states “A lead agency has discretion to choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to

express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled and may revise those estimates to reflect professional judgment based on substantial evidence." See also **Section 3.8, Greenhouse Gases**, for additional discussion on the connection between GHG and VMT and SCAG's ability to meet SB 375 and consistency with SB 743 guidance and suggested targets as well as statewide climate goals.

3.17.3.2 Methodology

Transportation-related impacts were evaluated in accordance with Appendix G of the 2019 *CEQA Guidelines*. Transportation-related impacts within the SCAG region were evaluated at a programmatic level of detail, in relation to the General Plans of the six counties and the 191 cities within the SCAG region review of general information characterizing transportation and review of published and unpublished literature germane to the SCAG region.

The methodology for determining the significance of impacts on transportation, traffic, and safety impacts compares current regional transportation conditions to expected future 2045 conditions with the Plan, as required by *State CEQA Guidelines*. SCAG utilized the Regional Travel Demand Model (RTDM) to compare the existing conditions to the Plan's 2045 condition. SCAG's role as the MPO for the region and as the preparer of the regional transportation plan is to evaluate the regional network. The most appropriate metric for such regional analysis is VMT which measures overall network efficiency, rather than LOS which is generally used to evaluate local (i.e., intersection level) impacts. Total daily VMT is used as a measure of overall utilization of roadways which relates to vehicle emissions, traffic congestion, and the effectiveness of land use patterns and alternate mode options in reducing the need for vehicular travel. Vehicle hours of delay (VHD) measures the congestion level of the roadway. Other measures such as transportation system accident rates measure the effect of other modal choices from vehicles to active transportation. Performance measures for the Plan's horizon year 2045 were compared to the existing regional conditions for each significance criterion to determine the significance of impacts. The 2045 transportation model output provides a regional and cumulative level of analysis for the impacts of the Plan on transportation, traffic, and safety.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in **Section 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However,

SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.17.3.3 Impacts and Mitigation Measures

Impact TRA-1 **Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.**

Less than Significant Impact.

The region provides a large and growing amount of transit service. In 2017, the region supplied 22.5 million hours of service, or roughly 1.18 hours for every resident. However, transit ridership has declined significantly over the last 10 years, even as service levels have grown. Between 2006 and 2017, total passenger trips declined by 125 million, or 17 percent. This works out to a decline of almost 10 trips per person, or just under 23 percent. This trend impacts agencies' ability to continue to provide these levels of service, as declining fare revenues will eventually lead to budgetary challenges.

The Plan calls for a substantial expansion of transit facilities and service over the next 25 years. While these capital projects would provide the SCAG region with a much more mature public transportation system, operational improvements and new transit programs and policies would also contribute to attracting more trips to transit and away from single-occupant vehicle travel. Expanding HOV and express lane networks calls for the development of an extensive express bus point-to-point network. In addition, transit oriented and land use strategies call for increasing the frequency and quality of fixed-route bus service by virtue of adding new bus rapid transit service, limited-stop service, increased frequencies along targeted corridors, and the introduction of local community circulators to provide residents of smart growth developments with the option of taking transit over using a car to make short, local trips.

Many of Metro's Measure R projects have made significant construction progress since the adoption of the 2016 RTP/SCS, including the Crenshaw/LAX Transit Corridor, the Regional Connector and the Purple Line Extension Phase 1. Additionally, work concluded on the Exposition Transit Corridor Phase 2 to Santa Monica and the Metro Gold Line Foothill Extension Phase 2A. Both of those projects entered revenue service in 2016.⁶⁹

On the November 2016 ballot, Los Angeles County voters approved Measure M, a fourth Local Option Sales Tax to fund both capital and operations within Los Angeles County. The tax was part of a forty-one-

⁶⁹ Metro, *Measure R*. Available online at: <https://www.metro.net/projects/measurer/>, accessed November 1, 2019.

year, \$120 billion plan to expand upon Measure R, adding new transit projects and expediting others previously approved under Measure R. The plan, known as Measure M, would be paid for by an additional permanent half-cent sales tax increase. Measure M passed with 70.15 percent of the vote, clearing the two-thirds majority required. The combined expenditure plan provides \$432.29 billion for transit operations, \$41.86 billion for capital construction of corridor improvements and facilities and \$2.39 billion for capital replacement to achieve a state of good repair. Additionally, the expenditure plan programs \$19.13 billion in local return funds, which are often used to fund transit operations.⁷⁰ **Table 3.17-11, Major Transit Capital Projects**, provides a summary of major transit projects included in the Plan. A map of the 2045 Transit Network is provided in **Figure 2.0-14, 2045 Plan Transit Network**, in **Chapter 2.0, Project Description**.

Table 3.17-11
Major Transit Capital Projects

County	Project	Connect SoCal Completion Year
Los Angeles	Crenshaw/LAX Transit Corridor	2020
Los Angeles	Metro Eastside Transit Corridor – Phase 2	2035
Los Angeles	Metro Gold Line Foothill Extension to Claremont	2025
Los Angeles	Airport Metro Connector	2024
Los Angeles	South Bay Metro Green Line Extension	2030
Los Angeles	Regional Connector	2021
Los Angeles	San Fernando Valley (East) North/South Rapidways	2027
Los Angeles	West Santa Ana Branch Corridor	2028
Los Angeles	Metro Purple Line Westside Subway Extension Section 1	2023
Los Angeles	Metro Purple Line Westside Subway Extension to Century City	2026
Los Angeles	Metro Purple Line Westside Subway Extension to Westwood	2027
Los Angeles	Sepulveda Pass Transit Corridor	2033
Los Angeles	Vermont Transit Corridor	2028
Los Angeles	Vermont Short Corridor: Wilshire/Vermont to Exposition/Vermont	2045
Orange	Santa Ana/Garden Grove Fixed Guideway	2021
Riverside	Rapid Commuter Corridor From Parris to San Jacinto	2045
San Bernardino	Redlands Rail – Phase 1	2021
San Bernardino	Redlands Rail – Phase 2	2045
San Bernardino	West Valley Connector	2024

In Los Angeles County, three key efforts are likely to substantially impact the implementation of Connect SoCal. The first of these is Metro's NextGen Bus Study.⁷¹ This study seeks to design a new bus network that is more relevant, reflective of and attractive to the residents of Los Angeles County. Specific objectives of the study include:

- Understand transit market demand in LA County
- Study the agency's current bus system and how well it serves current and potential customers
- Recommend how best to reimagine the system to be more relevant to what people need today

If implemented, this study may result in major changes to Metro's bus service. All aspects of Metro bus service are on the table for study, including speed, distance, frequency, time of day, reliability as well as quality of service, and safety. The study may also result in major changes to the Metro bus network's routes. Metro has compiled and processed data to help prepare the Regional Service Concept, which is guiding the development of the Draft NextGen Bus Service Plan, expected to be released in early 2020.

The second effort is the Twenty-Eight by '28 Initiative which highlights 28 Metro projects for potential completion by the 2028 Summer Olympic and Paralympic Games to be held in Los Angeles and surrounding areas. The Metro Board approved a list of projects, which includes projects already slated for completion by 2028, as well as projects with later delivery dates with potential for acceleration. Project acceleration would be considered on a case-by-case basis according to the adopted Early Project Delivery strategy. Not all Measure M investments scheduled for completion by 2028 are included in the Twenty-Eight by '28 list, and the list does not replace commitments made in the Measure M Ordinance. Metro reports quarterly on project delivery and funding status of the Twenty-Eight by '28 list.

The third planning effort is the City of Los Angeles's Mobility Plan 2035: An Element of the General Plan.⁷² This document provides the policy foundation for achieving a transportation system that balances the needs of all road users. As an update to the City's General Plan Transportation Element (last adopted in 1999), Mobility Plan 2035 incorporates "complete streets" principles and lays the policy foundation for how future generations of residents interact with their streets. This plan includes the Transit-Enhanced Network (TEN), a series of transit and active transportation investments on key corridors throughout the City of Los Angeles, including peak hour bus lanes, all day bus lanes and mixed flow lanes with

Total (Transit)	2,423,540	3,116,887	5,144,528

Source: SCAG, 2019

Connect SoCal proposes a variety of active transportation investments to improve conditions for people who walk, bike, and use micro-mobility (See **Chapter 2.0, Project Description**). Current rates of funding and the speed of implementation will need to be accelerated to complete the proposed projects within the Plan. This will require additional community engagement to build support for changes to roadway networks such as active mobility lanes and other safety improvements. SCAG has identified a number of implementation actions that an agency can pursue toward active transportation goals. These actions will serve as broad direction for the agency to support equity, short and regional trips, safety, and complete streets. Overall, cost estimates to implement active transportation goals of the Plan would total \$22.5 billion.

The Plan calls for a substantial expansion of transit facilities and service to attract trips to transit and away from single-occupancy vehicle travel. Transit-oriented land use strategies would increase the frequency and quality of fixed-route bus service by adding new rapid service, express service, and community circulators for short trips.

The proposed Active Transportation plan would increase the mode share of transit and active transportation in the SCAG region, from 10.6 percent in 2019 to 12.9 percent in 2045 (**Table 3.17-13**).

Table 3.17-13
Percentage of Mode Share on Transit and Active Transportation

Mode Share	2019	2045 No Project	2045 Plan
Walk	7.0	6.7	7.1
Bike	1.3	1.4	1.7
Transit	2.3	2.6	4.1
Total	10.6	10.7	12.9

Source: SCAG modeling, 2019.

In 2016 SCAG completed an Active Transportation Health and Economic Impact Study, which showed that the investments in the 2016 RTP/SCS would result in an additional \$113 billion in economic outcome for the region over the life of the plan, 70 percent of which would be from reduced health care costs and improved worker productivity. SCAG conducted a similar analysis as part of Connect SoCal and found that the Plan, including active transportation and nonactive transportation investments, would provide \$352 million in health care savings. Additional information on the physical activity rates and benefits of Connect SoCal is outlined in the Public Health Technical Report. Each RTP/SCS cycle, SCAG has expanded and improved its analysis of active transportation planning processes to better integrate people walking and bicycling into the regional transportation network.

Since 2016, county transportation commissions and councils of governments within SCAG's region have also completed notable active transportation planning initiatives including countywide pedestrian plans, multi-jurisdictional bicycle master plans, comprehensive Safe Routes to School plans, active transportation plans, and first-last mile policies and plans. Through grant sources such as the Active Transportation Program, SCAG's Sustainable Communities Program and Caltrans Sustainability Planning Grants, 68% of cities within SCAG's region have adopted bicycle master plans. The number of cities with Safe Routes to School and pedestrian master plans have doubled since 2016.

SCAG's analytic approach for its active transportation plans included a combination of outreach processes and data gathering efforts, including but not limited to SCAG's local input process with cities, county agencies, councils of governments, working groups, and technical advisory committees that review active transportation projects and programs, input collected through the scenario development process from agency partners, health departments, community based organizations and members of the public, input gathered through SCAG's Go Human events.

As described within the Environmental Setting, there are numerous plans and polices that address the circulation system. At the transit agency level, it is unlikely that conflicts would occur, as SCAG incorporates local transit plans into the RTP through regular amendments to the Plan. With regard to bicycle and pedestrian plans, as described above, SCAG has done extensive outreach and coordination across numerous groups to capture local input. Further, SCAG regularly assists local jurisdiction in planning for these types of projects through grant funding.

SCAG and the six Counties have worked towards the development of a metropolitan-wide strategy for new and existing transportation facilities eligible for funding under Title 23 U.S.C. and Title 49 U.S.C., to optimize the transportation system for safety and improve effectiveness. This strategy includes the development of a coherent and integrated regional goods movement system. Strategies include a Regional Freight Corridor System which would create a system of truck-only lanes for major freeway systems that are affected by haul trucks used for the goods movement; a Truck Bottleneck Relief Strategy which would mitigate top-priority truck bottlenecks; a Rail Strategy which would allow shippers the ability to move over long distances at lower costs, utilizing efficient rail strategies to include expansion and modernization of intermodal facilities; a Good Movement Environmental Strategy which would focus on a two-pronged approach for achieving an efficient, safe and economically sound freight system that reduces environmental impacts.

In order to meet federal certification requirements, SCAG and county CMAs, specifically LA County Metro, OCTA, RCTC, SANBAG, and VCTC are developing means to monitor and maintain the existing roadway infrastructure through demand reduction techniques, land-use and operation management strategies, and strategic capacity enhancement strategies. Additional strategies include supporting land use policies aimed to focus growth in HQTAs with enhanced opportunities for Southern California residents to access destinations without the use of an automobile.

SCAG has also worked with local Congestion Management Agencies (CMA) to support strategies for diversifying mode choices by encouraging public transit use and non-motorized forms of commute such as walking and other active transportation in the Plan. While the actual benefits of these alternative and active transportation modes are modest, SCAG transportation modeling indicates a potential to overall improvement in peak period work trips completed within 45 minutes by personal vehicle or by other transit with implementation of the Plan. In order to determine these findings, PM peak period work trips were used to assess impacts to work commute as PM trips are prone to the greatest amount of vehicle delay.

Lastly, the Plan includes land use strategies to focus development in HQTAs and High Quality Transit Corridors (HQTCs). Planned HQTCs are future improvements that are expected to be implemented by

transit agencies by 2045. These are assumed by definition to meet the statutory requirements of HQTC. The strategies of the SCS that focus development in these transit rich areas allow transit and land use to work together. CARB's 2016 Mobile Source Strategy recognizes that coordinated regional planning can improve California's land use patterns and transportation policy in a way that reduces transportation-related emissions by reducing growth in VMT. The SCS is one mechanism to pursue these reductions. The Plan includes policies to incentivize land use changes and promote communities that are designed to foster use of ZEVs and new modes of personal mobility consistent with the Mobile Source Strategy.⁷³

As such, the Plan would not conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. Impacts would be less than significant.

Impact TRA-2 Conflict or be inconsistent with CEQA Guidelines section 15064.3(b).

Significant and Unavoidable Impact – Mitigation Required.

CEQA Guidelines Section 15064.3(b) is intended to be applied at the project level; therefore, the myriad transportation and development projects that will occur under the Connect SoCal Plan will be required to address the specific requirements, as follows:

(b) Criteria for Analyzing Transportation Impacts.

(1) Land Use Projects. Vehicle miles traveled exceeding an applicable threshold of significance may indicate a significant impact. Generally, projects within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a less than significant transportation impact. Projects that decrease vehicle miles traveled in the project area compared to existing conditions should be considered to have a less than significant transportation impact.

(2) Transportation Projects. Transportation projects that reduce, or have no impact on, vehicle miles traveled should be presumed to cause a less than significant transportation impact. For roadway capacity projects, agencies have discretion to determine the appropriate measure of transportation impact consistent with CEQA and other applicable requirements. To the extent that such impacts have already been adequately addressed at a programmatic level, a lead agency may tier from that analysis as provided in Section 15152.

(3) Qualitative Analysis. If existing models or methods are not available to estimate the vehicle miles traveled for the particular project being considered, a lead agency may analyze the project's vehicle miles traveled

⁷³ Air Resources Board, Mobile Source Strategy 2016, <https://ww3.arb.ca.gov/planning/sip/2016sip/2016mobsrsrc.pdf>

qualitatively. Such a qualitative analysis would evaluate factors such as the availability of transit, proximity to other destinations, etc. For many projects, a qualitative analysis of construction traffic may be appropriate.

(4) Methodology. A lead agency has discretion to choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled, and may revise those estimates to reflect professional judgment based on substantial evidence. Any assumptions used to estimate vehicle miles traveled and any revisions to model outputs should be documented and explained in the environmental document prepared for the project. The standard of adequacy in Section 15151 shall apply to the analysis described in this section.

Connect SoCal is based on a regional employment and population forecast and accommodates this growth through the implementation of transportation projects and land use strategies. The Plan includes strategies to accommodate projected growth in a manner that increases transportation system efficiency and reduces VMT. Metrics such as VMT, VHT, and VHD have been used throughout the history of the Plan as a measure of the performance of the region's transportation system. SCAG has traditionally used VMT to assess transportation impacts as it is a more useful tool to evaluate impacts at the regional-scale than delay-based metrics for roadways such as LOS. In addition, the regional models used by SCAG do not include the LOS metric.

Traditionally project-level analysis of transportation impacts focused on local-level congestion and delay-based impacts (e.g., intersection and roadway LOS). The analysis of the Connect SoCal Plan is at the regional level and evaluates total regional VMT (including consideration of per capita data) and overall efficiency of the network.

CEQA Guidelines section 15064.3(b) provides that local jurisdictions have the ability to select the most appropriate methodology for their jurisdiction or project. As discussed above, methodologies and thresholds have been identified by OPR and CARB, as well as local jurisdictions. SCAG has discussed each of the thresholds in this PEIR and identified metrics at the regional scale (changes in total VMT and VMT per capita) over the Plan horizon.

CARB notes that their modeling assumes cleaner technology and fuels and identifies target ratios of total statewide VMT to population and that the suggested per capita reductions (i.e., 14.3 percent) are **not** household generated VMT and that values are **not** directly comparable to output from a local or regional travel demand model. Discussion of CARB's CTF modeling and suggested VMT thresholds under SB 743 is further discussed in **Section 3.8, Greenhouse Gases**.

OPR notes that with respect to their suggested thresholds (a reduction of 15 percent as compared to existing conditions [2017] for residential and office uses and a net increase for retail uses) combining different land uses and applying one threshold to those land uses may result in an inaccurate impact assessment.

Each jurisdiction may select the appropriate methodology and threshold for their jurisdiction and projects as long as the methodology is consistent with *CEQA Guidelines* Section 15064.3(b)(4). Jurisdictions may make use of regional SCAG data as appropriate and applicable in establishing thresholds.

As shown in **Table 3.17-14, Total VMT 2019 and 2045 By County**, total daily VMT in 2045 would increase when compared to current daily VMT, despite the reductions in per capita VMT. Total VMT is expected to grow from 461 million in 2019 to 518 million in 2045. This change constitutes a 12.3 percent increase and includes light, medium, and heavy-duty vehicle VMT in all six counties. The Plan is expected to reduce VMT per capita in Los Angeles, Orange and Ventura County and would increase VMT per capita in Imperial, Riverside, and San Bernardino County.⁷⁴

Studies have found that by adding roadway capacity in congested areas, network-wide VMT is increased by a nearly equivalent proportion within a few years, which results in reducing the initial congestion relief.⁷⁵ This increase in VMT is called “induced travel.” The long-term induced travel resulting from the Plan in 2035, which is calculated by analyzing roadway lane miles increase between 2016 and 2035 by 3 classes (interstate highway, other freeways and expressways, and other principal arterials), is 1.3 percent of total VMT in 2035.

Emerging technologies vary widely when it comes to their effect on VMT, and therefore GHG emissions. Some of these technologies, such as alternative fuel vehicles, micro-mobility, bikesharing and microtransit, have a mitigating influence on GHG emissions. Others, such as ride-hailing and automated vehicles, are expected to increase VMT and GHG emissions if their business models do not adapt.

⁷⁴ Connect SoCal Performance Results, 2019. Reductions are from a 2016 base year.

⁷⁵ National Center for Sustainable Transportation. Induced Travel Calculator. Accessed at <https://blinktag.com/induced-travel-calculator/about.html> on October 25, 2019.

Table 3.17-14
Total VMT 2019 and 2045 by County

County	In Thousands		
	2019	2045 No Project	2045 Plan
Imperial	7,000	11,000	11,000
Los Angeles	231,000	255,000	243,000
Orange	80,000	86,000	83,000
Riverside	61,000	80,000	78,000
San Bernardino	63,000	85,000	83,000
Ventura	19,000	21,000	20,000
SCAG Region	461,000	538,000	518,000

Note: Numbers are rounded to nearest thousand.
Source: SCAG modeling, 2019.

Table 3.17-15, Population and Daily VMT (2019 and 2045), presents information related to population, daily VMT and VMT per capita for the years 2019 and 2045.

Table 3.17-15
Population and VMT (2019 and 2045)

	2019	2045	2045 vs 2019
Total Population	19,339,700	22,507,200	14.1%
Total VMT	460,153,316	517,631,374	11.1%
VMT Per Capita Light Duty Vehicles	22.09	20.67	-6.4%
VMT Per Capita All Vehicles	23.79	22.89	-3.8%

Source: SCAG modeling, 2019.

By 2045 public transit boardings are projected to more than double in absolute numbers, and transit's mode share will also rise. The share of trips by bicycle and walking will rise and such active modes as well as transit will represent 12.9 percent of all trips. The share of trips by single-occupancy vehicles will fall from 69.62 percent to 65 percent of home-to-work trips for the region. The combined effect of these transportation mode shifts and the SCS land use pattern will result in a reduction in VMT per capita by 2045. Overall VMT per capita will decline by 3.8 percent for all vehicles and 6.4 percent for light, medium duty vehicles.

Table 3.17-16
VMT Per Capita by County

County	Total VMT per Capita			
	Light/Medium Duty Vehicles		All Vehicles	
	2019	2045	2019	2045
Imperial	28.43	31.24	33.57	39.70
Los Angeles	21.13	19.24	22.40	20.84
Orange	23.24	21.93	24.37	23.43
Riverside	22.01	20.56	24.61	23.83
San Bernardino	24.85	24.47	28.27	29.42
Ventura	21.02	19.47	22.15	21.05
Regional Average	22.09	20.67	23.79	23.00

Source: SCAG modeling, 2019.

As shown in **Table 3.17-16, VMT Per Capita by County**, Los Angeles County will experience the largest decline in per capita VMT in 2045, while Imperial County will experience the largest increase. In addition, as shown in **Table 3.17-17, Total Daily Vehicle Hours of Delay**, total delay in the region will decrease in Orange and Ventura Counties. Los Angeles, San Bernardino, Riverside and Imperial would all experience increases in delay.

Table 3.17-17
Total Daily Vehicle Hours of Delay

County	2019	2045 No Project	2045 Plan
Imperial	9,631	38,986	26,573
Los Angeles	1,686,548	2,097,088	1,742,303
Orange	431,378	553,724	381,522
Riverside	172,164	376,959	252,415
San Bernardino	152,870	326,859	221,484
Ventura	55,099	77,029	43,932
Regional	2,507,690	3,470,645	2,668,229

Source: SCAG modeling, 2019.

Table 3.17-18 shows percent of work trips completed within 45 minutes. As shown in this table, by 2045 there would be an increase of PM work trips by single-occupancy vehicles that take 45 minutes or less (from 79.78 percent to 82.62 percent). HOV PM trips within 45 minutes would increase from 83.27 percent to 84.39 percent and transit trips completed within 45 minutes would decline from 53.51 to 52.22 percent. Despite the decline for transit trips, this indicates that the Plan's strategies are improving overall congestion.

Table 3.17-18
Percent of PM Work Trips Completed within 45 Minutes

County	2019	2045 No Project	2045 Plan
Autos –Single Occupancy Vehicles			
Imperial	94.06%	92.42%	92.45%
Los Angeles	79.26%	79.70%	81.55%
Orange	84.30%	85.59%	86.79%
Riverside	74.69%	75.91%	79.41%

San Bernardino	42.51%	39.05%	44.44%
Ventura	46.21%	44.11%	45.24%
Region	53.51%	51.74%	52.22%

*Note: Numbers are rounded to nearest thousand.
Source: SCAG modeling, 2019.*

The VMT per-capita decline indicates that transportation projects, as well anticipated growth patterns under the Plan, if implemented, would effectively work together to improve system efficiency and minimize increases in VMT. This is because the Plan includes a more compact development pattern. Compact land uses are more efficiently served by transit, support potentially higher rates of walking and biking, and generate less vehicle travel. The Plan also places an emphasis on transit service and complete streets near transit, walk, and bicycle supportive land uses with higher density and a mix of uses most likely to generate a mix of travel modes. Road and highway projects concentrate on alleviating major bottlenecks and congestion points, while other programs and transportation systems management strategies, including technology and demand management programs, allow for greater optimization of existing transportation infrastructure. Other factors affecting future VMT are aging of the population and forecasted increases in auto operating costs.

As discussed above, the Plan is projected to increase total VMT in the SCAG region between 2019 to 2045 by approximately 12.36 percent, constituting a significant impact. Furthermore, the Plan is projected to increase total daily hours of delay from 2.50 million to 2.66 million hours between 2019 and 2045 (**Table 3.17-17, Total Daily Vehicle Hours of Delay**).

Connect SoCal commits more than \$37 billion for various highway improvements, including mixed-flow and interchange improvements, HOV/Express lanes, and transportation system management. For example, in Orange County, a \$1.9 billion project would add one mixed-flow lane in each direction, convert an HOV lane to HOT lane, and add an additional HOT lane on I-405. This project is scheduled for completion in 2026. In addition, numerous projects are scheduled for completion that would result in an Express Lane on I-405 from its northern terminus to the Los Angeles/Orange County border.

Policies that aim to charge drivers user fees to cover the costs of services they use can be effective in lowering emission and delays from increased VMTs. For example, Connect SoCal includes a local road charge program in the form of mileage-based user fees regionally, which can be adjusted by time-of-day at major activity centers. SCAG assumed congestion pricing during peak periods along with increases in parking pricing at major job centers in Los Angeles. The implementation of user-fees and pricing strategies can be structured to increase equity and mobility while reducing environmental impacts.⁷⁶

Potential development projects anticipated to occur under the Plan should consider the CEQA guidance regarding VMT. In general, as stated in *CEQA Guidelines* Section 15064.3(b)(1), projects located within HQTAs would likely have less than significant transportation impacts. For those projects located outside of HQTAs, transportation impacts would be determined based on the project's ability to reduce VMT.

⁷⁶ SCAG, Connect SoCal Technical Report, *Congestion Management*. November 2019.

For transportation projects under the Plan, those projects that reduce VMT, such as most transit and bike projects, the assumption is impacts will be less than significant. However, consistency with the RTP/SCS does not necessarily lead to a less than significant impacts. Further, OPR's technical guidance on SB 743 states "building new roadways, adding roadway capacity in congested areas, or adding roadway capacity to areas where congestion is expected in the future, typically induces additional vehicle travel. For the types of projects previously indicated as likely to lead to additional vehicle travel, an estimate should be made of the change in vehicle travel resulting from the project."

Ultimately, the determination of VMT impacts will be made at the project level. As discussed above and elsewhere in this PEIR (see **Section 3.8, Greenhouse Gases**), lead agencies have the discretion to determine the appropriate methodology and level of analysis. As described, there are multiple potential VMT targets, CARB has identified 14.3 percent reductions in total VMT from 2015 to 2050 (based on specific modeling assumptions and ratios that are not directly comparable to data from regional travel demand models, see discussion in **Section 3.8 Greenhouse Gases**) and OPR has identified 15 percent lower per capita residential and office VMT and no net increase in residential VMT (OPR recommends that these reductions be calculated separately for each land use).

In CARB's January 2019 report,⁷⁷ CARB identifies a statewide population increase of 10 million people (an increase of 24 percent) between 2015 and 2050, growth in the SCAG region would account for nearly one third of that increase. If California were to meet its climate goals for 2050, CARB estimates (using specific CTF assumptions and population to VMT ratios that are not directly comparable to regional travel demand modeling) a 14.3 reduction in total VMT would be necessary.⁷⁸ See **Section 3.8 Greenhouse Gases**, for additional discussion of SB 743 and the CARB guidance.

OPR generally recommends a threshold of 15 percent below existing VMT per capita for residential and office with a no net increase for retail projects. OPR indicates that "land use projects, residential projects, office and retail projects tend to have the greatest influence on VMT." OPR suggests that lead agencies with more specific location information may develop their own more specific thresholds. OPR indicates

⁷⁷ California Air Resources Board, *2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals*, 2019

⁷⁸ According to CARB: "Total VMT per capita is calculated as a ratio of total statewide VMT to forecast population from the California Department of Finance. This is not household-generated VMT, and the values are not directly comparable to output from a local or regional travel demand model. This estimate is merely meant to show the extent of per capita VMT reduction needed relative to existing conditions in order to show consistency with the State's climate goals."

that combining different land uses and applying one threshold to those land uses may result in an inaccurate impact assessment.⁷⁹

At the regional level, CARB has set a regional target for SCAG of a 19 percent reduction in per capita on-road light duty transportation-related GHG emissions by 2035 relative to 2005. While SCAG meets this target, CARB has indicated that additional reductions are needed beyond targets set for the MPOs and has identified a “gap” between the regional target and the emissions/VMT reductions necessary to meet the state’s climate action goals. Currently adopted SCSs would achieve in the aggregate, a nearly 18 percent reduction in statewide per capita transportation-related GHG emissions in aggregate. However, in order to meet the statewide goals, the full reduction needed, according to CARB, is a 25 percent reduction by 2035.⁸⁰ Although the region is making progress in per capita VMT reductions, and is making significant strides in the development of new initiatives, projects, and programs in the Plan, and is not directly interfering with the statewide VMT reductions required to meet the state’s climate goals, the Plan does not clearly achieve the necessary level of VMT reductions now forecast by the state to meet AB 32 and SB 32 (as well as associated SB 743 guidance) GHG reduction goals. As discussed above and in **Section 3.8, Greenhouse Gases**, there is a “gap” between the current MPO emissions reductions targets and the emissions/VMT reductions necessary to meet the state’s climate action goals.

While CARB acknowledges that SCAG and other MPOs cannot meet this need without the collaboration and help of the state itself (i.e., through stricter regulation), as well as local partners, at the time of writing this PEIR it is unknown how CARB and other state agencies, through statewide programs or in coordination with local and regional governments, would meet the identified higher VMT reductions. It is expected that individual projects will need to review their projects in light of CARB and OPR guidance regarding VMT reduction targets to determine the appropriate levels of reductions. In some cases, it could be CARB’s suggested 14.3 target, or OPRs 15 percent (for residential and office uses) reduction. Neither the agencies, nor the courts have provided any clear guidance yet as to the appropriate methodology, and it is expected that there will not be a “one size fits all” approach. Each project will need to be evaluated in light of its particular components.

Despite the benefits shown by implementing the Plan, the transportation projects and growth under the Plan would substantially increase VMT, which would be inconsistent with *CEQA Guidelines* section 15064.3(b) and may not support achievement of the state’s VMT goals as identified in the 2017 Scoping Plan, constituting a significant impact requiring the consideration of mitigation measures.

⁷⁹ The SCAG region includes a wide variety of project types, and as such, a generic 15 percent reduction would not be expected to accurately reflect the specific details of the region.

⁸⁰ California Air Resources Board, *2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals*, 2019

Mitigation Measures

SCAG Mitigation Measures

SMM TRA-1: SCAG shall facilitate minimizing VMT and related vehicular delay by minimizing impacts to circulation and access, improve mobility, and encourage transit and Active Transportation via workshops (i.e., Mobility 21 workshop and Regional Transportation Workgroups) and web-based planning tools for local governments, forums with policy makers, and County Transportation Planning Agencies, member cities, and state partners.

SMM TRA-2: SCAG shall identify further reduction in VMT, and fuel consumption that could be obtained through land-use strategies, additional car-sharing programs with linkage to public transportation, additional vanpools, additional bicycle sharing and parking programs, and implementation of a universal employee transit access pass (TAP) program.

SMM TRA-3: SCAG shall initiate and facilitate an SB 743 implementation program. The grant-funded project, co-sponsored by SCAG and LADOT, seeks to provide technical and mitigation strategy development guidance to local jurisdictions in the six-county SCAG region to facilitate implementation of the VMT-based CEQA transportation impact analysis provisions of SB 743. This coordinated program of technical guidance, evaluation of options, and cooperative engagement with local communities will serve to smooth the transition to the new VMT-reducing development paradigm, helping to ensure a successful region-wide implementation of SB 743 and attainment of the associated GHG reduction goals. Some of the primary features of the scope of work include:

- Evaluate the feasibility of various alternative VMT mitigation options, including local and regional VMT exchange and banking programs.
- Establish CEQA nexus to reduce VMT through a VMT mitigation exchange or banking program alternative.
- Substantiate the legal basis of a VMT exchange program for satisfying CEQA mitigation requirements.
- Collaborate with other communities and jurisdictions to reduce VMT through implementation of a VMT mitigation exchange or bank program.

- Improve the dissemination of transportation project VMT mitigation options.
- Support a variety of TDM strategies for Transportation Management Organization (TMO) membership agencies.
- Provide guidance to facilitate establishment of VMT mitigation exchange or bank programs throughout the region and state

SMM TRA-4: SCAG shall continue to analyze and develop potential implementation strategies for a regional, market-based system to price or charge for auto trips during peak hours.

SMM TRA-5: SCAG shall develop a vanpool program for SCAG employees' commute trips.

SMM TRA-6: SCAG shall encourage new developments to incorporate both local and regional transit measures into the project design that promote the use of alternative modes of transportation.

Project Level Mitigation Measures

PMM-TRA-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to transportation-related impacts. Such measures may include the following or other comparable measures identified by the Lead Agency:

- Transportation demand management (TDM) strategies should be incorporated into individual land use and transportation projects and plans, as part of the planning process. Local agencies should incorporate strategies identified in the Federal Highway Administration's publication: *Integrating Demand Management into the Transportation Planning Process: A Desk Reference* (August 2012) into the planning process (FHWA 2012). For example, the following strategies may be included to encourage use of transit and non-motorized modes of transportation and reduce vehicle miles traveled on the region's roadways:
 - include TDM mitigation requirements for new developments;
 - incorporate supporting infrastructure for non-motorized modes, such as, bike lanes, secure bike parking, sidewalks, and crosswalks;

- provide incentives to use alternative modes and reduce driving, such as, universal transit passes, road and parking pricing;
- implement parking management programs, such as parking cash-out, priority parking for carpools and vanpools;
- develop TDM-specific performance measures to evaluate project-specific and system-wide performance;
- incorporate TDM performance measures in the decision-making process for identifying transportation investments;
- implement data collection programs for TDM to determine the effectiveness of certain strategies and to measure success over time; and
- set aside funding for TDM initiatives.

- The increase in per capita VMT on facilities experiencing LOS F represents a significant impact compared to existing conditions. To assess whether implementation of these specific mitigation strategies would result in measurable traffic congestion reductions, implementing actions may need to be further refined within the overall parameters of the proposed Plan and matched to local conditions in any subsequent project-level environmental analysis.

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis, the increase in total VMT and SCAG's lack of authority to require project-level mitigation measures, this PEIR finds impacts related to VMT to be significant and unavoidable.

Impact TRA-3 Substantially increase hazards due to geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

Less than Significant Impact.

SCAG adopted its 2020 Regional Safety targets in February 2019 and aims to reduce fatalities by 3 percent and serious injuries by 1.5 percent annually by 2050 to reach the goal of Towards Zero Death (TZD). Connect SoCal prioritizes ensuring the safety and mobility of the region's residents, including drivers and passengers, transit riders, pedestrians, and bicyclists. The Plan's Safety and Security Technical report provides a framework largely grounded in the State's Strategic Highway Safety Plan, that can help member agencies interested in pursuing safety initiatives and strategies at the local level. The Plan also aims to address actionable strategies in which SCAG can support local jurisdictions.

In 2018, SCAG initiated a comprehensive update of its multi-county Regional Intelligent Transportation System (ITS) Architecture. Expected to be completed in 2019, the Regional ITS will make use of advanced detection, communications, and computing technology to improve transportation safety. ITS allows surveillance technologies to collect data about the status of highways, traffic signals, transit vehicles, and rideshare vehicles to improve the efficiency of the system. In addition to this framework, SCAG supports the efforts of local jurisdictions to improve transportation safety through a safe systems approach which utilizes systems thinking to design transportation systems with no deaths or serious injuries. A safe systems approach includes programs such as Vision Zero, which aims to eliminate traffic fatalities and severe injuries by promoting roadway design and policy that recognizes human error and prevents severe injury incidents. Connect SoCal land use strategies aim to focus growth in HQTAs, which are generally located away from high-speed transportation facilities where potential hazards due to design features tend to be high (e.g., mountain roads). Moreover, development in HQTAs would increase the number of SCAG region residents in proximity to transit and in areas with good opportunities for active transportation, making it imperative to design facilities with bike racks, improved sidewalks with shade, bikeways, and welcoming transit stations to promote an active streetscape.

Bicycling has continued to become a more popular activity across the SCAG region. Fatalities and serious injuries between motor vehicles and bicycles have steadily increased throughout the years and remain high. SCAG recommends strategies for local jurisdictions to improve safety for bicyclists, including connecting bicycle facilities, implementing active transportation plans, complete streets policies and intersection control for bicyclists.

The Plan identifies three major findings related to collisions in the SCAG region: fatalities and injuries are mostly occurring on a subset of streets, are increasing and are disproportionately impacting people walking and bicycling, and are occurring mostly in areas with high concentrations of low income residents and/or people of color. Between 2012 and 2016, 68 percent of fatalities and serious injuries have occurred on local streets and 65 percent of fatalities and serious injuries have occurred on less than 1.5

percent of the roadway network, and 66 percent of the High Injury Network is in disadvantaged communities (See Table 3.17-19, Active Transportation Serious Injuries and Fatalities [2006-2016]).⁸¹

Table 3.17-19
Active Transportation Serious Injuries and Fatalities (2006-2016)

Year	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016

Source:

SCAG Active Transportation, 2019.

The Plan includes strategies to encourage a complete streets approach to roadway improvements which would include design of facilities to enhance the safety of riders, bicyclists, and pedestrians and minimize hazards. These enhancements would also reduce hazards for drivers. Comprehensive road education, safe pedestrian routes to schools, and other safety campaigns would also occur. The Plan includes 392 safety projects, comprising 19 percent of the total budget, or slightly more than \$5.4 billion in programmed investments (See Table 3.17-20, 2016 RTP/SCS Safety Projects by County).

Table 3.17-20

Source: SCAG Transportation, Safety, and Security, 2019.

⁸¹ SCAG Safety and Security Technical Report, 2019.

In accordance with the provisions governing hazard designs from the Southern California Regional Intelligent Transportation System (ITS), the Plan would not result in an overall increase in hazards due to geometric design features or increase conflicts between incompatible uses, and impacts would be less than significant. Impacts from increased hazards due to geometric design features or incompatible attributes are less than significant.

Impact TRA-4 Result in inadequate emergency access.

Impact WF-1 Substantially impair an adopted emergency response plan or emergency evacuation plan.

Significant and Unavoidable Impact – Mitigation Required.

See also analysis of Impact HAZ-6 Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan,” in **Section 3.9, Hazards and Hazardous Materials.**

Natural or manmade disasters can have devastating impacts on our region’s livelihood and infrastructure. It is critically important to protect our region’s infrastructure in the form of transportation, utilities, communications, fuel, and water to provide the residents of this region with the quality of life they deserve. In addition, transportation infrastructure is critical to preserving life as it allows residents and goods to reach necessary destinations. Compromised infrastructure as a result of disaster may have impacts beyond the immediate SCAG region. Additionally, failure of multiple infrastructure components may result in a catastrophic impact to the mobility needs of the region.

Numerous agencies participate in the response to incidents and assist with hazard preparedness for individual jurisdictions. Collaboration occurs between many of these agencies. The Federal Emergency Management Agency (FEMA) oversees coordination. However, FEMA defines metropolitan areas and coordination different than the US Department of Transportation, limiting SCAG’s ability to participate at an agency level. SCAG aims to use its strengths and organization to assist planners, first responders and recovery teams in a supporting role.

Mitigating hazards before the occurrence of a disaster is the primary step in preparing for emergencies, rather than the final step of recovery. The goal of hazard mitigation plans is to guide implementation activities in order to achieve the greatest reduction of vulnerability, which will result in saved lives, reduced injuries, reduced property damage, and greater protection of the environment. FEMA requires state and local governments to develop hazard mitigation plans and update them every three years. The Disaster Mitigation Act of 2000 (DMA 2000), Section 322 (a-d) requires that local governments, as a

condition of receiving federal disaster mitigation funds, have a mitigation plan that describes the process for identifying hazards, risks and vulnerabilities; identifies and prioritizes mitigation actions; encourages the development of local mitigation; and provides technical support for those efforts. “Local Governments” are defined in the DMA 2000 to typically include counties, local municipalities, and tribal governments; but can also include other local agencies and organizations, including Councils of Governments, schools and other special districts.

California updated its State of California Multi-Hazard Mitigation Plan in 2018. The state is required to adopt a federally approved State Multi- Hazard Mitigation Plan to be eligible for certain disaster assistance and mitigation funding. The Plan is an evaluation of the hazards California faces and the strategies, goals and activities the state will pursue to address these hazards. All six counties and a number of cities within the SCAG region have complete Hazard Mitigation Plans.

While the Plan would impact traffic and delay in the region, California state law requires drivers to yield the right-of-way to emergency vehicles and even permits emergency vehicles to use opposing lane of travel, the center turn lanes, or bus-only lanes. In some instances, roadway reconfigurations with the implementation of transportation improvements could improve emergency access. For example, a roadway reconfiguration could improve emergency access where a bus-only lane or a contiguous center left-turn lane is introduced where it did not previously exist. Emergency vehicles are permitted to use bus-only lanes for local access to emergency destinations. People traveling by bicycle are required to pull to the side of the road to yield access to emergency providers regardless if they are traveling in a bus-only lane or in a standard travel lane. It is more likely that when in route to an emergency incident, general traffic will be expected to merge into the bus-only lane, permitting the emergency vehicle to pass in the through lane to the left. Emergency responders also routinely use the center left-turn lanes, or even travel in opposing travel lanes if needed. Generally, multi-lane roadways allow the emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle. The Plan includes strategies to improve emergency response services. These include using ITS to improve response times to and from collision sites and the development of guidance documents to share with EMS responders to increase crash scene safety.

Depending on the timing, location, and duration of construction activities, several of the proposed transportation projects (including grade crossings, arterials, interchanges, and auxiliary lanes), would result in delayed emergency vehicle response times or otherwise disrupt delivery of emergency response services, could occur. For example, closing off one or more lanes of a roadway, emergency routes would be impaired. The closure of these lanes could potentially cause traffic delays and ultimately prevent access to calls for service. Construction of development projects may also interfere with the use of existing transportation facilities (such as roadways) by potentially blocking travel lanes with construction

equipment and through increasing congestion as a result. Coordination with local jurisdictions is generally required by local jurisdictions in order to maintain adequate emergency access for ambulance and emergency services.

Land use strategies in the Plan encourage more compact development. As discussed in **Section 3.15.1, Public Services – Fire**, and **Section 3.15.2, Public Services - Police**, compact land uses are generally more efficient at serving the public for emergency response. This is often because urban areas tend to be well served with these facilities and also because the more compact land use pattern better facilitates access to specific sites.

However, while regulations (especially in urban areas) generally ameliorate potential impacts with respect to emergency access, due to potential increased traffic congestion associated with construction of transportation projects and development projects anticipated to occur in the region, there is the potential for the Plan to result in interference with emergency access. Therefore, the Plan would have the potential to result in inadequate emergency access, constituting a significant impact requiring mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

SMM TRA-7: SCAG shall, in cooperation with local and state agencies, identify critical infrastructure needs necessary for: a) emergency responders to enter the region, b) evacuation of affected facilities, and c) restoration of utilities. In addition, SCAG shall establish transportation infrastructure practices that promote and enhance security.

SMM TRA-8: SCAG shall provide the means for collaboration in planning, communication, and information sharing before, during, or after a regional emergency. This will be accomplished by the following:

- SCAG shall develop and incorporate strategies and actions pertaining to response and prevention of security incidents and events as part of the on-going regional planning activities.
- SCAG shall offer a regional repository of GIS data for use by local agencies in emergency planning, and response, in a standardized format.
- SCAG shall enter into mutual aid agreements with other MPOs (as feasible) to provide this data, in coordination with the California OES in the event that an event disrupts SCAG's ability to function.

Project Level Mitigation Measures

PMM TRA-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects which may substantially impair implementation of an adopted emergency response plan or emergency evacuation plan, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- Prior to construction, project implementation agencies can and should ensure that all necessary local and state road and railroad encroachment permits are obtained. The project implementation agency can and should also comply with all applicable conditions of approval. As deemed necessary by the governing jurisdiction, the road encroachment permits may require the contractor to prepare a traffic control plan in accordance with professional engineering standards prior to construction. Traffic control plans can and should include the following requirements:
 - Identification of all roadway locations where special construction techniques (e.g., directional drilling or night construction) would be used to minimize impacts to traffic flow.
 - Development of circulation and detour plans to minimize impacts to local street circulation. This may include the use of signing and flagging to guide vehicles through and/or around the construction zone.
 - Scheduling of truck trips outside of peak morning and evening commute hours.
 - Limiting of lane closures during peak hours to the extent possible.
 - Usage of haul routes minimizing truck traffic on local roadways to the extent possible.
 - Inclusion of detours for bicycles and pedestrians in all areas potentially affected by project construction.
 - Installation of traffic control devices as specified in the California Department of Transportation Manual of Traffic Controls for Construction and Maintenance Work Zones.

- Development and implementation of access plans for highly sensitive land uses such as police and fire stations, transit stations, hospitals, and schools. The access plans would be developed with the facility owner or administrator. To minimize disruption of emergency vehicle access, affected jurisdictions can and should be asked to identify detours for emergency vehicles, which will then be posted by the contractor. Notify in advance the facility owner or operator of the timing, location, and duration of construction activities and the locations of detours and lane closures.
- Storage of construction materials only in designated areas.
- Coordination with local transit agencies for temporary relocation of routes or bus stops in work zones, as necessary.
- Ensure the rapid repair of transportation infrastructure in the event of an emergency through cooperation among public agencies and by identifying critical infrastructure needs necessary for: a) emergency responders to enter the region, b) evacuation of affected facilities, and c) restoration of utilities.
- Enhance emergency preparedness awareness among public agencies and with the public at large.

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis, potential increases in traffic and construction-related impediments to emergency access and SCAG's lack of authority to require project-level mitigation measures, this PEIR finds impacts related to emergency access to be significant and unavoidable.

3.18 TRIBAL CULTURAL RESOURCES

This section of the Program Environmental Impact Report (PEIR) describes the tribal cultural resources in the SCAG region, identifies the regulatory framework with respect to laws and regulations that govern tribal cultural resources, and evaluates and discusses the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.18.1 ENVIRONMENTAL SETTING

3.18.1.1 Definitions

California Historical Resources Information System (CHRIS): The California Historical Resources Information System (CHRIS) consists of the California Office of Historic Preservation (OHP), nine Information Centers (ICs), and the State Historical Resources Commission (SHRC). The OHP administers and coordinates the CHRIS and presents proposed CHRIS policies to the SHRC, which approves these policies in public meetings. The CHRIS Inventory includes the State Historic Resources Inventory maintained by the OHP as defined in California Public Resources Code [PRC] § 5020.1(p), and the larger number of resource records and research reports managed under contract by the nine ICs.

Tribal Cultural Resources: Pursuant to Assembly Bill (AB) 52, a site feature, place, cultural landscape, sacred place or object, which is of cultural value to a Tribe and is either on or eligible for the California Historic Register or a local historic register, or such a resource that the lead agency, at its discretion, chooses to treat the resource as a Tribal Cultural Resources (see PRCPRC §§ 21074 (a)(1)(A)-(B)). A tribal cultural resource may also include a unique archaeological resource (see PRC § 21083.2(g)) or a “nonunique archaeological resource” (see PRC § 21083.2(h), subject to the provisions of PRC § 21074 (a)) may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

Unique archeological resource: Pursuant to Section 21083.2 of the PRC, a unique archaeological resource includes artifacts or sites that meet any one or all of the following criteria:¹

- It has made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States;
- It is associated with the lives of persons important to California’s past;

¹ California Legislative Information. 1972. *Chapter 2.6. General [21080-21098], Section 21083.2.*

- It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; and/or
- It has yielded, or may be likely to yield, information important to the prehistory or history of California.

Unique geologic feature: An important and irreplaceable geological formation. Such features may have scientific and/or cultural values.

3.18.1.2 Existing Conditions

Detailed information regarding the prehistoric occupation is presented in **Section 3.5, Cultural Resources**, of this PEIR. As noted in **Section 3.5**, the SCAG region once was the home to at least 11 distinct Native American groups. These include the Cahuilla, Chumash, Gabrielino, Halchidhoma, Kitanemuk, Luiseno, Mohave, Quechan, Serrano, Southern Paiute, Tataviam, and Tipai. The territorial boundaries of the Native Americans who were residing in Southern California at the time of first European contact do not coincide with today's political boundaries. Moreover, many tribal boundaries overlapped and most groups migrated within their general boundaries throughout the years.

The federal government established reservations in Southern California between 1875 and 1891. This includes the Martinez, Fort Yuma, and Colorado River reservations in Imperial County. In Riverside County are Torres, Cabazon, Augustine, Santa Rosa, Ramona, Pechanga, Soboba, Agua Caliente, Mission Creek, and Morongo. The reservations in San Bernardino County are the San Manuel, Chemehuevi, Fort Mojave, Twentynine Palms reservations. No reservations were established in Los Angeles, Ventura, or Orange Counties. It was believed that the local Native American groups in those counties had become extinct.²

As of July 2019, over 109,000 archaeological resource locations have been identified in the SCAG region (**Table 3.18-1, Archeological Resources Listed in the CHRIS**). In order to protect these archaeological sites, and the artifacts contained within their boundaries, from scavenging and looting, their locations are confidential. Under state law, detailed information about these sites, especially their location, is considered confidential.

² Environmental Protection Agency, Region 9 – Air. 2011. *California Tribal Lands*. Available online at: https://www3.epa.gov/region9/air/maps/pdfs/air1100040_3.pdf, accessed August 27, 2019.

**Table 3.18-1
Archeological Resources Listed in the CHRIS**

County	Archeological Resources	Archeological Resources Listed in CHRIS
Imperial*	12,398	16,500 (approx.)
Los Angeles	4,886	18,599
Orange	1,775	5,498
Riverside**	20,200 (approx.)	28,612
San Bernardino	8,236	36,924
Ventura	1,864	3,226
SCAG Region Total	49,359	109,359

Source:

SWCA Environmental Consultants, Inc. (2019).

* The SCIC database is currently being revised and the count of total resources is an approximation based on current listings. The number of resources with archaeological components is taken from the 2016 General Plan, Open Space & Conservation Element. The total number of resources was approximated by SCIC staff and provided to SWCA via email on July 1, 2019.

** The EIC database is not currently configured to distinguish historic-period archaeological resources from non-archaeological historic resources (i.e., buildings, structures, etc.). Instead, the EIC provided tallies of resources with components dating to the respective periods as follows: 13,993 Prehistoric archaeological sites; 1 Protohistoric archaeological site; 15,313 Historic period cultural resources (archaeological sites and historic resources); 202 sites of unknown cultural or temporal affiliation. Because an individual resource may have components that fall into multiple periods, the sum of all resources listed for each period is greater than the total number of resources. The total number of archaeological sites was estimated for Riverside County to allow for comparison with other counties across the SCAG region. This was done for Riverside County by taking the 13,994 archaeological sites listed as Prehistoric and Protohistoric (because these resources can only be archaeological sites) and adding an estimated fraction of those listed as Historic and Unknown Period, which could consist of historic resources (i.e., non-archaeological). The estimate provided here assumes 40 percent of those resources listed as Historic or Unknown Period have archaeological components that are not multi-component resources (and already tallied as Prehistoric or Protohistoric).

Native American Sacred Sites

Within the SCAG region there are 16 federally recognized tribes (84 Fed. Reg. § 1200) with lands administered as federal Indian reservations, also known as pueblos, rancherias, missions, villages, communities, etc.:³

- Agua Caliente Band of Cahuilla Indians
- Augustine Band of Mission Indians
- Cabazon Band of Mission Indians
- Cahuilla Band of Indians
- Chemehuevi Indian Tribe

³ Federal Register. *Indian Entities Recognized by and Eligible To Receive Services From the United States Bureau of Indian Affairs*. Updated 02/01/2019. Available at: <https://www.federalregister.gov/d/2019-00897>, accessed September 13, 2019.

- Colorado River Indian Tribe
- Fort Mojave
- Morongo Band of Mission Indians
- Quechan Indian Tribe
- Pechanga Band of Luiseño Indians
- Ramona Band of Cahuilla Mission Indians
- San Manuel Band of Mission Indians
- Santa Rosa Band of Cahuilla Indians
- Soboba Band of Luiseno Indians
- Torres-Martinez Desert Cahuilla Indians
- Twenty-Nine Palms Band of Mission Indians

Recognizing that tribal groups may have expertise with regard to their tribal history and practices that others may not, Assembly Bill 52 (AB 52) (as will be discussed in more detail below) requires lead agencies to provide notice to all tribal groups that are traditionally, culturally, and historically affiliated with the geographic area of a proposed project if they have requested such notice. Some of these groups are not federally recognized, have had their federal recognition revoked, or are in the processes of requesting federal recognition. The Native American Heritage Commission (NAHC) maintains the list of tribes that are traditionally and culturally affiliated within a specified geographic area.

Native American sacred sites reflect the evolution of the Southern California landscape, reflecting the rich cultural heritage of Native American cultures that predate and continued beyond European contact. Native American sacred sites may be related to a range of topics, including origins of the universe, the shifting of tectonic plates, and an evolving array of plants and animals that give Southern California its unique features today. Some sites are associated with the migration of humans into the region, where they settled, and how they lived. These sites document the view of Native American cultures of their own history and way of life.

The NAHC is charged with identifying, cataloging, and protecting Native American cultural resources and sacred sites, which is maintained as the SLF. **Table 3.18-2, Sacred Lands Recorded by the NAHC in the SCAG Region**, shows the total number of listings within each county. The nature and precise location of these resources is confidential.

**Table 3.18-2
Sacred Lands Recorded by the NAHC in the SCAG Region**

County	Sacred Lands
Imperial	84
Los Angeles	38
Orange	45
Riverside	123
San Bernardino	61
Ventura	12
SCAG Region Total	363

Tribal Consultation

SWCA Environmental Consultants (SWCA) led the AB 52 process undertaken by SCAG. SWCA contacted the NAHC on behalf of SCAG on December 5, 2018 to request a Sacred Lands File Search and CEQA Tribal Consultation List under AB 52. The NAHC responded in a letter dated December 18, 2018 and indicated that the SLF search yielded positive results; the letter also included a list of 61 contacts for tribal consultation. SCAG sent letters to all 61 of these contacts via certified mail on January 8, 2019. SCAG's letter described the Plan and PEIR, and invited tribal parties to consult under AB 52. On behalf of SCAG, SWCA subsequently followed up by email on March 13, 2019 with those contacts who had not responded. In total, seven parties responded to SCAG's outreach effort. Two of these, the Pala Band of Mission Indians and the Big Pine Paiute Tribe of the Owens Valley, declined consultation. Five parties – the Agua Caliente Band of Cahuilla Indians, the Fernandeno Band of Mission Indians, the Gabrieleno Band of Mission Indians – Kizh Nation, the Juaneño Band of Mission Indians Acjachemen Nation, and the San Manuel Band of Mission Indians – requested consultation and additional details, including the cultural resources technical study, once completed. SCAG replied to the five parties who requested consultation and provided a timeline for the cultural resources technical study, which it anticipates sharing in late 2019. SCAG also invited the interested tribes to attend project scoping meetings.

3.18.2 REGULATORY FRAMEWORK

3.18.2.1 Federal Regulations

Antiquities Act of 1906

The Antiquities Act of 1906 (16 U.S. Code [U.S.C.] §§ 431–433), which aimed to protect important historic and archaeological sites, initiated historic preservation legislation. It established a system of permits for conducting archaeological studies on federal land, as well as setting penalties for noncompliance. This permit process controls the disturbances that may be caused to archaeological sites.⁴ New permits are currently issued under the Archaeological Resources Protection Act (ARPA) of 1979. The purpose of ARPA is to enhance preservation and protection of archaeological resources on public and Native American lands.⁵

Historic Sites Act of 1935

The Historic Sites Act (16 U.S.C. §§ 461–467) became law on August 21, 1935, and declared that it is national policy to “Preserve for public use historic sites, buildings, and objects of national significance.”⁶ The National Historic Preservation Act (NHPA) expanded the scope to include important state and local resources. Provisions of NHPA established the National Register maintained by the National Park Service, advisory councils on Historic Preservation, State Historic Preservation Offices, and grants-in-aid programs. Section 106 of the NHPA requires all federal agencies to consult the Advisory Council before continuing any activity affecting a property listed on or eligible for listing on the National Register.⁷ The Advisory Council has developed regulations for Section 106 to encourage coordination of agency cultural resource compliance requirements (Executive Order 11593).⁸

National Register of Historic Places (National Register)

The National Register recognizes properties that are significant at the national, state, and/or local levels. Although administered by the National Park Service, the federal regulations explicitly provide that

⁴ National Park Service. *American Antiquities Act of 1906, 16 U.S.C. 431-433*. Available online at: <https://www.nps.gov/history/local-law/anti1906.htm>, accessed August 27, 2019.

⁵ National Park Service. *Archaeological Resources Protection Act*. Available online at: https://www.nps.gov/history/local-law/FHPL_ArchRsrcsProt.pdf, accessed August 27, 2019.

⁶ National Park Service. *Historic Sites Act of 1935, 16 U.S.C. sec. 461-467*. Available online at: <https://www.nps.gov/history/local-law/hsact35.htm>, accessed August 27, 2019.

⁷ National Park Service. *National Historic Preservation Act of 1966, Public Law 102-575*. Available online at: <https://www.nps.gov/history/local-law/nhpa1966.htm>, accessed August 27, 2019.

⁸ Federal Register. *Executive Order 11593 – Protection and enhancement of the cultural environment*. Available online at: <https://www.archives.gov/federal-register/codification/executive-order/11593.html>, accessed August 27, 2019.

National Register listing of private property “does not prohibit under federal law or regulation any actions which may otherwise be taken by the property owner with respect to the property.” Listing in the National Register assists in preservation of historic properties through: recognition that a property is of significance to the nation, the state, or the community; consideration in the planning for federal or federally-assisted projects; eligibility for federal tax benefits; consideration in the decision to issue a surface coal mining permit; and qualification for federal assistance for historic preservation, when funds are available. In addition, for projects that receive federal funding, a clearance process must be completed in accordance with Section 106 of the NHPA. Furthermore, state and local regulations may apply to properties listed in the National Register.⁹

The criteria for listing in the National Register follow the standards for determining if properties, sites, districts, structures, or landscapes of potential significance are eligible for nomination. In addition to meeting any or all of the following criteria, properties nominated must also possess integrity of location, design, setting, feeling, workmanship, association, and materials that:¹⁰ A property is eligible for the NRHP if it is significant under one or more of the following criteria:

Criterion A: It is associated with events that have made a significant contribution to the broad patterns of our history;

Criterion B: It is associated with the lives of persons who are significant in our past;

Criterion C: It embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction; and/or

Criterion D: It has yielded, or may be likely to yield, information important in prehistory or history.

Ordinarily cemeteries, birthplaces, or graves of historic figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, and properties that are primarily commemorative in nature, are not considered eligible for the NRHP, unless they satisfy certain conditions. In general, a resource must be 50 years of age to be considered for the NRHP, unless it satisfies a standard of exceptional importance.

In addition to meeting these criteria, a property must retain historic integrity, which is defined in National Register Bulletin 15 as the “ability of a property to convey its significance” (NPS 1990). In order

⁹ Government Publishing Office. 2019. *Title 36: Parks, Forests, and Public Property, Part 60 – National Register of Historic Places*.

¹⁰ Ibid.

to assess integrity, the NPS recognizes seven aspects or qualities that, considered together, define historic integrity. To retain integrity, a property must possess several, if not all, of these seven qualities, which are defined in the following manner in National Register Bulletin 15:

Location: the place where the historic property was constructed or the place where the historic event occurred;

Design: the combination of elements that create the form, plan, space, structure, and style of a property;

Setting: the physical environment of a historic property;

Materials: the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

Workmanship: the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory;

Feeling: a property's expression of the aesthetic or historic sense of a particular period of time;

Association: the direct link between an important historic event or person and a historic property.

Procedures for listing a property in the NRHP are outlined in Procedures for State, Tribal, and Local Government Historic Preservation Programs (36 C.F.R. § 61) and in Determinations of Eligibility for Inclusion in the National Register (36 C.F.R. § 63). The Secretary of the Interior's Professional Qualifications Standards for who is allowed to conduct cultural resources studies and evaluations are outlined in 36 C.F.R. § 61.

Procedures for artifact curation are noted in Curation of Federally Owned and Administered Archeological Collections (36 C.F.R. § 79) for artifacts recovered under the authority of the Antiquities Act (16 U.S.C. §§ 431- 433), the Reservoir Salvage Act (16 U.S.C. §§ 469-469c), Section 110 of the NHPA (16 U.S.C. § 470h-2), or the ARPA (16 U.S.C. §§ 470aa-mm).

National Historic Preservation Act of 1966 (NHPA)

The NHPA, as amended (54 U.S.C. § 470 *et seq.*), established guidelines to "preserve important historic, cultural, and natural aspects of our national heritage, and to maintain, wherever possible, an environment that supports diversity and a variety of individual choice." The NHPA includes requirements (Section 106) which pertain to all projects that are funded, permitted, or approved by any federal agency and which have the potential to affect cultural resources. Under the Section 106

consultation process (36 C.F.R. § 800 *et seq.*), federal agencies taking such actions are required to consult with the Advisory Council on Historic Preservation (ACHP), State Historic Preservation Officer (SHPO), local agencies, and Indian tribes, and avoid or mitigate adverse effects on National Register-listed or -eligible properties. Provisions of NHPA establish a National Register of Historic Places (National Register); see above for details.¹¹

Archaeological and Historic Preservation Act of 1974

Passed and signed into law in 1974, The Archaeological and Historic Preservation Act of 1974 (AHPA), 16 U.S.C. § 469 *et seq.*) amended and expanded the Reservoir Salvage Act of 1960. The AHPA as amended requires that federal agencies provide for the preservation of historical and archaeological data (including relics and specimens) which might otherwise be irreparably lost or destroyed as the result of any alteration of the terrain caused by any federal construction project or federally-licensed activity or program.¹²

Archaeological Resources Protection Act of 1979

The ARPA (16 U.S.C. § 470aa *et seq.*) applies when a project may involve archaeological resources located on federal or tribal land. ARPA requires that a permit be obtained before excavation of an archaeological resource on such land can take place.¹³

The American Indian Religious Freedom Act of 1978

The American Indian Religious Freedom Act of 1978 (AIRFA) (42 U.S.C. § 1996) proclaims that the US Government will respect and protect the rights of Indian tribes to the free exercise of their traditional religions; the courts have interpreted this as requiring agencies to consider the effects of their actions on traditional religious practices.

Native American Graves Protection and Repatriation Act of 1990

The Native American Graves Protection and Repatriation Act of 1990 (NAGPRA) (25 U.S.C. § 3001 *et seq.*) also applies if human remains of Native American origin are discovered on federal or tribal land. NAGPRA requires federal agencies and federally-assisted museums to return “Native American cultural

¹¹ National Park Service. *National Historic Preservation Act of 1966 as amended through 1992*. Available online at: <https://www.nps.gov/history/local-law/nhpa1966.htm>, accessed August 27, 2019.

¹² National Park Service. *Archeological and Historic Preservation Act as Amended*. Available online at: https://www.nps.gov/history/local-law/FHPL_ArchHistPres.pdf, accessed August 27, 2019.

items” to the federally recognized Indian tribes or Native Hawaiian groups with which they are associated. Regulations (43 C.F.R. Part 10) stipulate the following procedures be followed. If Native American human remains are discovered, the following provisions would be followed to comply with regulations:

- Notify, in writing, the responsible federal agency;
- Cease activity in the area of discovery and protect the human remains;
- Certify receipt of the notification;
- Take steps to secure and protect the remains;
- Notify the Native American tribes or tribes likely to be culturally affiliated with the discovered human remains within one working day; and
- Initiate consultation with the Native American tribe or tribes in accordance with regulations described in 43 C.F.R., Part 10, Subpart B, Section 10.5.

Archaeology and Historic Preservation; Secretary of the Interior’s Standards and Guidelines

Offers non-regulatory technical advice about the identification, evaluation, documentation, study, and other treatment of cultural resources. Notable in these Guidelines are the Standards for Archaeological Documentation, Professional Qualifications Standards for Archaeology, and Standards for the Treatment of Historic Properties.

3.18.2.2 State

Office of Historic Preservation

As an office of the California Department of Parks and Recreation, the Office of Historic Preservation (OHP) implements the policies of the NHPA on a statewide level. The OHP also carries out the duties set forth in the Public Resources Code and maintains the California Historic Resources Inventory.

The State Historic Preservation Officer (SHPO) is an appointed official who implements historic preservation programs within the state’s jurisdiction.

California Register of Historical Resources (California Register)

The California Register is “an authoritative listing and guide to be used by state and local agencies, private groups, and citizens in identifying the existing historical resources of the state and to indicate

which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change.”¹⁴ The criteria for eligibility for the California Register are based upon National Register criteria. These criteria are:

- Criterion 1 – Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California of the United States;
- Criterion 2 – Associated with the lives of persons important to local, California or national history;
- Criterion 3 – Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values; and
- Criterion 4 – Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

The California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed in the National Register of Historic Places (Category 1 in the State Inventory of Historical Resources) and those formally Determined Eligible for listing in the National Register of Historic Places (Category 2 in the State Inventory);
- California Registered Historical Landmarks from No. 0770 onward; and
- Those California Points of Historical Interest that have been evaluated by the Office of Historic Preservation (OHP) and have been recommended to the State Historical Resources Commission for inclusion in the California Register.

Other resources which may be nominated for listing in the California Register include:

- Historical resources with a significance rating of Categories 3 through 5 in the State Inventory. (Categories 3 and 4 refer to potential eligibility for the National Register, while Category 5 indicates a property with local significance);
- Individual historical resources;
- Historical resources contributing to historic districts; and

¹⁴ Public Resources Code Section 50241 (e)

- Historical resources designated or listed as a local landmark.

Additionally, a historic resource eligible for listing in the California Register must meet one or more of the criteria of significance described above and retain enough of its historic character or appearance to be recognizable as a historic resource and to convey the reasons for its significance. Historical resources that have been rehabilitated or restored may be evaluated for listing.

California Public Resources Code, Sections 5097.5, 5097.9, 5097.98–99, and 50907.9

Section 5097.5 of the PRC defines as a misdemeanor the unauthorized disturbance or removal of archaeological, historical, or paleontological resources located on public lands. This Section also prohibits the knowing destruction of objects of antiquity without a permit (expressed permission) on public lands, and provides for criminal sanctions. In 1987, the Code was amended to require consultation with the California Native American Heritage Commission whenever Native American graves are found. It also established that violations for taking or possessing remains or artifacts are felonies.

PRC Section 5097.9 establishes the California Native American Heritage Commission to make recommendations to encourage private property owners to protect and preserve sacred places in a natural state and to allow appropriate access to Native Americans for ceremonial or spiritual activities. The Commission is authorized to assist Native Americans in obtaining appropriate access to sacred places on public lands, and to aid state agencies in any negotiations with federal agencies for the protection of Native American sacred places on federally-administered lands in California.

PRC sections 5097.98 through 5097.99 require that the Governor's California Native American Heritage Commission be consulted whenever Native American graves are found. According to these sections, it is illegal to take or possess remains or artifacts taken from Native American graves; however, it does not apply to materials taken before 1984. Violations occurring after January 1, 1988 are felonies.

PRC Section 50907.9 (Section 7050 of the Health and Safety Code) authorizes the NAHC to regulate Native American concerns regarding the excavation and disposition of Native American cultural resources. Among its duties, the Commission is authorized to resolve disputes relating to the treatment and disposition of Native American human remains and items associated with burials. Upon notification of the discovery of human remains by a county coroner, the Commission notifies the Native American group or individual most likely descended from the deceased. PRC 5097.98(b) requires that landowners ensure that the immediate vicinity (according to generally accepted cultural or archaeological standards of practices) are not damaged or disturbed by further development until the landowner has discussed and conferred with most likely descendants.

AB 52 and Tribal Cultural Resources

Approved by Governor Brown on September 25, 2014, AB 52 establishes a formal notification and, when requested, consultation process for California Native American Tribes to identify significant impacts to Tribal Cultural Resources (TCRs), as defined in PRC section 21074, as part of CEQA. Tribal cultural resources are defined in PRC section 21074, subdivision (a), as either: (1) sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are included or determined to be eligible for inclusion in the California Register of Historical Resources, or included in a local register of historical resources (as defined by statute); or (2) resources determined by the lead agency, and supported by substantial evidence, to be significant pursuant to subdivision (c) of Section 5024.1. If the following resources meet the requirements of subdivision (a), they also be considered “tribal cultural resources”: (1) a cultural landscape that is geographically defined in terms of the size and scope of the landscape; or (2) a historical resource described in Section 21084.1, or a unique archaeological resource defined in subdivision (g) of Section 21083.2, or a “nonunique archaeological resource” as defined in subdivision (h) of Section 21083.2.

In the project planning stage, AB 52 requires the Lead Agency to consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of the proposed project, prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report. If the Lead Agency has not been contacted by any tribal parties who wish to consult on projects, the Lead Agency may contact the NAHC to obtain a list of traditionally and culturally affiliated groups affiliated with the geographic area of the proposed project to contact.

Consultation may include discussion concerning the type of environmental review necessary, the significance of the project’s impacts on the tribal cultural resources, and, if necessary, project alternatives or the appropriate measures for preservation and mitigation that the California Native American tribe may recommend to the lead agency. The consultation should be considered concluded when either the parties agree to measures to mitigate or avoid a significant effect, if one exists, on a tribal cultural resource; or a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached (PRC Section 21082.3.2[b]).

Pursuant to Government Code Sections 6254 and 6254.10, and PRC Section 21082.3(c), information submitted by a California Native American tribe during consultation under AB 52 should not be included in the environmental document or otherwise disclosed to the public by the lead agency, project applicant, or the project applicant’s agent, unless written permission is given. Exemptions to the confidentiality provisions include any information already publicly available, in lawful possession of the project

applicant before being provided by the tribe, independently developed by the project applicant or the applicant's public agent, or lawfully obtained by a third party (PRC Section 21082.3[c]).

California Coastal Act

The California Coastal Act (CCA; PRC Sections 30000 et seq.) includes protection of archaeological resources into Land Conservation Plans that regulate land uses within the coastal zone.

California Health and Safety Code, Section 7050 and Sections 18950 through 18961

Consistent with the provisions of Section 50907.9 of the PRC, Section 7050 of the Health and Safety Code (HSC) authorizes the NAHC to regulate Native American concerns regarding the excavation and disposition of Native American cultural resources. Among its duties, the Commission is authorized to resolve disputes relating to the treatment and disposition of Native American human remains and items associated with burials. Upon notification of the discovery of human remains by a county coroner, the Commission notifies the Native American group or individual most likely descended from the deceased.

The State Historic Building Code (HSC; Sections 18950–18961 provide alternative building regulations and building standards for the rehabilitation, preservation, restoration (including related reconstruction), or relocation of buildings or structures designated as historic buildings. Such alternative building standards and building regulations are intended to facilitate the restoration or change of occupancy so as to preserve their original or restored architectural elements and features, to encourage energy conservation and a cost-effective approach to preservation, and to provide for the safety of the building occupants.

California Penal Code Section 622 – Destruction of Historical Properties

This section of the California Penal Code makes it a misdemeanor for anyone (except the owner) to willfully injure or destroy anything of archaeological interest or value whether on private lands or within any public park or place. In addition, Penal Code Section 622.5 sets the penalties for the damage or removal of cultural resources.

Senate Bill 18 – Traditional Tribal Cultural Places

Senate Bill (SB) 18, enacted in 2004, requires local governments to consult with Native American groups at the earliest point in the local government land use planning process. The consultation intends to establish a meaningful dialogue regarding potential means to preserve Native American places of prehistoric, archaeological, cultural, spiritual, and ceremonial importance. It allows for tribes to hold conservation easements and for tribal cultural places to be included in open space planning.

Executive Order B-10-11

Executive Order B-10-11 states that it is the policy of the administration that every state agency and department subject to executive control is to encourage communication and consultation with California Native American tribes. It established the position of Governor's Tribal Advisor in the Office of the Governor of California. This position will serve as a direct link between the Governor's Office and tribal governments on matters including legislation, policy, and regulation.

3.18.2.3 Local

County General Plans

In addition to federal and state regulations, cities and counties in the SCAG region may also provide regulatory protection and advisement regarding cultural resources (**Table 3.18-3, County Policies and Ordinances Relevant to Tribal Cultural Resources in the SCAG Region**). California law requires that a general plan include seven elements (land use, open space, conservation, housing, circulation, noise, and safety). Many jurisdictions incorporate policies related to cultural and historical resources into the conservation element. Other jurisdictions choose to prepare a separate (optional) element dealing with cultural and/or historic preservation issues. Many jurisdictions also prepare ordinances addressing cultural resources and historic preservation.

**Table 3.18-3
County Policies and Ordinances Relevant to Tribal Cultural Resources in the SCAG Region**

County	County Policies and Ordinances
Imperial	<p>Conservation and Open Space Element of General Plan Policy Numbers: Only one policy, Section IV.B.2 Policies Specific to Archaeological Resources: Yes, brief Policies Specific to Paleontological Resources: No Policies Specific to Historic Resources: No</p>
Los Angeles	<p>Chapter 9: Conservation and Natural Resources Element of General Plan Policy Numbers: C/NR 14.1 – C/NR 14.6 Policies Specific to Archaeological Resources: Yes, very brief Policies Specific to Paleontological Resources: Yes, very brief Policies Specific to Historic Resources: Yes, very brief</p>
Orange	<p>Chapter VI: Resources Element of General Plan Policy Numbers: Goals 1, 2 and 3, each with multiple policy numbers Policies Specific to Archaeological Resources: Yes, extensive Policies Specific to Paleontological Resources: Yes, extensive Policies Specific to Historic Resources: Yes, extensive</p>
Riverside	<p>Chapter 5: Multipurpose Open Space Element of General Plan Policy Numbers: 19.1 – 19.9 Policies Specific to Archaeological Resources: Yes, brief Policies Specific to Paleontological Resources: Yes, brief Policies Specific to Historic Resources: Yes</p>
San Bernardino	<p>Conservation Element (Subchapter C2) of General Plan Policy Numbers: CO 3.1 – CO 3.18 Policies Specific to Archaeological Resources: No – together with historic resources, extensive Policies Specific to Paleontological Resources: Yes, extensive Policies Specific to Historic Resources: No – together with archaeological resources, extensive</p>
Ventura	<p>Chapter 1: Resources (Subchapter 1.8) of General Plan Policy Numbers: 1 – 6 Policies Specific to Archaeological Resources: Yes, Policies 1-3 Policies Specific to Paleontological Resources: Yes, Policies 4 & 5 Policies Specific to Historic Resources: Yes, Policy 6</p>

City General Plans and Ordinances

In accordance with Sections 6530(c) and (d) of the California Government Code, like the six counties in the SCAG region, all cities are required to have a conservation element and an open space element, as mandatory elements of their general plans. Many city general plans have provisions for historic districts and protection of locally important cultural resources that may or may not meet the criteria for eligibility for listing in the NRHP or CRHR.

3.18.3 ENVIRONMENTAL IMPACTS

3.18.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that the Connect SoCal Plan could result in significant impacts to tribal cultural resources, if the project would cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

- Listed or eligible for listing in the California Register of Historical Resources, or in the local register of historical resources as defined in Public Resources. Code Section 5020.1(k); or
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

3.18.3.2 Methodology

The methodology for determining the significance of impacts to tribal cultural resources compares the existing conditions to the future (2045) Connect SoCal conditions, as required by *CEQA Guidelines* Section 15126.2(a). The known tribal cultural resources (i.e. historical or archeological), Native American sacred sites, and human remains located within the SCAG region were evaluated using criteria set forth by the OHP, the CRHR, and the State CEQA Guidelines. Native American sacred sites were analyzed using information provided by the NAHC from the SLF. The NAHC does not disclose the location or nature of the SLF listings, which limits the analysis to a count of resources within respective counties.

Nearly 50,000 archaeological resources have been identified in the SCAG region. Each of these sites is documented at an Archaeological Information Center, which holds location information on archaeological sites for each region in California. These known resources are limited to areas that have been subject to various levels of research or investigation. Areas that have been subject to pedestrian surveys or sub-surface explorations represent only a fraction of the total area with the potential to yield such resources. Therefore, the analysis focuses on the potential for major transportation projects to necessitate ground-disturbing activities in areas where significant archeological resources have been previously recorded or require work in sediments that have not been previously investigated.

As described in **Section 3.18.2.1**, SWCA Environmental Consultants (SWCA) led the tribal consultation process undertaken by SCAG. SWCA contacted the NAHC to request a Sacred Lands File Search and CEQA Tribal Consultation List.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in **Chapter 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.18.3.3 Impacts and Mitigation Measures

- Impact TCR-1** **Cause a substantial adverse change in the significance of a tribal cultural resource defined in Public Resources Code section 21074 that is:**
- a) **Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or**
 - b) **A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1.**

Significant and Unavoidable - Mitigation Required.

Transportation projects and anticipated growth under the Plan have the potential to cause a substantial adverse change in the significance of tribal cultural resources in the SCAG region, defined in Public Resources Code section 21074, as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe.

To assist in this analysis, pursuant to AB 52, SCAG contacted NAHC and is currently consulting with five parties – the Agua Caliente Band of Cahuilla Indians, the Fernandeño Band of Mission Indians, the Gabrieleno Band of Mission Indians – Kizh Nation, the Juaneño Band of Mission Indians Acjachemen

Nation, and the San Manuel Band of Mission Indians – who requested consultation and additional details. SCAG will be providing the cultural resources technical study to these parties once it is completed and will incorporate any information received from the parties as appropriate in the Final EIR.

Direct permanent impacts to TCRs (resources either listed or eligible for listing in the California Register of Historical Resources, or local register of historical resources, or resources determined by the lead agency to be significant) may result from ground disturbance associated with construction, such as grading and excavation. The development of new transportation facilities, construction of additional lanes, or the projected land use pattern stemming from the Plan may have a relatively higher potential to directly impact TCRs, primarily by grading or excavation in previously undisturbed soil and by the disturbance of buried resources that have not been previously identified. The potential for direct impacts to TCRs may be comparatively less for improvements to existing facilities and modifications to existing rights-of-way since these areas have been previously disturbed. Regardless of prior disturbance, however, any excavation has the potential to directly impact undocumented TCRs of an archaeological nature.

Tribal cultural resources are likely to be encountered near areas of prior Native American occupation and activity, which includes areas both within and outside areas of current development. Surficial archaeological deposits that are TCRs are more likely to be heavily disturbed within urban areas and more intact in rural settings; however, this does not preclude the presence of buried archaeological resources that may be significant in urban settings. Archaeological sites that may meet the TCR definition that have been buried below grade have no surface manifestations, making accurate prediction of their location during project planning problematic.

Direct permanent impacts would be significant if TCRs cannot be avoided or preserved in place by project design or redesign and are destroyed or substantially altered. Disturbance of TCR features or places would compromise the traditional use of or the cultural character and integrity of the resource and may result in a significant impact if its contributing characteristics or the character of its physical setting is destroyed or substantially altered. Permanent direct impacts may be addressed by advance project planning and consulting with tribes that have requested consultation to ensure known TCRs are avoided and preserved in place, or to develop project alternatives that would minimize impacts to known TCRs. Permanent direct impacts to TCRs of an archaeological nature discovered inadvertently during project construction may be addressed by project redesign to avoid and preserve the TCR, and by requested tribal consultation focused at minimizing the impact.

Permanent indirect impacts from construction and operational improvements may result from potential access-related damage to TCRs when public accessibility is increased due to changes in land use or new

or improved transportation networks stemming from the Plan. The likelihood of unauthorized artifact collecting and destruction (intentional or unintentional) of TCRs of an archaeological nature, or of damage to or destruction (intentional or unintentional) of TCRs that are traditional places for gathering natural resources, cultural landscapes or sacred places, increases with ease of access. Recreational use, overland vehicle travel, and vandalism would degrade the integrity and traditional use of the TCRs. Ensuring appropriate measures that would minimize or reduce damage to TCRs are devised during project planning, coupled with requested tribal consultation, may reduce indirect access-related impact.

While there are state requirements in place to minimize adverse impacts to TCRs, there is still the potential for access-related damage associated with construction and operation of projects under the Plan. Therefore, the potential direct regional impacts on TCRs related to the transportation projects and growth under the Plan could result in substantial alteration or removal of a TCR. Indirect impacts from access-related damage from construction projects and ongoing operations resulting from the Plan are also considered significant requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

SMM TCR-1: Impacts to tribal cultural resources shall be minimized through cooperation, information sharing, and SCAG's ongoing regional planning efforts such as web-based planning tools for local governments including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts and sharing of associated online Training materials. SCAG shall consult with the Native American Heritage Commission, as well as Native American tribes, to identify opportunities for early and effective consultation to identify tribal cultural resources to avoid such resources wherever practicable and feasible and reduce or mitigate for conflicts in compatible land use to the maximum extent practicable.

Project Level Mitigation Measures

See PMM CULT-1.

PMM TCR-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects on tribal cultural resources. Such

measures may include the following or other comparable measures identified by the Lead Agency:

- a) Avoidance and preservation of the resources in place, including, but not limited to, planning and construction to avoid the resources and protect the cultural and natural context, or planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria;
- b) Treating the resource with culturally appropriate dignity taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following: protecting the cultural character and integrity of the resource; protecting the traditional use of the resource; and protecting the confidentiality of the resource;
- c) Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places; and protecting the resource.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce each of the impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project locations and locations of the unknown tribal cultural resources, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts to tribal cultural resources could be significant and unavoidable even with implementation of mitigation.

SWCA Environmental Consultants, Inc. 2019. DRAFT Cultural Resources Technical Report for the 2020–2045 Regional Transportation Plan and Sustainable Communities Strategy for the Southern California Association of Governments.

3.19 UTILITIES AND SERVICE SYSTEMS

This section of the Program Environmental Impact Report (PEIR) describes the existing utilities and service systems in the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect utilities and service systems, and analyzes the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.19.1 DEFINITIONS

To provide a context for analysis, definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for utilities and service systems are provided below.

Nonhazardous Municipal Solid Waste: More commonly known as trash or garbage—consists of everyday items that are used and then thrown away, such as product packaging, grass clippings, furniture, clothing, bottles, food scraps, newspapers, appliances, paint, and batteries. This comes from homes, schools, hospitals, and businesses.

Regional Water Quality Control Board (RWQCB): There are nine RWQCBs in California. The RWQCBs protect ground and surface water quality and are responsible for implementing Water Quality Control Plans.¹

Sanitary Landfill: Sanitary landfills are sites where waste is isolated from the environment until it is safe. It is considered safe when it has completely degraded biologically, chemically and physically.

Septic Tank: An underground vessel for treating wastewater from a single dwelling or building by a combination of settling and anaerobic digestion. Effluent is usually disposed of through a dispersal system which consists of one or a combination of leach fields, seepage pits, and/or subsurface drip dispersal system. Settled solids in septic tank are pumped out periodically and hauled to a treatment facility for disposal.

Storm Water and Stormwater: In layman’s terms, stormwater is defined as an abnormal amount of surface water due to a heavy rain or snowstorm. The term “stormwater,” instead of “storm water,” is used when employed by the cited source of information. In all other instances, “stormwater” is used,

¹ Water Education Foundation. *Regional Water Quality Control Boards in California*. Available online at: <https://www.watereducation.org/aquapedia/regional-water-quality-control-boards-california>, accessed September 4, 2019.

consistent with the provision of Appendix G of the *CEQA Guidelines* and as defined by the U.S. EPA. Stormwater runoff is generated when precipitation from rain and snowmelt events flows over land or impervious surfaces and does not percolate into the ground. As the runoff flows over the land or impervious surfaces (paved streets, parking lots, and building rooftops), it accumulates debris, chemicals, sediment, or other pollutants that could adversely affect water quality if the runoff is discharged untreated.²

Tier 1 Onsite Wastewater Treatment System (OWTS): Low Risk New or Replacement OWTS (Policy Section 7 & 8) applies to new or replacement OWTS that comply with conservative siting and design standards describe in the OWTS Policy. Tier 1 applies when a Local Agency Management Program (LAMP) has not been approved by the Regional Water Board. Maximum flow rate is 3,500 gallons per day (gpd).³

Tier 2 Onsite Wastewater Treatment System (OWTS): Local Agency Management Program (LAMP) for New or Replacement OWTS (OWTS Policy Section 9) applies to new or replacement OWTS that comply with the siting and design standards in an approved LAMP. LAMPs are developed by Local Agencies based on local conditions; siting and design standards may differ from Tier 1 standards. Maximum flow rate is 10,000 gpd.⁴

Tier 3 Onsite Wastewater Treatment System: Advanced Protection Management Program (OWTS Policy Section 10). Applies to OWTS located near impaired surface water bodies that are subject to a Total Maximum Daily Load (TMDL) implementation plan, a special provision contained in a LAMP, or is located within 600 feet of a water body listed on OWTS Attachment 2. Supplemental treatment requirements may apply to a Tier 3 system. Maximum flow rate is 10,000 gpd.⁵

Water Supply System: A water supply system is a system for the collection, transmission, treatment, storage and distribution of water from source to consumers, for example, homes, commercial establishments, industry, irrigation facilities and public agencies for water-related activities (firefighting, street flushing, and so forth).

⁵ Ibid.

Wastewater: The spent or used water of a community or industry that contains dissolved and suspended matter.

3.19.1 SOLID WASTE

3.19.1.1 ENVIRONMENTAL SETTING

3.19.1.1.1 Existing Conditions

The majority of solid waste within the SCAG region is disposed of at landfills. Due to increased recycling and waste reduction initiatives, solid waste within the SCAG region has declined in recent years. CalRecycle's Solid Waste Information System (SWIS) tracks the total tonnage of solid waste disposed in 2018 (the most recent year for which data is available), by county. As shown below, in **Table 3.19.1-1, Solid Waste Tonnage within the SCAG Region (2018)**, the total amount of solid waste disposed of in the SCAG region was 19,550,712 tons in 2018.¹ This number includes waste trucked into the region from counties outside the SCAG boundaries.

**Table 3.19.1-1
Solid Waste Tonnage within the SCAG Region (2018)**

County	Total Tonnage
Imperial	305,522
Los Angeles	5,478,772
Orange	5,054,229
Riverside	4,899,025
San Bernardino	1,908,462
Ventura	1,908,462
Total	19,550,712

Solid Waste Management Departments

Landfills

A landfill is a waste management unit at which waste is discharged in or on land for disposal. Landfills do not include surface impoundment, waste pile, land treatment unit, injection well, or soil

¹ This is approximately half the total solid waste disposed of in California in 2018.

amendments.² Landfills that receive solid waste in the SCAG region are listed in **Table 3.19.1-2** below.

Table 3.19.1-2
Active Solid Waste Landfills by SCAG County

County	Name
Imperial	Calexico Solid Waste Site
Imperial	Niland Solid Waste Site

Transfer Stations

Similar to the landfills, transfer stations accept trash for disposal. There are six county operated transfer stations. These stations accept waste of various types including general refuse and wood and green waste depending on size with flat and volume rates applying. These facilities collect material that is then "transferred" to be recycled or to the nearest landfill site. While not as all-inclusive as a landfill, transfer stations provide a broad collection opportunity for local residents.

Table 3.19.1-3, Active Transfer Stations by SCAG County, identifies active transfer stations within the region.

Waste Diversion and Recycling

The California Integrated Waste Management Act of 1989 (Chapter 1095, Statutes of 1989) requires every city and county, as part of the Countywide Integrated Waste Management Plan, to prepare a Source Reduction and Recycling Element that identifies how each jurisdiction would meet the mandatory state waste diversion goals of 50 percent of all solid waste through source reduction, recycling, and composting activities. The 50 percent diversion requirement is measured in terms of per-capita disposal expressed as pounds per person per day. CalRecycle calculates per-capita disposal for all counties and jurisdictions to monitor the success of program implementation, actual recycling, and other diversion programs.³

3.19.1.2 REGULATORY FRAMEWORK

3.19.1.2.1 Federal

Resource Conservation and Recovery Act of 1976

Subtitle D of the Resource Conservation and Recovery Act of 1976 (RCRA) (42 USC Section 6901 *et seq.*), focuses on state and local governments as the primary planning, regulating, and implementing entities for the management of non-hazardous solid waste, such as household garbage and nonhazardous industrial solid waste.⁴ To promote the use of safer units for solid waste disposal, Subtitle D provides regulations for the generation, transportation, and treatment, storage, or disposal of hazardous wastes. EPA developed federal criteria for the proper design and operation of municipal solid waste landfills and other solid waste disposal facilities, but state and local governments are the primary planning, permitting, regulating, implementing, and enforcement agencies for management and disposal subject to approval by EPA.⁵ EPA approved the State of California's program, a joint effort of the CIWMB, SWRCB, RWQCBs, and LEAs, on October 7, 1993.

3.19.1.2.2 State

California Integrated Waste Management Act

As many of the landfills in the state are approaching capacity and the siting of new landfills becomes increasingly difficult, the need for source reduction, recycling, and composting has become readily apparent. In response to this increasing solid waste problem, in September 1989 the state assembly passed Assembly Bill 939, known as the California Integrated Waste Management Act. This statute emphasizes conservation of natural resources through the reduction, recycling and reuse of solid waste. Assembly Bill 939 required cities and counties in the state to divert 25 percent of their solid waste stream from landfills by 1995 and 50 percent by year 2000, or face potential fines of millions of dollars per year. In 2008, the California Integrated Waste Management Act also requires that all cities conduct a Solid Waste Generation Study and prepare a Source Reduction Recycling Element.

AB 939 established CalRecycle. The purpose was to direct attention to the increasing waste stream and decreasing landfill capacity, and to mandate a reduction of waste being disposed. All jurisdictions were required to meet diversion goals of 25 percent by 1995 and 50 percent by the year 2000. A disposal reporting system was established with CalRecycle oversight, facility and program planning was required, and cities and counties began to address waste problems.⁶

AB 341 (Chapter 476, Statutes of 2011) established a statewide goal to reduce, recycle, or compost at least 75 percent of solid waste by 2020. AB 341 also requires local jurisdictions to implement commercial recycling programs to divert recyclable material away from landfills and required commercial generators and multi-family residences to arrange for recycling services starting in 2012.⁷

AB 2020 The California Bottle Bill

AB 2020 (Public Resources Code Section 14500 *et seq.*) took effect in 1987 as litter prevention legislation. At present, the minimum refund value established for each type of eligible beverage container is 5 cents for each container under 24 ounces and 10 cents for each container 24 ounces or greater.⁸

⁶ CalRecycle. 2018. *History of California Solid Waste Law, 1985-1989*. Available online at: <https://www.calrecycle.ca.gov/laws/legislation/calhist/1985to1989>, accessed August 28, 2019.

⁷ CalRecycle. 2019. *Mandatory Commercial Recycling*. Available online at: <https://www.calrecycle.ca.gov/recycle/commercial>, accessed August 28, 2019.

⁸ California Legislature. 2017. *An Overview of California's Beverage Container Recycling (Bottle Bill) Program*.

SB 20 Electronic Waste “E-Waste” Recycling

SB 20 (Public Resources Code Section 42460 *et seq.*) was signed in September of 2003; it establishes a system to recycle computers, TVs, and other video display devices (known as electronic waste) when they reach their end-of-life. Fees are collected from consumers at point of purchase to fund recycling programs.⁹

AB 2901 – Cell Phone Recycling

AB 2901 Public Resources Code Section 42490 *et seq.* was signed into law on September 29, 2004. It requires all cell phone retailers to take back used cell phones for recycling at no charge to the customer.¹⁰

AB 2449 and SB 270 - Plastic Bag Recycling

Adopted in 2006, AB 2449 (Chapter 845, Statutes of 2006) requires all California grocery stores to take back and recycle plastic grocery bags. The bill also requires retailers to provide consumers with a bag reuse opportunity by providing reusable bags which can be purchased and used in lieu of disposable ones.¹¹

Many cities and counties have adopted plastic bag ordinances. SB 270 of 2014 (Chapter 850, Statutes of 2014) established a statewide prohibition on the sale or distribution of single-use carryout plastic bags in grocery stores and pharmacies, convenience food stores, and food marts. Retailers must charge customers at least 10 cents to buy a recycled paper bag or reusable grocery bag.¹² A referendum to repeal this law failed in the November 2016 election.

Solid Waste: Diversion Rule (AB 341)

Under commercial recycling law (Chapter 476, Statutes of 2011), Assembly Bill (AB) 341, directed CalRecycle to develop and adopt regulations for mandatory commercial recycling. The final regulation was approved by the Office of Administrative Law on May 7, 2012. AB 341 declared a policy goal of the state that not less than 75 percent of solid waste generated be source reduced, recycled, or composted by the year 2020.¹³

⁹ CalRecycle. 2019. *Electronic Waste Recycling Act of 2003*. Available online at: <https://www.calrecycle.ca.gov/electronics/act2003>, accessed August 28, 2019.

¹¹ California Legislative Information. *Assembly Bill No. 2449*.

¹² California Legislative Information. *Senate Bill No. 270*.

¹³ California Legislative Information. *Assembly Bill No. 341*.

Assembly Bill 2675

Adopted in 2014, AB 2675 (Chapter 617, Statutes of 2014) requires each state agency to ensure that at least 75% of reportable purchases are recycled products on and after January 1, 2020 with exception to paint, antifreeze, and tires.¹⁴

Assembly Bill 1045

Adopted in 2015, AB 1045 (Chapter 596, Statutes of 2015) requires the California Environmental Protection Agency (Cal EPA) in coordination with CalRecycle, the State Water Resources Control Board, CARB, and the Department of Food and Agriculture to develop and implement policies to aid in diverting organic waste from landfills with the goal of reducing at least 5 million metric tons of GHG emissions per year.¹⁵

Senate Bill 1383

Adopted in 2016, SB 1383 (Chapter 395, Statutes of 2016) requires the California Air Resources Board (CARB) to approve and implement a comprehensive strategy to reduce short-living GHG pollutants in organic waste landfills to achieve a 40% reduction in methane, 40% reduction in hydrofluorocarbon gases, and a 50% reduction in anthropogenic black carbon by 50% below 2013 levels by 2030. SB 1383 also requires CARB, in consultation with the Department of Food and Agriculture, to adopt regulations to reduce methane emissions from livestock and dairy manure management operations.¹⁶

In response to SB 1383, CalRecycle developed the Short-Lived Climate Pollutants: Organic Waste Reductions strategy, which proposes a series of strategies and requirements to reduce methane emissions from organic waste. Strategies include maintaining a list of food recovery organizations, public outreach, and specific bin requirements.¹⁷

Lead-Acid Battery Recycling Act of 2016 (AB 2153)

Adopted in 2016, AB 2153 (Chapter 666, Statutes of 2016) updates the current law regarding the disposing of a lead-acid battery and creates numerous requirements related to lead-acid batteries. Some of these requirements include: starting April 2017, a \$1 fee on both consumers and manufacturers of lead-acid

batteries; 2022, the fee to consumers will increase to \$2 and the fee to manufacturers will be eliminated; creates the Lead-Acid Battery Clean-Up Fund; and require dealers to charge consumers a refundable deposit for new lead-acid batteries.¹⁸

Assembly Bill 1250

Adopted in 2016, AB 1250 (Chapter 861, Statutes of 2016) requires plastic beverage containers subject to the California Redemption Value to report to CalRecycle the amount of virgin plastic and postconsumer recycled plastic used by the manufacturer for plastic CRV-eligible beverages sold within the state.¹⁹

Title 14, California Code of Regulations, Division 7

CalRecycle regulations pertaining to nonhazardous waste management in California include minimum standards for solid waste handling and disposal; regulatory requirements for composting operations; standards for handling and disposal of asbestos containing waste; resource conservation programs; enforcement of solid waste standards and administration of solid waste facility permits; permitting of waste tire facilities and waste tire hauler registration; special waste standards; used oil recycling program; electronic waste recovery and recycling; planning guidelines and procedures for preparing, revising, and amending countywide IWMP; and solid waste cleanup program.²⁰

Title 27, California Code of Regulations, Environmental Protection, Division 2, Solid Waste

CalRecycle and the SWRCB jointly issue regulations pertaining to waste disposal on land, including criteria for all waste management units, facilities and disposal sites; documentation and reporting; enforcement, financial assurance; and special treatment, storage, and disposal units.²¹

2016 California Green Building Standard Code

The California Green Building Standards Code (California Code of Regulations, Title 24, Part 11), commonly referred to as the CALGreen Code, is a statewide mandatory construction code that was developed and adopted by the California Building Standards Commission and the California Department of Housing and Community Development in 2008. The purpose of this code is to improve public health, safety and general welfare by enhancing the design and construction of buildings through the use of

building concepts having a reduced negative impact or positive environmental impact and encouraging sustainable construction practices including recycling of construction (diversion of 50 percent) and other waste streams.²²

The California Universal Waste Law

Special laws and regulations pertain to disposal of universal waste. (22 Cal. Code Regs. § 66260 *et seq.*) Examples of universal wastes are batteries, fluorescent tubes, and some electronic devices, that contain mercury, lead, cadmium, copper, and other substances hazardous to humans and the environment. Universal waste cannot be disposed in solid waste landfills. Rather, universal wastes can be recycled. Recycling requirements are less stringent than those of other hazardous wastes to encourage recycling and recovery of valuable metals.

California Solid Waste Reuse and Recycling Act

The California Solid Waste Reuse and Recycling Act of 1991 (Pub. Res. Code §§ 42900-42901) was enacted to assist local jurisdictions with accomplishing the goals of AB 939. In accordance with AB 2176, any development project that has submitted an application for a building permit must include adequate, accessible areas for the collection and loading of recyclable materials. Furthermore, the areas to be utilized must be adequate in capacity, number, and distribution to serve the proposed project. Moreover, the collection areas are to be located as close to existing exterior refuse collection areas as possible.²³

3.19.1.2.3 Local

Countywide Integrated Waste Management Plan

Counties are required to prepare and submit to CalRecycle an integrated waste management plan which includes all Source Reduction and Recycling Element (SRREs), all Household Hazardous Waste Element (HHWEs), a Countywide Siting Element (CSE), all Non-Disposal Facility Elements (NDFEs), all applicable Regional SRREs, HHWEs. Public Resources Code Section 41751 requires that a countywide integrated waste management plan include a summary of significant waste management problems facing the county or city. The plan is required to provide an overview of the specific steps that will be taken by local agencies, acting independently and in concert, to achieve the purposes of this division. The plan is required to contain a statement of the goals and objectives set forth by the countywide task force.²⁴

²² California Building Standards Commission. 2017. *2016 California Green Building Standards Code*,

²⁴ California Legislative Information. *Article 1. Plan Preparation [41750-41751], Section 41751*.

Source Reduction and Recycling Element

The SRRE consists of the following components: waste characterization, source reduction, recycling, composting, solid waste facility capacity, education and public information, funding, special waste and integration. Each city and county is required to prepare, adopt, and submit to the California Department of Resources Recycling and Recovery (CalRecycle) an SRRE, which includes a program for management of solid waste generated within the respective local jurisdiction. The SRREs must include an implementation schedule for the proposed implementation of source reduction, recycling, and composting programs. In addition, the plan identifies the amount of landfill and transformation capacity that will be needed for solid waste which cannot be reduced, recycled, or composted.²⁵

Household Hazardous Waste Element

Cities and counties are required to prepare, adopt, and submit to CalRecycle, a HHWE that identifies a program for the safe collection, recycling, treatment, and disposal of hazardous wastes that are generated by households. The HHWE specifies how household hazardous wastes generated by households within the jurisdiction must be collected, treated, and disposed of.²⁶

Non-Disposal Facility Element (NDFE)

Cities and counties are required to prepare, adopt and submit to CalRecycle, an NDFE that includes a description of new facilities and expansion of existing facilities, and all solid waste facility expansions (except disposal and transformation facilities) that recover for reuse at least 5 percent of the total volume. The NDFE are to be consistent with the implementation of a local jurisdiction's SRRE. Each jurisdiction must also describe transfer stations located within and outside of the jurisdiction, which recover less than 5 percent of the material received.²⁷

Countywide Siting Element (CSE)

Counties are required to prepare a CSE that describes areas that may be used for developing new disposal facilities. The element also provides an estimate of the total permitted disposal capacity needed

²⁵ CalRecycle. 2018. *Source Reduction and Recycling Element Adequacy*. Available online at: <https://www.calrecycle.ca.gov/LGCentral/Library/Policy/CIWMPEnforce/Part1/SRREAdq/>, accessed August 28, 2019.

²⁶ CalRecycle. 2018. *Household Hazardous Waste Element (HHWE) Adequacy*. Available online at: <https://www.calrecycle.ca.gov/LGCentral/Library/Policy/CIWMPEnforce/Part1/HWWEAdq/>, accessed August 28, 2019.

²⁷ CalRecycle. 2018. *Nondisposal Facility Element Adequacy*. Available online at: <https://www.calrecycle.ca.gov/LGCentral/Library/Policy/CIWMPEnforce/Part1/NDFEAdq/>, accessed August 28, 2019.

for a 15-year period if counties determine that their existing disposal capacity will be exhausted within 15 years or if additional capacity is desired (PRC Sections 41700-41721.5).²⁸

General Plans

Local policies related to utilities and service systems are established in each jurisdiction's general plan. In general, jurisdictions have policies in place that state that utility and service systems must be provided at the same time (or in advance of) need. In addition to these general policies, jurisdictions may have more specific policies tailored to performance objectives including solid waste services. For further guidance regarding solid waste, some jurisdictions also produce an Integrated Waste Management Plan.

3.19.1.3 ENVIRONMENTAL IMPACTS

3.19.1.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the Plan could result in significant adverse impacts to utilities if the Plan would:

- Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals;
- Comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

3.19.1.3.2 Methodology

The methodology for determining the significance of impacts utilities and service systems compares existing conditions to the expected future use of landfills with the Plan. Factors such as existing capacity and expected demand (based on population and land use patterns) are reviewed at the regional level. The criteria above were applied to compare current conditions to future 2045 Plan conditions.

Implementation of Connect SoCal would affect the use of utility and service systems in the SCAG region. The analysis of these impacts is programmatic at the regional level. With regard to solid waste, the Plan's potential to exceed capacity of local infrastructure as well as compliance with applicable statutes and regulations were analyzed to determine whether or not there will be a significant impact.

²⁸ CalRecycle. 2018. *Countywide Siting Element Adequacy*. Available online at: <https://www.calrecycle.ca.gov/LGCentral/Library/Policy/CIWMPEnforce/Part1/CSEAdq/>, accessed August 28, 2019.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in **Section 1.0 Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.19.1.3.3 Impacts and Mitigation Measures

Impact USSW-1 **Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals**

Impact USSW-2 **Comply with federal, state, and local management and reduction statutes and regulations related to solid waste.**

Significant and Unavoidable – Mitigation Required.

Many of the transportation projects within the Plan have the potential to generate a substantial amount of solid waste during construction through grading and excavation activities, as well as debris resulting from removal of structures. Construction of development projects anticipated to occur during implementation of the Plan, would generate similar debris. Construction debris could be recycled or used as fill at other projects (clean dirt) or transported to the nearest landfill site and disposed of appropriately.

Although there are 40 landfills that serve the SCAG region (**Table 3.19.1-2, Active Solid Waste Landfills by SCAG County**), the lifetime of many of these landfills does not extend out 25 years. The total population is expected to grow by approximately 3.2 million across the SCAG region by 2045 resulting in substantial generation of solid waste (**Table 3.14-8, 2019-2045 Population, Households, and Employment Projections in the SCAG Region**). CalRecycle estimates that the average resident in California disposes of 5.2 pounds of trash per day and the average employee disposes of 11.9 pounds of trash per day, as of 2017. From 1989 to 2012, solid waste generation per employee and resident in California was reduced by approximately half in large part due to compliance with AB 939.²⁹ AB 341 requires 75 percent diversion

²⁹ CalRecycle. 2019. California Statewide per Resident, per Employee, and Total Disposed Since 1989. <http://www.calrecycle.ca.gov/Igcentral/goalmeasure/disposalrate/graphs/disposal.htm>, accessed September 5, 2019.

by 2020 as compared to 2000.³⁰ Because 2017 solid waste generation already reflects some reductions from AB 341 (which was implemented in 2012), an 18 percent reduction from the 2017 number was assumed for future years. This equates to approximately 4.2 pounds of trash per day for residences and 9.7 pounds of trash per day for employees in 2045. Because people both live and work in the region, calculating waste for total residents and total employees likely overestimates waste generation.

These solid waste generation rates were used to calculate the solid waste generated in 2045. As discussed above, solid waste generation per capita had been decreasing steadily each year, until 2013 when they began to rise again. Despite recent increases, it is expected that solid waste generation will return to a decreasing trend in the future due to sustainable policies and practices. As shown in **Table 3.19.1-4, Solid Waste Generated in the SCAG Region**, assuming solid waste generation for both residents and employees according to the factors discussed above, the waste generated per day in the SCAG region under the Plan in 2045 could be up to 96,001 tons per day as compared to 89,014 tons per day in 2019.³¹ However, as noted above, because the calculation is for residents and employees likely there is some double counting in the calculated numbers shown in the table.

³⁰ AB 341 requires a 75% reduction by 2020.

³¹ In order to estimate the amount of waste generated by residents and employees in 2019 and 2045, it was assumed that an even percentage of waste has been reduced from 2012 to 2020 to meet the AB 341 requirement. Therefore, each year represents a reduction of 6.25% ($50\% / 8 \text{ years} = 6.25\%/year$). Based on this assumption, 2017's estimated waste stream will have already met 31.25% of the required reduction ($6.25\%/year \times 5 \text{ years} = 31.25\%$). From 2017 to 2019, an additional 12.5% of waste would be reduced ($6.25\%/year \times 2 \text{ years} = 12.5\%$). As a result, 2017 residential and employment per capita waste generation is reduced by approximately 12.5%, resulting in a 2019 residential waste generation of 4.55 lbs/day and an employment waste generation of 10.4 lbs/day. From 2019 to 2020, an additional 6.25% of waste would be reduced (18.75% reduction from 2017), resulting in a 2020 residential waste generation of 4.2 lbs/day and an employment waste generation of 9.7 lbs/day.

**Table 3.19.1-4
Solid Waste Generated in the SCAG Region**

Year	Number of People	Solid Waste Generation Rate (lbs/day) ^a	Solid Waste Generated (tons/day)
Population			
2019	19,339,700	4.55	43,998
2045	22,507,200	4.2	47,265
Employment			
2019	8,657,000	10.4	45,016
2045	10,048,700	9.7	48,736
Population and Employment			
2019 Total			89,014
2045 Total			96,001

^a California Statewide per Resident, per Employee, and Total Disposed 1989-2017.

<http://www.calrecycle.ca.gov/lgcentral/goalmeasure/disposalrate/graphs/disposal.htm>, accessed September 5, 2019

Assumes an even reduction in solid waste from 2012 to 2020. This table overestimates waste generated as people both live and work within the region.

Source: SCAG modeling, 2019; Impact Sciences, 2019.

The maximum daily disposal for the 40 landfills in the SCAG region is calculated to be 152,155 tons/day as of 2019. However, only 18 of the landfills are currently anticipated to be operational in 2045 with a combined daily disposal of 61,459 tons/day.³² Therefore, the anticipated solid waste generated could exceed the projected landfill capacity resulting in a significant impact. Mitigation is required.

Plan projects would be required to comply with federal, state, and local statutes and regulations related to solid waste, including county and city general plans. Local jurisdictions also have goals and policies for recycling and diversion of solid waste to ensure compliance with the California Integrated Waste Management Act (AB 939), the California Solid Waste Reuse and Recycling Act, and the Solid Waste Diversion Rule (AB 341). Local governments submit an annual report to CalRecycle on the implementation of waste diversion plans to comply with their respective per capita disposal targets. CalRecycle reviews each local government's progress in implementing its unique diversion program and progress in sustaining or achieving compliance. CalRecycle may refer some local governments for a compliance evaluation review, although the number of local governments referred is generally less than 1 percent. If a more thorough analysis reveals a jurisdiction is not meeting the "good faith" standard for implementing its diversion programs or for reaching per capita disposal targets, CalRecycle will issue a

³² CalRecycle. 2019. SWIS Facility/Site Search. Available online at: <https://www2.calrecycle.ca.gov/swfacilities/Directory/13-AA-0004/Index>, accessed September 5, 2019.

compliance order. If the jurisdiction fails to fulfill its implementation plan to correct the program deficiencies, then the jurisdiction will be subject to penalties.

There are also multiple additional laws aimed at reducing solid waste in California including, AB 1826 which sought to greatly reduce the amount of organic material deposited into landfills by further mandating waste recycling services for organic material. At the beginning of 2016, local jurisdictions were required under AB 1826 to implement an organic waste recycling program and measure and monitor their efforts. Also, Section 5.408 “Construction Waste Reduction, Disposal and Recycling” of the 2016 California Green Building Standards code (CalGreen) requires all new construction and demolition projects to develop a Construction Waste Management Plan which recycles or salvages a minimum of 65% of non-hazardous construction and demolition waste.

Transportation projects contained in the Plan and development projects anticipated to occur under the Plan would be required to comply with AB 341, as well as the additional laws cited above which would further reduce anticipated solid waste generation. However, due to the volume of solid waste debris expected to be generated with implementation of the Plan and lack of identified landfill capacity, impacts would be significant requiring mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

SMM USSW-1: During the planning, design, and project-level CEQA review process for individual development projects, SCAG shall coordinate with waste management agencies and the appropriate local and regional jurisdictions to facilitate the development of measures and to encourage diversion of solid waste such as recycling and composting programs, as needed. This includes discouraging siting of new landfills unless all other waste reduction and prevention actions have been fully explored to minimize impacts to neighborhoods.

SMM USSW-2: SCAG shall coordinate with waste management agencies, and the appropriate local and regional jurisdictions, measures to facilitate and encourage diversion of solid waste such as recycling and composting programs.

Project Level Mitigation Measures

PMM USSW-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce the generation of solid waste, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

Integrate green building measures consistent with CALGreen (California Building Code Title 24) into project design including, but not limited to the following:

- a) Reuse and minimization of construction and demolition (C&D) debris and diversion of C&D waste from landfills to recycling facilities.
- b) Inclusion of a waste management plan that promotes maximum C&D diversion.
- c) Source reduction through (1) use of materials that are more durable and easier to repair and maintain, (2) design to generate less scrap material through dimensional planning, (3) increased recycled content, (4) use of reclaimed materials, and (5) use of structural materials in a dual role as finish material (e.g., stained concrete flooring, unfinished ceilings, etc.).
- d) Reuse of existing structure and shell in renovation projects.
- e) Development of indoor recycling program and space.
- f) Discourage the siting of new landfills unless all other waste reduction and prevention actions have been fully explored. If landfill siting or expansion is necessary, site landfills with an adequate landfill-owned, undeveloped land buffer to minimize the potential adverse impacts of the landfill in neighboring communities.
- g) Discourage exporting of locally generated waste outside of the SCAG region during the construction and implementation of a project. Encourage disposal within the county where the waste originates as much as possible. Promote green technologies for long-distance transport of waste (e.g., clean engines and clean locomotives or electric rail for waste-by-rail disposal systems) and consistency with SCAQMD and Connect SoCal policies can and should be required.

- h) Encourage waste reduction goals and practices and look for opportunities for voluntary actions to exceed the 80 percent waste diversion target.
- i) Encourage the development of local markets for waste prevention, reduction, and recycling practices by supporting recycled content and green procurement policies, as well as other waste prevention, reduction and recycling practices.
- j) Develop ordinances that promote waste prevention and recycling activities such as: requiring waste prevention and recycling efforts at all large events and venues; implementing recycled content procurement programs; and developing opportunities to divert food waste away from landfills and toward food banks and composting facilities.
- k) Develop and site composting, recycling, and conversion technology facilities that have minimum environmental and health impacts.
- l) Integrate reuse and recycling into residential industrial, institutional and commercial projects.
- m) Provide education and publicity about reducing waste and available recycling services.
- n) Implement or expand city or county-wide recycling and composting programs for residents and businesses. This could include extending the types of recycling services offered (e.g., to include food and green waste recycling) and providing public education and publicity about recycling services.

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to solid waste exceeding the capacity of local

infrastructure and consistency with plans could be significant and unavoidable even with implementation of mitigation.

3.19.2 WASTEWATER

3.19.2.1 EXISTING CONDITIONS

Wastewater is defined as water that contains wastes from residential, commercial, and industrial processes. Sewage, gray water, and industrially polluted discharges can all be categorized as wastewater. Within the SCAG region, wastewater is generally conveyed through the storm drain and sanitary sewer systems.

3.19.2.1.1 Wastewater Treatment Facilities

Wastewater treatment is generally performed in three stages: primary treatment, secondary treatment, and tertiary treatment. During primary treatment, materials sink to the bottom of tanks and then microbes eat the organic material and settle out in the secondary treatment tanks. Tertiary treatment occurs last, in which remaining pollutants are filtered out via sand and coal. Along with the additions of disinfectant chemicals like chlorine and careful testing and monitoring, this process treats water to an acceptable level to be returned into natural water bodies or recycled for irrigation, industrial, and agricultural uses. More recently, advanced treatment techniques have achieved level of cleanliness that allows highly purified recycled water to recharge underground aquifers.¹

A majority of wastewater within the SCAG region is treated by one of the 67 major wastewater treatment facilities in the area. Such facilities are often located in densely populated areas and in close proximity to bodies of water for simple discharge of treated water. Within each SCAG county, various smaller municipal wastewater systems and agencies manage wastewater from cities on a smaller scale, and private on-site sewage disposal systems are also available to serve wastewater generators without access to a municipal system. **Table 3.19.2-1, Major Wastewater Treatment Facilities in the SCAG Region**, lists the 67 large-scale facilities managing wastewater within the region, which have a combined design flow of approximately 3,088 millions of gallons per day (mgd).

Wastewater Treatment Requirements

Created by the State Legislature in 1967, the SWRCB has jurisdiction throughout California, where it protects water quality by setting statewide policies.² The SCAG region incorporates five of the nine Regional Water Boards in the State:

- Region 4—Los Angeles Regional Water Quality Control Board: Los Angeles and Ventura Counties (and small portions of Kern and Santa Barbara Counties).
- Region 6—Lahontan Regional Water Quality Control Board: San Bernardino and Los Angeles (N/E corner) counties.
- Region 7—Colorado River Regional Water Quality Control Board: Imperial, San Bernardino, Riverside, and San Diego Counties.
- Region 8—Santa Ana Regional Water Quality Control Board: Orange, Riverside, and San Bernardino Counties.
- Region 9—San Diego Regional Water Quality Control Board: San Diego, Imperial, and Riverside Counties.

3.19.2.1.2 Storm Water Drainage Facilities

Each city and county within the SCAG region maintains a storm drain system. The systems vary by age, size, and type depending on the municipality, and may consist of day pipe, iron/steel pipe, very old brick collector sewers, and reinforced concrete pipe facilities.

² California Water Boards. *Water Board Structure*. Available online at: https://www.waterboards.ca.gov/lahontan/about_us/water_boards_structure.html, accessed August 23, 2019.

California Water Board Districts 4, 6, 7, 8, and 9 are all within the SCAG region and manage their own storm water drainage facilities, utilizing NPDES program permits. Under a NPDES permit, operators must develop a storm water management program to prevent polluted storm water run-off from entering Municipal Separate Storm Sewer Systems (MS4s), which often discharge to local water bodies.

In April 2018, the State Water Resources Control Board released a storm water strategy called the Strategy to Optimize Resource Management of Storm Water, or STORMS. The report focuses on enhancing urban run-off capture and use by identifying barriers, providing incentives, and increasing public engagement. The STORMS report found that urban run-off can be a viable source of water and that hybrid strategies combining green and gray infrastructure will be imperative for future urban water management.³

3.19.2.2 REGULATORY FRAMEWORK

3.19.2.2.1 Federal

Clean Water Act/National Pollutant Discharge Elimination System Permits

The Clean Water Act (CWA) (33 USC Sections 1251 *et seq.*) was enacted by Congress in 1972 and has been amended several times since its adoption. It is the primary federal law regulating water quality in the U.S. Its objective is to reduce or eliminate water pollution in the nation's rivers, streams, lakes, and coastal waters. The CWA prescribes the basic federal laws for regulating discharges of pollutants and sets minimum water quality standards for all surface waters in the U.S. The CWA is administered by the U.S. Environmental Protection Agency (USEPA).⁴

In California, the State Water Resources Control Board (State Water Board) and the nine Regional Water Quality Control Boards (Regional Water Boards) implement many of the Clean Water Act's provisions. The Clean Water Act requires the State to adopt water quality standards and to submit those standards for approval by the U.S. Environmental Protection Agency (US EPA). For point source discharges to surface water, the Clean Water Act authorizes the U.S.EPA and/or approved states (such as California) to administer the National Pollutant Discharge Elimination System (NPDES) program. The NPDES program regulates the discharge of pollutants from point sources. Municipal point sources consist primarily of municipal wastewater treatment plant outfalls and stormwater conveyance system outfalls. The Clean

3 California State Water Resources Control Board. 2018. *Strategy to Optimize Resource Management of Storm Water (Storm Water Strategy, STORMS)*. April. Available online at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/storms/, accessed January 15, 2019.

4 U.S. Environmental Protection Agency. 2002. *Federal Water Pollution Control Act*. Available online at: <https://www.epa.gov/sites/production/files/2017-08/documents/federal-water-pollution-control-act-508full.pdf>, accessed August 23, 2019.

Water Act also establishes a loan program—the State Revolving Fund—for the implementation of water quality improvement projects.

MS4 Permit Guidance Provision C.3

On May 17, 1996, EPA published an Interpretive Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems, which provided guidance on permit application requirements for regulated MS4s. MS4 permits include requirements for post-construction control of stormwater runoff in what is known as Provision C.3. The goal of Provision C.3 is for the Permittees to use their planning authorities to include appropriate source control, site design, and stormwater treatment measures in new development and redevelopment projects to address both soluble and insoluble stormwater runoff pollutant discharges and prevent increases in runoff flows from new development and redevelopment projects. This goal is to be accomplished primarily through the implementation of low impact development (LID) techniques.⁵

3.19.2.2.2 State

Porter-Cologne Water Quality Control Act

The Porter-Cologne Act is the principal law governing water quality regulation in California. It establishes a comprehensive program to protect water quality and the beneficial uses of water. The Porter-Cologne Act applies to surface waters, wetlands, and ground water and to both point and nonpoint sources of pollution. Pursuant to the Porter-Cologne Act (California Water Code section 13000 *et seq.*), the policy of the State is as follows:

- That the quality of all the waters of the State shall be protected;
- That all activities and factors affecting the quality of water shall be regulated to attain the highest water quality within reason; and
- That the State must be prepared to exercise its full power and jurisdiction to protect the quality of water in the State from degradation.

The Porter-Cologne Act established nine Regional Water Boards (based on hydrogeologic barriers) and the State Water Board, which are charged with implementing its provisions and which have primary responsibility for protecting water quality in California. The State Water Board provides program

⁵ Government Publishing Office. 1996. *Environmental Protection Agency 40 CFR Part 122*. Available online at: <https://www.govinfo.gov/content/pkg/FR-1996-08-09/pdf/96-20228.pdf>, accessed August 23, 2019.

guidance and oversight, allocates funds, and reviews Regional Water Boards decisions. In addition, the State Water Board allocates rights to the use of surface water. The Regional Water Boards have primary responsibility for individual permitting, inspection, and enforcement actions within each of nine hydrologic regions. The State Water Board and Regional Water Boards have numerous NPS-related responsibilities, including monitoring and assessment, planning, financial assistance, and management.

The Regional Water Boards regulate discharges under the Porter-Cologne Act primarily through issuance of NPDES permits and waste discharge requirements (WDRs for point and nonpoint source discharges. Anyone discharging or proposing to discharge materials that could affect water quality (other than to a community sanitary sewer system regulated by an NPDES permit) must file a report of waste discharge.

The Porter-Cologne Act also implements many provisions of the Clean Water Act, such as NPDES permitting program. Section 401 of the Clean Water Act gives the State Water Board the authority to review any proposed federally permitted or federally licensed activity that may impact water quality and to certify, condition, or deny the activity if it does not comply with State water quality standards.

The Porter-Cologne Act also requires adoption of water quality control plans (basin plans) that contain the guiding policies of water pollution management in California. A number of statewide water quality control plans have been adopted by the State Water Board. In addition, regional basin plans have been adopted by each of the Regional Water Boards and get updated as needed. These plans identify the existing and potential beneficial uses of waters of the State and establish water quality objectives to protect these uses. The basin plans also contain implementation, surveillance, and monitoring plans. Statewide and regional water quality control plans include enforceable prohibitions against certain types of discharges, including those that may pertain to nonpoint sources. Portions of water quality control plans, the water quality objectives and beneficial use designations, are subject to review by U.S.EPA, when approved they become water quality standards under the Clean Water Act.⁶

California Ocean Plan

The California Ocean Plan establishes water quality objectives for California's ocean waters and provides the basis for regulation of wastes discharged into the state's coastal waters. The plan applies to point and nonpoint source discharges. Both the SWRCB and the six coastal RWQCBs implement and interpret the California Ocean Plan. The California Ocean Plan identifies the applicable beneficial uses of marine waters. These beneficial uses include preservation and enhancement of designated Areas of Special Biological Significance (ASBS), rare and endangered species, marine habitat, fish migration, fish

⁶ California State Water Resources Control Board. 2019. *Porter-Cologne Water Quality Control Act*. Available online at: https://www.waterboards.ca.gov/laws_regulations/docs/portercologne.pdf, accessed August 23, 2019.

spawning, shellfish harvesting, recreation, commercial and sport fishing, mariculture, industrial water supply, aesthetic enjoyment, and navigation.

The California Ocean Plan establishes a set of narrative and numerical water quality objectives to protect beneficial uses. These objectives are based on bacterial, physical, chemical, and biological characteristics as well as radioactivity. The water quality objectives in Table 1 (formerly Table B) of the California Ocean Plan apply to all receiving waters under the jurisdiction of the plan and are established for the protection of aquatic life and for the protection of human health from both carcinogens and noncarcinogens. Within Table 1 there are 21 objectives for protecting aquatic life, 20 for protecting human health from noncarcinogens, and 42 for protecting human health from exposure to carcinogens. The Ocean Plan also includes an implementation program for achieving water quality objectives. Effluent limitations are established for the protection of marine waters.⁷

Strategy to Optimize Resource Management of Storm Water (STORMS)

In April 2018, the California State Water Resources Control Board published the STORMS report to advance the ideology that storm water is a valuable resource. The report explores policies for collaborative watershed level storm water management and pollution prevention, obstacles to funding and barriers to development. It also describes the importance of integrating regulatory and non-regulatory interests and how raised awareness of the benefits of storm water management invokes participation and enthusiasm with regards to this little-explored resource.⁸

NPDES General Permits

Construction General Permit

The California Construction Stormwater Permit (Construction General Permit) 1 (also, known as Industrial General Permit), adopted by the State Water Resources Control Board (SWRCB), regulates construction activities that include clearing, grading, and excavation resulting in soil disturbance of at least one acre of total land area. The Construction General Permit authorizes the discharge of stormwater to surface waters from construction activities. It prohibits the discharge of materials other than stormwater and authorized non-stormwater discharges and all discharges that contain a hazardous

⁷ California Water Boards. 2015. *California Ocean Plan*. Available online at: https://www.waterboards.ca.gov/water_issues/programs/ocean/docs/cop2015.pdf, accessed August 27, 2019.

⁸ California State Water Resources Control Board. 2019. *Strategy to Optimize Resource Management of Stormwater*. Available online at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/storms/docs/storms_capture_use.pdf, accessed August 23, 2019.

substance in excess of reportable quantities established in Title 40, Sections 117.3 or 302.4 of the CFR, unless a separate National Pollution Discharge Elimination System (NPDES) permit has been issued to regulate those discharges. The Construction General Permit requires that all developers of land where construction activities will occur over more than 1 acre do the following:

- Complete a risk assessment to determine pollution prevention requirements pursuant to the three risk levels established in the General Permit;
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the US;
- Develop and implement a Stormwater Pollution Prevention Plan (SWPPP), which specifies BMPs that will reduce pollution in stormwater discharges to the Best Available Technology Economically Achievable/ Best Conventional Pollutant Control Technology standards; and
- Perform inspections and maintenance of all BMPs.

To obtain coverage under the NPDES Construction General Permit, the Legally Responsible Person must electronically file all permit registration documents with the SWRCB before the start of construction. Permit registration documents must include:

- Notice of Intent,
- Risk Assessment,
- Site Map,
- SWPPP,
- Annual Fee, and
- Signed Certification Statement.

Typical BMPs contained in SWPPPs are designed to minimize erosion during construction, stabilize construction areas, control sediment, control pollutants from construction materials, and address post construction runoff quantity (volume) and quality (treatment). The SWPPP must also include a discussion of the program to inspect and maintain all BMPs.⁹

⁹ State Water Resources Control Board. *Construction General Permit Fact Sheet*. Available online at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/constpermits/wqo_2009_0009_complete.pdf, accessed August 27, 2019.

Industrial General Permit

The Statewide General Permit for Storm Water Discharges Associated with Industrial Activities, Order 2014-0057-DWQ (Industrial General Permit or IGP) implements the federally required storm water regulations in California for storm water associated with industrial activities discharging to waters of the United States.¹⁰

Municipal Stormwater Program

The Municipal Storm Water Program regulates storm water discharges from municipal separate storm sewer systems (MS4s) throughout California. Pursuant to the Federal Water Pollution Control Act (Clean Water Act) section 402(p), storm water permits are required for discharges from an MS4 serving a population of 100,000 or more. The Municipal Storm Water Program manages the Phase I Permit Program (serving municipalities over 100,000 people), the Phase II Permit Program (for municipalities less than 100,000), and the Statewide Storm Water Permit for the State of California Department of Transportation (Caltrans).¹¹

Caltrans is responsible for the design, construction, management, and maintenance of the State highway system, including freeways, bridges, tunnels, Caltrans' facilities, and related properties, and is subject to the permitting requirements of CWA Section 402(p). Caltrans' discharges consist of storm water and non-storm water discharges from state-owned rights-of-way.

Before July 1999, discharges from Caltrans' MS4 were regulated by individual NPDES permits issued by the RWQCBs. On July 15, 1999, the SWRCB issued a statewide permit (Order No. 99-06-DWQ) that regulated all discharges from Caltrans MS4s, maintenance facilities, and construction activities.¹² On September 19, 2012, Caltrans' permit was reissued (Order No. 2012-0011-DWQ), and it became effective on July 1, 2013.¹³

¹³ California State Water Resources Control Board. *Order No. 2012-0011-DWQ NPDES No. CAS000003 National Pollutant Discharge Elimination System (NPDES) Statewide Storm Water Permit Waste Discharge Requirements (WDRS) for State of California Department of Transportation*. Available online at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2012/wqo2012_0011_dwq.pdf, accessed August 27, 2019.

The Caltrans permit requires development of a program for communication with local agencies, and coordination with other MS4 programs where those programs overlap geographically with Caltrans facilities. As part of the permit, Caltrans is required to create and annually update a Stormwater Management Plan (SWMP) that is used to outline the regulation of pollutant discharge caused by current and future construction and maintenance activities. SWMP requirements apply to discharges from Caltrans stormwater conveyances, including catch basins and drain inlets, curbs, gutters, ditches, channels, and storm drains. The SWMP applies to discharges consisting of stormwater and non-stormwater resulting from the following:

- maintenance and operation of state-owned highways, freeways, and roads;
- maintenance facilities;
- other facilities with activities that have the potential for discharging pollutants;
- permanent discharges from subsurface dewatering;
- temporary dewatering; and
- construction activities.

Caltrans' Storm Water Management Plan (SWMP) describes the procedures and practices used to reduce or eliminate the discharge of pollutants to storm drainage systems and receiving waters. The SWMP was most recently updated in July of 2016.¹⁴

California Department of Transportation NPDES Permit

The California Department of Transportation (Caltrans) was originally issued a statewide NPDES permit (Order 99-06-DWQ) in 1999, which requires Caltrans to regulate nonpoint source discharge from its properties, facilities, and activities. The Caltrans permit requires development of a program for communication with local agencies, and coordination with other MS4 programs where those programs overlap geographically with Caltrans facilities. As part of the permit, Caltrans is required to create and annually update a stormwater management plan (SWMP) that is used to outline the regulation of pollutant discharge caused by current and future construction and maintenance activities. SWMP requirements apply to discharges from Caltrans stormwater conveyances, including catch basins and drain inlets, curbs, gutters, ditches, channels, and storm drains. The SWMP applies to discharges consisting of stormwater and non-stormwater resulting from:

¹⁴ Caltrans. 2016. *Statewide Stormwater Management Plan*. Available online at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/caltrans/swmp/swmp_approved.pdf, accessed August 27, 2019.

- maintenance and operation of state-owned highways, freeways, and roads;
- maintenance facilities;
- other facilities with activities that have the potential for discharging pollutants;
- permanent discharges from subsurface dewatering;
- temporary dewatering; and
- construction activities.

The discharges addressed by the SWMP flow through municipal stormwater conveyance systems or flow directly to surface water bodies in the state. These surface water bodies include creeks, rivers, reservoirs, lakes, wetlands, lagoons, estuaries, bays, and the Pacific Ocean and tributaries.

This SWMP applies to the oversight of outside agencies' or non-Caltrans entities' (third parties) activities performed within Caltrans' MS4 to ensure compliance with stormwater regulations. Non-Caltrans activities include highway construction and road improvement projects, as well as residential use and business operations on leased property.

The SWMP must be approved by the SWRCB and, as specified in the permit, it is an enforceable document. Compliance with the permit is measured by implementation of the SWMP. Caltrans' policies, manuals, and other guidance related to storm water are intended to facilitate implementation of the SWMP. Caltrans also requires all contractors to prepare and implement a program to control water pollution effectively during the construction of all projects. In lieu of the more recently adopted General Construction Permit as described above, Caltrans continues to modify its current policies and procedures to be consistent with the new permit.¹⁵

California Administrative Code, Title 22

Under Title 22, the State Department of Health establishes State-wide effluent bacteriological and treatment reliability standards for recycled water uses. The standards are based on the potential for human contact with recycled water. The regional water quality control board (RWQCB) has established and enforces requirements for the application and use of recycled water. Permits are required from a RWQCB for any recycling operation. Applicants for a permit are required to demonstrate that the

Available online at: <https://www3.epa.gov/region9/water/npdes/pdf/ms4/ca/021108-caltrans-report.pdf>, accessed August 23, 2019.

proposed recycled water operation is in compliance with Title 22 and will not exceed the ground and surface water quality objectives in the regional basin management plan.¹⁶

3.19.2.2.3 Regional

The water quality control plans and groundwater protection responsibilities for the SCAG region are described in Section 3.10, *Hydrology and Water Quality*.

Urban Water Management Plans

Under California Water Code Division 6, Part 2.6, Section 10610-10656, the Urban Water Management Planning Act (UWMPA) requires urban water suppliers that supply more than 3,000 acre-feet of water annually, or serve more than 3,000 connections, to submit an Urban Water Management Plan (UWMP).¹⁷ The UWMP is a public document prepared by water suppliers to support their long-term resource planning over a 20-year period and ensure adequate water supplies are available to meet existing and future water demands. The UWMP must be submitted to the DWR every 5 years, and must demonstrate progress toward reduction in 20 percent per capita urban water consumption by the year 2020, as required in the Water Conservation Bill of 2009, Senate Bill X7-7.^{18, 19} There are 138 service districts in the SCAG region required to develop a UWMP, which is typically prepared and submitted to DWR within 30 days and reviewed 60 days prior to public hearing for plan adoption and implementation. The preparation of the plan includes guidebook, workshops, and programming for comprehensive strategies to conserve water.

3.19.2.2.4 Local

Utility Master Plans & Utility Capital Improvement Programs

Jurisdictions usually have utility master plans or other planning documents that identify and prioritize projects needed to maintain adequate levels of utility service in the jurisdiction.

General Plans

Local policies related to utilities and service systems are established in each jurisdiction's general plan. In general, jurisdictions have policies in place that state that utility and service systems must be provided at the same time (or in advance of) need. In addition to these general policies, jurisdictions may have more specific policies tailored to performance objectives including wastewater treatment services.

3.19.2.3 ENVIRONMENTAL IMPACTS

3.19.2.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of Connect SoCal could result in significant adverse impacts with regards to wastewater if the Plan would result in any of the following:

- Require or result in the relocation or construction of new or expanded wastewater treatment or storm drainage facilities, the construction or relocation of which could cause significant environmental effects;
- Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments

3.19.2.3.2 Methodology

The methodology for determining the significance of impacts to utilities and service systems, compares existing conditions to the expected future use of potable water supplies, wastewater, storm water facilities, and landfills with the Plan. The criteria above were applied to compare current conditions to future 2045 Plan conditions. Consideration was given to existing capacity and expected growth as well as transportation projects.

Implementation of the Plan would affect the use of utility and service systems in the SCAG region. The analysis of these impacts is programmatic at the regional level. With regards to wastewater, the Plan's potential to exceed capacity of local infrastructure and require the relocation or construction of new or expanded facilities or result in a determination that projected demand in addition to current demand will be used to determine the significance of the projects effects.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the

Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.19.2.3.3 Impacts and Mitigation Measures

Impact USWW-1 Require or result in the relocation or construction of new or expanded wastewater treatment or storm drainage facilities, the construction or relocation of which could cause significant environmental effects

Significant and Unavoidable – Mitigation Required.

Implementation of some transportation projects and anticipated growth under the Plan would involve construction of new storm water drainage facilities and may require construction of new or expanded wastewater treatment facilities.

Projects that increase impervious surface area, including expanding roadways, and new development may increase urban runoff. This would result in greater quantities of contaminants to receiving waters that may currently be impaired and would require the construction of new storm water drainage facilities or expansion of existing ones. Construction activities related or identified in the Plan could increase pollutant loads carried by storm water runoff. For example, road cut erosion can increase long-term siltation in local receiving waters. The Los Angeles Basin includes approximately 100,000 acres of transportation related impervious surfaces.²⁰ According to the USGS, there is an inverse relationship between water quality as well as flooding and impervious area.²¹ This relationship tends to become problematic when impervious surfaces within a watershed exceed 10 percent of land area. Where this percentage is greater than 25 percent, water quality is generally degraded and inhospitable for habitat or for recreation activities.²² In addition, many of the pollutants in urban runoff are attributable to

landscape irrigation, highway runoff, and illicit dumping. Highway runoff is a component of urban runoff contributing oil and grease, sediment, nutrients, heavy metals, and toxic substances.

The Plan would increase impervious surfaces in the SCAG region through a combination of transportation projects and development, resulting in construction or expansion of storm water drainage facilities. As shown in **Table 3.19.2-2, Existing Lane Miles by County**, and **Table 3.19.2-3, 2045 Plan Lane Miles by County**, the Plan would increase total lane miles in the region, with the most increase in San Bernardino County (from 14,871 to 17,067 lane miles). Among all facilities toll has the most increase in lane miles from 453 in 2016 to 1,463 lane miles in 2045 with the Plan.

Source: SCAG modeling, 2019. Connect SoCal: Highways & Arterials Appendix.

Municipal wastewater is related to water use. Most of the water that is not used in landscaping becomes wastewater. California residents used an estimated average 85 gallons of water per day in 2016.²³ However, water demand varies substantially by community and by land use type and therefore wastewater is anticipated to similarly vary substantially by community. The reuse and recycling of wastewater would reduce the amount of wastewater to be discharged to the ocean, although the total benefits from wastewater reduction would be limited.

Wastewater generation rates are closely tied to population growth. The total population is expected to grow by approximately 16 percent across the SCAG region by 2045, wastewater generation would proportionally increase by up to 16 percent (although this increase is likely to be unevenly spread across the region with some wastewater agencies may experience greater increases than others). In addition to increased demand for wastewater treatment facilities, increases in housing and population would increase wastewater flows in existing wastewater conveyance infrastructure (sewers). Individual development projects would either be accommodated by existing infrastructure, or project proponents and/or local jurisdictions would be required to make improvements to wastewater infrastructure (replacing sewers and upgrading wastewater treatment facilities). In less developed areas of the region,

²³ Legislative Analyst's Office. *Residential Water Use Trends and Implications for Conservation Policy*. Available online at: <https://lao.ca.gov/Publications/Report/3611>, accessed September 11, 2019.

new housing and employment developments could require additional wastewater infrastructure (new sewers and possibly new treatment facilities).

Due to anticipated transportation projects and anticipated growth under the Plan, construction of new storm water drainage or wastewater treatment facilities or expansion of existing facilities may be needed, thereby potentially resulting in a significant impact, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

SMM-USWW-1: SCAG shall work with local jurisdictions and wastewater agencies to encourage regional-scale planning for improved wastewater and stormwater management. Future impacts to wastewater and stormwater facilities shall be avoided to the extent practical and feasible through cooperative planning, information sharing, and comprehensive pollution control measure development within the SCAG region. This cooperative planning shall occur as part of current and existing coordination, an integral part of SCAG's ongoing regional planning efforts.

Project Level Mitigation Measures

See **PMM-HYD-1**.

PMM-USWW-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects on utilities and service systems, particularly for construction of wastewater facilities, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- During the design and CEQA review of individual future projects, implementing agencies and projects sponsors shall determine whether sufficient wastewater capacity exists for the proposed projects. There CEQA determinations must ensure that the proposed development can be served by its existing or planned treatment capacity. If adequate capacity does not exist, project sponsors shall coordinate with the relevant service provider to ensure that adequate public services and utilities could accommodate the increased demand, and if not, infrastructure improvements for the

appropriate public service or utility shall be identified in each project's CEQA documentation. The relevant public service provider or utility shall be responsible for undertaking project-level review as necessary to provide CEQA clearance for new facilities.

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to wastewater and storm water facilities could be significant and unavoidable even with implementation of mitigation. 1

Impact USWW-2 Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

Significant and Unavoidable – Mitigation Required.

Implementation of the Plan could result in a determination by one or more of the wastewater treatment providers in the region that there is inadequate capacity to serve the future population demand in addition to the provider's existing commitments, resulting in a significant impact. Wastewater generation rates are closely tied to population growth, and the total population is expected to grow by approximately 3.2 million or 16 percent across the SCAG region by 2045 (although this increase is likely to be unevenly spread across the region with some wastewater agencies experiencing greater increases than others). Therefore, wastewater generation could increase by 16 percent as well. Implementation of transportation projects contained in the Plan as well as anticipated growth under the Plan may increase demand for wastewater treatment facilities. Development projects would either be accommodated by existing infrastructure, or project proponents and local jurisdictions would be required, to make improvements to wastewater infrastructure (sewers and treatment facilities). In less developed areas of the region, new housing and commercial developments could require additional wastewater infrastructure (new sewers and treatment facilities). The higher density development reflected in the Plan's land use strategies could also require construction of new and/or replacement wastewater infrastructure including sewers with greater conveyance capacity in urban and urbanizing areas. In

addition, additional wastewater entering the existing wastewater treatment facilities may overload the current capacity levels of some wastewater treatment facilities. Therefore, impacts would be significant, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM USWW-1, SMM HYD-1** through **SMM HYD-3**.

Project Level Mitigation Measure

See **PMM USWW-1**.

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts with respect to wastewater treatment capacity could be significant and unavoidable even with implementation of mitigation.

3.19.3 WATER SUPPLY

3.19.3.1 ENVIRONMENTAL SETTING

3.19.3.1.1 Water Supplies

California's water supply is a hotly debated topic, with limited water resources stretched tightly between the environment, agriculture, and residential uses. Severe weather patterns linked to climate change have exacerbated the water issue, resulting in record low snowpack in several recent years (although the 2018/2019 snowpack was high) and record high heat waves. Supply water includes natural, managed, and reclaimed water. Natural sources consist of surface water bodies like rivers and lake, and groundwater resources stored in underground aquifers. Manmade sources include run-off water that is captured, treated, and stored in reservoirs. Reclaimed water is wastewater, treated at a treatment plant and typically reused for uses like industrial operations and irrigation. As reclaimed water is often non-potable, it must be conveyed in a separate system to ensure no possibility of direct human consumption. Another source of potable freshwater that is being considered throughout regions of the world include desalination, which removes the dissolved salt in seawater.

Surface and groundwater within the SCAG region are insufficient to support the region's growing population. In the SCAG region, approximately three quarters of potable water comes from imported sources.¹ Restrictions on imported water as well as drought conditions have necessitated water conservation measures. These conservation measures have slightly lessened the use of potable water in many areas of the region. In addition, the demand for water is being partially fulfilled by the increasing use of reclaimed water for non-potable purposes such as greenbelt irrigation and industrial processing and servicing.

Counties within the SCAG region use groundwater and surface water to meet water demand. Integrated Regional Water Management Plans (IRWMPs) and Urban Water Management Plans (UWMPs), developed for cities and counties throughout the region, help guide water management and supply and demand projections. Water is imported by the Metropolitan Water District of Southern California (MWD) and the State Water Project (SWP), and groundwater is pumped from various local wells.

¹ Southern California Association of Governments (SCAG). 2008. Regional Comprehensive Plan: Water. Available online at: http://www.scag.ca.gov/Documents/f2008RCP_Water.pdf, accessed September 26, 2019.

Watershed Management

Watershed management relates to sustaining watersheds at an acceptable level of quality, contributing to resource quality, and maintaining groundwater supplies. The watersheds in the SCAG region are shown in **Section 3.10, Hydrology (Figure 3.10-2, Watersheds in the SCAG Region)**. These large watersheds are further divided into smaller sections by internal surface water drainage areas and groundwater basins.

Colorado River

The Colorado River is a major source of water for Southern California, and is imported via the Colorado River Aqueduct, owned and operated by MWD.

Under water delivery contracts with the United States, California entities have enjoyed legal entitlements to Colorado River water, beginning with the 1922 Colorado River Compact.² California was entitled to 4.4 million-acre feet (af), as well as half on any surplus, as defined by the U.S. Department of the Interior. Typically, the river's surplus has allowed California entities to take an additional 800,000 af annually.

However, with increased urbanization in the Colorado River Basin states and limitation agreements between those states, surplus water for California was eliminated; the State will gradually return to its original allotment of 4.4 million af. Given these new terms, California water agencies are pursuing various strategies to offset this gradual, but certain loss of future water supply. Examples of these strategies include additional reservoir and storage agreements, new water transfers between agricultural and urban users, and more water conservation and recycling.³

The Colorado River Hydrologic Region (see discussion below) is of particular concern because it encompasses the Coachella Valley in the West Basin and the desert in the East Basin. Irrigation needs in the Coachella Valley are met almost exclusively by water imported from the Colorado River. Historical extraction of groundwater in the Coachella Valley has caused overdraft. Currently, an extensive groundwater recharge project is being undertaken by the Coachella Valley Water District that recharges Colorado River Water into spreading basins. Within the East Basin, irrigation and domestic water is provided by the Colorado River with only approximately 1 percent groundwater use and little direct reclamation. Agricultural runoff and some domestic wastewater do get returned to the Colorado River. Therefore, the water at the southern end of the watershed is a mixture of Colorado River water, agricultural runoff, and reclaimed water.

³ Metropolitan Water District of Southern California. 2016. *2015 Urban Water Management Plan*. Available online at: https://www.mwdoc.com/wp-content/uploads/2017/05/UWMP_May-2016-v2.pdf, accessed January 14, 2019.

State Water Project

The State Water Project supplies water to Southern California via the California Aqueduct, with delivery points in Los Angeles, San Bernardino, and Riverside Counties. SWP was constructed and is managed by the Department of Water Resources (DWR), and is the largest state-owned, multipurpose water project in the country. State Water Project has historically provided 25 to 50 percent of MWD's water, anywhere from 450,000 af to 1.75 million af annually.⁴ In 2019, the State Water Project allocated 75 percent, or 3.1 million acre feet, of water to the state supply due to the previous winter's robust storms that resulted in above average snowpack and reservoir levels.⁵ The State Water Project provides water to approximately 27 million people and irrigation water for roughly 750,000 acres of agricultural lands annually.

Los Angeles Aqueduct

The Los Angeles Aqueduct, originally built in 1913, carries water 233 miles south from Owens Valley to the City of Los Angeles. The original aqueduct project was extended in 1940 to the Mono Basin. The system was supplemented by a second project, parallel to the first, completed in 1970. Los Angeles Aqueduct deliveries from the Mono Basin and Owens Valley have ranged from a 2015 low of 36,000 af and a high of 467,000 af in 1998. Since 1990, average deliveries have been approximately 240,000 af per year. Due to environmental considerations, approximately half of the Los Angeles Aqueduct water supply has been reallocated to supply environmental mitigation and enhancement projects.⁶

Transfers

In an effort to diversify water sources and reduce reliance on specific water imports, water agencies have engaged in water transfer agreements. These contractual agreements, made with irrigation districts, reduce water use on agricultural lands either through agricultural conservation or fallowing land.⁷ The water "freed" by these reductions is transferred to a municipal water district, where it may be used or

⁷ Some urban agencies also have the ability to enter "spot" water markets and to purchase water on an "as needed" basis.

stored in aquifers for future use, a practice called water banking. Water banking is also done during wet years, when rainwater is collected and directed toward recharge facilities for future use.

Water Suppliers

The SCAG region is served by many water suppliers, both retail and wholesale; the largest of these agencies is MWD. Created under state law in 1931, MWD serves the urbanized coastal plain from Ventura to the Mexican border in the west to parts of the rapidly urbanizing counties of San Bernardino and Riverside in the east. It provides water to about 90 percent of the urban population of Southern California. MWD is comprised of 26 member agencies, 12 of which supply wholesale water to retail agencies and other wholesalers, and 14 of which are individual cities which directly supply water to their residents.⁸ The Imperial Irrigation District (IID), in Imperial County, is the fourth largest irrigation district in the country.⁹

3.19.3.1.2 Water Treatment Facilities

As identified below in **Table 3.19.3-1, Active Water Treatment Facilities in the SCAG Region**, there are 36 water treatment facilities that service the SCAG region. There are no water treatment facilities currently active in the County of the Imperial.

California's water-related assets and services are provided by many interdependent systems that historically have been managed on a project-by-project basis. The gap between water supply and water demand decreased substantially between 2001 and 2010 (see **Table 3.19.3-2, California Hydrologic Summary**). This narrowing gap has been further exacerbated in the SCAG region by the 2012-2015 California drought. There are typically three sources of supply water: (1) natural sources, (2) manmade sources, and (3) reclamation. Natural water sources include rivers, lakes, streams, and groundwater stored in aquifers. Manmade sources include runoff water that is treated and stored in reservoirs and other catchment structures. Reclaimed water is wastewater that has been conveyed to a treatment plant and then treated enough that it may be used again for certain uses (such as irrigation). However, reclaimed water is not potable (drinkable) and must be conveyed in a separate system in order to ensure there is no possibility of direct human consumption. See **Table 3.19.3-2, California Hydrologic Summary (in Millions of Acre-Feet)**.

Table 3.19.3-2
California Hydrologic Summary (in Millions of Acre-Feet)

	Water Year									
	2007	2008	2009	2010	2011	2012	2013	2014	2015	Average 1998- 2015

Groundwater ^b	-11.5	-13.1	-13.1	-8	-5.9	-12.8	-15.8	-18.4	-19.0	-10.6
Total	-19.5	-17	-12	-2.9	0.3	-20.2	-19.9	-23.5	-19.8	-11.2

Note:

a Consumptive use is the amount of applied water used and no longer available as a source of supply. Applied water is greater than consumptive use because it includes consumptive use, reuse, and outflows.

b Change in Supply: Groundwater – The difference between water extracted from and water recharged into groundwater basins in a region. All regions and years were calculated using the following equation: change in supply: groundwater = intentional recharge + deep percolation of applied water + conveyance deep percolation and see page - withdrawals. This does not include unknown factors such as natural recharge and subsurface inflow and outflow.

Surface and groundwater resources are largely managed as separate resources, when they are, in fact, a highly interdependent system of watersheds and groundwater basins. Water quality, land use, and flood management are also integral to the effective management of these systems.¹⁰

Within the SCAG region, water supply comes from a variety of sources. While the Metropolitan Water District (MWD) imports water from Colorado River and State Water Project and provides wholesale water supply to its coverage area, many cities and some county areas rely on groundwater, especially those along the coast. San Bernardino and Riverside Counties, for example, rely on a mixture of groundwater and surface water.

Following are the descriptions of the two primary hydrologic regions (South Coast and Colorado River) as well as associated regional water budgets.

Water Supply and Use in the South Coast Hydrologic Region

The South Coast Hydrologic Region has a diverse mix of both local and imported water supply sources. Local water sources include water recycling, groundwater storage, and infrastructure enhancements. The region imports water through the State Water Project, the Colorado River Aqueduct, and the Los Angeles Aqueduct. These resources allow the region flexibility in managing supplies and resources in wet and dry years. The MWD wholesales the water to a consortium of 26 member agencies, including 14 cities, 11 municipal water districts, and one county authority that serve nearly 19 million people living in six counties stretching from Ventura to San Diego. MWD imported an average of 1 million af of water per year from the SWP from 1995 to 2010, and just under 1 million af per year from the CRA during the same time period. **Table 3.19.3-3, South Coast Region Water Balance**, shows the water balance of the South Coast Hydrologic Region from 2011 to 2015.

¹⁰ California Department of Water Resources. 2013. *California Water Plan, Volume 1 – The Strategic Plan*. Available online at: <https://water.ca.gov/Programs/California-Water-Plan/Water-Plan-Updates>, accessed September 16, 2019.

Water Supply and Use in the Colorado River Hydrologic Region

About 85 percent of the Colorado River Region’s urban and agricultural water supply comes from surface water deliveries from the Colorado River. Water from the river is delivered to this region via the All American and Coachella canals, local diversions, and the Colorado River Aqueduct by means of an exchange for SWP water. The Colorado River is an interstate and international river whose use is apportioned among the seven Colorado River Basin states and Mexico by a complex body of statutes, decrees, and court decisions known collectively as the “Law of the River.” Local surface water, groundwater, and the SWP provide the remainder of water to the region. In addition, many of the alluvial valleys in the regions are underlain by groundwater aquifers that are the sole source of water for many local communities. However, some alluvial valleys contain groundwater of such poor quality it is not suitable for potable uses.

Other cities such as Banning, Coachella, Indio, Palm Desert, Hesperia, and Victorville, are solely dependent on groundwater; while other cities in the SCAG region have supplemented their groundwater supplies with water from the State Water Projects or local streams and reservoirs. **Table 3.19.3-4, Colorado River Region Water Balance**, shows the water balance for the Colorado River Hydrologic Region from 2011 to 2015.

Table 3.19.3-4
Colorado River Region Water Balance

Local Water Supply

Local sources of water account for approximately 30 percent of the total volume consumed annually in the SCAG region.¹¹ Local sources include surface water runoff, groundwater, and water reclamation. Some local agencies have led efforts to diversify water supply, such as South Coast Water District's Doheny Ocean Desalination Project and West Basin Municipal Water District's Ocean Water Desalination project.

Local Surface Water (within Each Hydrologic Unit [HU] Region)

The infiltration of surface runoff augments groundwater and surface water supplies. However, the regional water demand exceeds the current natural recharge of runoff water. The arid climate, summer drought, and increased impervious surface associated with urbanization contribute to this reduction in natural recharge. Urban and agricultural runoff often contains pollutants that decrease the quality of local water supplies. Runoff captured in storage reservoirs varies widely from year to year depending on the

¹¹ California Department of Water Resources. Accessed 15 September 2015. *California Water Plan Update 2013*. Available at: <http://www.waterplan.water.ca.gov/cwpu2013/final/index.cfm>

amount of local precipitation. On average, precipitation contributes approximately 38,000 acre-feet per year (afy) within the MWD service area (not including San Diego County). Within the desert regions, the amount is considerably less, owing to climatic differences.

Local Groundwater

Groundwater represents most of the SCAG region's fresh water supply, making up approximately 34 percent of total water use, depending on precipitation levels.¹² The hydrologic regions vary in their dependence on groundwater for urban and agricultural uses (**Table 3.19.3-5, Groundwater Dependence in the SCAG Region**). The DWR estimates that the state has a groundwater overdraft of approximately 1 to 2 maf in average years.¹³

**Table 3.19.3-5
Groundwater Dependence in the SCAG Region**

Hydrologic Region	Percentage of Total Urban and Agricultural Water Supply Provided by Groundwater
Central Coast ^a	86%
South Coast ^b	34%
South Lahonton ^c	66%
Colorado River ^d	9%

Note:

a Includes part of Ventura County. The remainder is outside of the SCAG Region.

b Includes Orange County, most of San Diego and Los Angeles counties, parts of Riverside, San Bernardino, Ventura, Kern and Santa Barbara counties.

c Includes most of San Bernardino County, as well as Inyo, and parts of Mono, Kern and Los Angeles counties.

d Includes all of Imperial County, most of Riverside, and parts of San Bernardino and San Diego counties.

Recent efforts to store recycled water and surplus water in groundwater basins for use during drought periods have proven successful. MWD has 10 projects with various water agencies for groundwater storage, resulting in approximately 421,900 af of added capacity per year. A number of agencies within the region are also active in the recharge of surface water, including the Orange County Water District,

3.19.3.2 REGULATORY FRAMEWORK

3.19.3.2.1 Federal

Clean Water Act/National Pollutant Discharge Elimination System Permits

The Clean Water Act (CWA) (33 USC Sections 1251 *et seq.*) was enacted by Congress in 1972 and has been amended several times since its adoption. It is the primary federal law regulating water quality in the U.S. Its objective is to reduce or eliminate water pollution in the nation's rivers, streams, lakes, and coastal waters. The CWA prescribes the basic federal laws for regulating discharges of pollutants and sets minimum water quality standards for all surface waters in the U.S. The CWA is administered by the U.S. Environmental Protection Agency (USEPA).¹⁴

In California, the State Water Resources Control Board (State Water Board) and the nine Regional Water Quality Control Boards (Regional Water Boards) implement many of the Clean Water Act's provisions. The Clean Water Act requires the State to adopt water quality standards and to submit those standards for approval by the U.S. Environmental Protection Agency (US EPA). For point source discharges to surface water, the Clean Water Act authorizes the U.S.EPA and/or approved states (such as California) to administer the National Pollutant Discharge Elimination System (NPDES) program. The NPDES program regulates the discharge of pollutants from point sources. Municipal point sources consist primarily of municipal wastewater treatment plant outfalls and stormwater conveyance system outfalls. The Clean Water Act also establishes a loan program - the State Revolving Fund - for the implementation of water quality improvement projects.

Safe Drinking Water Act

Passed in 1974 and amended in 1986 and 1996, the Safe Drinking Water Act (SDWA) gives the EPA the authority to set drinking water standards. Drinking water standards apply to public water systems, which provide water for human consumption through at least 15 service connections, or regularly serve at least 25 individuals. There are two categories of drinking water standards, the National Primary

¹⁴ U.S. Environmental Protection Agency. *Clean Water Act, Section 402: National Pollutant Discharge Elimination System*. Available online at: <https://www.epa.gov/cwa-404/clean-water-act-section-402-national-pollutant-discharge-elimination-system>, accessed August 29, 2019.

Drinking Water Regulations (NPDWR) and the National Secondary Drinking Water Regulations. The NPDWR are legally enforceable standards that apply to public water systems. NPDWR standards protect drinking water quality by limiting the levels of specific contaminants that can adversely affect public health and are known or anticipated to occur in water.¹⁵

3.19.3.2.2 State

Porter-Cologne Water Quality Control Act

The Porter-Cologne Act is the principal law governing water quality regulation in California. It establishes a comprehensive program to protect water quality and the beneficial uses of water. The Porter-Cologne Act applies to surface waters, wetlands, and ground water and to both point and nonpoint sources of pollution. Pursuant to the Porter-Cologne Act (California Water Code section 13000 *et seq.*), the policy of the State is as follows:

- That the quality of all the waters of the State shall be protected;
- That all activities and factors affecting the quality of water shall be regulated to attain the highest water quality within reason; and
- That the State must be prepared to exercise its full power and jurisdiction to protect the quality of water in the State from degradation.

The Porter-Cologne Act established nine Regional Water Boards (based on hydrogeologic barriers) and the State Water Board, which are charged with implementing its provisions and which have primary responsibility for protecting water quality in California. The State Water Board provides program guidance and oversight, allocates funds, and reviews Regional Water Boards decisions. In addition, the State Water Board allocates rights to the use of surface water. The Regional Water Boards have primary responsibility for individual permitting, inspection, and enforcement actions within each of nine hydrologic regions. The State Water Board and Regional Water Boards have numerous NPS-related responsibilities, including monitoring and assessment, planning, financial assistance, and management.

The Regional Water Boards regulate discharges under the Porter-Cologne Act primarily through issuance of NPDES permits and waste discharge requirements (WDRs for point and nonpoint source discharges. Anyone discharging or proposing to discharge materials that could affect water quality (other than to a community sanitary sewer system regulated by an NPDES permit) must file a report of waste discharge.

¹⁵ U.S. Environmental Protection Agency. *Safe Drinking Water Act (SDWA)*. Available online at: <https://www.epa.gov/sdwa>, accessed August 29, 2019.

The Porter-Cologne Act also implements many provisions of the Clean Water Act, such as NPDES permitting program. Section 401 of the Clean Water Act gives the State Water Board the authority to review any proposed federally permitted or federally licensed activity that may impact water quality and to certify, condition, or deny the activity if it does not comply with State water quality standards.

The Porter-Cologne Act also requires adoption of water quality control plans (Basin plans) that contain the guiding policies of water pollution management in California. A number of statewide water quality control plans have been adopted by the State Water Board. In addition, basin plans have been adopted by each of the Regional Water Boards and get updated as necessary and practical. These plans identify the existing and potential beneficial uses of waters of the State and establish water quality objectives to protect these uses. The basin plans also contain implementation, surveillance, and monitoring plans. Statewide and regional water quality control plans include enforceable prohibitions against certain types of discharges, including those that may pertain to nonpoint sources. Portions of water quality control plans, the water quality objectives and beneficial use designations, are subject to review by U.S.EPA, when approved they become water quality standards under the Clean Water Act.¹⁶

California Administrative Code

California Administrative Code Title 24 contains the California Building Standards, including the California Plumbing Code (Part 5), promotes water conservation. Title 20 addresses Public Utilities and Energy and includes appliance efficiency standards that promote water conservation. In addition, a number of State laws listed below require water-efficient plumbing fixtures in structures:

- Title 20, California Administrative Code, Section 1604(g) establishes efficiency standards that give the maximum flow rate of all new showerheads, lavatory faucets, sink faucets, and tub spout diverters.
- Title 20 California Administrative Code Section 1606 prohibits the sale of fixtures that do not comply with established efficiency regulations.
- Title 24, California Administrative Code, Sections 25352(i) and (j) address pipe insulation requirements, which can reduce water used before hot water reaches equipment or fixtures. Insulation of water-heating systems is also required.
- Health and Safety Code Section 17921.3 requires low-flush toilets and urinals in virtually all buildings.

¹⁶ California Water Boards. 2019. *Porter-Cologne Water Quality Control Act*. Available online at: https://www.waterboards.ca.gov/laws_regulations/docs/portercologne.pdf, accessed August 29, 2019.

Under Title 22, the State Department of Health establishes State-wide effluent bacteriological and treatment reliability standards for recycled water uses. The standards are based on the potential for human contact with recycled water. The regional water quality control board (RWQCB) has established and enforces requirements for the application and use of recycled water. Permits are required from a RWQCB for any recycling operation. Applicants for a permit are required to demonstrate that the proposed recycled water operation is in compliance with Title 22 and will not exceed the ground and surface water quality objectives in the regional basin management plan.¹⁷

The Water Conservation Act of 2009

These sections of the Water Code, enacted as SB X7-7—The Water Conservation Act of 2009, set water conservation targets and efficiency improvements for urban and agricultural water suppliers, Sections 10608.16 and Sections 10608.48, respectively. The legislation establishes a State-wide target to reduce urban per capita water use by 20 percent by 2020. Urban retail water suppliers are required, individually or on a regional basis, to develop an urban water use target by December 31, 2010, to meet their target by 2020, and to meet an interim target (half of their 2020 target) by 2015. Urban water suppliers cannot impose conservation requirements on process water (water used in production of a product) and are required to employ two critical efficient water management practices—water measurement and pricing. Urban retail water suppliers must include in a water management plan, to be completed by July 2011, the baseline daily per capita water use, water use target, interim water use target, and compliance daily per capita water use.¹⁸

California Urban Water Management Planning Act

This part of the State Water Code (Section 10610) states that each urban water supplier that provides water to 3,000 or more customers, or that provides over 3,000 AF of water annually, should make every effort to ensure the appropriate level of reliability in its water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry years by preparing a UWMP and updating it every five years. The Act describes the contents of UWMPs and requires each agency's UWMP to assess the reliability of the agency's water resources over a 20-year planning horizon.¹⁹

California Senate Bill 610

Referred to as SB 610, the intent of this part of the State Water Code is to ensure that sufficient water supplies are available for growing communities. Water Code Section 10910 requires any project subject to CEQA of a specified minimum size to require a local public water provider with more than 3,000 service connections to prepare a water supply assessment (WSA) for the project. The WSA must document sources of water supply, quantify water demands, and compare future water supply and demand to show that sufficient water will be available to serve the development project. Water supply must be assessed for normal, single dry, and multiple dry water years during a 20-year forecast.²⁰ If supplies are found to be insufficient to serve the project, the WSA must include plans for acquiring sufficient supplies. The WSA must be included in the CEQA document for the project.²¹

California Senate Bill 221

SB 221 applies to subdivisions of more than 500 dwelling units (Water Code Section 10912). Like SB 610, it is intended to ensure an adequate water supply for new development. SB 221 requires that approval of a tentative map showing the design and improvement of a proposed subdivision shall include a requirement that a sufficient water supply is available.^{22,23}

California Groundwater Management Act

The Groundwater Management Act (AB 3030, Water Code Sections 10750 et seq.) provides guidance for applicable local agencies to develop voluntary groundwater management plans (GMP) in State-designated groundwater basins. GMPs can allow agencies to raise revenue to pay for measures influencing the management of the basin, including extraction, recharge, conveyance, facilities' maintenance and water quality.²⁴

California Model Water Efficient Landscape Ordinance

The California Model Water Efficient Landscape Ordinance (MWELo) sets restrictions on outdoor landscaping. Because the City of Lincoln is a “local agency” under the MWELo, it must require project applicants to prepare plans consistent with the requirements of the MWELo for review and approval by the City. The MWELo was most recently updated by the Department of Water Resources and approved by the California Water Commission on July 15, 2015. All provisions became effective on February 1, 2016. The revisions, which apply to new construction with a landscape area greater than 500 square feet, reduced the allowable coverage of high-water-use plants to 25 percent of the landscaped area. The MWELo also requires use of a dedicated landscape meter on landscape areas for residential landscape areas greater than 5,000 square feet or nonresidential landscape areas greater than 1,000 square feet, and requires weather-based irrigation controllers or soil-moisture based controllers or other self-adjusting irrigation controllers for irrigation scheduling in all irrigation systems.²⁵

Governor’s Executive Order B-29-15 issued on April 1, 2015

Key provisions of Executive Order B-29-15 included ordering the State Water Resources Control Board to impose restrictions to achieve a 25-percent reduction in potable urban water usage through February 28, 2016; directing DWR to lead a statewide initiative, in partnership with local agencies, to collectively replace 50 million square feet of lawns and ornamental turf with drought tolerant landscapes, and directing the California Energy Commission to implement a statewide appliance rebate program to provide monetary incentives for the replacement of inefficient household devices.²⁶

3.19.3.2.3 Regional

The water quality control plans and groundwater protection responsibilities for the SCAG region are described in **Section 3.10, Hydrology and Water Quality**.

Urban Water Management Plans

Under California Water Code Division 6, Part 2.6, Section 10610-10656, the Urban Water Management Planning Act (UWMPA) requires urban water suppliers that supply more than 3,000 acre-feet of water annually, or serve more than 3,000 connections, to submit an Urban Water Management Plan (UWMP).

²⁵ California Department of Water Resources. *Model Water Efficient Landscape Ordinance*. Available online at: <https://water.ca.gov/LegacyFiles/wateruseefficiency/docs/MWELo09-10-09.pdf>, accessed August 29, 2019.

²⁶ California Water Boards. 2015. *Executive Order B-29-15 State of Emergency Due to Sever Drought Conditions*. Available online at: https://www.waterboards.ca.gov/waterrights/water_issues/programs/drought/docs/emergency_regulations/econ_analysis.pdf, accessed August 29, 2019.

The UWMP is a public document prepared by water suppliers to support their long-term resource planning over a 20-year period and ensure adequate water supplies are available to meet existing and future water demands. The UWMP must be submitted to the DWR every 5 years, and must demonstrate progress toward reduction in 20 percent per capita urban water consumption by the year 2020, as required in the Water Conservation Bill of 2009, Senate Bill X7-7. There are 138 service districts in the SCAG region required to develop a UWMP, which is typically prepared and submitted to DWR within 30 days and reviewed 60 days prior to public hearing for plan adoption and implementation. The preparation of the plan includes guidebook, workshops, and programming for comprehensive strategies to conserve water.²⁷

3.19.3.2.4 Local

Utility Master Plans & Utility Capital Improvement Programs

Jurisdictions usually have utility master plans or other planning documents that identify and prioritize projects needed to maintain adequate levels of utility service in the jurisdiction.

General Plans

Local policies related to utilities and service systems are established in each jurisdiction's general plan. In general, jurisdictions have policies in place that state that utility and service systems must be provided at the same time (or in advance of) need. In addition to these general policies, jurisdictions may have more specific policies tailored to performance objectives including wastewater treatment services.

3.19.3.3 ENVIRONMENTAL IMPACTS

3.19.3.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of Connect SoCal could result in significant adverse impacts with regards to water supply if the Plan would result in any of the following:

- Require or result in the relocation or construction of new or expanded water facilities, the construction or relocation of which could cause significant environmental effects;

²⁷ California Department of Water Resources. *California Water Code Division 6 Part 2.6. Urban Water Management Planning*. Available online at: https://water.ca.gov/LegacyFiles/urbanwatermanagement/docs/water_code-10610-10656.pdf, accessed August 29, 2019.

- Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.

3.19.3.3.2 Methodology

The methodology for determining the significance of impacts to utilities and service systems compares existing conditions to the expected future use of potable water supplies, wastewater, stormwater facilities, and landfills with the Plan. The criteria above were applied to compare current conditions to future 2045 Plan conditions.

Implementation of the Plan would affect the use of utility and service systems in the SCAG region. The analysis of these impacts is programmatic at the regional level. With regards to water supply, the Plan's potential to exceed capacity of local infrastructure and require the relocation or construction of new or expanded facilities or result in a determination that projected demand in addition to current demands is used to determine the significance of the projects effects.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.19.3.3.3 Impacts and Mitigation Measures

Impact USWS-1 Require or result in the relocation or construction of new or expanded water facilities, the construction or relocation of which could cause significant environmental effects.

Significant and Unavoidable – Mitigation Required.

Population in the SCAG region is expected to increase by 3.2 million people by 2045 which may result in a significant impact to the existing water infrastructure in the region. In 2014, California passed Proposition 1 in order to guarantee approximately \$7.12 billion for water infrastructure projects,

including \$725 million for projects that treat wastewater or saltwater.²⁸ Moreover, the DWR announced in June 2019 that \$14 million in grant funding will be appropriated for projects that increase water quality, supply, and infrastructure.²⁹ A number of desalination projects have been proposed or are under construction within the SCAG region, including the West Basin Desalination Project which could produce 20 million gallons per day (mgd) (with potential expansion to 60 million gallons per day),³⁰ the Doheny Ocean Desalination Project which could produce 5 million gallons per day (with potential expansion to 15 mgd),³¹ and the Huntington Beach Desalination Plant which could produce 50 mgd.³² Additionally, Los Angeles and Orange Counties will develop pilot projects to increase stormwater capture. Specifically, the Mayfair Park Capture Project and Caruthers Park Water Capture Project Los Angeles County will capture an estimated 710 and 780 acre-feet/year, respectively.³³ In Orange County, the San Juan Aquifer Recovery Project is in the preliminary design phases for a stormwater capture project in the San Juan Watershed.³⁴ In February 2019 the City of Los Angeles announced its commitment to 100 percent recycled water at the Hyperion, L.A. Glendale, Tillman, and Terminal Island water treatment facilities by 2035.³⁵

Therefore, there is anticipated to be an increase in water supply within the SCAG region from recycling and desalination. California residents used an estimated average 85 gallons of water per day in 2016.³⁶ Assuming per capita water consumption remains consistent, the SCAG region could require approximately 312.4 million more gallons of water per day to meet the increase in population. In recent years, as a result of increased water conservation, urban water demand has remained relatively constant despite growing population. However, there may be a limit to how much water can be saved through

³⁶ Legislative Analyst's Office. *Residential Water Use Trends and Implications for Conservation Policy.*

conservation and even with increases in water efficiency, increasing population could increase water demand. As a result, new water facilities will likely need to be constructed or expanded in order to meet this demand. Water facility projects vary in sizes and locations, but larger regional-scale facilities may be constructed in sensitive environments (e.g. desalination plants adjacent to the ocean). The construction of these larger-scale facilities could result in significant impacts because of their size, prominence and location.

Mitigation Measures

SCAG Mitigation Measure

SMM USWS-1: SCAG shall coordinate with local agencies as part of SCAG's Sustainability Program regarding the implementation of Urban Greening, Greenbelts and Community Separator land use strategies. Primary features of land use strategies address the following:

- Increased trail and greenway connectivity;
- Improved water quality, groundwater recharge and watershed health;
- Reduce urban runoff;
- Expand the urban forest;
- Provision of wildlife habitat and increased biodiversity;
- Expand recreation opportunities and beautification;
- Preserving agrarian economies;
- Restore severed wildlife corridors.

Project Level Mitigation Measures

PMM USWS-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to ensure sufficient water supplies, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Reduce exterior consumptive uses of water in public areas, and should promote reductions in private homes and businesses, by shifting to drought-tolerant native

landscape plantings, using weather-based irrigation systems, educating other public agencies about water use, and installing related water pricing incentives.

- b) Promote the availability of drought-resistant landscaping options and provide information on where these can be purchased. Use of reclaimed water especially in median landscaping and hillside landscaping can and should be implemented where feasible.
- c) Implement water conservation best practices such as low-flow toilets, water-efficient clothes washers, water system audits, and leak detection and repair.
- d) For projects located in an area with existing reclaimed water conveyance infrastructure and excess reclaimed water capacity, use reclaimed water for non-potable uses, especially landscape irrigation. For projects in a location planned for future reclaimed water service, projects should install dual plumbing systems in anticipation of future use. Large developments could treat wastewater onsite to tertiary standards and use it for non-potable uses onsite.

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce demand for water which could result in reduced need to construct new water facilities, but construction of new large-scale water facilities is reasonably foreseeable given the expected population increase and anticipated demand for water. Therefore, given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts with respect to new or expanded water facilities could be significant and unavoidable even with implementation of mitigation.

Impact USWS-2 Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.

Significant and Unavoidable – Mitigation Required.

The Plan could result in insufficient water supplies from existing entitlements and resources resulting in significant impacts. Transportation projects and development projects anticipated to occur under the Plan have the potential to result in water use that could exceed available water supply. Potential factors that would lead water supply capabilities being exceeded include vulnerability and uncertainty of water supply, in relation to climate variability, resulting from increased temperatures and wildlife fires, as well as regulatory or legislative decisions that could affect the availability of imported water.

Water agencies in the SCAG region produce Urban Water Management Plans (UWMPs) and other long-range planning studies to provide a system adequate to supply water demand. At current usage rates, existing water supplies and infrastructure would not be sufficient to meet demand in 2045. The volume of water and water delivery infrastructure available within the SCAG region may not be sufficient to meet the future multiple dry year or average year water demand in 2045 without substantial reduction in water demand. **Table 3.19.3-6, Metropolitan Water District's Local Supplies for Average and Dry Years**, shows the anticipated water supply for the MWD area, which makes up a portion of the SCAG region, for 2020, 2030, and 2040.

**Table 3.19.3-6
Metropolitan Water District's Local Supplies for Average and Dry Years**

	2020		2030		2040	
	Average Year	Dry Year	Average Year	Dry Year	Average Year	Dry Year
Local Groundwater						
<i>From Natural Recharge</i>	1,011,000	1,007,000	1,004,000	1,005,000	1,005,000	1,006,000
<i>Replenishment</i>	292,000	298,000	297,000	297,000	297,000	297,000
Local Projects						
<i>Groundwater Recovery</i>	143,000	139,000	163,000	162,000	167,000	167,000
<i>Recycling</i>	436,000	427,000	486,000	482,000	509,000	507,000
<i>Seawater Desalination</i>	51,000	56,000	51,000	56,000	51,000	56,000
Local Runoff Stored	110,000	102,000	110,000	102,000	110,000	102,000
Los Angeles Aqueduct	261,000	113,000	264,000	125,000	268,000	133,000
IID-SDCWA Transfer and Canal Lining	274,000	274,000	282,000	282,000	282,000	282,000
Total	2,578,000	2,416,000	2,657,000	2,511,000	2,689,000	2,550,000

The Metropolitan Water District of Southern California. 2016. 2015 Urban Water Management District. Available online at: http://www.mwdh2o.com/PDF/About_Your_Water/2.4.2_Regional_Urban_Water_Management_Plan.pdf, accessed September 12, 2019.

Based on projected population growth under the Plan, the demand for municipal water would increase. Many agencies are implementing aggressive water conservation, recycling and planning strategies (water

transfer and water banking) to sustain the supply of water during wet and dry years. The City of Los Angeles for example has maintained relatively constant water demand over the past ten years as a result of water conservation despite increasing population. Additionally, the Plan's land use strategies encourage compact development and smaller single-family lots in urbanized areas such as HQTAs. Compact development tend to consume water more efficiently (lower per capita consumption). Nonetheless, when considering the Plan as a whole for the region, there is potential for demand in the region to exceed existing and reasonably foreseeable water supplies, due to increased population, drought conditions, and unreliable water supply in the region, constituting a significant impact.

Meeting future water demand is the responsibility of local and regional water agencies. Water supplies are either produced locally from groundwater and surface water sources or are imported via the Los Angeles Aqueduct, the California Aqueduct, the Colorado River Aqueduct, the All American Canal, or the Coachella Canal. Other means of providing water without increasing imported supplies include reclamation and recycling, conservation, water transfers, groundwater banking, developing brackish groundwater, and ocean desalination.

The Urban Water Management Plan Act of 1990 requires that local water agencies prepare plans showing projected water supplies and demands for average years and multiple dry years. These plans are updated every five years. As part of the statewide continued efforts on reducing water usage, the UWMP has been amended to further require urban water suppliers to include narrative descriptions of their water demand management measures in the UWMPs. The descriptions include discussions on progress on water demand management measures implemented over the last five year, and identify additional measures and water saving practices that will help suppliers achieve water use reduction targets. Additionally, the amended Act requires UWMPs to quantify distribution system water losses as a new category of past and current water use and allows water use projections to account for estimated water savings resulting from implementation of applicable codes, building design standards, ordinances, and transportation and land use plans.

The Metropolitan Water District of Southern California prepared the Integrated Water Resources Plan (IRP)³⁷ that provides a roadmap for maintaining regional water supply. The framework places an increased emphasis on regional collaboration. Earlier plans dating back to 1996 set a regional reliability goal of meeting full-service demands at the retail level under all foreseeable hydrologic conditions. This updated plan seeks to stabilize Metropolitan's traditional imported water supplies and to continue developing additional local resources.

³⁷ Metropolitan Water District of Southern California. *Integrated Water Resources Plan*. Available online at: [http://www.mwdh2o.com/PDF_About_Your_Water/2015%20IRP%20Update%20Report%20\(web\).pdf](http://www.mwdh2o.com/PDF_About_Your_Water/2015%20IRP%20Update%20Report%20(web).pdf), accessed August 28, 2019.

Over 80 percent of the projected population in the SCAG region for the year 2045 is within the MWD service area.³⁸ It is anticipated that moderate density development in suburban areas, and compact development in urbanized areas, would reduce the need to extract and haul waters to distances outside of the urbanized and undeveloped areas. Supplying the water necessary to meet future demand and/or minimizing that demand based on anticipated land use distribution would mitigate anticipated impacts. Each water district develops its own policy for determining its planning horizon and for acquiring and building water facilities. Water districts would provide water for the growth planned and authorized by the appropriate land use authority. However, given the challenges to imported water supplies, meeting future demand is difficult. Therefore, impacts would be significant, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

See **SMM USWS-1**.

Project Level Mitigation Measures

See **PMM-USWS-1**.

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to sufficient water supplies could be significant and unavoidable even with implementation of mitigation.

This section of the Program Environmental Impact Report (PEIR) describes existing wildfire conditions within the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect wildfire, and analyzes the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible. Other fire protection considerations are addressed in **Public Services, Section 3.15.1, Fire Protection**, in addition emergency access is addressed in **Section 3.17, Transportation, Traffic, and Safety**, and emergency response and evacuation plans are addressed in **Section 3.9, Hazards and Hazardous Materials**.

3.20.1 ENVIRONMENTAL SETTING

3.20.1.1 Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for wildfire are provided.

CAL FIRE: California Department of Forestry and Fire Protection (abbreviated Cal Fire and styled CAL FIRE). CAL FIRE is the State of California’s fire protection agency responsible for protection and stewardship of over 31 million acres of the state’s privately-owned wildlands. CAL FIRE is an “all-risk” department, meaning its teams may respond to a car crash, medical incident, hazardous material spill, or natural disaster, not just fires. CAL FIRE is also responsible for managing 71,000 acres of Demonstration State Forests, overseeing enforcement of state forest management regulations, and operating training and certification course trainings.¹

Clearance: Space cleared of vegetation as required by law, regulation, easement, etc. for the purpose of preventing fires.

Containment/Control: A fire is contained when it is completely surrounded by a boundary but is still burning and has the potential to jump a boundary line. The boundary may be a “fire line” which is a strip of area where the vegetation has been removed to deny the fire fuel, or a river, a freeway or some other barrier which is expected to stop the fire. Hose lines from fire engines may also contribute to a fire being

¹ California Department of Forestry and Fire Protection. *About Us*. Available online at <https://www.fire.ca.gov/about-us/>, accessed September 10, 2019.

surrounded and contained. A fire is controlled when there is no further threat of it jumping a containment line. While crews continue to do mop-up work within the fire lines, the fire fight is over.

Contract Counties: Contract counties are counties where the local county fire department is contracted by CAL FIRE to protect a State Responsibility Area (SRA). Section 4133 of the Public Resources Code and Section 55607 of the Government Code permit the CAL FIRE Director to contract with counties for protection of SRAs. In California, six counties provide fire-prevention services in SRAs under contract with the state. These counties are Marin, Kern, Santa Barbara, Ventura, Los Angeles and Orange.

Damage Assessment: Amount of economic loss, including cost of fire suppression.

Defensible Space: An area either natural or manmade where material capable of causing a fire to spread unchecked has been treated, cleared, reduced or changed in order to act as barrier between the advancing wildfire and the loss to life, property, or resources. This concept is vital for firefighter safety and provides the single significant element of protection of individual property owners. California law requires homeowners to maintain 100 feet of defensible space around homes and structures.

Easement: A right to cross or otherwise use someone else's property for a specified purpose.

Fire Hazard: Dangerous accumulation of flammable fuels in wildland areas, usually referring to vegetation or the flammable materials that may be ignited by various fire risks or cause fires to increase in intensity or rate of spread.

Fire Hazard Zoning: A planning and regulatory activity (typically conducted by a local agency such as a city or county) which provides criteria for what kinds, how many and under what conditions development or other activities should be regulated in areas of various hazard classification.

Fire Season: In California fire season generally lasts for six to eight months, from summer to early fall. In recent years, fire season has extended into December.

Greenbelts: A facility or land use designed for a use other than fire protection, which will slow or resist the spread of a wildfire. Includes parking lots, irrigated or landscaped areas, golf courses, parks, playgrounds and maintained vineyards, orchards or annual crops that do not cure in the field.

Interface/ Wildland Interface: The meeting point of wildland and structures. At this interface, structures and vegetation are sufficiently close that a wildland fire could spread to structures or a structure fire ignites vegetation.

Intermix/ Wildland Intermix: Interspersion of developed land with wildland, where there are no easily discernible boundaries between the two systems. In this setting, there may be homes or other structures intermixed with wildland fuels, as opposed to a distinct area of wildland fuel adjacent to a developed area.

Local Responsibility Area (LRA): Areas where wildland fire protection is the responsibility of the local government. Local responsibility area fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local governments.

Prescribed Burning: Controlled application of fire to wildland fuels, in either their natural or modified state, under conditions of weather, fuel moisture, soil moisture, etc., as to allow the fire to be confined to a predetermined area and at the same time to produce results to meet planned objectives of land management.

Santa Ana Winds: Santa Ana winds blow from the northeast toward the beaches as areas of strong high pressure build across the interior west. The wind speed can be magnified as air squeezes over mountain passes and rushes downhill, heating and drying as it descends in elevation. Severe Santa Ana Wind events pose a heightened wildfire risk.

State Responsibility Area (SRA): SRAs are areas in which the primary financial responsibility for preventing and suppressing fires is that of the state and is defined based on land ownership, population density and land use.² These include: lands covered wholly or in part by timber, brush, undergrowth or grass, whether of commercial value or not; lands which protect the soil from erosion, retard run-off of water or accelerated percolation; lands used principally for range or forage purposes; lands not owned by the Federal government; and lands not incorporated. By Board regulations, unless specific circumstances dictate otherwise, lands are removed from SRA when housing densities average more than 3 units per acre over an area of 250 acres. CAL FIRE has SRA responsibility for the protection of more than 31 million acres of California's privately-owned wildlands.³

Wildland: Refers to unoccupied lands

Wildland Urban Interface: Refers to the geographical point where flammable vegetation meets man-made structures.

² CAL FIRE. 2017. *Fire Prevention Fee*. Available online at: <https://www.cdtfa.ca.gov/taxes-and-fees/fire-prevention-fee.htm>, accessed September 7, 2019.

3.20.1.2 Existing Conditions

A wildfire is defined as a non-structural fire in undeveloped area with the potential to spread to an urban area. While wildfires are common across California, a variety of factors can affect the likelihood of a fire occurring and the severity of the burn. Unsurprisingly, locations with hot, dry, and windy conditions face a greater fire hazard than wetter and cooler locations, and communities near wildland areas are more endangered than those in cities and towns. Vegetation, topography, roadways, and management methods also contribute to an area's potential for fire hazards. Steep hillsides and varied topography may also increase the risk of wildland fires, and could affect natural resources, as well as life and property. Most fires in California occur during late summer and early fall, but recently the fire season is starting earlier and lasting longer in the year, affecting areas longer, and resulting in more extreme events due to climate change.

CalFire publishes Fire Hazard Severity Zone Maps for the entire State of California, which include fire hazard measurements, as well as the areas that are under State Responsibility Areas (SRA) lands or Local Responsibility Area (LRA) lands, for each county in the State. These maps place areas of the state into different fire hazard severity zones (FHSZ) based on a hazard scoring system using subjective criteria for fuels, fire history, terrain influences, housing density, and occurrence of severe fire weather where urban fire could result in catastrophic losses. As part of this mapping system, land where CAL FIRE is responsible for wildland fire protection and generally located in unincorporated areas is classified as a SRA. In addition to establishing local or state responsibility for wildfire protection in a specific area, CAL FIRE designates areas as very high fire hazard severity (VHFHSZ) zones or non-VHFHS zones.⁴

In 2017, and then again in 2018, California experienced record-breaking heat as a part of a global warming trend. The heat, coupled with years of drought and an increase of forest pests and disease linked to climate change, created perfect fire conditions that allowed for some of the most destructive and deadliest fires in the state's history. Wind direction and intensity, particularly for fires close to populated areas pose not only safety issues, but also air quality related health issues.

Fire Hazard Severity Zones

Wildland fire protection in California is the responsibility of either the local, state, or federal government. Public Resources Code Section 4201-5 (Chapter 806, Statutes of 1982) requires CAL FIRE to evaluate fire hazard severity and map FHSZ for all SRA.⁵ FHSZs are based on factors such as fuel, slope, and weather

⁴ CAL FIRE. 2007. *Fire Hazard Severity Zones in SRA*. Available online at: https://osfm.fire.ca.gov/media/6636/fhszs_map.pdf, accessed August 20, 2019.

⁵ California Legislative Information. 1982. *Article 9. Fire Hazards Severity Zones [4201-4204]*.

and are designated as moderate, high, and very high. Zone classification is based on a combination of how a fire will behave and the probability of flames and embers threatening buildings. By identifying areas with the potential for more severe wildfire hazards, FHSZ maps allow for proper planning, prevention, and mitigation that reduce wildfire damages. As of 2018, CAL FIRE is in the planning stages of updating all FHSZ for SRA counties and upon completion, would make recommendations to LRAs.

After the Oakland Hills Fire of 1991, the “Bates Bill” (Senate Bill 337) was passed in 1992, calling on CAL FIRE to make recommendations to local jurisdictions where VHFHSZs exist. The bill provides direction for local jurisdictions to mitigate fire spread and reduce the intensity of uncontrolled blazes.

Fire hazard severity zone levels range from Moderate to Very High. Fire hazard severity zones are designated in three types of areas based on what level of government is financially responsible for preventing and suppressing wildfires:

- **Federal Responsibility Areas (FRAs):** The federal government is financially responsible for wildfire suppression. Within the District, the Angeles National Forest and federal land in the Santa Monica Mountains National Recreation Area are FRAs.
- **State Responsibility Areas (SRAs):** The state is financially responsible for wildfire suppression. Within the District, SRAs are in outlying areas such as the Santa Susana Mountains, foothills of the San Gabriel Mountains, and parts of the Santa Monica Mountains.
- **Local Responsibility Areas (LRAs):** Cities or the County are financially responsible for wildfire suppression. LRAs in Los Angeles County include foothills of the Santa Susana and San Gabriel Mountains, and in the Verdugo Mountains, Santa Monica Mountains, Hollywood Hills, San Rafael Hills, Puente Hills, and in other hills in the central Los Angeles area.

SCAG Region

Though wildland fires are a natural part of the ecological processes, in the past, it was presumed that all wildland fires should be extinguished promptly. This caused “protected” vegetation to grow denser, weakening vegetation in a struggle for living space and increasing destruction by pests and disease; and in turn, added fuel for future fire. In addition, the absence of fire can alter or disrupt the cycle of natural plant succession and the associated habitats that form. Recognizing this, land management agencies are now committed to finding ways, such as prescribed burning, to reintroduce fire into natural ecosystems. In addition, California has extended droughts, which increase dead and dying vegetation, dry fuel per acre volumes, and many days of low humidity. Furthermore, the majority of wildfires in the region are human caused by factors including but not limited to campfires and building fires. This remains true

even before accounting for the crisis of anthropogenic climate change, which exacerbates wildfires. Wildfire increases the potential for runoff and erosion, as fire removes ecological stabilizers such as vegetation and healthy soil. In coastal regions and other areas with steep slopes, scorched land left after a wildfire is particularly susceptible to debris flow and other hazards.

SRAs and LRAs have been mapped in every county in the SCAG region.⁶ The majority of VHFHSZs are located where wildlands meet urbanized areas, usually near large recreation areas.

Los Angeles County

Northern and western Los Angeles County feature vast swaths of wildland areas. The County's largest wildland area is the Angeles National Forest, a 700,000-acre forest that stretches across northern Los Angeles County between Gorman and Mt. Baldy. Much of the forest is marked by dense chaparral shrubs and woodlands. The Santa Monica Mountains National Recreation Area, a 150,000-acre area in the western portion of Los Angeles County, is comprised of several contiguous open space areas, including Malibu Creek State Park, Topanga State Park, and Leo Carrillo State Park. The Woolsey Fire in November 2018 burned 88 percent of all National Park Service acres within the park boundary. Following the Woolsey Fire, a wet winter allowed black mustard plants to quickly establish a presence in the area. This non-native plant quickly dries and provides fuel for future fires.

In Los Angeles County, heavily urbanized areas in the northwest and southern parts of the County are largely excluded from VHFHSZ designations, whereas communities near Topanga State Park and Angeles National Forest are at a much higher risk of wildfire impacts. However, even densely populated areas may be designated as VHFHSZ depending on their proximity to wildlands, such as the highly urbanized area surrounding the Kenneth Hahn State Recreation Area in Los Angeles.⁷

Orange County

Orange County is highly urbanized with wildland areas located primarily in the east and southeast of the county. The largest wildland area is the Cleveland National Forest, a 460,000-acre forest partially located in Orange County along the boundary with Riverside County. The Cleveland National Forest is characterized by chaparral and a warm, dry Mediterranean climate. The South Coast Wilderness Area, located along the Orange County Coast between Newport Beach and Laguna Niguel, is comprised of

⁶ CAL FIRE. *Fire Hazard Severity Zones Maps*. Available online at: <https://osfm.fire.ca.gov/divisions/wildfire-prevention-planning-engineering/wildland-hazards-building-codes/fire-hazard-severity-zones-maps/>, accessed September 7, 2019.

⁷ CAL FIRE. 2007. *Los Angeles County: Fire Hazard Severity Zones in SRA*. Available online at: https://osfm.fire.ca.gov/media/6705/fhszs_map19.pdf, accessed August 20, 2019.

several contiguous open space areas, including Crystal Cove State Park, Laguna Coast Wilderness Park, and Aliso and Wood Canyons Wilderness Park.⁸ These parks feature rugged coastal canyons, grasslands, and riparian woodlands. Wildfire increases the potential for runoff and erosion, as fire removes ecological stabilizers such as native vegetation and healthy soil and replaces them with invasive plants and debris. In addition, a portion of the 14,173-acre Chino Hills State Park is located in northern Orange County and features chaparral plant communities.

CAL FIRE marks portions of the following cities as VHFHSZs: Aliso Viejo, Anaheim, Brea, Dana Point, Fullerton, Irvine, La Habra, Laguna Beach, Laguna Niguel, Laguna Woods, Lake Forest, Mission Viejo, Newport Beach, Orange, Rancho Santa Margarita, San Clemente, San Juan Capistrano, Tustin, Villa Park, and Yorba Linda.

San Bernardino County

Most of San Bernardino County is in an FRA. Thus, fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government. The San Bernardino County Fire Protection District is one of the largest providers of fire protection services in these areas. Due to its dry, desert climate San Bernardino County has limited areas of very high FHSZ. The only very high FHSZs in the county are located in the southwest corner, stretching along the San Gabriel Mountains from the county's western border to Yucca Valley.⁹ Most of the very high FHSZs in San Bernardino County are along its north and northeast edges at the foot of the San Bernardino and San Gabriel mountains; at its southeast margin in the north end of the San Timoteo Badlands; and in the southwest corner of the region in Chino Hills. Nearly the entire Mountain Region is mapped as very high FHSZ, while most of the desert regions are mapped outside of high or very high FHSZs. As of 2019, it is estimated that more than 34,000 residents in the unincorporated county live in very high fire hazard areas, and more than 63,000 live in high fire hazard areas.¹⁰

Imperial County

Imperial County is a predominantly agricultural area and approximately 50 percent of County lands are undeveloped and under federal jurisdiction. The potential for a major fire in the unincorporated areas of the County is generally low.

⁸ CAL FIRE. 2007. *Orange County: Fire Hazard Severity Zones in SRA*. Available online at: https://osfm.fire.ca.gov/media/6737/fhszs_map30.pdf, accessed August 20, 2019.

⁹ CAL FIRE. 2007. *SW San Bernardino County: Fire Hazard Severity Zones in SRA*. Available online at: https://osfm.fire.ca.gov/media/6781/fhszs_map62.pdf, accessed August 20, 2019.

¹⁰ San Bernardino Countywide Plan Draft PEIR, June 2019

From the standpoint of fire safety, building and fire codes are the tool most commonly used by local jurisdictions. The County implements the Uniform Building Code (UBC) and the Uniform Fire Code (UFC).^{11,12} The Imperial County Codified Zoning Ordinance also contains provisions which act to reduce fire hazards. The Imperial County Subdivision Ordinance is also used to reduce the risk of fire by securing, as a condition of subdivision of land, water systems of adequate size and pressure for firefighting, and adequate roadway widths for emergency service vehicle access including maneuverability of fire trucks.¹³ Additionally, the County's Fire Prevention and Explosives Ordinance, contains provisions for the purpose of prescribing regulations governing conditions hazardous to life and property from fire or explosion. This program enables the public to be better prepared when an emergency fire situation occurs.

Imperial County's Fire Prevention Bureau runs the Imperial County Fire Prevention Program. The purpose of the Imperial County Fire Prevention Program is to assist in preventing injuries, deaths, business interruption and property damages resulting from fires and other emergencies. The Fire Prevention Bureau currently enforces the 2010 California Fire, Building, Electrical, County Ordinances, as amended by the County of Imperial Municipal Code, in addition to National Fire Protection Association standards; Title 19, of the California Public Safety Code; and, the California Health and Safety Code.¹⁴

Imperial County has virtually no VHFHSZ, with only extremely small areas located near the northwest and southwest corners of the county.¹⁵ Similar to Imperial, the eastern half of Riverside County contains essentially no VHFHSZ.¹⁶ The western half of Riverside County, however, is where a significant amount of the county's wildland interface occurs, and a majority of the land is designated VHFHSZ. Lands near the San Bernardino National Forest and the Santa Ana mountains are largely within SRA, while urban

15 CAL FIRE. 2007. *Imperial County: Fire Hazard Severity Zones in SRA*. Available online at: https://osfm.fire.ca.gov/media/6680/fhszs_map13.pdf, accessed August 20, 2019.

16 CAL FIRE. 2007. *Eastern Riverside County: Fire Hazard Severity Zones in SRA*. Available online at: https://osfm.fire.ca.gov/media/6749/fhszl06_1_map61.pdf, accessed August 20, 2019.

communities near smaller portions of wildland, such as Terra Cotta and eastern Sun City, are under the jurisdiction of an LRA.¹⁷

Ventura County

Much of Ventura County is considered a VHFHSZ and is primarily located in a SRA. Specifically, the central and northern portions of the County are part of the Los Padres National Forest, accounting for 46 percent of the overall landmass. The forest features semi-arid, chaparral vegetation, which is prone to wildfire. The Fire Hazard Reduction Program is the cornerstone of Ventura County Fire Department's (VCFD) Wildland Fire Action Plan. In partnership with property owners and neighbors, VCFD recommends a 100-foot defensible space radius between structures and vegetation and places restrictions on certain types of vegetation.¹⁸

Several major freeways in Ventura County are located within VHFHSZs, including US-101 between Camarillo and Thousand Oaks, SR-33 between Ventura and Ojai, and SR-118 between Moorpark and Simi Valley. Much of the housing in these cities is located within an urban-wildland intermix area, and as such, wildfires and subsequent evacuations are a concern. In December 2017, the Thomas Fire burned through Ventura and Santa Barbara Counties and was the largest wildfire in California history at the time. The fire spread quickly, destroying hundreds of structures, prompting evacuations, and leading to deadly mudflows after a rainstorm the following month.

Riverside County

With development growing into outlying hill and grassland areas and an increasing number of people owning homes and businesses in Riverside County, wildfires are becoming a growing and catastrophic hazard in the County. As more and more people are moving into areas of wildland-urban interface, the danger for wildfire conditions from the mix of fuels, topography, and accessibility, are posing increasing risks to residents, as well as to fire protection service providers. In some parts of Riverside County, fire danger can be worsened by steep, rugged topography, which would allow wildland fire to spread quickly and make it more difficult to fight.

The Riverside County Hazard Reduction Office, a division within the Riverside County Fire Department, enforces the abatement of hazardous vegetation and abandoned or neglected orchards, groves, and vineyards. The County's Hazard Abatement Program requires property owners to maintain 100 feet of

¹⁷ CAL FIRE. 2007. *Western Riverside County: Fire Hazard Severity Zones in SRA*. Available online at: https://osfm.fire.ca.gov/media/6752/fhszs_map60.pdf, accessed August 20, 2019.

¹⁸ Ventura County Fire Code, Fire Hazard Reduction Program, Appendix W, available online: <https://vcfd.org/images/FHRP/Ord-30-Appendix-W-FHRP.pdf>, accessed September 12, 2019.

defensible space between structures and vegetation. Guidelines on horizontal and vertical spacing of plants and trees are also enforced.

CAL FIRE's recommendations on VHFHSZs for Riverside County bisect the county into an eastern and western portion. Eastern Riverside County is primarily comprised of dry, desert land and is sparsely populated. This region is designated as a Moderate Fire Hazard Severity Zone. Western Riverside County has a greater variety of climates, topography, and flora. The 800,000-acre San Bernardino National Forest is located in this half of Riverside County within a VHFHSZ. At the boundary with Orange County, the Cleveland National Forest is also a designated VHFHSZ. Additionally, several major freeways in Riverside County are located within VHFHSZs, including I-15 between Lake Elsinore and Temecula, I-215 between Sun City and Murrieta, and SR-60 between Moreno Valley and Beaumont.

Climate Change

In the last decade, California has experienced five of the state's 10 largest wildfires and seven of its 10 most destructive fires in its history. Between 2017 and 2018, the State spent over \$1.5 billion on fire suppression, far more than any previous 2-year period. Over the past five decades, summertime forest fires have increased in size by roughly 800 percent. Though no single wildfire can be attributed solely to climate change, evidence shows that the increase in average temperatures statewide is creating conditions more prone to wildfires.¹⁹ Southern California has warmed about three degrees Fahrenheit in the last century, and every additional increment of warming speeds up evaporation, dries out soil and vegetation, and increases the amount of fuel available for a wildfire.²⁰ In 2018, wildfires in California released approximately 68 million tons of carbon dioxide, or about 15 percent of the State's annual emissions.²¹ Studies suggest that greenhouse gas emissions from wildfires create a positive feedback loop, wherein the emissions warm the planet further, leading to more wildfires and more emissions.

3.20.2 REGULATORY FRAMEWORK

3.20.2.1 Federal

Disaster Mitigation Act (DMA) of 2000

DMA 2000 (Public Law 106-390) provides the legal basis for FEMA mitigation planning requirements for state, local and tribal governments as a condition of mitigation grant assistance. DMA 2000 amended the Robert T. Stafford Disaster Relief and Emergency Assistance Act by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need for state, local, and tribal entities to closely coordinate mitigation planning and implementation efforts. The requirement for a state mitigation plan is continued as a condition of disaster assistance, adding incentives for increased coordination and integration of mitigation activities at the state level through the establishment of requirements for two different levels of state plans. DMA 2000 also established a new requirement for local mitigation plans and authorized up to 7 percent of Hazard Mitigation Grant Program (HMGP) funds available to a state for development of state, local, and tribal mitigation plans.²²

Federal Response Plan

The Federal Response Plan of 1999 is a signed agreement among 27 federal departments and agencies, including the American Red Cross, that (1) provides the mechanism for coordinating delivery of federal assistance and resources to augment efforts of state and local governments overwhelmed by a major disaster or emergency; (2) supports implementation of the Robert T. Stafford Disaster Relief and Emergency Act, as well as individual agency statutory authorities; and (3) supplements other federal emergency operations plans developed to address specific hazards. The Federal Response Plan is implemented in anticipation of a significant event likely to result in a need for federal assistance or in response to an actual event requiring federal assistance under a Presidential declaration of a major disaster or emergency.²³

Federal Emergency Management Agency (FEMA) Regulation

The primary mission of FEMA is to reduce the loss of life and property and protect the nation from all hazards, including natural disasters, acts of terrorism, and other human-made disasters, by leading and supporting the nation in a risk-based, comprehensive emergency management system of preparedness,

protection, response, recovery, and mitigation.²⁴ SCAG is under the jurisdiction of FEMA Region 9, which covers Arizona, California, Hawaii, Nevada, Guam, American Samoa, Commonwealth of Northern Mariana Islands, Republic of Marshall Islands, Federated State of Micronesia, and more than 150 sovereign tribal entities. In Southern California, FEMA Region 9 specifically plans for hazards such as major earthquakes and wildfires.²⁵

National Fire Plan

The Department of the Interior's National Fire Plan is intended to ensure an appropriate federal response to severe wildland fires, reduce fire impacts to rural communities, and ensure sufficient firefighting capacity in the future.²⁶ The Rural Fire Assistance program is funded to enhance the fire protection capabilities of rural fire districts and safe and effective fire suppression in the wildland/urban interface. The program promotes close coordination among local, state, tribal, and federal firefighting resources by conducting training, equipment purchase, and prevention activities on a cost-shared basis.²⁷

3.20.2.2 State

Senate Bill 99

In November 2018, the Camp Fire devastated the town of Paradise, California, killing 86 people and destroying nearly 19,000 structures. One reason the Camp Fire was so deadly was the lack of adequate evacuation routes to simultaneously allow residents to leave and first responders to enter. Although modern developments require adequate ingress and egress routes, many existing developments, such as those in Paradise, predate these requirements. SB 99, signed into law on August 30, 2019, requires cities to identify in the safety element of their general plans any residential developments in any wildfire hazard areas that do not have at least two emergency evacuation routes.²⁸

²⁸ California Legislative Information. 2019. *Senate Bill No. 99*.

Senate Bill 901

After record-breaking drought in California from 2011 to 2017, perfect wildfire conditions allowed faulty PG&E utility lines to spark devastating fires that would scorch over 4,000 square miles of land across the state. In response to the deadly season, the California Legislature developed Senate Bill 901 (Utility Wildfire Management Plans) as the “centerpiece measure” in its attempt to rectify damages from the 2017 wildfires and prevent future wildfire disasters. SB 901 mandates all electric utilities to prepare and submit wildfire mitigation plans that describe the utilities’ plan to prevent, combat, and respond to wildfires affecting their service territories. The California Public Utilities Commission (CPUC) will review and refine the plans before implementing and enforcing them. In the short-term, SB 901 allows PG&E to lean on its customers in paying for billions of dollars in fire-related damages. It also provides over \$1 billion for vegetation management over five years.²⁹

Assembly Bill 1054 (AB 1054)

AB 1054 was signed into law by Governor Gavin Newsom on July 12, 2019, creating a \$21 billion fund to help California’s investor-owned utilities cover liabilities caused by wildfires. Under the legislation, the state’s investor-owned utilities will put a combined \$5 billion toward improvements in their electrical grids to access the fund. Ratepayers will also contribute \$10.5 billion by way of a 15-year extension of an existing rate increase. The bill also imposes several conditions on utilities, including \$5 billion in safety investments and utility participation in a new annual safety certification process overseen by CPUC.³⁰ The legislation was passed in the wake of the Camp Fire, California’s deadliest and most destructive wildfire in history. Pacific Gas & Electric (PG&E) Corp’s equipment failure was responsible for the blaze. PG&E sought bankruptcy protection after the Camp Fire so it could reorganize its finances to pay \$30 billion in liabilities from multiple wildfires.³¹

Senate Bill 1079 (SB 1079)

SB 1079 (Forest Resources: Fire Prevention Grant Fees) builds from existing laws establishing grants to private entities, Native American tribes, and public agencies to assist in the implementation and administration of projects and programs relating to improving forest health and reducing GHG emissions. SB 1079 authorizes CAL FIRE to make advance payments to grantees (such as fire safe

²⁹ California Public Utilities Commission (CPUC). *Utility Wildfire Mitigation Plans (SB 901)*. Available online at: <http://cpuc.ca.gov/SB901/>, accessed March 29, 2019.

³¹ New York Times. *California Says PG&E Power Lines Caused Camp Fire That Killed 85*. Available online at: <https://www.nytimes.com/2019/05/15/business/pg-e-fire.html>, accessed September 18, 2019.

councils, Native American tribe, or special district), which receive funds from the healthy forest and local fire-prevention grant programs.³²

Senate Bill 1241 (SB 1241)

In 2012, SB 1241 added Section 66474.02 to Title 7 Division 2 of the California Government Code, commonly known as the Subdivision Map Act. The statute prohibits subdivision of parcels designated very high fire hazard, or that are in a SRA, unless certain findings are made prior to approval of the tentative map. The statute requires that a city or county planning commission make three new findings regarding fire hazard safety before approving a subdivision proposal. The three findings are, in brief: (1) the design and location of the subdivision and its lots are consistent with defensible space regulations found in PRC Section 4290-91, (2) structural fire protection services will be available for the subdivision through a publicly funded entity, and (3) ingress and egress road standards for fire equipment are met per any applicable local ordinance and PRC Section 4290. The Occupational Safety and Health Act (29 Code of Federal Regulations [CFR] Parts 70 to 2400), which is implemented by the Federal Occupational Safety and Health Administration (OSHA), contains provisions with respect to hazardous materials handling. Federal OSHA requirements, as set forth in 29 CFR Section 1910 et seq., are designed to promote worker safety, worker training, and a worker's right-to-know. In California, OSHA has delegated the authority to administer OSHA regulations to the State of California.³³

Assembly Bill 301

Assembly Bill 301 was enacted to amend Section 4213.1, and to add Section 4213.2 to the Public Resources Code related to fire prevention. Section 4213.1 requires CAL FIRE to notify a property owner that the property's terms of sale could include a portion of the Fire Prevention Fee. Section 4213.2 allows a property owner to negotiate a portion of the fee as one of the terms of sale.³⁴

Assembly Bill 38 (California Emergency Services Act)

This bill would require the Natural Resources Agency, by July 1, 2021, and in consultation with the State Fire Marshal and the Forest Management Task Force, to review the regional capacity of each county that contains a very high fire hazard severity zone to improve forest health, fire resilience, and safety, as specified. On or after July 1, 2021, the bill would require a seller of real property located in a high or very high fire hazard severity zone to provide specified documentation to the buyer that the real property is in

³² California Legislative Information. 2018. *Senate Bill No. 1079*.

³³ California Legislative Information. 2012. *Senate Bill No. 1241*.

³⁴ California Legislative Information. 2015. *Assembly Bill No. 301*.

compliance with the wildfire protection measures or a local vegetation management ordinance, or enter into an agreement with the buyer pursuant to which the buyer will obtain documentation of compliance.³⁵

Assembly Bill 2551

Approved in 2018, Assembly Bill 2551 Forestry and Fire Prevention: Joint Prescribed Burning Operation (AB 2551) authorizes CAL FIRE to collaborate with private landowners on controlled burns to reduce wildfire fuel. Mismanagement of the forests can lead to a build-up of forest underbrush that serves as a perfect fuel for wildfires. By allowing small, non-industrial landowners to choose to individually implement various fire prevention programs, such as prescribed burns, AB 2551 promotes good, local forest management in the state.³⁶

State California Department of Forestry and Fire Protection

CAL FIRE protects the people of California from fires, responds to emergencies, and protects and enhances forest, range, and watershed values providing social, economic, and environmental benefits to rural and urban citizens. CAL FIRE's firefighters, fire engines, and aircraft respond to an average of more than 5,600 wildland fires each year. The Office of the State Fire Marshal supports CAL FIRE's mission by focusing on fire prevention. It provides support through a wide variety of fire safety responsibilities including regulating buildings in which people live, congregate, or are confined; controlling substances and products which may, in and of themselves, or by their misuse, cause injuries, death, and destruction by fire; providing statewide direction for fire prevention in wildland areas; regulating hazardous liquid pipelines; reviewing regulations and building standards; and providing training and education in fire protection methods and responsibilities.³⁷

State Fire Regulations

Fire regulations for California are established in Sections 13000 et seq. of the California Health and Services Code and include regulations for structural standards (similar to those identified in the California Building Code); fire protection and public notification systems; fire protection devices such as extinguishers and smoke alarms; standards for high-rise structures and childcare facilities; and fire suppression training. The State Fire Marshal is responsible for enforcement of these established

³⁵ California Legislative Information. 2008. *Assembly Bill No. 38*.

³⁷ CAL FIRE Office of the State Fire Marshal. 2019. *About the Office of State Fire Marshal*. Available online at: <https://osfm.fire.ca.gov/about-us/>, accessed August 20, 2019.

regulations and building standards for all state-owned buildings, state-occupied buildings, and state institutions within California.³⁸

California Governor's Office of Emergency Services (OES)

Cal OES is the Emergency Management authority for the State of California. The California Governor's Office of Emergency Services (Cal OES) began as the State War Council in 1943. With an increasing emphasis on emergency management, it officially became OES in 1970. On July 1, 2013, Governor Edmund G. Brown Jr.'s Reorganization Plan #2 eliminated the California Emergency Management Agency (Cal EMA); restored its powers, purposes, and responsibilities to Cal OES; and also merged it with the Office of Public Safety Communications. Cal OES' mission statement is the following: "Protect lives and property, build capabilities, and support our communities for a resilient California." OES goals include:³⁹

- **Goal 1:** Anticipate and enhance prevention and detection capabilities to protect our State from all hazards and threats.
- **Goal 2:** Strengthen California's ability to plan, prepare for, and provide resources to mitigate the impacts of disasters, emergencies, crimes, and terrorist events.
- **Goal 3:** Effectively respond to and recover from both human-caused and natural disasters.
- **Goal 4:** Enhance the administration and delivery of all state and federal funding, and maintain fiscal and program integrity.
- **Goal 5:** Develop a united and innovative workforce that is trained, experienced, knowledgeable, and ready to adapt and respond.
- **Goal 6:** Strengthen capabilities in public safety

California Public Resources Code

Fire Hazard Severity Zones – Public Resources Code Sections 4201–4204 Public Resources Code (PRC) Sections 4201–4204 and Government Code Sections 51175–89 direct CAL FIRE to map areas of significant fire hazards based on fuels, terrain, weather, and other relevant factors. FHSZ define the application of various mitigation strategies to reduce risk associated with wildland fires.^{40, 41}

⁴⁰ California Legislative Information. 1982. *ARTICLE 9. Fire Hazard Severity Zone [4201-4204].*

California Fire Code

Part 9 of the 2019 California Building Standards Code (CBC) (Cal. Code Regs., Title 24) covers the California Fire Code (2019, Title 24, Part 9). The purpose of the California Fire Code is to establish the minimum requirements consistent with nationally recognized good practices to safeguard the public health, safety, and general welfare from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures, and premises.

The purpose of the California Fire Code is to establish the minimum requirements consistent with nationally recognized good practices to safeguard the public health, safety, and general welfare from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures, and premises. The Fire Code also establishes requirements intended to provide safety for and assistance to firefighters and emergency responders during emergency operations. The provisions of the Fire Code apply to the construction, alteration, movement, enlargement, replacement, repair, equipment, use and occupancy, location, maintenance, removal, and demolition of every building or structure throughout California. The Fire Code includes regulations regarding fire-resistance-rated construction, fire protection systems such as alarm and sprinkler systems, fire services features such as fire apparatus access roads, means of egress, fire safety during construction and demolition, and wildland-urban interface areas. Several jurisdictions within the SCAG region have adopted the California Fire Code as part of their building regulations.⁴²

California Fire Plan

The Fire Plan is a cooperative effort between the State Board of Forestry and Fire Protection and the California Department of Forestry and Fire Protection. By placing the emphasis on what needs to be done long before a fire starts, the Fire Plan looks to reduce firefighting costs and property losses, increase firefighter safety, and to contribute to ecosystem health. The current plan was adopted in 2018, which reflects CAL FIRE's goals of 1) fire prevention and suppression activities to protect lives, property, and ecosystem services, and 2) natural resource management to maintain the state's forests as a resilient carbon sink to meet California's climate change goals and to serve as important habitat for adaptation and mitigation.⁴³

California Disaster Assistance Act (CDAA)

The California Disaster Assistance Act (CDAA; CCR Title 19, Chapter 6) authorizes the Director of the California Governor’s Office of Emergency Services (Cal OES) to administer a disaster assistance program that provides financial assistance from the state for costs incurred by local governments as a result of a disaster event. Funding for the repair, restoration, or replacement of public real property damaged or destroyed by a disaster is made available when the Director concurs with a local emergency proclamation requesting state disaster assistance.⁴⁴

Governor’s Office of Planning and Research (OPR)

The Governor’s Office of Planning and Research serves the Governor and his Cabinet as staff for long-range planning and research and constitutes the comprehensive state planning agency (Government Code Section 65040). OPR is empowered to draft *CEQA Guidelines* for adoption by the Secretary of Natural Resources in collaboration with the Natural Resources Agency. In January 2018, OPR transmitted its proposal for comprehensive updates to the *CEQA Guidelines* to the Natural Resources Agency, who finalized the updates in late 2018. The updated Guidelines became effective on December 28, 2018.

California Public Utilities Commission Fire Safety Rulemaking

In December 2017, CPUC issued Decision (D.) 17-12-024 adopting regulations to enhance fire safety in the High Fire Threat District (HFTD) and subsequently adopted CPUC’s final fire threat map. This map, together with CAL FIRE’s Tier 1 High Hazard Zones comprise the HFTD Map where stricter fire-safety regulations apply. These regulations include requiring utilities to prioritize safety hazards, maintain more stringent wire-to-wire clearances in certain areas, and prepare a fire prevention plan annually if they have overhead facilities in the HFTD. Further, electric utilities may disconnect service to customers who refuse to provide access to their property for the removal of trees that pose an immediate threat for contacting a power line.⁴⁵

3.20.2.3 Local

County General Plans

In addition to federal and state requirements, general plans and municipal codes of counties and cities in the SCAG region may include safety elements that goals and policies related protecting people and property from risks from wildfires and associated hazards.

Los Angeles County General Plan

The Safety Element of the Los Angeles County General Plan 2035 Update, in conjunction with the All-Hazard Mitigation Plan prepared by the Chief Executive Office, Office of Emergency Management (CEO OEM), sets strategies for natural and man-made hazards in Los Angeles County.⁴⁶ The 2014 All-Hazard Mitigation Plan, which has been approved by FEMA and Cal OES, includes a compilation of known and projected hazards in Los Angeles County.⁴⁷ Specific applicable goals and policies related to fire hazards within the County of Los Angeles include, but are not limited to:

- Goal S: An effective regulatory system that prevents or minimizes personal injury, loss of life, and property damage due to fire hazards.
- Policy S 3.1: Discourage high density and intensity development in VHFHSZs.
- Policy S 3.2: Consider climate change implications in fire hazard reduction planning for FHSZs.
- Policy S 3.3 Ensure that the mitigation of fire related property damage and loss in FHSZs limits impacts to biological and other resources.
- Policy S 3.5: Encourage the use of low-volume and well-maintained vegetation that is compatible with the area's natural vegetative habitats.
- Policy S 3.8: Support the retrofitting of existing structures in FHSZs to help reduce the risk of structural and human loss due to wildfire.

⁴⁶ County of Los Angeles, Department of Regional Planning. *General Plan 2035, Safety Element*. Available online at: http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch12.pdf, accessed September 10, 2019.

⁴⁷ County of Los Angeles, Chief Executive Office – Office of Emergency Management. *2014 All-Hazard Mitigation Plan*. Available online at: <https://ceo.lacounty.gov/wp-content/uploads/OEM/hazmitgplan.pdf>, accessed September 8, 2019.

San Bernardino County General Plan

The San Bernardino County General Plan contains a Hazards Element, which addresses wildfires. It mandates the development of Community Wildfire Protection Plans (CWPP) for mountain communities, compliance with the County's Tree Preservation Ordinance, improvements to public notification systems, and the continued monitoring of post-wildfire debris flow hazard evaluation and prediction methodologies. Specific applicable goals and policies related to fire hazards within the County of San Bernardino include, but are not limited to:⁴⁸

- Goal HZ-1: Minimized risk of injury, loss of life, property damage, and economic and social disruption caused by natural environmental hazards and adaptation to potential changes in climate
- Policy HZ-1.2: All new development is required to be built outside of high or very high fire hazard severity zones. For any lot or parcel that does not have sufficient buildable area outside of such hazard areas, mitigation is required.
- Policy HZ-1.7: Underground utilities are required to be designed to withstand seismic forces, accommodate ground settlement, and be hardened to fire risk.

Imperial County General Plan

The Land Use Planning and Public Safety and Emergency Preparedness Elements of the Imperial County General Plan have established goals related to protection of public health and safety for consideration in the land use planning process. The specified goals and objectives are intended to minimize potential hazards to public health and safety and prevent the loss of life and damage to properties and rely heavily on ensuring conformance with established applicable state codes. However, the Plan does not include any goals or policies relating directly to wildfire at this time.⁴⁹

Orange County General Plan

The Safety Element of the Orange County General Plan provides for the protection of people and property from risks associated with hazards, including those affiliated with wildfire, through the implementation of mitigation measures as outlined in the California Emergency Plan, the California Master Mutual Aid Agreement, the Orange County Emergency Plan, the Orange County Operational

⁴⁸ County of San Bernardino. 2014. *2007 General Plan*. Available online at: <http://www.sbcounty.gov/Uploads/lus/GeneralPlan/FINALGP.pdf>, accessed August 20, 2019.

⁴⁹ Imperial County Planning & Development Services. 2015. *Land Use Element of the Imperial County General Plan*. Available online at: [http://www.icpds.com/CMS/Media/Land-Use-Element-\(2015\).pdf](http://www.icpds.com/CMS/Media/Land-Use-Element-(2015).pdf), accessed August 20, 2019.

Area Plan, S.O.N.G.S. Plan, County of Orange and Orange County Fire Authority Hazard Mitigation Plan, and other emergency management plans. The Safety Element of the Orange County General Plan focuses primarily upon the County's planned response to extraordinary emergency situations associated with natural disasters, technological incidents, intentional acts of terrorism and nuclear protection operations. To reduce the County's susceptibility and vulnerability to extraordinary emergency situations, the Safety Element recommends continued emphasis is placed on several coordinated efforts:⁵⁰

- Mitigation
- Emergency planning
- Training of full-time, auxiliary, and reserve personnel
- Public awareness and education; and assuring the adequacy and availability of sufficient resources to cope with such emergencies

In November 2015, the Board of Supervisors adopted a new County of Orange and Orange County Fire Authority Hazard Mitigation Plan (HMP) in compliance with federal and state regulations.⁵¹

The County's Wildland Fire Defense Planning and Prevention oversees its READY! SET! GO! program, which aims to reduce wildland fire risk through a formalized fuel modification inspection and enforcement program, and monitors wildland and vegetation conditions to identify potential hazards, ensuring communities in the wildland urban interface areas are better protected from the risk of wildland fire. Specific applicable goals and policies related to fire safety within the Safety Element of the Orange County General Plan are:

Goal 1: Provide a safe living environment, ensuring adequate fire protection facilities and resources to prevent and minimize the loss of life and property fire.

Policy 1: To encourage periodic updating of fire hazard mapping and continue to analyze existing fire hazard data as it pertains to Orange County.

Policy 13: To improve emergency response times for emergency responders through the use of computer-aided dispatch system and "preempt traffic signal control" system.

⁵⁰ Orange County Planning & Development. *General Plan: Chapter IX. Safety Element*. Available online at: <https://www.ocgov.com/civicax/filebank/blobdload.aspx?blobid=40234>, accessed August 20, 2019.

⁵¹ County of Orange, Orange County Fire Authority. 2015. *Local Hazard Mitigation Plan*. Available online at: https://www.smwd.com/DocumentCenter/View/2193/APPENDIX-H_OC-HMP-Final, accessed August 20, 2019.

Ventura County General Plan

The Safety Element of the Ventura County General Plan contains specific goals to minimize the risk of loss of life, injury, serious illness, damage to property, and economic and social dislocations resulting from fire hazards and wildfire. Additionally, the Plan identifies areas with high fire hazard severity zones and lists specific management practices to protect those who currently live within such a zone, and prepare appropriate development and management in the future. Specific policies related to fire hazards within Ventura County include, but are not limited to:⁵²

- Minimize the risk of loss of life, injury, damage to structures, and economic and social dislocations resulting from fire hazards.
- Ensure that development in high fire hazard areas is designed and constructed in a manner that minimizes the risk from fire hazards.
- Require at least two means of access for emergency vehicles and resident evacuation for new residential subdivisions, except if otherwise permitted by County Fire Chief.

City General Plans

The SCAG region spans six counties and 191 cities, each of which has a general plan that contains policies related to hazards, including those related to fires. Additional plans and ordinances at the master plan level, city-level, and specific plan level may also apply within the SCAG region. Furthermore, fire departments and other agencies in the SCAG region have a variety of local laws that regulate reporting, storage, handling, and transporting hazardous substances and materials.

3.20.3 ENVIRONMENTAL IMPACTS

3.20.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the Plan could result in significant adverse impacts related to wildfire risk, if transportation projects and anticipated development projects are located in or near SRAs or lands classified as very high hazard severity zones and would result in any of the following:

⁵² Ventura County. 2019. *2040 General Plan: Preliminary Public Review Draft*. Available online at: https://vc2040.org/images/2040_General_Plan_Files_-_May_2019/PPRD_2040_General_Plan_COMPLETE-compressed.pdf, accessed August 20, 2019.

- Substantially impair an adopted emergency response plan or emergency evacuation plan (this criterion is addressed in **Section 3.17, Transportation, Traffic, and Safety**);
- Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire;
- Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment; or
- Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

In addition, the following criterion from **Section 3.9, Hazards and Hazardous Materials**, is addressed along with wildfire:

- Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires

3.20.3.2 Methodology

The methodology for determining the significance of the Plan's impacts to wildfire response and related hazards and infrastructure compares the existing conditions to future (2045) conditions. Wildfire conditions and hazards within the SCAG region were evaluated at the programmatic level of detail, in relation to the general plans of the six counties and 191 cities within the SCAG region; the management plans for the four national forests in the SCAG region, Angeles National Forest, San Bernardino National Forest, Los Padres National Forest, and Cleveland National Forest; the California Department of Forestry and Fire Protection, and a review of related literature germane to the SCAG region.

The Plan includes transportation projects as well as regional transportation and land use strategies. Although land use development is anticipated to occur within the region even without the Plan, Connect SoCal includes regional land use strategies that could influence growth, including distribution patterns, throughout the region. This analysis considers the Plan's impacts on wildfire hazards, provides mitigation measures, where necessary, and addresses the environmental effects related to wildfire hazards. The potential for impacts related to wildfire was assessed by evaluating the location of existing and planned major transportation projects in relation to surrounding land uses and fire hazard severity zones. Because some transportation projects and growth under the Plan could be located in or near SRAs or lands classified as very high hazard severity zones, all potential wildfire impacts are analyzed below.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in **Chapter 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by lead agencies and project sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.20.3.3 Impacts and Mitigation Measures

Impact WF-2 Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.

Impact HAZ-7 Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

Significant and Unavoidable Impact - Mitigation Required.

The SCAG region is susceptible to wildfires particularly during the summer and fall seasons, especially during Santa Ana wind conditions. Examples of recent fires in the SCAG region include the October 2019 Getty Fire in Los Angeles which was sparked by a tree branch that broke off and landed on nearby powerlines, and the December 2017 Thomas Fire sparked by two power lines touching. Both fires were ignited during strong Santa Ana wind conditions.^{53,54} Wildfires have the potential to occur not only in fire-prone undeveloped areas, but also in developed areas where existing transmission lines, lightning strikes, lawn equipment operated over dry grass, fireworks, and even arson may ignite a wildfire. While the urban and developed areas of Riverside, San Bernardino, Imperial, and Ventura counties, may include fire resistant and drought tolerant plants that offer some protection to existing structures, these counties also have more undeveloped areas susceptible to wildfire risks than Los Angeles and Orange counties. According to the Fire Hazard Severity Zones for the area, the rural areas in the SCAG region

⁵³ Los Angeles Times. *DWP power lines hit by tree branch sparked Getty fire that destroyed homes*. Available online at: <https://www.latimes.com/california/story/2019-10-29/getty-fire-arson-investigation>, accessed October 30, 2019.

⁵⁴ Los Angeles Times. *Southern California Edison power lines sparked deadly Thomas fire, investigators find*. Available online at: <https://www.latimes.com/california/story/2019-10-29/getty-fire-arson-investigation>, accessed October 30, 2019.

range from Moderate to Very High under the State’s Wildfire Hazard Severity Zones.⁵⁵ Population in the SCAG region is expected to grow by 3.2 million people by 2045 and SCAG estimates that an additional 343,000 people and 154,300 dwelling units would be in areas at risk of wildfire (very high fire hazard severity zones). The Plan recognizes inherent constraints to expansive regional growth, and areas that are susceptible to natural hazards and a changing climate must be recognized. Because of this, Connect SoCal sets forth land use strategies that encourage conservation of farmland, resource areas and habitat corridors, and guide growth away from lands that are vulnerable to wildfire, flooding and near-term sea-level rise.

During peak wildfire season where high winds and low humidity may occur, electrical utilities may preemptively shut off power to customers in wildfire-prone areas as a precautionary measure. For example, Southern California Edison began this practice in 2017 and notifies customers two days in advance. At the direction of CPUC, customers who live in high fire risk areas, as defined by CPUC maps, are more likely to experience a power shutoff.⁵⁶

The ongoing crisis of climate change has worsened wildfire conditions in California and the SCAG region. Since the early 1970s, California's annual wildfire extent increased fivefold, punctuated by extremely large and destructive wildfires in 2017 and 2018. This trend was mainly due to an eightfold increase in summertime forest-fire area and was very likely driven by drying of fuels promoted by human-induced warming.⁵⁷ Since climate change makes droughts more frequent and severe and makes temperatures warmer in California, the drying of fuels is likely to continue worsening conditions in wildfire-prone areas of the SCAG region.

Wildfires pose a significant public health risk due to their air quality impacts, particularly with regard to smoke and particulate matter exposure. This risk persists even after a wildfire is extinguished because particulate matter from fire ash can be picked up by winds. In addition, as discussed in **Section 3.8, Greenhouse Gases**, wildfires release substantial amounts of greenhouse gases.

Connect SoCal’s land use strategies deemphasize development on agricultural lands in unincorporated counties, and in areas subject to future two-foot sea level rise. To further prioritize natural habitat areas

⁵⁷ Williams, A. P., Abatzoglou, J. T., Gershunov, A., Guzman-Morales, J., Bishop, D. A., Balch, J. K., & Lettenmaier, D. P. (2019). Observed impacts of anthropogenic climate change on wildfire in California. *Earth's Future*, 7, 892–910. Available online at: <https://doi.org/10.1029/2019EF001210>, accessed September 10, 2019.

and avoid impacts to the environment, Connect SoCal’s strategies seek to avoid growth in wetlands, wildlife corridors, biodiverse areas, wildfire prone areas and floodplains. The Plan includes greenbelts and community separators to serve as contiguous areas that support land conservation. Creating a sustainable, “green” region requires that the built environment and natural resource areas coexist in a well-balanced land use pattern that encourages mutual co-benefits. The quality and range of conservation, natural and agricultural areas present in the region can be reinforced and enhanced by a range of regional and local tools. Paired with an emphasis on compact development, Connect SoCal’s conservation strategies promote the economic and ecological benefits of preserving natural areas and farmlands, while also maximizing their potential for greenhouse gas reduction. New housing and employment development is emphasized in Growth Priority Areas, such as Job Centers, TPAs, HQTAs and NMAs, and away from natural and farm lands on the edges of urban and suburban areas, to incentivize infill development and the concentration of varied land uses. This emphasis on concentrated, compact growth makes it easier to travel shorter distances, which reduces per-capita greenhouse gas emissions. In addition, natural areas and farmlands have the capacity to absorb and store atmospheric carbon dioxide, preventing additional contributions of GHG emissions. Natural lands conservation has the co-benefit of protecting communities from major hazards caused or exacerbated by climate change, such as wildfires and flooding.

Furthermore, wildfire-prone areas tend to pose accessibility challenges for vehicular access points due to topography. These roads could face more gridlock in the event of a sudden emergency evacuation than flat, urbanized areas may experience. Such circumstances could expose vehicle occupants to active flames and potential death, as was seen in the recent Camp Fire in Paradise and the Woolsey Fire in Malibu in 2018.⁵⁸ Transportation projects and anticipated development projects may be located in wildfire-prone areas which could potentially exacerbate wildfire risks and thereby expose project occupants to pollutant concentrations from wildfires or the uncontrolled spread of wildfires, particularly those populations living down wind of the fire. As such, impacts would be significant and unavoidable. Mitigation is required.

Mitigation Measures/

SCAG Mitigation Measures

SMM WF-1: SCAG shall facilitate minimizing future impacts to fire protection services through information sharing regarding Fire-wise Land Management (vegetation data, fire-resistant building materials, locations where development is vulnerable to wildfire, and best

⁵⁸ New York Times, *Forced Out by Deadly Fires, Then Trapped in Traffic*. Available online at: <https://www.nytimes.com/2018/11/11/us/california-fire-paradise.html>, accessed September 18, 2019.

practices for safe land management) with county and city planning departments. Furthermore, SCAG shall examine wildfire risk management strategies in areas where at-risk critical electrical infrastructure is located based on CPUC and CAL FIRE maps.

- SMM WF-2:** SCAG, in partnership with technical experts and stakeholders shall launch or continue existing initiatives to help local cities and counties to protect Southern California communities and economies from the disruption of wildfire occurrences. Initiatives could include but not be limited to seminars that review the risk of wildfire and approaches for preparation, including strengthening of infrastructure, emergency services, emergency evacuation plans and reviewing building safety codes.
- SMM WF-3:** SCAG shall develop a regional resilience program and identify specific strategies to reduce vulnerabilities from natural disasters related to land based or atmospheric hazards, climate change, wildfire and other extreme weather events.

Project Level Mitigation Measures

- PMM WF-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to wildfire risk, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:
- a) Launch fire prevention education for local cities and counties such that local fire agencies, homeowners, as well as commercial and industrial businesses are aware of potential sources of fire ignition and the related procedures to curb or lessen any activities that might initiate fire ignition.
 - b) Ensure structures in high fire risk areas are built to current state and federal standards which serve to greatly increase the chances the structure will survive a wildfire and also allow for people to shelter-in-place.
 - c) Improve road access for emergency response and evacuation so people can evacuate safely and timely when necessary.
 - d) Improve, and educate regarding, local emergency communications and notifications with residents and businesses.
 - e) Enforce defensible space regulations to keep overgrown and unmanaged vegetation,

accumulations of trash and other flammable material away from structures.

- f) Provide public education about wildfire risk and fire prevention measures, and safety procedures and practices to allow for safe evacuation and/or options to shelter-in-place

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to exacerbating wildfire risk and exposure of residents to pollutants could be significant and unavoidable even with implementation of mitigation.

Impact WF-3 Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risks or that may result in temporary or ongoing impacts to the environment.

Significant and Unavoidable Impact - Mitigation Required.

The SCAG region is a mix of urban and rural communities, natural woodland areas, as well as semi-desert areas. Future development and/or re-development in these areas has the potential to require the installation of new roadways or infrastructure facilities such that there is an increased risk of new ignition sources generating the spread of wildfires. Areas with dry vegetation have the potential to exacerbate wildfire risk due to future development activities that could generate flammable debris piles. This is particularly true in the rural and underdeveloped parts of the SCAG region. Future roadway and development construction in such areas, while likely to be less in the future, may still occur, such development has the potential to result in significant impacts as a result of construction equipment generating sparks or oil spill and other combustible materials leading to the start and spread of wildfires. Newer electrical equipment providing power to any new homes developed in fire prone areas is anticipated to be fitted with fire-safe devices, but hazards may remain as a result of electricity infrastructure as well as common fire hazards associated with human habitation.

The Plan includes land use strategies that encourage further development in urban areas. As discussed above, natural lands conservation has the co-benefit of protecting communities from major hazards caused or exacerbated by climate change, such as wildfires and flooding.

Nonetheless, it is expected that new development will also occur in rural or suburban areas which may have a greater wildfire risk. Increased development, in combination with a push for more electrical infrastructure (e.g., SB 100), may result in increased wildfire risk due to power lines. SCE maintains a policy to shut off power to its lines during high wildfire probability events (i.e., when conditions are such that wildfire is a high probability) which would help to reduce potential impacts.⁵⁹ In addition, many local jurisdictions and plans require undergrounding of electrical infrastructure which also helps to reduce risk of wildfire. Due to the anticipated number of greenfield areas that would be converted to other land uses under the Plan, development may continue to occur in urban/wildlands interface areas which would necessitate infrastructure such as power poles that could result in wildfire risk. As such, significant impacts would occur and mitigation measures are required.

Mitigation Measures

SCAG Mitigation Measures

See **SMM-WF-1, SMM WF-2, SMM AG-4, and SMM BIO-3.**

Project Mitigation Measures

See **PMM HAZ-4.**

PMM WF-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to wildfire risk, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) New development or infrastructure activity within very high hazard severity zones or SRAs shall be required to
 - 1) Submit a fire protection plan including the designation of fire watch staff;
 - 2) Maintain water and other fire suppression equipment designated solely for firefighting on site for any construction and maintenance activities;

⁵⁹ Southern California Edison. *Public Safety Power Shutoff*. Available online at: <https://www.sce.com/safety/wildfire/psps>, accessed October 30, 2019.

- 3) Locate construction and maintenance equipment in designated “safe areas” such that they do not discharge combustible materials; and
- 4) Designate trained fire watch staff during project construction to reduce risk of fire hazards.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts, but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG’s lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to installation of infrastructure that could exacerbate fire risks could be significant and unavoidable even with implementation of mitigation.

Impact WF-4 Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope stability, or drainage changes.

Significant and Unavoidable Impact - Mitigation Required.

Wildfires are becoming more and more common and intense in all areas within the SCAG region. While the Plan focuses development in urban and compact areas, SCAG recognizes there will continue to be development towards, and through natural wildland areas. The Plan estimates consumption of 41,546 greenfield acres and identifies and additional 154,300 housing units in very high fires hazard zones by 2045. These potential fire-prone spaces have created situations where people and property could be impacted by wildfire and associated subsequent hazards (flooding, landslides, etc.). As discussed in **Section 3.10, Hydrology and Water Quality**, in Southern California, intense rainfall may occur during the winter months, creating natural flooding events when the ground is saturated and water levels are high. This has the potential for flooding issues, and fire hazards may exacerbate such flooding and debris flows along waterways. Since debris flows may occur quickly and without warning, such flows can damage structures, block drainage or even sweep away vegetation resulting in tenuous post-fire slope stability. Fast moving debris flows can be one of the most dangerous post-fire hazards. Due to the loss of vegetation and potential resulting soil erosion, debris flows may cause a risk to life and physical property, destroy or strip vegetation, block existing drainage patterns, and impact roadways and other

infrastructure. If this were to occur within the 100-year floodplain areas, existing flow conditions may be altered, or new sources of flooding may be created. This has the potential to alter peak flow conditions and affect upstream, as well as downstream areas. Typically, debris flow from fire damaged areas may be a result of excessive rainfall runoff and surface erosion, since previously-burned slopes repel water and generate higher runoff rates. This can be especially true in the higher elevation areas, with steep slopes and limited drainage basins. Post-fire debris flows are typically triggered by heavy rainfall in areas already damaged by recent wildfire events, and susceptible to soil erosion.

Debris flows could affect both the transportation network, utilities, and new development. In December 2018, the Thomas Fire burned through Ventura and Santa Barbara Counties, leading to loss of vegetation and soil erosion along sloped hillsides. Subsequently, a strong storm poured five inches of rain onto charred hillsides over a short period of time on January 9, 2019. The storm resulted in deadly mudslides, caused extensive property damage, and caused the closure of US-101 for nearly two weeks.^{60,61} A similar incident occurred in Malibu as a result of a mudslide following the Woolsey Fire, which forced the closure of a 13-mile stretch of Pacific Coast Highway.⁶² Furthermore, mudflows could expose people to hazards posed by ruptured methane gas pipelines, as occurred in Burbank in January 2018 following the La Tuna Fire of September 2017.⁶³ Development of homes and infrastructure is anticipated to continue to occur in areas of the region that are subject to wildfire hazards, despite the Plan's focus on adding development to existing urban areas. Due to the anticipated increased consumption of greenfields under the Plan, development may continue to occur in urban/wildlands interface areas which would result in significant risks for people and structures. Therefore, the impacts would be significant and unavoidable, requiring mitigation.

3.21 CUMULATIVE IMPACTS

Section 15130 of the *State CEQA Guidelines* requires that an EIR evaluate potential environmental impacts that are individually limited but cumulatively significant. CEQA defines cumulative impacts as “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts” (*State CEQA Guidelines* § 15355). “Cumulatively considerable” means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects” (*State CEQA Guidelines* § 15065(a)(3)).

The purpose of a cumulative analysis is to determine if several projects when evaluated together could result in a significant “cumulative” impact that would otherwise not be considered significant when projects are evaluated one at a time. If several projects considered together have the potential to result in a significant cumulative impact (that is not already identified as a significant project impact), the question becomes whether the project being analyzed would result in a “considerable” contribution to such a significant cumulative impact. Therefore, if a project results in a significant impact by itself, then its contribution to a cumulative impact is considerable. Mitigation measures that reduce project impacts would similarly reduce a project’s contribution to cumulative impacts.

Connect SoCal is a planning project that is comprised of multiple other planning projects as well as transportation and development projects. Therefore, the analysis of the Plan is cumulative in nature. At this regional-scale, cumulative projects that are considered cumulative to and similar to the proposed Plan are other regional-scale projects primarily consisting of RTPs/SCSs for adjacent jurisdictions and AQMPs.

The proposed Plan includes transportation projects throughout the SCAG region and land use development patterns to accommodate projected regional growth through 2045. The Plan also includes land use and transportation strategies that complement the projects and vice versa. As such, the impacts of Connect SoCal is cumulative on a regional scale. Therefore, the environmental analysis included in each issue area of this PEIR is, in essence, a cumulative analysis of the potential impacts of the transportation projects and growth anticipated to occur under the Plan. Furthermore, this PEIR considers other regional-scale projects that have similar regional-scale impacts that could overlap with impacts of the Plan, for identified CEQA impact areas. Such regional scale cumulative projects include RTPs and similar regional-scale plans for neighboring jurisdictions (Santa Barbara, Kern and San Diego counties) as well as Air Quality Managements Plans within the SCAG region and neighboring jurisdictions.

CEQA allows for analysis of cumulative impacts based on a list of cumulative projects or projections of growth. This PEIR uses a combination of approaches. The analysis of cumulative impacts is qualitative and based on anticipated growth in adjacent jurisdictions assuming that each jurisdiction will adopt an RTP and AQMP as applicable and that growth will be consistent with Department of Finance (DOF) forecasts.

Cumulative impacts occur in one of two ways: 1) impacts from one project overlap with impacts from another project, so for example with respect to the Plan, traffic from within the SCAG region could overlap with traffic from an adjacent county to impact the same transportation facilities (the SCAG Regional Travel Demand Model accounts for travel from adjacent jurisdictions); 2) the other way that cumulative impacts occur is when a resource is of value to a broader community than just the immediate project vicinity, for example, impacts to a cultural or biological resource that has more than local significance, for example state or even national significance, impacts to such a resource would be cumulative with impacts to other resources of similar significance wherever they occur in the state or across the entire US.

The geographic area for evaluation of cumulative impacts is the area within which impacts of the proposed Plan could overlap with impacts of other regional-scale projects. In general, the areas that could experience overlapping impacts are on the periphery of the region where growth from the Plan and growth in accordance with other plans could occur and result in overlapping impacts.

The potential for cumulative or overlapping impacts is contemplated at four basic geographies, the SCAG region, adjacent jurisdictions, the state, and global (see **Table 3.21-1, Cumulative Impact Analysis Geographies**). Although there is some potential for categories to overlap, for example, recreational impacts may occur at the SCAG regional geography as well as the adjacent county and state level.

For purposes of the cumulative analysis, the qualitative discussion identifies how impacts could overlap; **Table 3.21-1** provides an approximate guide of the primary focus of the cumulative analysis and is not intended to limit the geography of a particular cumulative analysis where impacts may overlap at a number of levels.

**Table 3.21-1
Cumulative Impact Analysis Geographies**

SCAG Region	Adjacent Jurisdictions (San Diego, Santa Barbara, Kern)	State of California	Global
Air Quality -- Localized Impacts	Air Quality – Regional Impacts	Agriculture and Forestry Resources	Greenhouse Gases
Biological Resources	Biological Resources	Public Services – Park and Recreation (Regional Facilities)	Paleontological
Cultural Resources	Cultural Resources	Solid Waste Wastewater	
	Transportation and Traffic	Water Supply	
Noise	Public Services – Fire, Police, Schools, Libraries, Parks and Recreation (Local Facilities)	Energy	
	Aesthetics	Mineral Resources	
	Noise	Tribal Cultural Resources	
	Hazards and Hazardous Materials	Biological Resources	
	Hydrology and water quality	Paleontological	
	Population and Housing	Transportation	
	Land Use and Planning		
	Mineral Resources		
	Wildfire		

Source, Impact Sciences, 2019

3.21.1 AESTHETICS

Connect SoCal includes transportation projects and land use strategies that would shape the region over the next 25 years. As discussed in **Section 3.1, Aesthetics**, these changes include the extension of transportation and related infrastructure and expansion of urbanized areas that would impact scenic resources. Transportation projects could facilitate access not only within SCAG boundaries but also to areas outside the region. In addition, Plan projects would connect with projects outside the region facilitating and potentially inducing construction of transportation infrastructure and development outside the region. Some of these changes would be expected on the fringe of the region (e.g. projects along the border of Los Angeles and Kern Counties). Urbanization or loss of these visual resources could also affect areas outside the region as many of these scenic areas extend beyond SCAG borders. As a result, the Plan could indirectly cause changes to the visual character or to scenic areas outside the region. Therefore, the Plan would contribute to cumulative impacts to scenic resources and visual character. Implementation of **Mitigation Measures SMM AES-1 and PMM AES-1 through PMM AES-2** would

reduce potential impacts to aesthetic resources. However, even with the implementation of mitigation measures, impacts are considered significant and could add to such impacts from cumulative projects (for example other RTPs for surrounding jurisdictions) outside the region.

3.21.2 AGRICULTURE AND FORESTRY

Under the Connect SoCal Plan, consumption of farmland is anticipated. These impacts would be the direct result of either implementation of transportation projects or development anticipated to occur due to projected growth under the Plan. As discussed in **Section 3.2, Agriculture and Forestry Resources**, impacts to agricultural and forestry resources from the Plan are considered significant and unavoidable. Loss of farmland would worsen the conversion of agricultural lands due to urbanization throughout the state. The 2015 California Farmland Conversion Report ranks the Southern California region at the top in net acres converted to urban land, with Riverside County ranked second at the county level.¹ The Southern California and San Joaquin Valley regions accounted for the largest urban growth in terms of acreage.² Implementation of **Mitigation Measures SMM AG-1**, through **SMM AG-4** and **PMM AG-1** would reduce impacts, but as other California regions continue to urbanize, agricultural land in the state may continue to be lost due to land use conversion, contributing to cumulative statewide significant impacts.

The Plan has the potential to conflict with Williamson Act lands or existing zoning for agricultural use. **Mitigation Measures SMM AG-1** through **SMM AG-2** and **PMM AG-1** through **PMM AG-2** would reduce impacts, but they are still considered significant. As noted above, through the increasing urbanization, other regions adjacent to SCAG boundaries may also convert agricultural lands to urban uses and conflict with existing zoning.

The Plan would have a significant impact regarding forest lands. Transportation projects included in the Plan that would result impact to forest lands include highway expansion, highway widening projects, and potential connectors. Projects in adjacent regions could convert forestry resources and forest lands due to development, resulting in cumulative impacts.

The Plan would involve other changes in the environment which, due to their location or nature, could convert Farmland to non-agricultural use or conversion of forest land to non-forest use. Implementation of **Mitigation Measures SMM AG-1** through **SMM AG-2** as well as **SMM GHG-1** through **SMM GHG-**

¹ California Department of Conservation. 2015. *California Farmland Conversion Report 2015*. Available at: https://www.conservation.ca.gov/dlrp/fmmp/Documents/fmmp/pubs/2010-2012/FCR/FCR%202015_complete.pdf, accessed November 5, 2019.

² Ibid.

5 and **PMM AG-2** as well as **PMM GHG-2** would reduce impacts, but they are still considered significant. As development pressure from conversion of Farmland to urban uses increases, lands adjacent to SCAG boundaries may feel the same indirect pressure to develop and convert lands. Therefore, there would be a significant cumulative impact.

3.21.3 AIR QUALITY

Connect SoCal is a regional plan that integrates transportation investments with land use strategies for the SCAG region. As such, the analysis of air quality impacts presented is inherently cumulative. As discussed in **Section 3.3, Air Quality**, the Plan would result in significant impacts as a result of short-term emissions of criteria pollutants and as a result of sensitive receptors being in proximity to sources of TACs (**Impact AQ-4**). However, the Plan could also contribute to air quality impacts outside the SCAG region itself. The cumulative analysis impact area for air quality consists of air basins that extend beyond the SCAG boundaries, such as the Mojave Desert Air Basin that extends into Kern County. Implementation of the Connect SoCal Plan combined with cumulative development outside of the SCAG region would add to the significant air quality impacts of the Plan.

Implementation of **Mitigation Measures SMM AQ-1** through **SMM AQ-3** and **PMM AQ-1** through **PMM AQ-3** would reduce the contribution to cumulative air quality impacts; however, the Plan's impacts would remain significant and would add to the impacts of other RTPs in surrounding jurisdictions.

3.21.4 BIOLOGICAL RESOURCES

As discussed in **Section 3.4, Biological Resources**, Connect SoCal would result in impacts to sensitive species as well as habitat fragmentation and loss and disturbance. Implementation of **Mitigation Measures SMM BIO-1** through **SMM BIO-2** and **PMM BIO-1** through **PMM BIO-6** would reduce impacts to biological resources but impacts would remain significant. Many of these impacts would be the direct result of either transportation improvements or development. Impacts to sensitive species, as well as loss of habitat and habitat fragmentation would contribute to similar statewide impacts. Many important habitat corridors cross the SCAG region's boundaries. As a result, the loss of an important corridor, or fragmentation of habitat could limit the movement of wildlife species resulting in additional cumulative impacts. Similarly, fragmentation could reduce the viability of a species beyond the plan area. Therefore, the significant impacts to biological resources anticipated to result from transportation and development projects occurring under the Plan would contribute to cumulative biological resources impacts outside of just the SCAG region, including effects throughout California.

3.21.5 CULTURAL RESOURCES

The Plan includes transportation projects and land use strategies that will shape the region over the next 25 years. As discussed in **Section 3.5, Cultural Resources**, these changes include the extension of transportation and related infrastructure that would impact cultural resources through activities such as demolition of historical resources or indirect impacts such as changing the historic context of the resource. In addition, Plan projects will connect with projects outside the region, thereby facilitating and potentially inducing construction of transportation infrastructure outside the region. This additional infrastructure could lead to additional development, both inside and outside the region. Plan impacts would add to cultural resource impacts of cumulative projects (transportation projects and development in accordance with RTP plans of adjacent jurisdictions). Implementation of **Mitigation Measures SMM CULT-1** and **PMM CULT-1** and **PMM CULT-2**, would reduce the contribution to cumulative impacts to cultural resources. However, the Plan would still result in significant impacts to historical resources as well as archaeological resources and would contribute to significant cumulative impacts. Although in general cultural and historical impacts are specific to a smaller area (region), there is the potential for the project to contribute to impacts in adjacent counties.

3.21.6 ENERGY

Impacts to energy related to implementation of the Plan are analyzed in **Section 3.6, Energy**. The increase in energy demand that is anticipated to occur as population increases in the SCAG region would contribute cumulatively to state increases in energy consumption. The state population is anticipated to continue to grow throughout the implementation period of the Connect SoCal Plan, reaching over 47 million by 2045.³ Inland areas within the state will grow at higher rates, as the Inland Empire, San Joaquin Valley, and the Sacramento region experience faster growth.⁴ The population growth reflects California's increasing energy demand, with the lowest 2030 estimates indicating an annual consumption demand of 326,026 GWh.⁵ Transportation energy demand will see significant changes in response to increasing vehicle electrification, higher vehicle fuel economy, and hydrogen fuel demand. Although California's population and economy are expected to grow, gasoline consumption is projected to decline by 2030.⁶ Diesel demand and demand for hydrogen fuel will continue to rise during same period.⁷ The

⁴ Public Policy Institute of California. 2016. *California's Future*. Available at: https://www.ppic.org/content/pubs/report/R_116HI3R.pdf, accessed November 6, 2019.

⁵ California Energy Commission. 2018. *California Energy Demand 2018-2030 Revised Forecast*. Available at: https://www2.energy.ca.gov/2017_energy_policy/documents/, accessed November 6, 2019.

⁶ California Energy Commission. 2017. *Transportation Energy Demand Forecast, 2018-2030*.

various counties and cities within the SCAG region, in accordance with state law, will require the implementation a variety of energy efficiency measures to decrease energy consumption as a means to reduce GHG emissions. The Plan aims to reduce energy consumption and GHG emissions, and would comply with the state's goals, as adjacent counties' regional plans would also comply with state goals. Energy impacts would be less than significant. Therefore, the Plan would not cumulatively contribute to wasteful, inefficient, or unnecessary consumption of energy resources.

3.21.7 GEOLOGY AND SOILS

Impacts to geology and soils related to implementation of the Plan are analyzed in **Section 3.7, Geology and Soils**. The SCAG region extends primarily over four California geomorphic provinces: the Mojave Desert, the Transverse Ranges, the Peninsular Ranges, and the Colorado Desert.⁸ These geomorphic provinces include several active faults, and they extend beyond SCAG's boundaries to neighboring counties. However, geologic effects occur independently of one another and are related to site-specific and project-specific characteristics and conditions. In addition, existing regulations specify mandatory actions that must occur during project development, which would adequately address the potential for effects from construction or operation of projects related to exposure to seismic hazards. Since the implementation of the Plan would not exacerbate existing geologic hazards including fault rupture, in addition to the fact that there are already numerous regulations in place to reduce such risks to any planned development or transportation project, geologic impacts would be less than significant and the Plan would not result in a considerable contribution to cumulative impacts.

The paleontology of the SCAG region is as equally diverse as the geologic diversity. The Plan's ground disturbing activities would potentially impact paleontological resources. Ground-disturbing activities such as excavation for building foundations and bridges, trenching for utility lines, tunneling, and grading, could damage or destroy sensitive paleontological resources on or near the surface or at depth. Implementation of **Mitigation Measures SMM-GEO-3** and **PMM-GEO-1** would reduce the level of impacts but would still be considered significant. Paleontological resources, and important paleontological finds may still occur. For example, in 2005 a Mammoth was discovered in the City of Moorpark. The fossils were dated as between 400,000 and 1.8 million years old. Such finds, while locally important, provide important contextual information to the state's history and beyond. The loss of such resources would be cumulatively considerable.

⁷ Ibid.

⁸ California Geological Survey. 2002. *California Geomorphic Provinces*. Available online at: https://www.conservation.ca.gov/cgs/Documents/Note_36.pdf, accessed June 12, 2019.

3.21.8 GREENHOUSE GASES

In general, GHG emissions analyses are by nature cumulative as impacts from GHG emissions are global, and there is currently no method to tie local impacts to specific sources. Emissions from any single project mix in the atmosphere and contribute to local, regional, and global impacts over long periods of time. Consequently, any project specific GHG analysis is inherently a cumulative analysis. The analysis presented in **Section 3.8, Greenhouse Gases**, is also a cumulative analysis in that it considers the entire SCAG region as the project site, includes all growth in residential and commercial space as well as region-wide vehicle traffic, and compares these impacts to statewide plans and regulations. In this way, it includes all projects of a similar nature and compares the total impact to regional thresholds. Adjacent jurisdictions in preparing their RTPs will similarly evaluate GHG emissions; in addition, air quality management districts will evaluate emissions associated with stationary and other non-mobile sources and local jurisdictions will more precisely quantify emissions associated with individual projects. Consequently, the analysis presented in **Section 3.8** of this PEIR is a cumulative analysis, and no separate assessment of cumulative effects is needed.

3.21.9 HAZARDS AND HAZARDOUS MATERIALS

Impacts associated with hazards and hazardous materials related to implementation of the proposed Plan are analyzed in **Section 3.9, Hazards and Hazardous Materials**. Hazards and hazardous materials impacts may be related to the transport, use, or disposal of hazardous materials, create a significant hazard through upset or accident conditions involving release of hazardous materials, hazardous materials within one-quarter mile of an existing or proposed school, location on a known hazardous materials site, airport-related hazards, and conflict with an emergency response plan. These effects occur independently of one another, related to site-specific and project-specific characteristics and conditions. However, the analysis in **Section 3.9** concluded there would be significant and unavoidable effects regarding impacts to transport of hazardous materials, release of hazardous materials, hazardous materials within one-quarter mile of a school, location on a known hazardous materials site, and conflict with an emergency response plan. Implementation of **Mitigation Measures SMM HAZ-1 through SMM HAZ-5** as well as **SMM TRA-5** and **PMM HAZ-1 through PMM HAZ-1 through PMM HAZ-5** as well as **PMM TRA-5** would reduce the Plan's impacts, but they would remain significant. These impacts have the potential, due to transportation projects and land use strategies, to have effects beyond SCAG boundaries, particularly to adjacent jurisdictions. Therefore, implementation of the Plan would have significant cumulative impacts.

3.21.10 HYDROLOGY AND WATER QUALITY

As discussed in **Section 3.10, Hydrology and Water Quality**, the Plan would result in significant impacts related to water quality, groundwater recharge, flood hazards and water supply. The land use strategies included in the Plan would result in a more compact development pattern that would be more water efficient. The water providers within the SCAG region that serve the population would need to coordinate water supply with nearby jurisdictions. Given the unreliability of water supply in the region, the increase of approximately 3.2 million people would result in a significant impact to water supply that would add to the impacts of development in surrounding jurisdictions. The Plan could also facilitate access to other areas of the state by increasing infrastructure which could ultimately influence growth (and associated impermeable surfaces) in areas outside SCAG boundaries. **Mitigation Measures SMM HYD-1 through SMM HYD-2 and PMM HYD-1 through PMM HYD-2** would reduce impacts, but they would remain significant. This could result in greater impacts to water quality and could affect water in areas outside the SCAG region. Therefore, the Plan would result in significant cumulative impacts.

3.21.11 LAND USE AND PLANNING

As discussed in **Section 3.11, Land Use and Planning**, implementation of the Connect SoCal Plan has the potential to physically divide an established community and to conflict with existing land use plans. The Plan would result in an increase in density and land use development. Improved accessibility from the Plan could help facilitate urbanization to areas outside the region. Furthermore, changes in land use patterns in the region (i.e. increased urbanization) could affect areas outside the region, resulting in increased urbanization in adjacent jurisdictions. Implementation of **Mitigation Measures SMM LU-1 through SMM LU-4 and PMM LU-1 through PMM LU-2** would reduce impacts, but they would remain significant. Therefore, the Plan would result in significant cumulative land use impacts.

3.21.12 MINERAL RESOURCES

Impacts to mineral resources related to implementation of the Plan are analyzed in **Section 3.12**. The analysis concluded that there would be a significant and unavoidable impact regarding the loss of known mineral resources occurring from transportation projects and land use strategies in the Plan. Aggregate resources used in construction activities throughout the SCAG region would potentially be reduced due to the Plan's transportation projects and anticipated development under the Plan. The Plan could worsen depletion of aggregate supply which would impact surrounding areas and the state. **Mitigation Measures SMM MIN-1 and PMM MIN-1** would reduce impacts, but they would remain significant. Therefore, the Plan would have significant cumulative impact on mineral resources adding to the impact from development of areas outside the SCAG region.

3.21.13 NOISE

As discussed in **Section 3.13, Noise**, the Plan would result in significant impacts related to increases in noise. Changes resulting from the Plan include the extension of transportation and related infrastructure that would result in new noise sources as well as increased noise from some existing sources. Implementation of **Mitigation Measures SMM NOISE-1** and **PMM NOISE-1** would reduce noise and vibration impacts, however they would remain significant. Many of the transportation projects could facilitate access not only within SCAG boundaries but also areas outside the region to adjacent jurisdictions. In addition, Plan projects will connect with projects outside the region, facilitating and potentially inducing construction of transportation infrastructure outside the region. Construction noise and vibration impacts are generally site specific, but to the extent that the Plan might influence growth outside the region, it could result in construction noise outside the region. As population in the region continues to increase, the Plan could also contribute to a cumulatively considerable temporary or permanent increase in noise and vibration outside the region as a result of increased travel. This activity would include railroads, as well as freeway, arterial and transit noise. As a result, there would be a significant cumulative impact.

3.21.14 POPULATION AND HOUSING

As discussed in **Section 3.14, Population and Housing**, implementation of the Connect SoCal Plan could facilitate an increase in population, housing, and employment (although the same increases are anticipated whether or not the Plan is adopted). It is possible that the improved accessibility gained by transportation investments and key land use strategies could result in an increase in population in areas outside the region (as people find it easier to move from outside the region to employment centers within the region). If population increases in areas outside the SCAG region were in excess of forecasts and plans, it could add to cumulative impacts in other jurisdictions. Impacts would be reduced by **Mitigation Measures SMM POP-1** through **SMM POP-4** and **PMM POP-1** would reduce impacts, but they would remain significant. Therefore, the significant impacts of the Plan could contribute to population and displacement impacts of other Plans in neighboring jurisdictions, resulting in a significant cumulative impact.

3.21.15 PUBLIC SERVICES

Fire Protection

As discussed in **Section 3.15.1, Fire Protection**, the Plan would result in significant impacts related to the need for new facilities, the construction of which could cause physical impacts. In general impacts to fire services would be confined to the region and would result from transportation projects and anticipated

growth. It is possible that developments that occur near the region's boundary could result in the need for new or expanded fire protection facilities outside the region. This impact would be cumulatively considerable. In addition, wildfire impacts would be significant. Large fires can extend across regional boundaries requiring firefighters from adjacent regions and beyond to assist on a case-by-case basis. To the extent that the Plan would increase urban uses along the wildland interface and increase fire risk, the chance of a fire requiring multi-regional support also increases. **Mitigation Measures SMM PSF-1** through **SMM PSF-3** and **PMM PSF-1** would reduce impacts but they would remain significant. As a result, the Plan would have a significant cumulative impact.

Police Protection

As discussed in **Section 3.15.2, Police Protection**, the Plan would result in significant impacts related to the need for new facilities. Impacts would be reduced by **Mitigation Measures SMM PSP-1** through **SMM PSP-4** and **PMM PSP-1** would reduce impacts but they would remain significant. In general, impacts as a result of construction of new police facilities would be confined to the immediate area of the construction of each facility. However, as with fire protection, where development and transportation projects are located on the boundary of the region, it is possible that new or expanded facilities would be necessary outside the region. If the construction of such facilities results in a significant impact, the Plan's impact would be cumulatively considerable.

Schools

As discussed in **Section 3.15.3, Schools**, the Plan would result in significant impacts related to the need for new school facilities. **Mitigation Measure SMM PSS-1** would reduce impacts, but they would remain significant. In general, impacts as a result of construction of new schools would be confined to the immediate area of each school. However, if development and transportation projects occur on the boundary of the region, it is possible that new or expanded school facilities would be necessary. If the construction of such facilities results in significant impacts, the Plan's impact would be cumulatively considerable.

Library Services

As discussed in **Section 3.15.4**, the Plan would result in significant impacts related to the need for new facilities. **Mitigation Measure PMM PSL-1** would reduce impacts, but they would remain significant. In general, impacts as a result of construction of new library facilities would be confined to the immediate area of each library. However, if development and transportation projects occur on the boundary of the region, it is possible that new or expanded library facilities would be necessary. If the construction of such facilities results in significant impacts, the Plan's impact would be cumulatively considerable.

3.21.16 PARKS AND RECREATION

To the extent that development may occur on the periphery of the SCAG region, it could increase demand for recreation facilities in surrounding jurisdictions as discussed in **Section 3.16, Parks and Recreation**. Similarly, development on the periphery of these other regions, such as adjacent counties, would result in demand for recreational facilities within the SCAG region. In addition, given the natural resources in the SCAG region, any development in other counties would tend to increase demand for recreation facilities with statewide appeal that are within the SCAG region. Improved transportation infrastructure would facilitate access to these recreational facilities. Impacts would be reduced by **Mitigation Measures SMM REC-1** and **PMM REC-1, PMM AQ-2(b), and PMM NOISE-1(b)** but would remain significant. Therefore, the significant impacts of the Plan on existing facilities of statewide appeal would add to similar impacts anticipated to result from RTPs in other jurisdictions, resulting in a significant cumulative impact.

3.21.17 TRANSPORTATION, TRAFFIC, AND SAFETY

As discussed in **Section 3.17, Transportation, Traffic and Safety**, the Plan would result in increases in total VMT and vehicle hours of delay but reductions in per capita VMT and vehicle hours of delay. Implementation of the Connect SoCal Plan would result in an increase in density and land use development over the life of the Plan. Transportation and traffic related impacts would be reduced by **Mitigation Measures SMM TRA-1** through **SMM TRA-8** and **PMM TRA-1** through **PMM TRA-2** but they would remain significant. Implementation of the Plan, combined with growth outside the region, has the potential to conflict with congestion management programs outside SCAG boundaries. Congestion and delay from RTPs in adjacent counties would add to these significant impacts, which would result in a significant cumulative impact. Further, as discussed in Section 3.17 Transportation, the per capita VMT reductions may not be enough to meet the state goals established by CARB. This, combined with other MPO's not achieving reductions in VMT beyond those identified by CARB, would result in a cumulative statewide impact.

3.21.18 TRIBAL CULTURAL RESOURCES

Plan projects will facilitate access to areas outside the region. In addition, Plan projects will connect with projects outside the region, thereby facilitating and potentially inducing construction of transportation infrastructure outside SCAG boundaries. As discussed in **Section 3.18**, implementation of the Plan would result in significant impacts to tribal cultural resources. **Mitigation Measures SMM TCR-1** and **PMM TCR-1** would reduce impacts but they would remain significant. Therefore, the impacts would contribute

to significant cumulative impacts to tribal cultural resources throughout the state as resources are impacted by new development and land is disturbed.

3.21.19 UTILITIES AND SERVICE SYSTEMS

Solid Waste

The Plan would result in significant impacts related to solid waste generation in the region, as discussed in **Section 3.19.1, Solid Waste**. Implementation of **Mitigation Measures SMM USW-1** through **SMM USW-2** and **PMM USW-1** would reduce impacts but they would remain significant. As population increases across the state, it is expected that additional demands will be placed on landfills with remaining capacity both from inside the SCAG region and from nearby areas such as adjacent counties. The increased demand on landfill capacity could result in the need to truck waste long distances, including to sites outside the region which could result in localized impacts outside the region (noise, air quality, traffic). Further, landfill capacity is finite and by reducing landfill capacity outside the region, there would be less capacity available for areas outside the region. As a result, the Plan would add to impacts on available landfill capacity and result in a cumulatively considerable impact.

Wastewater

The Plan would result in a significant impact related to wastewater capacity and the need for new facilities, as discussed in **Section 3.19.2, Wastewater**. Impacts would be reduced by **Mitigation Measures SMM HYD-1** through **SMM HYD-3** and **PMM UWW-1** but impacts would remain significant. Connect SoCal includes transportation projects and regional land use strategies, targeting growth in urban areas. However, due to planned transportation projects and anticipated development, there would be potential for construction of new stormwater drainage facilities or expansion of existing facilities would be needed. The need for new or expanded facilities for Plan projects in combination with other large projects outside the region, such as wastewater projects in adjacent counties or transportation projects that connect with projects to outside areas could result in significant impacts. As such the Plan would result in a cumulatively considerable impact.

Water Supply

The Plan would result in significant impacts related to water supply, as discussed in **Section 3.19.3, Water Supply**. Impacts would be reduced by **Mitigation Measures SMM USS-2** and **PMM USS-1** but impacts would remain significant. The water providers within the SCAG region that serve the population would need to coordinate water supply with nearby jurisdictions. Given the unreliability of water supply in the region, additional population growth would result in a significant impact to water supply that would add

to the impacts of development in surrounding jurisdictions. Water supply projects that serve the SCAG region include infrastructure that extends beyond the boundaries of the SCAG region. For example, the California Aqueduct conveys water from the Sierra Nevada Mountains and the Colorado River Aqueduct conveys water from the Colorado River to Southern California. Increases in population could require or result in the relocation or construction of new or expanded water facilities outside of the region. As such, the Plan would result in a cumulatively considerable impact.

3.21.20 WILDFIRE

The Plan would result in significant wildfire risk impacts. Impacts associated with wildfire hazards related to implementation of the Plan are analyzed in **Section 3.20**. Impacts would be reduced by **Mitigation Measures SMM WF-1** through **SMM WF-2** and **PMM WF-1** but impacts would remain significant. Wildfire impacts may be related to impairing an emergency response or evacuation plan, exposing occupants to wildfire risks and pollutant concentrations from wildfire, and exposing people or structures to post-fire slope instability. Wildfires pose a significant public health risk due to their air quality impacts. Furthermore, as wildfire-prone areas tend to have fewer vehicular access points than flat, urbanized areas, these roads could face gridlock in the event of a sudden emergency evacuation. Such circumstances could expose vehicle occupants to active flames and potential death. Development of transportation or housing projects in wildfire-prone areas would cause an increase in population exposed to wildfire risk and exacerbate exposure of those populations to pollutant concentrations from wildfires, particularly populations living downwind of the fire. Plan projects, in combination with other projects outside the region, specifically, potential development projects in wildfire areas, could result in additional impacts. Therefore, the project would result in a cumulative considerable impact.

3.21.21 SOURCES

4.0 ALTERNATIVES

The California Environmental Quality Act (CEQA) requires an Environmental Impact Report (EIR) to describe a range of reasonable alternatives to the project or to the location of the project that could feasibly avoid or substantially lessen significant environmental impacts while attaining most of the project objectives.¹ This chapter sets forth potential alternatives to the Plan and provides a combination of quantitative and qualitative analysis of each alternative and a comparison of each alternative to the Plan. Plan alternatives are evaluated as to how well they achieve the goals, policies, and objectives, the extent of their environmental impacts compared to the Plan, and whether or not they reduce or eliminate significant impacts caused by the Plan.

4.1 RATIONAL FOR ALTERNATIVES SELECTION

Key provisions of the *State CEQA Guidelines* pertaining to the alternatives analysis are summarized below.²

- The discussion of alternatives shall focus on alternatives to the project, including alternative locations that are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.
- The EIR shall include a brief discussion of the rationale for selecting alternatives to be discussed and should identify any alternatives that were considered but were rejected as infeasible during the scoping process and briefly explain the reason underlying the lead agency's decision. Among others, the following factors may be used to eliminate alternatives from detailed consideration in an EIR: (1) failure to meet most of the basic project objectives; (2) infeasibility, or (3) inability to avoid significant environmental impacts.
- The No Project Alternative shall be evaluated along with its impacts. The No Project Alternative analysis shall discuss the existing conditions at the time the notice of preparation is published, as well as what would reasonably be expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services. When the project involves an update to an existing land use or regulatory plan, the "no project" alternative will be a continuation of the existing plan, policy or operation into the future.

¹ *CEQA Guidelines* § 15126.6, 2005

² *CEQA Guidelines* § 15126.6, 2005

The projected impacts of the plan are compared to the impacts from the continuation of the existing plan.

- The range of alternatives required in an EIR is governed by a “rule of reason.” Therefore, the EIR must evaluate only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the proposed project.
- An EIR need not consider an alternative whose effects cannot be reasonably ascertained and whose implementation is remote and speculative.
- The evaluation of alternatives should include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. A matrix displaying the major characteristics and significant environmental effects of each alternative may be used to summarize the comparison. If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative shall be discussed, but in less detail than the significant effects of the proposed project.

The range of feasible alternatives is selected and discussed in a manner intended to foster meaningful public participation and informed decision making. Among the factors that may be taken into account when addressing the feasibility of alternatives (as described in *State CEQA Guidelines* Section 15126.6(f)(1)) are environmental impacts, site suitability, economic viability, availability of infrastructure, general plan consistency, regulatory limitations, jurisdictional boundaries, and whether the proponent could reasonably acquire, control, or otherwise have access to the alternative site.

An EIR must briefly describe the rationale for selection and rejection of alternatives. The lead agency may make an initial determination as to which alternatives are feasible, and, therefore, merit in-depth consideration.³ Alternatives may be eliminated from detailed consideration in the EIR if they fail to meet project objectives, are infeasible, or do not avoid any significant environmental effects.⁴

Project Objectives

Pursuant to Section 15126.6(a) of the *State CEQA Guidelines*, the PEIR must consider “alternatives ... which would feasibly attain most of the basic objectives of the project but would avoid or substantially

³ CEQA Guidelines §15126.6(f)(3).

⁴ CEQA Guidelines §15126.6(c).

lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives.” SCAG has established ten goals and seven guiding principles to serve as project objectives:

Connect SoCal Goals:

1. Encourage regional economic prosperity and global competitiveness
2. Improve mobility, accessibility, reliability, and travel safety for people and goods
3. Enhance the preservation, security, and resilience of the regional transportation system
4. Increase person and goods movement and travel choices within the transportation system
5. Reduce greenhouse gas emissions and improve air quality
6. Support healthy and equitable communities
7. Adapt to a changing climate and support an integrated regional development pattern and transportation network
8. Leverage new transportation technologies and data-driven solutions that result in more efficient travel
9. Encourage development of diverse housing types in areas that are supported by multiple transportation options
10. Promote conservation of natural and agricultural lands and restoration of critical habitats

Connect SoCal Guiding Principles:

1. Base transportation investments on adopted regional performance indicators and MAP-21/FAST Act regional targets
2. Place high priority for transportation funding in the region on projects and programs that improve mobility, accessibility, reliability and safety, and that preserve the existing transportation system
3. Assure that land use and growth strategies recognize local input, promote sustainable transportation options, and support equitable and adaptable communities

4. Encourage RTP/SCS investments and strategies that collectively result in reduced non-recurrent congestion and demand for single occupancy vehicle use, by leveraging new transportation technologies and expanding travel choices
5. Encourage transportation investments that will result in improved air quality and public health, and reduced greenhouse gas emissions
6. Monitor progress on all aspects of the Plan, including the timely implementation of projects, programs and strategies
7. Regionally, transportation investments should reflect best-known science regarding climate change vulnerability, in order to design for long term resilience.

Limits of SCAG Authority

While SCAG is required to prepare an SCS as part of the RTP, SCAG lacks the legal authority to require the decision makers of cities and counties to adopt or amend their respective land use policies, such as general plan and zoning code amendments that would implement the land use patterns included in the SCS component of the Plan. Furthermore, SCAG lacks the legal authority to implement land use designations in the SCS component of the Plan or the alternatives. While this PEIR analyses one land use scenario for the proposed Plan and other scenarios in the alternatives analyses below, there are nearly an infinite variety of specific land use scenarios at the local level that could achieve Plan objectives to a similar extent. Pursuant to CEQA, the range of alternatives considered in this PEIR illustrates the different environmental consequences of potential distinct regional-level alternatives to the Plan.

SCAG also does not have any ability or authority to control population and employment levels in the region. The accuracy of growth projections at the regional scale, over both the short and long term, are inherently estimates that are subject to a wide variety of factors outside of the control of SCAG or any of its member counties and cities. Accordingly, all alternatives assume the same forecasted regional growth in population and employment. Estimating the environmental consequences of regional growth within the SCAG region is also subject to a wide variety of uncertainties that are outside of the control of SCAG, and for many topical areas are outside the control of SCAG's member counties and cities.

4.2 ALTERNATIVES TO THE PROPOSED PROJECT

SCAG developed three alternatives for analysis in the PEIR. Each alternative consists of a transportation network element and a land use pattern element and is aligned in part with the scenarios for developing

the Plan (See **Chapter 2.0, Project Description** for further details). The following alternatives are evaluated:

1. No Project Alternative
2. Existing Plans-Local Input Alternative
3. Intensified Land Use Alternative

SCAG did not identify additional alternatives that were rejected. As such, three alternatives were identified for comparative analysis: The No Project Alternative and two other potentially feasible RTP/SCS alternatives, one that increases greenfield development (Existing Plans-Local Input Alternative) and one that places additional emphasis on infill development and transit (Intensified Land Use Alternative).

The No Project alternative, required to be analyzed under CEQA, assumes the projected land use pattern and planned transportation improvements would be consistent with those set forth in the 2016 RTP/SCS and that investments would cease beyond what is currently programmed. The two other alternatives allow for analysis variation in projected land use pattern and planned transportation improvements that could realistically be expected to occur over the Plan horizon. The alternatives reflect different growth patterns and different investment decisions for the transportation system. All three alternatives assume the same regional employment, population, and housing growth projections and roughly the same overall transportation budget. Land use and transportation assumptions vary in the following ways:

Land Use Variables:

- The amount of compact or infill development, which is measured in terms of housing product mix (the mix of high- and low-density housing units) and amount of development occurring in existing developed versus undeveloped areas. Compact development has been shown to be more effectively served by transit, to support potentially higher rates of walking and biking, and to generate less vehicle travel.
- The amount of development in high-quality transit areas, where residents are more likely to use available transit.
- The amount of mixed-use development, which supports shorter vehicle trips and higher rates of non-motorized travel.

Transportation Variables:

- The location, intensity, and type of transit service, based on the extent of transit-supportive land uses in corridors. Higher density, mixed-use corridors provide greater opportunities for higher capacity transit, such as light rail.
- The level of investment in transportation systems management (TSM) strategies, including technology and travel demand management (TDM) programs that allow for greater optimization of existing transportation infrastructure. More compact and mixed-use development patterns can allow some shifts in investment priorities away from road extensions and expansions to improving the function of existing roads for multi-modal travel.
- System pricing strategies, such as cordon pricing as a tool for managing congestion.

Generally, the alternatives represent a progression of land use and transportation investments, such that Existing-Plans Alternative includes the most dispersed land use and fewest transportation investments and Intensified Land Use Alternative represents the most compact land use pattern but maintains the same transportation investments as the Plan. Connect SoCal falls in between the two alternatives. As stated above, all alternatives analyzed accommodate the same amount of regional growth: 3,167,500 new people, 1,391,700 new jobs, and 1,426,700 new housing units.

A more detailed description of each of these alternatives is provided below, followed by a comparative analysis of how well the alternative would achieve the project objectives and the relative level of environmental impact associated with each alternative as compared to implementation of Connect SoCal. For each resource area evaluated in this PEIR the text summarizes whether the impacts of the alternative would generally result in greater or lesser impacts than those Connect SoCal. **Table 4.0-1, Comparison of Connect SoCal and Alternatives**, provides an “at a glance” comparison of the three alternatives and Connect SoCal.

**Table 4.0-1
Comparison of Connect SoCal and Alternatives**

Elements	Proposed Project: Connect SoCal	Alternative 1: No Project Alternative	Alternative 2: Existing Plans- Local Input Alternative	Alternative 3: Intensified Land Use Alternative
Greenfield Land Consumption	41,546 acres	64,608 acres	54,679 acres	32,247 acres
Natural Land	21,561,361 acres	21,559,568 acres	21,553,029 acres	21,563,157 acres
Agricultural Land (total)	892,477 acres	887,706 acres	882,069 acres	890,603 acres
Total Area Converted from Agriculture to Urban from the existing	6,732 acres	10,101 acres	14,861 acres	8,563 acres
Agriculture Production Value	\$3,561,365,881	\$3,543,507,241	\$3,522,366,445	\$3,556,648,245
Acres of Habitat Improved from the existing (Threatened and Endangered Species)	311 acres	29 acres	481 acres	126 acres
Acres of Habitat Improved from the existing (Species Vulnerable to Climate Change – Except Birds)	354 acres	44 acres	735 acres	220 acres
Acres of Habitat Improved from the existing (Species Vulnerable to Climate Change - Birds)	1,525 acres	1,265 acres	3,125 acres	1,216 acres
Acres of Habitat Degraded from the existing (Threatened and Endangered Species)	7,899 acres	8,365 acres	12,274 acres	7,115 acres
Acres of Habitat Degraded from the existing (Species Vulnerable to Climate Change – Except Birds)	9,621 acres	10,456 acres	14,967 acres	8,728 acres
Acres of Habitat Degraded from the existing (Species Vulnerable to Climate Change - Birds)	12,778 acres	15,231 acres	19,862 acres	11,666 acres
High Species Movement Potential	22,210,114 acres	22,211,576 acres	22,191,944 acres	22,211,104 acres

Alternative 1: No Project Alternative

The No Project Alternative is required by Section 15126.6I(2) of the *CEQA Guidelines* and assumes that the Plan would not be implemented. The No Project Alternative allows decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project. The No Project Alternative evaluates “what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services” (*CEQA Guidelines* Section 15126.6E(2)). The No Project Alternative is aligned with the Trend/Baseline Scenario⁵ and includes transportation projects that are in place at the time of

⁵ Connect SoCal – Sustainable Communities Strategy Technical Report.

preparation of the Connect SoCal Plan and that are included in the first two years of the previously conforming transportation plan and/or federal transportation improvement program (FTIP). “Exempt projects” include safety projects and certain mass transit projects, transportation control measures (“TCMs”) that are approved by the State Implementation Plan, and project phases that were authorized by the FHWA/FTA prior to expiration of SCAG’s conformity finding for the adopted 2016 RTP/SCS. These exempt projects would also be included in the No Project Alternative since they could move forward in the absence of an adopted Connect SoCal Plan.⁶

The land use strategies included in the No Project Alternative are based on the trending socioeconomic growth projection to the future (2045) updated with the same jurisdictional local input population, household and employment data as those in the Connect SoCal Plan to reflect the most recent local input growth estimates in the region.

Alternative 2: Existing Plan-s - Local Input Alternative

The Existing Plans - Local Input Alternative is aligned with the Existing Plans – Local Input Scenario in the Plan.⁷ This alternative incorporates local general plans and land use information to reflect the Plan’s population, household and employment growth estimates in the region. The Plan’s transportation and land use strategies are not included in this alternative. The transportation network analyzed under this alternative are the transportation projects planned by each County Transportation Commission (CTC) in the region. In general, this alternative represents a more dispersed land use pattern as compared to Connect SoCal.

Alternative 3: Intensified Land Use Alternative

This Intensified Land Use Alternative is based off the Plan’s transportation network and strategies. This alternative analyzes more aggressive densities and land use patterns than included in the Accelerated Tomorrow Scenario.⁸ The land use pattern builds on the land use strategies as described in the Connect SoCal Plan and beyond. Specifically, it increases densities and intensifies land use patterns of the Plan, especially around HQTAs in an effort to maximize transit opportunities. The growth pattern associated with this alternative optimizes urban areas and suburban town centers, transit-oriented developments (TODs), HQTAs, livable corridors, and neighborhood mobility areas. It also includes a greater

⁶ Federal Highway Administration. *Transportation Conformity: A Basic Guide for State and Local Officials (Revised 2010)*, FHWA-HEP-11-001. Available at: http://www.fhwa.dot.gov/environment/air_quality/conformity/guide/guide10.cfm

⁷ Connect SoCal – Sustainable Communities Strategy Technical Report.

⁸ Connect SoCal – Sustainable Communities Strategy Technical Report.

progressive job-housing distribution optimized for TODs and infill in HQTAs. It includes the same transportation investments as the Plan. This alternative considers the basis of the Plan with enhancements to accelerate the SB 375 GHG emissions reduction trend into 2045 and beyond, and includes related improvements for air quality, livability, public health, active transportation opportunities, and affordability.

4.3 COMPARATIVE ANALYSIS OF IMPACTS

Consistent with the requirements of Section 15126.6(d) of the *State CEQA Guidelines*, this section of the analysis provides information for the alternatives, including the No Project Alternative, to allow meaningful evaluation, analysis, and comparison with the Project, inclusive of direct, indirect, and cumulative impacts (**Table 4.0-2, Comparison of Alternatives to Connect SoCal**). The evaluation demonstrates if the alternative can avoid or reduce the significant and unavoidable effects of the Project.

Alternative 1: No Project Alternative

Aesthetics

Impacts to scenic vistas from transportation projects in the No Project would be less than Connect SoCal because the No Project Alternative would result in fewer transportation projects overall and therefore fewer opportunities to obstruct a scenic vista. Impacts from the land use pattern could be greater than Connect SoCal as the overall land use pattern would be more dispersed resulting in more opportunities to obstruct a scenic vista, however, projects would also generally be of a lower scale than with Connect SoCal. However, with fewer projects, impacts would likely be less than the Plan but still significant.

The No Project Alternative would also result in fewer opportunities to create visually contrasting elements due to the reduced number of transportation and land use projects as well as the lower scale of projects overall. The No Project Alternative would not include any transportation projects that could affect any State Scenic Highways or vista points. However, views of green space from these areas could be impacted by land use development. Impacts would still be significant but less than the Plan.

Connect SoCal includes strategies to focus growth in HQTAs, which would help reduce the consumption and disturbance of natural lands and reduce resultant impacts on aesthetics and views. Under the No Project Alternative, these land use patterns may not occur and therefore greater areas of greenfield would be impacted resulting in greater impacts to visual character (although individual jurisdictions may still seek to reduce the urban footprint through their general plans). The No Project Alternative's impacts would result in the consumption of more greenfield land (91 square miles, as opposed to 51 square miles under the Plan) potentially resulting in loss of scenic resources and changes in visual character. Impacts

to visual character in urbanized areas would be similar to Connect SoCal because existing zoning and other regulations governing visual quality are mandatory and would be equally enforced under this alternative. Regarding light and glare, the greater amount of land consumed under this alternative, could introduce more lighting into undeveloped areas resulting in potential impacts greater than the Plan.

Agriculture and Forestry Resources

Conversion of agricultural land (including Prime Farmland, Unique Farmland, and Farmland of Statewide Importance), forest land, timberland, and timberland zoned Timberland Production to non-agricultural, non-forest, or non-timber uses under this alternative would be greater than under Connect SoCal because the projected land use pattern of the No Project Alternative would be less compact and would convert 3,369 more acres of agricultural land to urban use. However, the planned transportation improvements of this alternative would include 5,308 fewer lane miles of new or expanded roadway and highways relative to Connect SoCal. The additional land disturbance associated with the less compact land use pattern would occur in areas with agricultural land.

Because the No Project Alternative would not include projects with the potential to impact forest lands, impacts under this alternative would be reduced compared to the Plan. Impacts related to forest land under the No Project would be less than significant.

The potential for conflicts with zoning, land use designations, Williamson Act contracts, and/or other applicable regulations that protect agricultural and forestry resources and timberlands would also be greater because additional agricultural lands would be converted to non agricultural uses. Similarly, the potential for other changes that could result in the conversion of agricultural land to developed land uses would be greater due to increases in urbanization in rural areas under this alternative as compared to Connect SoCal.

Air Quality

Under the No Project Alternative, no new transportation investments would be made, beyond those that are currently programmed. As a result, fewer transportation projects would be built than under the Plan resulting in less construction emissions compared to the Plan. However, construction emissions in the region as a whole would still exceed the significance thresholds established in the *CEQA Guidelines* (these thresholds were developed for use in analyzing individual development projects) and applied by the local air districts (SCAQMD, VCAPCD, MDAQMD, and AVPCD). Similar to the Plan, the cumulative construction emissions in the region would result in a significant impact, which would be short-term for each individual project but overall the region would experience on-going air quality impacts.

Projected long-term emissions are cumulatively significant if they are not consistent with the local air quality management plans and state implementation plans. Unlike the Plan, the No Project Alternative may not conform to the local air quality management plans. The No Project Alternative is anticipated to have higher levels of VMT than the Plan (**Table 4.0-3, Plan Compared to Alternative 1: Summary of Maximum Exposed Individuals Residential 30-Year Exposure Cancer Risk**) resulting in a higher level of particulate matter and ozone precursors, pollutants for which the area is designated as non-attainment. As a result, the No Project Alternative could have a significant cumulative impact.

With respect to cancer risk and impact to public health, the No Project Alternative would result in more emissions as compared to the Plan due to the increase in VMT (**Table 4.0-3**). Due to differences in VMT (light and medium duty vehicles and heavy-duty truck traffic) in some cases, for some segments the No Project Alternative would have slightly less risk than under the Plan. As for the Plan, future emissions would be substantially less than existing conditions.

**Table 4.0-3
Plan Compared to No Project Alternative: Summary of Maximum Exposed Individuals Residential 30-Year Exposure Cancer Risk**

Segment No.	Transportation Segment	County/Region	No Project Alternative (risk in a million)	Connect SoCal Plan (risk in a million)
1	IMP I-8	Imperial/El Centro	14.2	14.5
2	IMP SR-78	Imperial/Westmoreland	37.1	18.9
3	LA I-110	Los Angeles/Carson	24.8	23.5
4	LA I-710	Los Angeles/Compton	29.9	30.9

16	VEN US-101 TO	Ventura/ Thousand Oaks	19.6	21.9

Source: Impact Sciences, 2019.

Note: Segments 7, 11, 12, 13, and 16 under No Project Alternative will have a higher health risk than under the Plan.

Health risk associated with construction activities would be similar to the Plan and potentially significant adjacent to extended intense construction activities.

Objectionable odors are expected to be similar to the Plan, there would be fewer construction projects causing these odors but also higher VMT, causing more diesel emission odors.

Overall impacts to air quality would be greater when compared to Connect SoCal due to the more dispersed growth pattern and greater VMT.

Biological Resources

The No Project Alternative would result in greater impacts to biological resources when compared with the implementation of the Plan. Under this alternative there would be 57 percent more standard (single family) suburban residential development and an additional 1,793 acres of natural lands developed. As such, more sensitive biological resources would be expected to be affected under the No Project Alternative. The No Project Alternative would not include transportation and land use strategies that focus growth along existing corridors and in urbanized areas, nor would it encourage additional greenways. As a result, development would be more scattered through the region when compared to the Plan, and native habitat conversion and fragmentation would increase.

The Plan includes transportation and land use strategies that focus growth along existing corridors and in urbanized areas, rather than allowing development of vacant, open space/recreation, and agricultural lands. This compact development pattern would focus population in urban areas. Without the Plan land use strategies, impacts to biological resources would be more widespread throughout the region. Additionally, habitat degradation would be higher under the No Project Alternative (8,365 acres) than under the Plan (7,899 acres). Impacts to biological resources are directly linked to the amount of native habitat conversion in non-urban areas. As such, impacts would be greater under the No Project Alternative.

Cultural Resources

Impacts to cultural resources (historic built environments, archeological, and human remains, and important examples of major periods of California history or prehistory) under this alternative would be greater than under Connect SoCal because this alternative's projected land use pattern would be less compact and include an additional 23,062 of greenfield development. The additional land disturbance, such as grading and excavation, resulting from the projected land use pattern of this alternative would result in greater likelihood of encountering unknown surface or subsurface archaeological resources, or human remains; it would also result in greater impacts to the character of settings that contribute to the

significance of historic built environments. However, this alternative would result in fewer lane miles constructed which would reduce transportation related impacts compared to Connect SoCal (as discussed below). Overall, impacts to cultural resources would be greater when compared to Connect SoCal.

Energy

The No Project Alternative would likely result in increased use of energy because the No Project Alternative assumes more large lot development, resulting in a larger share of individual detached structures. These individual structures require more energy for materials, more materials overall, and more fuel to build (e.g., additional equipment and vehicle use for site development, grading, and excavation) than would be needed for attached structures.

Per-capita energy consumption under this alternative would be greater than under Connect SoCal due to the less compact land use pattern. The No Project Alternative also includes a housing mix with a greater proportion of large-lot single-family homes (73 percent standard suburban) as compared to the Plan (16 percent standard suburban). Because the No Project Alternative would include more large-lot single-family homes, which require more energy use per capita as compared to attached and multi-family homes, this alternative would result in more energy use per capita as compared to the Plan. The less compact land use pattern also leads to higher VMT, and more inefficient consumption of transportation energy than under the Plan. While it would be likely that, compared to baseline conditions (2019), per capita energy consumption would go down under this alternative (as the trajectory of per capita energy is on a downward trend overall), per capita energy consumption would be higher than under the Plan. Therefore, although impacts would be less than significant, the No Project Alternative would result in greater impacts related to the wasteful, inefficient, or unnecessary consumption of energy during construction activities and long-term operations.

This alternative is likely to have similar impacts on state and local plans for renewable energy or energy efficiency as compared to the Plan. Use of some renewable energy sources could be facilitated, while the use of other renewable energy sources could be hindered by this alternative. Implementation of the California Energy Code and State goals for increasing the percentage of electricity from renewable and zero-carbon sources under this alternative would be the same as under the Plan.

Geology and Soils

While implementation of the Connect SoCal Plan would result in a greater number of transportation projects than the No Project Alternative, the No Project Alternative would result in similar impacts associated with risk as a result of surface fault rupture, ground-shaking liquefaction, landslides, and

other risks associated with seismic events. The anticipated population growth would remain constant over all alternatives and the Project, and the entire region is subject to the same seismic risk. Existing state and local building code requirements addressing substantial adverse effects due to earthquakes and seismic activity would apply to the projected land use pattern and planned transportation improvements of the Plan.

Impacts related to soil erosion would be significant and would be greater under this alternative as there would be an increase in land consumed which could result in more soils exposed. Impacts related to unstable soil, expansive soil, and septic systems would also be less than significant and similar to the Plan as projects would continue to comply with existing regulations.

Impacts to unique geologic features would be greater under this alternative than under the Plan because the projected land use pattern of this alternative is less compact. The additional land disturbance resulting from the projected land use pattern under this alternative would result in greater impacts to unique geologic features.

Greenhouse Gas Emissions

The greenhouse gas (GHG) emissions for building energy would be higher under the No Project Alternative (32.4 MMTCO₂e/year) than under the Plan (31.3 MMTCO₂e/year), a difference of 3 percent (**Table 3.8-9, Greenhouse Gas Emissions for the SCAG Region from Three Primary Sources [CO₂e]**). The water-energy GHG emissions under the No Project Alternative (2.6 MMTCO₂e/year) would be higher than under the Plan (2.5 MMT CO₂e/year) (see **Table 3.8-9**). For transportation, the GHG emissions with the No Project Alternative (74.6 MMT CO₂e/year) would also be greater compared to the Plan (64 MMT CO₂e/year) (see **Table 3.8-9**). The more dispersed development pattern of the No Project Alternative would result in increased building energy use (as multi-family buildings are more efficient than single-family homes) and more VMT. The Plan would improve regional GHG emissions compared to the No Project Alternative.

Senate Bill (SB) 375 requires CARB to develop regional CO₂ emission reduction targets, compared to 2005 emissions, for cars and light trucks only for 2020 and 2035 for each of the state's MPOs. Unlike the Plan, the No Project Alternative would not achieve SB 375 targets due to the inability to complete the transportation investments and increase density of development in HQTAs that are required to achieve the GHG emission reductions made possible by the Plan. Since the GHG emissions from transportation sources would be higher with the No Project Alternative than under the Plan, this alternative would not meet the regional GHG reduction targets for cars and light-duty trucks, would not be sufficient to meet

the state's overall GHG reduction goals, and would conflict with AB 32 and SB 32 even more than the Plan. As such, the No Project Alternative would have a greater impact on GHG emissions than the Plan.

Hazards and Hazardous Materials

Hazardous materials impacts to the public or the environment associated with construction activities and operation under this alternative would be the same as the impacts under the Plan. This is because of the numerous federal, state, and local requirements and regulations that minimize the creation of significant hazards to the public or the environment through the routine transport, use, or disposal of hazardous materials; through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment and through handling of hazardous materials, substances, and waste within 0.25 mile of an existing or proposed school. These existing requirements and regulations would apply equally to the different projected land use patterns and planned transportation network improvements of this alternative and the proposed Plan, so impacts would be the same. The same is true for existing requirements and regulations addressing potential safety hazards and excessive noise within an airport land use plan or within two miles of a public or public use airport, so airport-related safety and noise impacts to people residing or working in the plan area would be the same under this alternative.

The more dispersed land use pattern under this alternative would be more automobile-oriented than the Plan and could complicate emergency evacuation plans that rely in part on public transit. Therefore, the less compact land use pattern of this alternative would result in greater impacts associated with impairing the implementation of adopted emergency response and emergency evacuation plans.

Hydrology and Water Quality

Under the No Project Alternative, fewer areas would be impacted by excavation and construction activities related to transportation projects as compared to the Plan. While the No Project Alternative would reduce the number of transportation projects built in the SCAG region, it would result in greater vacant land consumption that would, in turn, increase impervious surface. The additional land area permanently converted to impervious surfaces would increase the potential volume and decrease the water quality of stormwater flows. Additional impervious surface also would interfere with groundwater recharge and alter drainage patterns in a manner that would increase the potential for substantial erosion, siltation, and flooding relative to the Plan. This alternative would require greater storm drainage system capacity than the Plan because of its conversion of additional land area to impervious surface area. In addition, the housing mix of this alternative would include a larger share of large-lot single-family homes, which would result in more managed landscaping areas and associated pollutants such as

nutrients, herbicides, and irrigated runoff, which in turn could adversely affect surface and groundwater quality.

With fewer transportation projects than the Plan, impacts of the No Project Alternative would be reduced when compared with the Plan. As the currently planned projects included in the No Project alternative are built, the impacts resulting from increased roadway runoff and drainage patterns would remain significant. Likewise, the impacts to groundwater infiltration caused by the increased impervious surfaces of roadway projects, and to increased flooding hazards, would remain significant.

Similar to the Plan, this alternative could conflict with or obstruct the implementation of a water quality control plan or sustainable groundwater management plan, impacts would be similar to the Plan.

Land Use Planning

Under the No Project Alternative, no new transportation investments would be made, beyond those that are currently programmed. As a result, fewer transportation projects would be built than under the Plan and new growth would occur consistent with local general plans, although it would be more dispersed than contemplated under the Plan. The less compact land use pattern of this alternative provides less connectivity within existing communities because of its more dispersed allocation of future growth, but it would not physically divide any existing communities. This impact would be the same as under the Plan. The transportation projects in this alternative would add 5,308 fewer lane miles compared to the Plan. With fewer lane miles, the planned transportation improvements of this alternative would result in less impact from physically dividing existing communities. Impacts would be less than the Plan, however would remain significant.

The No Project Alternative would result in fewer impacts with regard to conflicts with any applicable land use plan, policy, or regulation for the purpose of avoiding or mitigating an environmental effect due to there being fewer transportation projects. The Plan's land use strategies would be implemented to the extent they have already been built into existing local jurisdiction's plans and therefore there would be less opportunity for land use policy conflicts as compared to the Plan.

Mineral Resources

The No Project Alternative would result in fewer lane miles compared to the Plan which would require less aggregate. Further, the No Project Alternative could result in greater loss of availability of known mineral resources that would be of value to the region and the residents of the state, as well as locally important mineral resources, due to the greater amount of land that would be converted to urban land

potentially covering more mineral resource extraction opportunities. However, overall impacts would be less than the Plan but still significant.

Noise

The No Project Alternative would result in reduced impacts from noise when compared with Connect SoCal. Under the No Project Alternative, no new transportation investments would be made, beyond those that are currently programmed; and land use development would be more distributed than under the Plan. Therefore, the No Project Alternative would not include transportation and land use strategies that focus growth along existing corridors and in urbanized areas, would not result in construction or operation of new transportation infrastructure, and would not develop new HQTAs. As a result, fewer transportation projects would be built than under the Plan, however a greater area would be affected by construction noise associated with land use development.

Construction noise in urban areas is generally expected and considered less than significant. Construction noise on individual sites could still exceed significance thresholds in some jurisdictions. Construction-related noise impacts would be similar, although possibly fewer sensitive receptors would be impacted under this alternative due less urban locations that would be subject to disturbance during construction activities. This would increase the number of separate construction sites, which would increase overall noise levels associated with construction activities. However, impacts overall would be similar as the Plan and still significant.

The projected land use pattern of this alternative, while less compact than the Plan, would not result in land use types that would result in meaningfully different levels of vibration or groundborne noise. The planned transportation improvements of this alternative would include limited roadway and highway improvements which also would not result in meaningfully different levels of vibration or groundborne noise relative to the planned transportation improvements identified in the Plan. This impact is the same under this alternative.

Regarding aviation noise, the No Project Alternative would result in similar impacts to the Plan, as there would be no change in air traffic patterns or airport operations under this alternative.

Population and Housing

Impacts related to population and housing should be similar under all alternatives, because the same number of people, housing units and jobs are assumed. The less compact land use pattern of this alternative could still result in displacement of substantial numbers of people or existing housing that

necessitates the construction of replacement housing elsewhere. This impact is the same as the Plan and would remain significant.

Public Services

This alternative is anticipated to result in public service impacts similar to those that would be generated under the Plan, because the same total population, housing, and employment are assumed, and public service impacts are generally population driven. However, this alternative could worsen the ability to achieve local levels of service due to a more dispersed land use pattern that makes it more difficult to efficiently serve the population. This impact is greater than the Plan. The planned transportation improvements of this alternative would have the same public services impacts as the Plan, although congestion (VHD) would increase compared to the Plan which could affect police and fire services in some areas.

Regarding schools and libraries, the population would be the same under each of the alternatives. While there could be less demand in urban areas (due to the more dispersed land use pattern) there could be greater impacts in less developed areas. Given the increased growth in suburban areas, this alternative could contribute to substantial adverse physical impacts associated with the construction and subsequent operation of new or physically altered school and library facilities in order to maintain acceptable service ratios. Impacts would be significant and similar to the Plan.

Parks and Recreation

This alternative could worsen the ability to achieve local levels of service due to a more dispersed land use pattern that makes it more difficult to efficiently serve the population. This impact is greater than the Plan. Although there would be less demand on urban parks (which are often overburdened) there could be more demand on large regional parks due to a more dispersed land use pattern and the need to travel to parks. As the regional is well-served with regional parks, this impact would be less than the Plan but still significant.

Transportation, Traffic, and Safety

The No Project Alternative would result in greater VMT per capita (23.80 VMT/per capita) than under the Plan (22.89 VMT/per capita), in part because of the less compact land use pattern. This alternative would also locate fewer homes and jobs near HQTAs. According to CARB much greater VMT reductions (beyond those achieved by the Plan) will be required to meet the state's long-term climate goals. Therefore, the VMT impact of this alternative is greater than under the Plan. For the reasons provided above, this alternative would also result in lower levels of transit ridership (by two million boardings) as

well as walking, and biking for commute trips and all trips and it would be less complementary to existing and planned bicycle and pedestrian facilities.

The No Project Alternative would also result in higher VHD by 802,416 (total). The compact development pattern included in the Plan would concentrate population in urban areas and encourage alternative modes of travel other than automobiles. Without the Plan development patterns, vehicle miles traveled, vehicle hours of delay, worker commute trips, and accident rates would be higher than under the Plan resulting in greater impacts.

Under the No Project Alternative, impacts related to design hazards would also be greater (although still less than significant) as fewer transportation improvements would be constructed and the Plan's focus on safety would not be implemented. Emergency access would be greater because the land use pattern of large lot homes would be less efficient and there would be fewer transportation improvements constructed.

Tribal Cultural Resources

The No Project Alternative would result in greater impacts to tribal cultural resources when compared with the Plan. Under the No Project Alternative, there would be an additional 23,062 acres of greenfield land consumed, which would have the potential to impact previously undiscovered tribal cultural resources, such as archaeological resources, sacred sites, or human remains. However, the transportation network in this alternative would include fewer lane miles and could reduce the potential to impact previously undiscovered tribal cultural resources as compared to the Plan. Due to the less compact land use pattern and the increase in greenfield consumed, impacts would be greater under the No Project Alternative and would be significant.

Utilities and Service Systems

This alternative is anticipated to result in impacts to utilities and service systems similar to those that would be generated under the proposed Plan and would be significant because the same total population, housing, and employment numbers are assumed, and utilities impacts are generally population driven. The larger share of single-family homes under this alternative would likely increase the demand for surface and groundwater supplies because such housing units have higher demand for water, for example through increased irrigation demand for landscaping areas and additional appliances and fixtures that use potable water (e.g., sinks, toilets, showers). As a result, this alternative could exceed the capacity of existing water storage, conveyance, distribution, and treatment facilities to a greater degree than the Plan and result in construction of new, expanded, or relocated facilities. These impacts of this alternative are greater than under the Plan and would be significant.

In addition, this alternative could adversely affect the capacity of the necessary utility conveyance and distribution systems (e.g. wastewater, storm drain,) due to a more dispersed land use pattern that makes it more difficult to efficiently serve the population. All of the alternatives would be required to follow the same federal, state, and local statutes and regulations related to solid waste. This alternative would have the same impact related to solid waste generation and conflicts with solid waste management and reduction statutes and regulations.

Wildfire

Under the No Project Alternative, impacts would increase with regards to increased development along the wildland interface that may exacerbate fire risks. The No Project Alternative would result in an additional 43,692 housing units at risk for wildfire as compared to the Plan, resulting in greater potential wildfire risk. Areas with dry vegetation have the potential to exacerbate wildfire risk due to future development activities that could generate flammable debris piles. This is particularly true in the currently rural and underdeveloped parts of the SCAG region. Future roadway and development construction in such areas has the potential to result in significant impacts as a result of construction equipment generating sparks or oil spill and other combustible materials leading to the start and spread of wildfires. This impact would be greater under the No Project Alternative and would be significant.

Alternative 2: Existing Plans - Local Input Alternative

Aesthetics

Impacts to scenic vistas from the land use pattern under this alternative would be less than the Plan, because this alternative assumes lower density development. Structures are likely to be shorter and more dispersed, with less likelihood of blocking or impeding scenic vistas. However, with more development in non-urbanized areas, there could be greater potential for conflicts with scenic vistas which would be a greater impact than the Plan. The transportation network would result in the same number of lane miles as the Plan and therefore potential transportation related impacts would be similar. With a land use pattern that is more dispersed - combined with the same number of capacity-enhancing planned transportation improvements as the Plan, this alternative would have greater impacts to scenic resources along official or eligible state scenic highways.

Conversion of greenfield to development would be more dispersed, as the Existing Plans-Local Input Alternative would consume 54,679 acres compared to the Plan's consumption of 41,546 acres. Because population growth would be less concentrated in existing open areas than the Plan, there would be greater overall impacts to visual character and quality. In urban areas, with regard to conflicts with applicable zoning or regulations regarding scenic quality, there would be similar effects under this

alternative as the Plan since there would be a similar number of transportation projects. The potential for substantial degradation of visual character or quality of public views of sites and their surroundings in non-urbanized areas would be greater under this alternative as compared to the Plan because this alternative would locate more housing within non-urbanized areas. With a more dispersed land use pattern combined with capacity-enhancing planned transportation improvements in non-urbanized areas, this alternative would result in greater impacts to visual quality compared to the Plan and impacts would be significant.

Agriculture and Forestry Resources

Conversion of agricultural land (including Prime Farmland, Unique Farmland, and Farmland of Statewide Importance), forest land, timberland, and timberland zoned Timberland Production to non-agricultural, non-forest, or non-timber uses under this alternative would be greater than under the Plan because the projected land use pattern of the Existing Plans-Local Input Alternative would be less compact and would result in the direct loss of an additional 8,129 acres of agricultural land converted to urban use compared to the Plan. The potential for conflicts with zoning, land use designations, Williamson Act contracts, and/or other applicable regulations that protect agricultural resources would also be greater for the same reasons and because the same projects are included in the transportation network that have the potential to conflict with or convert forest lands. Similarly, the potential for other changes that could result in the conversion of agricultural land to developed land uses would be greater due to the overall increase in greenfield consumption under this alternative as compared to the Plan.

Air Quality

The Existing Plans-Local Input Alternative would have the same population, housing, and employment as the Plan, but would result in an incrementally less dense land use pattern. Similar to the No Project Alternative, construction emissions would still likely exceed the significance thresholds established in the *CEQA Guidelines* and result in a significant short-term impact. However, in the long term, the Existing Plans-Local Input Alternative would likely have a similar less than significant impact to the AQMPs since development under this alternative would focus the majority of new housing on compact (walkable) locations (although less than under the Plan) and result in a lower VMT than under No Project Alternative. However, the Existing Plan-Local Input Alternative would not implement the same land use strategies as Connect SoCal, therefore the alternative would have higher VMT than the Plan. Thus, while this alternative would reduce particulate matter and ozone precursor emissions compared to the No Project Alternative, emissions would not be reduced to the same level as under the Plan.

As with the Plan, under the Existing Plans-Local Input Alternative, reductions in cancer risk levels associated with diesel particulate matter occur as a result of on-going emission controls. The cancer risk and impact to public health for this alternative would be similar compared to the Plan since the transportation network is the same as the Plan (**Table 4.0-4 Connect SoCal Compared to Alternative Existing Plans-Local Input Alternative: Summary of Maximum Exposed Individuals Residential 30-Year Exposure Cancer Risk**). There are incremental differences in risk among segments due to differing traffic volumes, however, as for the Plan risk would be reduced substantially as compared to existing conditions.

**Table 4.0-4
Connect SoCal Compared to Existing Plans-Local Input Alternative: Summary of Maximum Exposed
Individuals Residential 30-Year Exposure Cancer Risk**

Segment No.	Transportation Segment	County/Region	Existing Plans-Local Input Alternative (risk in a million)	Connect SoCal (risk in a million)
1	IMP I-8	Imperial/El Centro	14.6	14.5
2	IMP SR-78	Imperial/Westmoreland	20.8	18.9
3	LA I-110	Los Angeles/Carson	24	23.7
4	LA I-710	Los Angeles/Compton	31.1	30.9
5	LA SR-60 DB	Los Angeles/Diamond Bar	29.1	29.7
6	LA SR-60 SEM	Los Angeles/ South El Monte	16.4	16.3
7	ORA I-5	Orange/ Orange	5.51	5.49
8	ORA I-405	Orange/ Seal Beach	11.9	11.8
9	RIV I-10	Riverside/ Banning	4.99	4.83
10	RIV SR-15	Riverside/ Temecula	9.57	9.52
11	RIV SR-91	Riverside/ Corona	8.49	8.41
12	SB I-15 ONT	San Bernardino/Ontario	11.1	10.5
13	SB I-15 VIC	San Bernardino/ Victorville	40.7	41.3
14	SB SR-60	San Bernardino/ Ontario	18.5	18.8
15	VEN US-101 SB	Ventura/ San Buenaventura	4.82	4.85
16	VEN US-101 TO	Ventura/ Thousand Oaks	22	21.9

Source: Impact Sciences, 2019.

Note: Segments 5, 12, 12, 14, and 15 under Existing Plans-Local Input Alternative will have a higher health risk than under the Plan.

Health risk associated with construction activities would be similar to the Plan and potentially significant adjacent to extended intense construction activities.

Objectionable odors are expected to be similar, although more dispersed since the same amount of construction will occur but over a more distributed area. Overall impacts to air quality could be incrementally greater when compared to Connect SoCal due to the greater VMT.

Biological Resources

Impacts to candidate, sensitive, or special status species (including plants, wildlife, and fish) under this alternative would be greater than under the Plan, because this alternative's projected land use pattern would be less compact and would result in 12,274 acres of habitat degraded compared to 7,899 acres of habitat degraded under the Plan. While this alternative includes the same total population as the Plan and captures HQTAs strategies, this alternative has a slightly less compact housing mix (57 percent homes and 70 percent jobs in growth priority areas) than the Plan (60 percent homes and 73 jobs percent, respectively) and includes a land use pattern that includes 4 percent of new housing in urban infill areas and 27 percent of new housing in standard suburban housing (compared to 21 percent urban infill and 16 percent standard suburban with the Plan). Further this alternative would have lower high species movement potential by 18,170 acres compared to the Plan.

Impacts to biological resources are directly linked to the amount of land disturbance and habitat conversion in non-urban areas. The land use pattern of this alternative would therefore result in additional conversion in natural habitats and greater impacts to biological resources. Without a more compact land use development pattern as included in the Plan, impacts to biological resources would be more widespread throughout the region and would be greater than the Plan.

Cultural Resources

Impacts to cultural resources (historic built environments, archeological and human remains, and important examples of major periods of California history or prehistory) under this alternative would be greater than under the Plan because this alternative's projected land use pattern would be less compact and include nearly 13,133 additional acres of development (greenfield). The additional land disturbance, such as grading and excavation, resulting from the projected land use pattern and planned transportation improvements of this alternative would result in greater likelihood of encountering unknown surface or subsurface archaeological or human remains; it would also result in greater impacts to the character of settings that contribute to the significance of historic built environments. Construction activities under this alternative would also have greater impacts to historic built environments, archaeological, human remains, and important examples of major periods of California history or prehistory for the reasons provided above.

Energy

The Existing Plans-Local Input Alternative would have greater impacts on the residential energy consumption than the Plan because of the less compact growth pattern (multi-family development is more energy and water efficient than single-family development). Total residential and commercial energy consumption under This alternative would result in an additional 28 trillion Btu, compared to the Plan. Residential and commercial building water use would be 539,233-acre feet higher than the Plan. VMT for this alternative would also increase by more than 11 million VMT. Overall, per-capita energy consumption under this alternative would be greater than under the Plan because this alternative would result in less compact development. Because this alternative includes more single-family homes, which require more energy per capita as compared to attached and multi-family homes, it would likely result in more energy use per capita as compared to the Plan. While compared to existing conditions, per capita energy consumption would go down under this alternative, however 2045 per capita energy consumption would be higher than under the Plan. Therefore, this alternative would result in greater impacts related to the wasteful, inefficient, or unnecessary consumption of energy during construction activities and long-term operations.

This alternative is likely to have a similar impact on state and local plans for renewable energy or energy efficiency as compared to the Plan. Use of some renewable energy sources could be facilitated, while the use of other renewable energy sources could be hindered by this alternative. Implementation of the California Energy Code and State goals for increasing the percentage of electricity from renewable and zero-carbon sources under this alternative would be the same as under the Plan.

Geology and Soils

Under this alternative, the following impacts associated with earthquakes and seismic activity would be the same as the Plan: rupture of a known earthquake fault; strong seismic ground shaking; seismic-related ground failure, including liquefaction; and landslides. Existing state and local building code requirements addressing substantial adverse effects due to earthquakes and seismic activity would apply to the projected land use pattern and planned transportation improvements of the Plan. The following operational and construction impacts of this alternative would be greater than the Plan because this alternative includes a less compact land use pattern that would develop nearly 13,133 additional acres: soil erosion and loss of topsoil; on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse; development on expansive soil; and inadequate soils for alternative wastewater systems. The more compact land use pattern of the Plan would be expected to result in less land development within areas subject to adverse impacts from the geologic and soils conditions.

Impacts to unique geologic features and paleontological features would be greater under this alternative than under the Plan because the projected land use pattern of this alternative is less compact and would develop nearly 13,133 additional acres. The additional land disturbance resulting from the projected land use pattern combined with planned transportation improvements under this alternative would result in greater impacts to unique geologic features.

Greenhouse Gas Emissions

The GHG emissions for building energy and water-related energy are expected to be slightly greater under the Existing Plans-Local Input Alternative when compared to the Plan as it would develop less infill land use projects which tend to be more efficient than standard development. For transportation, the GHG emissions are projected to be greater under this alternative when compared to the Plan because of increased VMT. The Existing Plans-Local Input alternative would result in greater GHG emissions when compared to the Plan.

Per capita emissions would decrease under this alternative due to the land use strategies being implemented from the 2016 RTP/SCS . However, unlike the Plan, this alternative would not achieve SB 375 targets for 2035 as it would only achieve a 17 percent reduction and would not meet the 19 percent reduction target. The transportation network and land use pattern under this alternative would not achieve the same GHG emissions reductions as the Plan because the Plan includes more integrated transportation and land use strategies. SCAG has no control over many future emissions factors (e.g., energy and water demand), SCAG made extremely conservative assumptions regarding these factors.

Since meeting the regional reduction goals from cars and light-duty trucks would not be sufficient to meet the state's overall GHG reduction goals and the Existing Plans-Local Input Alternative would not meet the SB 375 targets, this alternative would conflict even more with AB 32 and SB 32. As such, this alternative would have a greater impact on GHG emissions than the Plan.

Hazards and Hazardous Materials

Hazardous materials impacts to the public or the environment associated with construction activities and operations under this alternative would be the same as the impacts under the Plan. This is because of the numerous federal, state, and local requirements and regulations that minimize the creation of significant hazards to the public or the environment through the routine transport, use, or disposal of hazardous materials; through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment and through handling of hazardous materials, substances, and waste within 0.25 mile of an existing or proposed school. These existing requirements and regulations would apply equally to the different projected land use patterns and planned transportation network

improvements of this alternative and the Plan, so impacts would be the same. The same is true for existing requirements and regulations addressing potential safety hazards and excessive noise within an airport land use plan or within two miles of a public or public use airport, so airport-related safety and noise impacts to people residing or working in the plan area would be the same under this alternative.

The more dispersed land use pattern would be more automobile-oriented than the Plan and could complicate emergency evacuation plans that rely in part on public transit. Therefore, the less compact land use pattern of this alternative would result in greater impacts associated with impairing the implementation of adopted emergency response and emergency evacuation plans.

Hydrology and Water Quality

Impacts associated with hydrology and water quality under this alternative would be greater than under the Plan because its significantly less compact land use pattern would result in disturbance to a larger land area during construction activities and would permanently convert a greater amount of land to impervious surfaces, such as parking lots, buildings, roadways, highways, and other paved areas, as compared to the Plan. The additional land area subject to construction disturbance would increase potential for short-term discharge of pollutants from construction sites into surface or groundwater. Construction impacts to hydrology and water quality would be greater under this alternative.

The Existing Plans – Local Input Alternative encourages a housing mix that is slightly less compact (40 percent multifamily and 28 percent single family large lot) than the Plan (42 percent and 27 percent, respectively). This alternative also includes 27 percent of new development as standard suburban compared to 16 percent standard suburban under the Plan. Additional impervious surfaces would interfere with groundwater recharge and alter drainage patterns in a manner that would increase the potential for substantial erosion, siltation, and flooding relative to the Plan. This alternative would require greater storm drainage system capacity than the Plan because of its conversion of additional land area to impervious surface area. In addition, the housing mix of this alternative would include a larger number of large-lot single-family homes which would result in more managed landscaping areas and associated pollutants such as nutrients, herbicides, and irrigated runoff, which in turn could adversely affect surface and groundwater quality, resulting in greater impacts than the Plan.

The projected land use pattern and planned transportation improvements of this alternative would have the same potential as the Plan to conflict with or obstruct the implementation of a water quality control plan or sustainable groundwater management plan due to the same total, anticipated population growth.

Land Use and Planning

The Existing Plans–Local Input Alternative has a similar transportation network as the Plan. New growth would occur consistent with local general plans as a result of the local input process and would overall be more dispersed compared to the Plan. The less compact land use pattern of this alternative provides less connectivity within existing communities because of its more dispersed allocation of future growth, but it would not physically divide any existing communities. This impact is the same as under the Plan. New roadway or highway improvements can physically divide existing communities by providing physical barriers where none previously existing. Expansion of existing roadways and highways also can physically divide existing communities to the extent that wider facilities with additional lanes represent greater physical barriers than narrower facilities. The planned transportation improvements of this alternative would be generally the same as the Plan and would result in similar land use impacts.

Because this alternative is largely based on local plan, conflict with plans could be reduced compared to the Plan. However, most general plans are not updated to reflect the year 2045, as such there is the potential for conflict with Plans that have not been updated to the Plan’s horizon. This impact would therefore be similar and would be significant.

Mineral Resources

The Existing Plans-Local Input Alternative could result in greater loss of availability of known mineral resources that would be of value to the region and the residents of the state, as well as locally important mineral resources, due to the greater amount of land that would be converted to urban land potentially covering more mineral resource extraction opportunities. Transportation network improvements would occur similar to the Plan, requiring a comparable amount of aggregate resources to be used for the construction of the transportation network improvements. However, overall impacts related to aggregate would be greater than the Plan.

Noise

The Existing Plans-Local Input Alternative would generate noise levels generally similar to those that would be generated under the Plan because the same total population, housing, and employment are assumed. However, the less compact land use pattern of this alternative would direct more housing to non-urbanized areas, increasing localized operational noise levels in these areas that tend to have lower existing noise levels than more developed communities. Noise thresholds could be exceeded in these communities. The roadway and highway improvements under this alternative would be similar to the Plan and therefore impacts would be similar.

There would similar, but potentially greater construction-related noise impacts under this alternative due to the nearly 13,133 acres of additional land area (greenfield) that would be subject to disturbance during construction activities associated with the less compact land use pattern. This would increase the number of separate construction sites, which would exacerbate overall noise levels associated with construction activities. However, fewer sensitive receptors may be impacted due to construction occurring in less urban locations.

The projected land use pattern of this alternative, while less compact than the Plan, would not result in land use types that would result in different levels of vibration or groundborne noise. The planned transportation improvements would be the same as the Plan, this would also not result in significantly different levels of vibration or groundborne noise. This impact is the same under this alternative and would be significant.

Regarding aviation noise, this alternative would have similar impacts as the Plan. Neither the Plan, nor the alternatives affect airport operations or capacity. While different land use patterns could result in more or less housing in flight paths as compared to the Plan, there are a nearly infinite number of variables that could occur (flight path, housing location, zone changes, etc.). Overall, it is expected aviation noise impacts under this alternative would be largely similar to the Plan.

Population and Housing

Impacts related to population and housing should be similar under all alternatives, because the same number of people and dwelling units are assumed. The less compact land use pattern of this alternative have the potential to result in displacement of substantial numbers of people or existing housing that necessitates the construction of replacement housing elsewhere. Under this alternative, the same number of transportation investments would be made to the transportation network as in the Plan. As a result, impacts related to population growth, population displacement, and the need to construct replacement housing would be similar to the Plan and would be significant.

Public Services

This alternative is anticipated to result in public service impacts similar to those that would be generated under the Plan, because the same total population, housing, and employment are assumed and public service impacts are generally population driven. However, this alternative could worsen the ability to achieve local levels of service due to the more dispersed land use pattern that makes it more difficult to efficiently serve the population. This impact is greater than the Plan. The planned transportation improvements of this alternative would have the same public services impacts as the Plan.

Similarly, with regard to the need for additional schools and libraries, impacts would be similar to the Plan. This is because each alternative would result in the same population totals. While it is possible there could be less demand in urban areas and more demand in suburban areas, overall impacts would be similar to the Plan. Given the increased growth in suburban areas, this alternative could contribute to substantial adverse physical impacts associated with the construction and subsequent operation of new or physically altered school and library facilities in order to maintain acceptable service ratios. Impacts would be significant and similar to the Plan.

Recreation

This alternative is anticipated to result in recreation impacts less than those that would be generated under the Plan. Although the same total population, housing and employment are assumed, with no concentration of growth, the park usage would be more dispersed in urban and suburban areas leading to a reduced need for expansion or construction of recreation facilities, and place additional demand on larger regional parks; however as the region is well-served with regional parks, impacts would be reduced compared to the Plan. Impacts related to the construction of new parks would be similar to the Plan as the types of park construction impacts that would occur would be the same.

Transportation, Traffic, and Safety

The Existing Plans-Local Input Alternative would result in more miles traveled, more vehicle hours traveled, and more delay than the Plan. In 2045, this alternative would result in 23.41 VMT per capita and 14,539,787 VHT. Implementation of the Plan would reduce vehicle miles traveled by approximately 2 percent to 22.89 VMT per capita, reduce VHT by 3 percent to 14,130,874 VHT. VHD per capita would remain the same at 0.12; however total VHT would be reduced by 155,568.

The effects of growth and other external factors are included in the Regional Travel Demand Model that produces the results reported above. Because these external factors are modeled, the cumulative effects of regional growth are captured in the VMT, VHT, and VHD data under this alternative.

This compact development pattern included in the Plan would concentrate population in urban areas and encourage alternative modes of travel other than automobiles. While this alternative captures the HQTAs-focus based on local plans, it encourages a land use pattern and housing mix that is slightly less urban, less compact, and more suburban compared to the Plan. Also, this Alternative has slightly less compact land use and transit coordination in HQTAs (46% homes and 55% jobs) than that for the Plan (48% homes and 59% jobs). Vehicle miles traveled, vehicle hours of delay, worker commute trips, and accident rates would be higher than under the Plan resulting in a less efficient transportation system

overall. Further, this alternative would not achieve VMT reductions necessary to meet the state's climate goals.

Tribal Cultural Resources

This alternative would result in greater impacts to tribal cultural resources when compared with the Plan. Under this alternative, there would be an additional 13,133 acres of greenfield land consumed, which would have the potential to impact previously undiscovered tribal cultural resources, such as archaeological resources, sacred sites, or human remains. Due to the less compact land use pattern and the increase in greenfield consumed, impacts would be greater under this alternative and would be significant.

Utilities and Service Systems

This alternative is anticipated to result in similar impacts to utilities and service systems to those that would be generated under the Plan because the same total population, housing, and employment are assumed, and these areas are generally population driven. The larger share of single-family homes under this alternative would likely increase the demand for surface and groundwater supplies because such housing units have higher demand for water, for example due to increased irrigation demand for landscaping areas and additional appliances and fixtures that use potable water (e.g., sinks, toilets, showers). As a result, this alternative could exceed the capacity of existing water storage, conveyance, distribution, and treatment facilities to a greater degree than the Plan and result in construction of new, expanded, or relocated facilities.

The population assumed in alternative is the same as under the Plan, thereby resulting in similar need for solid waste disposal and transfer facilities to accommodate the population.

In addition, this alternative could adversely affect the capacity of the necessary utility conveyance and distribution systems (e.g. wastewater and storm drain) due to a more dispersed projected land use pattern that makes it more difficult to efficiently serve the population. All of the alternatives would be required to follow the same federal, state, and local statutes and regulations related to solid waste. This alternative would have the same impact related to solid waste generation and conflicts with solid waste management and reduction statutes and regulations.

Wildfire

The Existing Plans-Local Input Alternative would result in greater wildfire threat than the Plan. This alternative consumes 13,133 more greenfield acres than the Plan and would result in an additional 43,692

housing units in wildfire risk areas compared to the Plan. Additionally, it includes the same transportation investments as the Plan. However, the more dispersed pattern of development would result in a greater wildfire risk than the Plan. Impacts would be significant.

Alternative 3: Intensified Land Use Alternative

Aesthetics

The Intensified Land Use Alternative has the highest percentage of new housing as urban infill (16 percent) and the smallest development footprint among the alternatives and the Plan. Impacts to scenic resources from the land use pattern under this alternative in urban areas would be greater than under the Plan because this alternative assumes higher density and intensity of development; however, the impact would be less in suburban and rural areas as less development would occur in these locations. New structures would be taller and more concentrated, with greater likelihood of blocking or impeding scenic vistas. Impacts from transportation projects to scenic vistas would be the same as the Plan since the transportation network would be the same as the Plan.

The potential for substantial degradation of visual character or quality of public views of sites and their surroundings in non-urbanized areas would be less under this alternative as compared to the Plan because under this alternative a smaller share of the projected land use pattern would be located within existing non-urbanized areas. Impacts to visual quality in urbanized areas would be similar to the Plan because existing zoning and other regulations typically address visual quality and would be equally enforced under this alternative. With development focused in urban areas there would be less potential for light and glare impacts as light and glare is already occurring in urban areas, and impacts would be less than the Plan, but would remain significant.

Agriculture and Forestry Resources

Conversion of agricultural land (including Prime Farmland, Unique Farmland, and Farmland of Statewide Importance), forest land, timberland, and timberland zoned Timberland Production to non-agricultural, non-forest, or non-timber uses under this alternative would be greater than under Plan because the projected land use pattern under the Intensified Land Use Alternative convert 1,831 more acres of agricultural land to urban use, although the transportation network would be generally the same. The more compact land use pattern would reduce the amount of land disturbance overall (less greenfield developed). Under this alternative, there would be 9,299 fewer greenfield acres converted to other uses compared to the Plan. The improved land use and transit coordination would require less acreage to accommodate future growth and a higher concentration of development in urban areas will reduce the

conversion of agricultural uses. However, the loss of agricultural land would still be significant and would be greater than with the Plan.

The potential for conflicts with zoning, land use designations, Williamson Act contracts, and/or other applicable regulations that protect agricultural would also be greater for the same reasons. However, the potential for conflicts with agricultural lands would still be significant. Regarding forest land, impacts would be similar to the Plan due to the similar transportation networks and would remain significant.

Air Quality

The Intensified Land Use Alternative would have the same population, housing, and employment as the Plan, but would result in a denser land use pattern. Similar to the Plan, construction emissions would likely exceed the significance thresholds established in the *CEQA Guidelines* and result in a significant short-term impact especially considering multiple projects occurring in a condensed area. In the long term, Alternative 3 would have a similar impact to the local AQMPs and a reduced cumulative impact since development projects would be more efficient than the Plan, resulting in fewer emissions.

As with the Plan, under this alternative results in substantial reductions in cancer risk levels associated with diesel particulate matter would occur as compared to existing conditions. The cancer risk and impact to public health for this alternative would be similar compared to the Plan since the transportation network is the same as the Plan with minor adjustments for land use and transit coordination strategies (**Table 4.0-5, Connect SoCal Compared to Intensified Land Use Alternative: Summary of Maximum Exposed Individuals Residential 30-Year Exposure Cancer Risk**).

Table 4.0-5
Connect SoCal Compared to Intensified Land Use Alternative: Summary of Maximum Exposed
Individuals Residential 30-Year Exposure Cancer Risk

Segment No.	Transportation Segment	County/Region	Intensified Land Use Alternative (risk in a million)	Connect SoCal Plan (risk in a million)
1	IMP I-8	Imperial/El Centro	14.2	14.5
2	IMP SR-78	Imperial/Westmoreland	19.6	18.9
3	LA I-110	Los Angeles/Carson	23.7	23.5
4	LA I-710	Los Angeles/Compton	31.3	30.9
5	LA SR-60 DB	Los Angeles/Diamond Bar	29.2	29.7
6	LA SR-60 SEM	Los Angeles/ South El Monte	16.9	16.3
7	ORA I-5	Orange/ Orange	5.59	5.49
8	ORA I-405	Orange/ Seal Beach	11.9	11.8
9	RIV I-10	Riverside/ Banning	4.83	4.83
10	RIV SR-15	Riverside/ Temecula	9.54	9.52
11	RIV SR-91	Riverside/ Corona	8.38	8.41
12	SB I-15 ONT	San Bernardino/Ontario	10.9	10.5
13	SB I-15 VIC	San Bernardino/ Victorville	41	41.3
14	SB SR-60	San Bernardino/ Ontario	18.5	18.8
15	VEN US-101 SB	Ventura/ San Buenaventura	4.84	4.85
16	VEN US-101 TO	Ventura/ Thousand Oaks	22	21.9

Source: Impact Sciences, 2019.

Note: Segments 2-4, 6-8, 10, 12, and 16 under Alternative 3 would have higher health risks than the Plan.

Health risk associated with construction activities would be similar to the Plan and potentially significant adjacent to extended intense construction activities.

Objectionable odors are expected to be similar as well since construction impacts will be similar to the Plan.

Overall impacts to air quality could be incrementally less when compared to Connect SoCal due to the more compact growth pattern and reduced VMT.

Biological Resources

Impacts on candidate, sensitive, or special status species (including plants, wildlife, and fish) under the Intensified Land Use Alternative would be less than under the Plan because this alternative's projected land use pattern would be more compact and include approximately 9,299 fewer acres of greenfield development, this alternative would result in incrementally less impact related to biological resources

when compared with the implementation of the Plan. Impacts to biological resources are directly linked to the amount of native habitat conversion in non-urban areas a potential project proposes. Under this alternative, there would be an additional 990 acres of high species movement potential maintained compared to the Plan. While this alternative would affect fewer acres of natural lands, impacts to biological resources in and near the urban areas would remain significant because impacts to sensitive species could still occur.

Cultural Resources

Impacts to cultural resources (historic built environments, archeological, and human remains, and important examples of major periods of California history or prehistory) under this alternative would be less than under the Plan because this alternative's projected land use pattern would be more compact and include approximately 9,299 fewer acres of greenfield development in the same transportation network. The reduced land disturbance, such as grading and excavation, resulting from the projected land use pattern of this alternative would result in lower likelihood of encountering unknown surface or subsurface archaeological, or human remains. However, increased development in urban areas, where historic buildings tend to be located could result in greater impacts to the character of settings that contribute to the significance of historic built environments, as pressure to redevelop historic buildings increases. Construction activities under this alternative would also have less impacts to historic built environments, archaeological, human remains, and important examples of major periods of California history or prehistory for the reasons provided above.

Energy

The Intensified Land Use Alternative contains more infill development to accommodate a higher proportion of growth in more energy-efficient housing types like townhomes, apartments, and smaller single-family homes, as well as more compact commercial building types. As a result, residential energy consumption, building energy consumption, and water consumption would incrementally decrease compared to the Plan because there would be a higher percentage of multi-family units and higher density in the land use. Individual detached structures require more energy for materials, more materials overall, and more fuels to build than would be needed for attached structures. This alternative also includes a housing mix with fewer single-family homes (48 percent) and more townhome or multifamily homes (8 and 44 percent) as compared to the proposed Plan (48 percent single family and 8 and 42 percent multi-family, respectively). As a result, this alternative would likely result in lower energy use per capita because attached homes require less energy per capita as compared to large-lot single-family homes. At 335 trillion Btu, this alternative's residential energy would result in similar but somewhat lower consumptive energy use than the Plan (338 trillion Btu). Per-capita energy consumption under this

alternative would be lower than under the Plan because this alternative would result in a more compact land use pattern. This alternative would result in less impacts related to the wasteful, inefficient, or unnecessary consumption of energy during construction activities and long-term operations. Impacts would continue to be less than significant.

This alternative is likely to have less impact on state and local plans for renewable energy or energy efficiency as compared to the Plan as it would be overall more energy efficient. Implementation of the California Energy Code and State goals for increasing the percentage of electricity from renewable and zero-carbon sources under this alternative would be the same as under the Plan.

Geology and Soils

The following impacts associated with earthquakes and seismic activity under this alternative would be the same as the Plan: rupture of a known earthquake fault; strong seismic ground shaking; seismic-related ground failure, including liquefaction; and landslides. Existing state and local building code requirements addressing substantial adverse effects due to earthquakes and seismic activity would apply to the land use pattern and planned transportation improvements of the Plan. The following operational and construction impacts of this alternative would be less than the Plan because this alternative includes a more compact land use pattern that would develop approximately 9,299 fewer acres: soil erosion and loss of topsoil; on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse; development on expansive soil; and inadequate soils for alternative wastewater systems.

Impacts to unique geologic features would be less under this alternative than under the Plan because the land use pattern of this alternative is more compact and would develop fewer acres in the same transportation network. The decreased land disturbance resulting from the projected land use pattern and planned transportation improvements under this alternative would result in less impacts to unique geologic features.

Greenhouse Gas Emissions and Climate Change

The GHG emissions for building energy and water-related energy are expected to be less with the Intensified Land Use Alternative compared to the Plan as this alternative would develop a more intense land use pattern with increased infill and compact development which tends to be more efficient than large lot development. For transportation, the GHG emissions are projected to be less under this alternative compared to the Plan because of decreased VMT. This alternative would improve regional GHG emissions compared to the Plan.

As with the Plan, this alternative would reduce per capita GHG emissions from cars and light-duty trucks compared to the 2005 baseline so it would achieve both the 8 percent target set for 2020 and exceed the 19 percent set for 2035, set pursuant to SB 375.

Since meeting the regional reduction goals from cars and light-duty trucks would not be sufficient to meet the state's overall GHG reduction goals this alternative would conflict with AB 32 and SB 32. The Plan would have the same impact as this alternative.

Hazards and Hazardous Materials

Hazardous materials impacts to the public or the environment associated with construction activities and operation under this alternative would be the same as the impacts under the Plan. This is because of the numerous federal, state, and local requirements and regulations that minimize the creation of significant hazards to the public or the environment through the routine transport, use, or disposal of hazardous materials; through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment and through handling of hazardous materials, substances, and waste within 0.25 mile of an existing or proposed school. These existing requirements and regulations would apply equally to the different projected land use patterns and planned transportation network improvements of this alternative and Plan, so impacts would be the same. The same is true for existing requirements and regulations addressing potential safety hazards and excessive noise within an airport land use plan or within two miles of a public or public use airport, so airport-related safety and noise impacts to people residing or working in the plan area would be the same under this alternative.

The more compact land use pattern under this alternative would be more transit-oriented than the Plan and could complement emergency evacuation plans that rely in part on public transit to a greater degree. Therefore, this alternative would result in less impacts associated with impairing the implementation of adopted emergency response and emergency evacuation plans.

Hydrology and Water Quality

Impacts associated with hydrology and water quality under this alternative would be less than under the Plan because its more compact land use would result in disturbance to a smaller land area during construction activities and would permanently convert a smaller amount of land to impervious surfaces, such as parking lots, buildings, roadways, highways, and other paved areas, as compared to the Plan. The decreased land area subject to construction disturbance would decrease potential for short-term discharge of pollutants from construction sites into surface or groundwater.

The decreased land area permanently converted to impervious surfaces would decrease the potential volume and increase the water quality of stormwater flows relative to the Plan. Less impervious surface also would reduce interference with groundwater recharge and result in less alteration of drainage patterns in a manner that would increase the potential for substantial erosion, siltation, and flooding. This alternative would require less storm drainage system capacity than the Plan because of its conversion of reduced land area to impervious surface area. In addition, the housing mix of this alternative would include a smaller share of single-family homes, which would result in less managed landscaping areas and associated pollutants such as nutrients, herbicides, and irrigated runoff, which in turn could adversely affect surface and groundwater quality. Impacts to groundwater recharge, erosion, siltation and flooding would be less than the Plan but would remain significant.

Land Use and Planning

The more compact land use pattern of this alternative provides more connectivity within existing communities, so it would not physically divide any existing communities. This impact is the same as under the Plan. New roadway or highway improvements can physically divide existing communities by providing physical barriers where none previously existing. Expansion of existing roadways and highways also can physically divide existing communities to the extent that wider facilities with additional lanes represent greater physical barriers than narrower facilities. The planned transportation improvements of this alternative would be generally the same as the Plan network, which means it would result in similar impacts from physically dividing existing communities.

Because this alternative would include a more compact land use that would result in decreased land disturbance relative to the Plan, it would have less impacts to resources within the region including agriculture, biological resources, and recreational land. Alternative 3 would result in similar impacts with regard to physically dividing an established community due to the similar scale and number of transportation projects being constructed. This alternative would have greater potential to conflict with local land use plans as the greater amount of infill projected may be beyond what is currently considered in some local land use plans. This impact would be greater than the Plan and would be significant.

Mineral Resources

Alternative 3 could result in less loss of availability of known mineral resources that would be of value to the region and the residents of the state, as well as locally important mineral resources, due to the reduction in land that would be converted to urban land potentially covering more mineral resource extraction opportunities. Transportation network improvements would occur similar to the Plan, requiring a comparable amount of aggregate resources to be used for the construction of the

transportation network improvements. Although transportation network impacts would be similar under this alternative, overall impacts would be less than the Plan and would remain significant.

Noise

This alternative would generate noise levels generally similar to those that would be generated under the Plan because the same total population, housing, and employment are assumed. However, the more compact land use pattern of this alternative would direct less housing growth to in non-urbanized areas, decreasing construction and operational noise levels relative the Plan in areas that tend to have lower existing noise levels than more developed communities. Noise thresholds would be less likely to be exceeded.

The projected land use pattern of this alternative, while more compact than the Plan, would not result in land use types that would result in different levels of vibration or groundborne noise. There would potentially be less construction-related noise impacts under this alternative due to the approximately 9,299 fewer acres of land area that would be subject to disturbance during construction activities associated with the less compact land use pattern. This would decrease the number of separate construction sites, which would decrease overall noise levels associated with construction activities relative to the Plan.

The planned transportation improvements of this alternative would include the same lane miles of roadway and highway improvements, and this would also not result in significantly different levels of vibration or groundborne noise relative to the planned transportation improvements identified in the proposed Plan. This impact is the same under this alternative and would remain significant. With regard to aviation noise, impacts would be similar to the Plan as this alternative would not affect airport capacity.

Population and Housing

Impacts related to population and housing would be similar under all alternatives, because the same number of people and dwelling units are assumed. The more compact land use pattern of this alternative combined with the same lane miles of roadway and highway improvements would not result in displacement of substantial numbers of people or existing housing that necessitates the construction of replacement housing elsewhere. This impact is the same as the Plan and would remain significant.

Public Services

This alternative is anticipated to result in public service impacts similar to those that would be generated under the Plan, because the same total population, housing, and employment are assumed. However, this alternative could result in less demand on the ability to achieve local levels of service due to the more compact land use pattern that makes it more efficient to serve the population. This impact is less than the Plan. The planned transportation improvements of this alternative would have the same public services impacts as the Plan. It is possible that denser development in urban areas, although more efficient from a service perspective, could result in the need for more police and fire services from a demand perspective resulting in a need for new facilities to maintain service ratios. Nonetheless, due to the more efficient land use pattern, this impact would be less than the Plan. Similarly, the more compact land use pattern would more efficiently serve the population for schools and libraries. However, there still could be need for new facilities resulting in physical impacts. As such this impact would be significant, but less than the Plan.

Recreation

With the same population growth across all alternatives impacts would be expected to be similar. However, with more compact development, there could be increased pressure on urban parks which are currently overburdened. With higher population density, there would more use of the same parks, leading to greater deterioration of existing recreational facilities in urban areas. As such, impacts could be greater than the Plan.

Transportation, Traffic, and Safety

The Intensified Land Use Alternative would result in greater transportation impacts than the Plan. Alternative 3 would result in slightly lower VMT (total and per capita), less VHD and less VHT. In 2045 Alternative 3 would result in 22.83 VMT per capita, 14,074,675 VHT and 2,619,980 VHD. Comparing these number to the Plan (22.89 VMT per capita, 14,130,874 VHT and 2,668,229 VHD). Despite the overall reduction in VMT and VHD as compared to the Plan, this alternative does not maximize mobility and accessibility for all people and goods in the region to the extent of the Plan because it results in more severe localized traffic congestion conditions with adverse mobility and reliability consequences for goods and people (increased vehicle and truck delay). The effects of growth and other external factors are included in the Regional Travel Demand Model that produces the results reported above. Because these external factors are modeled, the cumulative effects of regional growth are captured in the VMT, VHT and VHD data for this alternative. This alternative could increase localized congestion and compromise accessibility to destinations which would result in more adverse effects related to safety considerations for pedestrians, cyclists, and motorists. Hence, this Alternative could have somewhat more adverse

impacts than the Plan related to design hazards. Regarding emergency access, the more dense land use patterns of this alternative could result in more efficient emergency access. Impacts would be less than the Plan.

Tribal Cultural Resources

This alternative would result in less impacts to tribal cultural resources when compared with the Plan. Under this alternative, there would be 9,299 fewer acres of greenfield land consumed, which would reduce the potential to impact previously undiscovered tribal cultural resources, such as archaeological resources, sacred sites, or human remains. Due to the more compact land use pattern and the reduction in greenfield consumed, impacts would be less under this alternative.

Utilities and Service Systems

This alternative is anticipated to result in impacts to utilities and service systems similar to those that would be generated under the Plan because the same total population, housing, and employment are assumed. With less single-family homes, this alternative could decrease demand for surface and groundwater supplies because such housing units have higher demand for water. Single family homes typically required additional water due to increased irrigation demand for landscaping areas and additional appliances and fixtures that use potable water (e.g., sinks, toilets, showers). As a result, this alternative could exceed the capacity of existing water storage, conveyance, distribution, and treatment facilities to a lesser degree than the Plan. These impacts of this alternative are less than under the Plan but would remain significant.

This alternative could result in greater impacts related to adversely affecting the capacity of the necessary utility conveyance and distribution systems (e.g. wastewater, storm drain,) due to the more compact land use pattern that, although more efficient, in many urban areas is aging and may not be capable of supporting increased loads. Overall the alternative would demand less water and energy during construction compared to the Plan. All alternatives would be required to follow the same federal, state, and local statutes and regulations related to solid waste. This alternative would have the same impact related to solid waste generation and conflicts with solid waste management and reduction statutes and regulations

Wildfire

The Intensified Land Use Alternative would result in fewer impacts related to wildfires than the Plan. This alternative would result in fewer housing units in wildfire zones compared to the Plan. Therefore,

fewer people and structures would be placed within proximity to wildfire-prone areas at urban-wildland interfaces. Impacts would be less than the Plan.

4.4 ABILITY OF ALTERNATIVES TO MEET THE PROJECT OBJECTIVES

The effectiveness of each of the alternatives to achieve the basic objectives of the Plan has been evaluated in relation to the statement of goals and guiding principles described above. Although the No Project Alternative is not capable of meeting most of the goals of the Project, it has been analyzed, as required by CEQA.

The Existing Plans – Local Input Alternative, meets some but not all the project goals. Specifically, it is less effective than the Plan in meeting Plan goals:

1. Encourage regional economic prosperity and global competitiveness. The Existing Plans – Local Input Alternative would not include the strategies in the Plan (for example, strategies related to job centers and goods movement) that will enhance regional prosperity.
2. Improve mobility, accessibility, reliability, and travel safety for people and goods. As demonstrated above, the Existing Plans – Local Input Alternative would not reduce VMT to the same extent as the Plan and would not achieve the GHG reduction goals set by CARB.
3. Enhance the preservation, security, and resilience of the regional transportation system. The Existing Plans – Local Input Alternative does not include the Plan’s safety and resilience strategies and therefore would not achieve this goal.
4. Increase person and goods movement and travel choices within the transportation system. The Existing Plans – Local Input Alternative does not include the goods movement strategies aimed at increasing person and freight mobility, including critical access projects.
5. Reduce greenhouse gas emissions and improve air quality. The Existing Plans – Local Input Alternative would not reduce greenhouse gas emissions or improve air quality to the same extent as the Plan.
6. Support healthy and equitable communities. The Existing Plans – Local Input Alternative would not include the regional strategies for complete streets and jobs/housing balance and planning for trips that reduce dependence on solo car trips.
7. Adapt to a changing climate and support an integrated regional development pattern and transportation network. The Existing Plans – Local Input Alternative would not include the “green

region” strategies such as supporting climate action plans, renewable energy production, and integrated food production.

8. Leverage new transportation technologies and data-driven solutions that result in more efficient travel. The Existing Plans – Local Input Alternative would not include strategies such as promoting low emissions technologies, shared rides, car and bike sharing and scooters, as well as improving access to services through technology.
9. Encourage development of diverse housing types in areas that are supported by multiple transportation options. The Existing Plans – Local Input Alternative would not include the Plan’s strategies to focus growth near destinations and mobility options.
10. Promote conservation of natural and agricultural lands and restoration of critical habitats. The Existing Plans – Local Input Alternative would result in the consumption of more natural lands and habitat lands as compared to the Plan.

The Intensified Land Use Alternative is capable of meeting most of the goals of the Plan. However, because it would place a large portion of growth in existing communities it may conflict with local plans or place a burden on some community facilities such as parks and other services to a greater extent than the Plan. Therefore, it is less effective in meeting the following goal:

6. Support healthy and equitable communities. The Intensified Land Use Alternative would not achieve this goal to the same extent as the Plan due to its focus on compact development beyond what is currently contemplated under the Plan. The emphasis on development in urban communities may result in overuse of parks and other services (police, fire, schools, library) which has the potential to result in quality of life impacts in urban areas.

As further described below, consideration of alternatives requires careful examination of the multiple facets of each alternative. For example, while urban development may preserve farmland or other natural resources, it could place a burden on urban parks, schools, police and fire services, and aging infrastructure.

4.5 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

Section 15126.6 of the *State CEQA Guidelines* requires that an “environmentally superior” alternative be selected among the alternatives that are evaluated in the EIR. In general, the environmentally superior alternative is the alternative that would be expected to generate the fewest adverse impacts. If the No

Project alternative is identified as environmentally superior, then another environmentally superior alternative shall be identified among the other alternatives.

For purposes of this PEIR, the impacts associated with reducing global GHG emissions and regional air pollutants must be examined alongside the other adverse impacts that are caused by increasing the density and intensity of the region's development patterns and, for example, bringing people closer to sources of air pollutants such as transit corridors and freeways (even though these sources would have fewer emissions in the future, despite increasing traffic, due to emission controls). The tension between CEQA's mandate to reduce all types of impacts to the maximum extent feasible, and the statutory mandates of reducing GHG emissions under AB 32, SB 32 and SB 375, is a well-recognized CEQA compliance challenge.⁹ CEQA does not provide any legal mechanism for "weighting" environmental impacts, and scoring some categories of impacts as "more important" and others as "less important." Instead, CEQA is structured to require the disclosure of all impacts for each alternative and the Plan, to foster informed decision making and to disclose the inherent trade-offs between different types and magnitudes of impacts associated with different alternatives.

As indicated by the comparative analysis, the Plan and each Alternative result in many impacts that are "significant and unavoidable" under CEQA. Alternative 3, the Intensified Land Use Alternative, would result in somewhat less adverse impacts for nine of the 20 environmental issues that were analyzed. The anticipated increases in the density and intensity of development within the region's established communities under Alternative 3 would result in more localized impacts that are greater than the Plan in four areas (land use; noise; public services and recreation). This alternative would also consume more agricultural land.

Of the three alternatives, the Intensified Land Use Alternative would be considered the environmentally superior alternative due to fewer impacts to reduced VMT and GHG emissions, and because it would substantially restrict the use of land for single-family development, in a manner that differs from the adopted general plans of the six counties and 191 member cities in the SCAG region. This alternative concentrates development in existing urban centers, and near transit stations and activity centers. As such, the Intensified Land Use has less impact on rural and undeveloped areas, specifically greenfields. However, the Intensified Land Use Alternative would have more severe impacts on the built environment (i.e., seven CEQA impact categories: land use; noise and vibration, public services, traffic delay, and overtaxed recreation facilities in the vicinity of HQTAs).

⁹ Adams, Tom (California League of Conservation Voters), and Amanda Eaken and Anne Nothoff (Natural Resources Defense Council). 2010. Tackling California's Global Warming Challenge: A Guide to SB 375, by Tom Adams (California League of Conservation Voters), p. 24.

While the Intensified Land Use Alternative would be considered the environmentally superior alternative because of the more compact land use patterns fewer emissions and reduced VMT, this alternative requires implementation of the same mitigation measures required for the Connect SoCal Plan and would not resolve any of the significant and unavoidable impacts of the Plan. However, the more intensified and compact land use development pattern would result in somewhat less adverse impacts to energy, land, and water resources due to the denser pattern of development. The Intensified Land Use Alternative would also achieve greater overall reductions in criteria air pollutants and greenhouse gas emissions, as a result of the more compact pattern of land use development. The level of impact for the Existing Plan – Local Input Alternative and the Intensified Land Use Alternative varies in relation to the land use development pattern, but neither is capable of avoiding any of the significant and unavoidable impacts of the Plan, because those impacts are primarily associated with net increase in population anticipated for the SCAG region. Therefore, the comparative impacts between the alternatives and the Plan are primarily related to the level of severity of the impacts.

Similarly, the No Project Alternative does not avoid the significant and unavoidable impacts of the Plan, and in several instances the impacts would be more adverse due to the failure to achieve reductions in the consumptive use of land, energy, and water resources achieved through the policies and program embedded in the Plan that facilitate a more efficient use of these resources.

As discussed throughout this PEIR, SCAG has no land use authority; rather it sets regional land use policy. SB 375 addresses the land use component (in the context of transportation planning) of statewide efforts to achieve AB 32 GHG reduction goals that include all sectors of the economy. In order to meet the SB 375 targets for statewide GHG reductions, CARB identified that SCAG must plan to reduce GHG emissions by 19 percent by 2035. SCAG has developed the SCS (the regional land use policy component of Connect SoCal) which sets forth land use strategies to meet these GHG emissions reduction targets. Actual implementation of the SCS will be undertaken by local jurisdictions through general plans and specific plans and through actions on individual projects.

While the Intensified Land Use is one potential generalized land use scenario that results in achieving CARB GHG targets (as well as reducing impacts on open space and agricultural lands), the Intensified Land Use Alternative would have other impacts. For example, the Intensified Land Use Alternative would result in more development in urban areas potentially overloading infrastructure in some areas. The jurisdiction that is anticipated to receive most of the infill development under this alternative is the City of Los Angeles. It is possible, that the zoning in the City of Los Angeles would be sufficiently flexible to accommodate the additional units by 2045, but it is not certain that it would. This scenario assumes that very little development would be approved outside urban areas, which could require zoning

changes or land use interventions beyond those currently in place. In addition, as urban areas become denser (more units per acre), urban infrastructure is used more:

- Water and sewer lines are required to carry more, greater than the current capacity, which could result in the need to construct additional capacity in the older infill areas at significant cost.
- Demand for police and fire services increases requiring expansion of existing stations and service personnel (although significant environmental impacts are not anticipated from such construction).
- Parks are used more, resulting in potential crowding and/or over use, with facilities becoming worn and substandard (grass becomes over used and dies, equipment breaks, etc.) and/or the need to construct more parks and recreational facilities.

Passenger vehicle transportation infrastructure cannot accommodate peak period volumes creating increased congestion, noise and air emission impacts. Increasing population in the infill core areas could also reduce mobility for goods movement which cannot use alternative modes during peak periods, resulting in more trucks in stop and go traffic, impacting air quality, and noise. While development outside urban areas would likely require the construction of new infrastructure, it would occur in less populated areas and would expose fewer people to construction impacts. Also, in general infrastructure in less urban areas has greater available capacity since infrastructure is generally sized for capacities that can accommodate substantially more than the current densities (parks, police stations, water lines, etc. have minimum sizes that can generally accommodate more than rural level density). New development on the periphery is often closer to higher capacity sewer trunk lines, treatment plants and water wells, lowering infrastructure costs compared to retrofitting older existing urban areas.

Furthermore, as more people are located in the same area, urban impacts increase. Congestion increases, noise and air emissions in proximity to sensitive receptors (residences, schools, hospitals, etc.) also increase.

Each community must determine what level of population it can support – balancing infrastructure capacity and population density. In developing the Plan, SCAG has satisfied its obligation under SB 375 to identify a policy and growth pattern that meets desired GHG reduction goals.

The Plan provides general guidance on location of development. The Plan does not impose specific land use controls. This EIR evaluates a number of potential scenarios. It will be up to each jurisdiction to interpret the Connect SoCal land use strategies and through ongoing monitoring of key performance measures (in cooperation with SCAG), monitor GHG reductions. Through ongoing monitoring SCAG

will adjust regional policy as needed (in the next RTP/SCS or in interim amendments if needed) to ensure that the region complies with applicable State law including AB 32 and SB 375.

SCAG is not rejecting the Intensified Land Use Alternative or any alternative with increased density and/or greater percentage of high-density housing that might fall between the Intensified Land Use Alternative and the Plan as a possible land use scenario for 2045. Rather, SCAG is rejecting the inclusion of policies in the Plan that would impose extensive land use intervention (to mandate specific land use densities and/or specific locations) with local jurisdictions because SCAG has no land use authority and no mechanism exists to impose detailed land use changes.

5.0 OTHER CEQA CONSIDERATIONS

Section 15126 of the *California Environmental Quality Act (CEQA) Guidelines* states that an Environmental Impact Report (EIR) must include a discussion of the following topics:

- growth-inducing effects of the proposed project
- significant environmental effects which cannot be avoided if the proposed project is implemented
- significant irreversible environmental changes which would be involved in the proposed project should it be implemented; and

In addition, Section 15128 of the *State CEQA Guidelines* requires a brief statement of the reasons that various possible effects of a project have been determined not to be significant and, therefore, are not discussed in detail in the EIR. This PEIR analyzed all potential effects of the project as described in Appendix G of the *State CEQA Guidelines*, therefore, there is no listing of effects determined not to be significant.

5.1 SIGNIFICANT ENVIRONMENTAL EFFECTS OF THE PROJECT THAT CANNOT BE AVOIDED IF THE PROPOSED PROJECT IS IMPLEMENTED

An EIR must identify significant impacts associated with a proposed agency action that could not be mitigated to a less than significant level. Many of the impacts that are determined to be significant and unavoidable could be mitigated to less than significant at the project level. However, this PEIR evaluates impacts at a programmatic level, and detailed site plans and project descriptions are not available. Therefore, without the ability to evaluate each project that could occur as a result of the Plan, these impacts were determined to be significant and unavoidable.

Table ES-5, Summary of Project Impacts, Mitigation Measures, and Residual Impacts, which is contained in the **Executive Summary** of this PEIR, and **Sections 3.1 through 3.21** of this PEIR provide a comprehensive identification of the environmental effects of the SCAG's proposed Connect SoCal Plan, including the level of significance both before and after mitigation.

Section 15126.2(c) of the *CEQA Guidelines* requires that an EIR (including a PEIR) describe any significant impacts that cannot be avoided, even with the implementation of feasible mitigation measures. Implementation of the Plan would result in significant and unavoidable project-related and/or cumulative impacts in the following areas:

- **Aesthetics:** Implementation of transportation projects contained in the Plan and development projects anticipated to occur under the Plan may result in the conversion of open space or vacant lands to new uses. Areas potentially affected include designated open space visible from USFS, Caltrans, county, and city designated scenic vistas. The Plan would also have the potential to impact rock outcroppings or other scenic elements such as historic resources within eligible state scenic highways. Many of the transportation projects and the HQTAs are in areas with designated scenic resources including historic buildings and scenic rock outcroppings. Therefore, there is potential for the Plan to affect these resources. Implementation of transportation projects contained in the Plan and development anticipated to occur under the Plan has the potential to degrade the visual character of project sites, constituting a significant impact. Implementation of transportation projects contained in the Plan and development anticipated to occur under the Plan has the potential to create new substantial sources of light or glare, constituting a significant impact.
- **Agriculture and Forestry Resources:** Implementation of transportation projects as well as growth anticipated under the Plan would have the potential to convert the following to non-agricultural use: Prime Farmland, Farmland of Statewide Importance, Unique Farmland and Farmland of Local Importance. Implementation of the transportation projects and growth anticipated under the Plan would have the potential to conflict with land managed pursuant to Williamson Act contracts constituting a significant impact. Implementation of the transportation projects and anticipated growth under the Plan has the potential to conflict with existing zoning for forest land, timberland, or timberland zoned Timberland Production. Implementation of transportation projects and anticipated growth under the Plan would result in significant impacts with regards to the loss of forest land or conversion of forest land to non-forest use. Implementation of transportation projects and anticipated growth under the Plan would result in significant impacts with regards to the conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use.
- **Air Quality:** At the regional level, criteria pollutant emissions would be mostly reduced compared to existing conditions and the region would meet air quality standards. In 2045, when compared to existing conditions, on-road mobile-source PM_{2.5} would increase in Imperial, Riverside, and San Bernardino Counties and mobile-source PM₁₀ would increase in Imperial, Orange, Riverside, and San Bernardino Counties due to increasing traffic. On-road mobile-source particulate matter emissions would remain the same or decrease from existing conditions in the other counties. Within the SCAB (which is likely indicative of the region as a whole), SCAQMD indicates that total pollutant emissions are being reduced through at least 2031, except for small increases in SO_x and PM_{2.5}. Individual project emissions may result in significant construction and/or operational emissions as compared to thresholds of significance identified by each air district which would result in a

cumulative impact. Over the lifetime of the Plan numerous transportation projects and land use development projects would be implemented. The construction of these projects could expose sensitive receptors to substantial pollutant concentrations.

- **Biological Resources:** Implementation of transportation projects identified in the Plan and development projects anticipated to occur under the Plan would affect biological resources. Direct impacts that could occur during construction of some projects include direct loss of sensitive plant and/or wildlife species resulting from injury, death, or disturbance of these species. Direct impacts may also occur through direct habitat loss and fragmentation during construction, displacement of sensitive species due to construction noise or during operation, accidental introduction of non-native plants by construction equipment or during maintenance and general operation, introduction of new lighting sources, and dust and noise during construction and operation. Implementation of transportation projects identified in the Plan and development projects anticipated to occur under the Plan would have a substantial adverse effect on riparian habitats and other sensitive natural communities. Implementation of transportation projects identified in the Plan and development projects anticipated to occur under the Plan would have a substantial adverse effect on wetlands. Implementation of transportation projects identified in the Plan and development projects anticipated to occur under the Plan would interfere substantially with the movement of native resident or migratory fish, or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites directly, as a result of habitat conversion to accommodate transportation projects and growth under the Plan, or indirectly through interruption of movement or migratory corridors caused by construction and operation of infrastructure for transportation projects and adjacent projects that may result from improved transportation access. Implementation of transportation projects as well as land use and transportation strategies identified in the Plan have the potential to conflict with local policies and ordinances related to biological resources. Implementation of transportation projects identified in the Plan and development projects anticipated to occur under the Plan would have a potential to result in conflicts with the provisions of applicable adopted HCPs and NCCPs because some planned major transportation projects and development projects may occur in or adjacent to lands protected under these plans, constituting a significant impact.
- **Cultural Resources:** The Plan has the potential to effect historical resources in the SCAG region, including sites listed in the NRHP. Transportation projects and anticipated growth under the Plan have the potential to cause a substantial adverse change in the significance of archaeological resources in the SCAG Region, pursuant to *CEQA Guidelines* Section 15064.5, constituting a significant impact. The Plan includes transportation projects that have the potential to disturb human remains

interred outside of formal cemeteries or those interred in Native American sacred sites, constituting a significant impact.

- **Geology and Soils:** Implementation of transportation projects included in the Plan as well as growth under the Plan, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects may result in significant impacts from soil erosion or the loss of topsoil. The potential direct impacts on paleontological resources related to implementation of transportation projects and development projects anticipated to occur under the Plan, could result in substantial alteration or removal of a significant paleontological resource from construction activities, and is considered significant.
- **Greenhouse Gas Emissions:** Implementation of the Plan could conflict with CARB's 2017 Scoping Plan or any applicable plan, policy or regulation adopted for the purpose of reducing emissions of GHGs. Furthermore, while GHG emissions are anticipated to decrease compared to existing conditions, they are not anticipated to be reduced sufficiently to meet the targets established for California.
- **Hazards and Hazardous Materials:** Implementation of the Plan would increase the risk of significant hazards to the public or the environment through the routine transport, use, or disposal of hazardous materials as well as through reasonably foreseeable upset conditions. Transportation projects and land use strategies included in the Plan may increase the risk of emitting hazardous materials within one-quarter mile of a school. Furthermore, the Plan may cause transportation projects and development to be located on sites included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. The Plan would not in itself result in a safety hazard; however, increased population growth that would occur by 2045 would result in increased air traffic in major commercial airports in Southern California which could result in significant safety impacts. The Plan would result in significant impacts in regards to impairing implementation of or physically interfering with an adopted emergency response plan or emergency evacuation plan.
- **Hydrology and Water Quality:** Grading, excavation, and other construction activities associated with implementation of transportation projects and development projects anticipated to occur under the Plan, could impact water quality due to erosion resulting from exposed soils that may be transported in stormwater runoff. Given that most of the groundwater basins in the Plan area are already in a state of overdraft, future development may result in a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of preexisting nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted). Implementation of transportation projects as well as anticipated development under the

Plan would occur within watersheds that have impaired water bodies. Many of the impaired water bodies are located near a freeway, transit, or rail projects included in the Plan. Several projects may impact water bodies by placing fill material within a stream channel. The Plan has the potential to change existing drainage patterns. Transportation projects such as lane widening projects, new highways, as well as bridges/tunnels, and transportation facilities projects that could cross existing creeks, water crossings, rivers or be expanded into wetland areas may impact water bodies by placing fill material within a stream channel. the Plan has the potential to alter existing drainage patterns. Implementation of the Plan's transportation projects as well as land use strategies may increase impervious surfaces, which in turn could increase urban runoff if not regulated, resulting in the transport of greater volumes of polluted water into storm drain systems. With regard to flooding, implementation of transportation projects and development projects anticipated to occur under the Plan built in low-lying areas or in proximity to waterways and/or dam inundation zones may be subject to flood hazards. An increase in impervious surfaces would increase water runoff and potentially affect groundwater recharge rates and water quality in the basins. Therefore, the Plan may conflict with or obstruct the implementation of a water quality control plan or sustainable groundwater management plan and mitigation measures are required.

- **Land Use:** Physical division of an established community could occur as a result of real or perceived barriers to pedestrians, bicyclists, and motorists. Short-term construction related impacts could result from disturbances due to construction equipment; these impacts are discussed under other impact categories (e.g., Noise, Aesthetics, and Air Quality). Long-term impacts could result from the completion of new or expanded roadways or transit facilities in existing communities. , since the Plan's planning horizon year is beyond the timeline of many of the most recent general plans, implementation of the Plan's transportation projects and land use strategies could potentially result in changes in the land use patterns in the region that may facilitate land use changes in some areas. Therefore, there is potential for inconsistencies with general plans as well as regional conservation plans.
- **Mineral Resources:** Transportation projects contained in the Plan and development projects anticipated to occur under the Plan would require substantial amounts of aggregate resources for construction purposes, constituting a significant impact. Transportation projects contained in the Plan and development projects anticipated to occur under the Plan have the potential to impact availability of mineral resources if they are constructed in mineral resource zones.
- **Noise:** Implementation of transportation projects and development projects anticipated to occur under the Plan would likely result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other

agencies, constituting a significant impact. Implementation of the transportation projects and the construction of land use development projects anticipated to occur under the Plan would generate varying levels of vibration and groundborne noise. Implementation of transportation projects and development anticipated to occur under the Plan may result in exposure of persons to or generation of significant noise levels from aircrafts and other airport activity (including ground transportation) constituting a significant impact.

- **Population and Housing:** Due to the Plan's land use strategies that focus on compact development, there is potential to induce growth in some areas of the region although overall the Plan accommodates anticipated growth rather than inducing growth. The construction of transportation projects that require expansion of existing or designation of new ROWs have the potential to result in the displacement of existing people and housing, necessitating the construction of replacement housing, thereby constituting a potentially significant impact.
- **Public Services:** Implementation of Connect SoCal could affect the need for construction of new or physically altered fire protection and emergency response facilities in order to maintain acceptable service ratios. Although the location and size of such facilities is not yet known, impacts could occur, requiring the consideration of mitigation measures. The Plan could contribute to the need for construction of new or physically altered police facilities in order to maintain acceptable service ratios. The Plan could contribute to substantial adverse physical impacts associated with the construction and subsequent operation of new or physically altered school facilities in order to maintain acceptable service ratios. The Plan could contribute to substantial adverse physical impacts associated with the construction of library facilities in order to maintain acceptable service ratios.
- **Parks and Recreation:** Transportation projects and growth under the Plan would have the potential to increase use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration would occur, constituting a potentially significant impact.. Implementation of the Plan would result in additional linear recreation facilities, including a regional greenway network, a regional bikeway network, and local bikeway networks, the construction of which might have an adverse physical effect on the environment.
- **Transportation and Traffic:** The Plan could conflict with or be inconsistent with *CEQA Guidelines* section 15064.3(b). The Plan also has the potential to result in inadequate emergency access, or to substantially impair an adopted emergency response plan.
- **Tribal Cultural Resources:** Transportation projects and anticipated growth under the Plan have the potential to cause a substantial adverse change in the significance of tribal cultural resources in the

SCAG region, defined in Public Resources Code section 21074, as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe.

- Utilities and Service Systems:** Many of the transportation projects within the Plan have the potential to generate a substantial amount of solid waste during construction through grading and excavation activities, as well as debris resulting from removal of structures, due to the volume of solid waste debris expected to be generated with implementation of the Plan and lack of identified landfill capacity, impacts would be significant. Implementation of some transportation projects and anticipated growth under the Plan would involve construction of new storm water drainage facilities and may require construction of new or expanded wastewater treatment facilities. Implementation of the Plan could result in a determination by one or more of the wastewater treatment providers in the region that there is inadequate capacity to serve the future population demand in addition to the provider's existing commitments, resulting in a significant impact. Implementation of the Plan, could require or result in the relocation or construction of new or expanded water facilities, the construction or relocation of which could cause significant environmental effects. The Plan could result in insufficient water supplies from existing entitlements and resources resulting in significant impacts.
- Wildfire:** Transportation projects and anticipated development projects may be located in wildfire-prone areas which could potentially exacerbate wildfire risks and thereby expose project occupants to pollutant concentrations from wildfires or the uncontrolled spread of wildfires, particularly those populations living down wind of the fire. Development may continue to occur in urban/wildlands interface areas which would necessitate infrastructure such as power poles that could result in wildfire risk. Due to the anticipated increased consumption of greenfields under the Plan, development may continue to occur in urban/wildlands interface areas which would result in significant risks for people and structures

All other environmental impacts (project-specific and cumulative) are either less than significant or can be mitigated to a less than significant level.

5.2 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

Section 15126.2(d) of the *State CEQA Guidelines* states that an EIR must include a discussion of any significant irreversible environmental changes that would be caused by a proposed project. Specifically, Section 15126.2(d) states:

Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or nonuse thereafter

unlikely. Primary impacts and, particularly, secondary impacts (such as highway improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified

For purposes of this analysis, the Plan would result in significant irreversible environmental changes if it:

- involves a large commitment of nonrenewable resources that would commit future generations;
- results in irreversible damage from environmental accidents; or
- irretrievable commitments of nonrenewable resources to justify current consumption.

5.2.1 Large Commitment of Nonrenewable Resources that would commit future generations

The Plan would result in the irreversible consumption of nonrenewable resources. The irreversible commitment of limited resources is inherent in any development project or, in the case of the Plan, combined transportation and development projects. Resources anticipated to be irreversibly committed over the timespan of the construction activities related to the Plan include, but are not limited to, lumber and other related forest products; sand, gravel, and concrete; petrochemicals; construction materials; steel, copper, lead, and other metals; and water.

Growth and land use changes that would result from implementation of the Plan would likely commit future generations to those uses. Once established, land use patterns can be difficult to change and/or significantly influence without considerable political, social, and economic cost. The development pattern reflected in the Plan represents a commitment of these areas to those uses for the foreseeable future. The Plan emphasizes a compact land use pattern, the result is more efficient use of urban land as well as land at the urban edges or in undeveloped areas of the region. As a secondary result, per capita use of many nonrenewable resources decreases under this Plan. These include: lower per capita use of energy and fuels; less conversion of agricultural, open space, and habitat lands; lower per-capita emissions of air pollutants, including GHGs; resulting in slower climate change effects over time.

However, construction activities related to the proposed project would nevertheless result in the irretrievable commitment of nonrenewable energy resources, primarily in the form of fossil fuels (including fuel oil), natural gas, and gasoline for automobile and construction equipment and aggregate supply used in construction.

With respect to operation activities, compliance with all applicable building codes, as well as project mitigation measures or project requirements, would help ensure that natural resources are conserved or recycled as feasible. It is also possible that new technologies or systems will emerge, or will become more cost-effective or user-friendly, that will further reduce the region's reliance upon nonrenewable natural resources; however, even with implementation of conservation measures consumption of natural resources would generally increase with implementation of the Plan.

Furthermore, growth generally results in long-term increase in the demand for electricity and natural gas supplies and distribution. However, the Plan and other federal and state energy efficiency standards will result in lower per-capita demand by encouraging development in urban areas; encouraging energy conservation in new construction and existing buildings; and reducing the infrastructure energy demands by encouraging alternative transportation such as bicycling, walking, and public transit. Furthermore, the Plan will result in lower per-capita VMT through the horizon year.

The region also has multiple nonrenewable resources including agricultural lands, open space, habitat areas, and mineral resources areas that contain aggregate, oil, and natural gas. Increased levels of development outside of already developed areas could result in permanent loss or other adverse impacts to these resource areas.

The Plan would result in the conversion of 41,546 acres of greenfield to urbanized uses, however, this area of potential impact is much smaller that would otherwise occur without regional efforts to encourage more compact growth. By increasing density in urban areas and decreasing the footprint of growth, pressures to convert agricultural and natural lands outside areas planned for growth are decreased.

5.2.2 Irreversible Damage from Environmental Accidents

Any growth in the region includes the potential for irreversible damage from environmental accidents. For example, greater densities expose more people in the same area to unexpected environmental events such as fire, flood, and/or earthquake which could lead to irreversible damage. In addition, irreversible changes to the physical environment could occur from the accidental release of hazardous materials associated with transport on roadways as more hazardous materials are transported through the region and more people are located in closer proximity to hazardous materials threats.

However, this exposure would exist under any growth scenario. Federal and state regulations require the Plan to accommodate expected growth in the region based on market-based forecasts. The SCS minimizes the footprint of that growth. Implementation of the Plan does not, in and of itself, result in greater potential of irreversible damage from an environmental accident.

5.2.3 Irretrievable Commitments of Nonrenewable Resources to Justify Current Consumption

The region has multiple nonrenewable resources including agricultural lands, open space, habitat areas, and mineral resources areas that contain aggregates and natural gas. Increased levels of development outside of already developed areas could result in permanent loss or other adverse impacts to these resource areas. In addition, increased levels of development throughout the region could result in greater use of nonrenewable resources during construction, including nonrenewable aggregates, or increased use of glass, plastic, and other petroleum products.

While approximately 41,546 acres of undeveloped land would be converted to urban land uses as a result of implementation of the Plan, this area of potential impact is much smaller than would otherwise occur without regional efforts to encourage more compact growth following “smart growth” principles and to direct as much growth as possible to existing developed areas. By increasing the density of development, and decreasing the footprint of growth, pressures to convert agricultural and open space lands outside areas planned for growth are decreased.

New growth generally results in additional demand for electricity, natural gas, and propane supplies and distribution. However, the Plan, and other federal and state efforts, will result in lower per-capita demand by encouraging compact development; encouraging energy conservation in new construction and existing buildings; and reducing the infrastructure energy demands by encouraging alternative transportation such as bicycling, walking, and public transit. Furthermore, the Plan will result in lower per-capita VMT through the horizon year (2045). **Section 3.8, Greenhouse Gas Emissions**, of the PEIR further addresses VMT.

Any growth in the region will result in significant irreversible resource commitments. In evaluating the significance of a project’s irreversible resource commitments, CEQA requires a lead agency to consider whether such commitments are “justified” (*CEQA Guidelines* Section 15126.2(c)). As discussed above, and consistent with the project objectives for the Plan (See **Chapter 2.0, Project Description**), the Plan is designed to minimize irreversible resource commitments, thus maximizing opportunities for future generations. While the Plan will result in irreversible resource commitments, by encouraging higher density, less-consumptive development, as compared to the environmental baseline and forecasted conditions, the commitments are justified and beneficial. Therefore, these commitments are considered less than significant.

5.3 GROWTH-INDUCING IMPACTS

Section 15126.2(e) of the *State CEQA Guidelines* requires that growth inducing impacts of a proposed project be considered. Growth inducing impacts are characteristics of a project that could directly or indirectly create economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Growth can be induced in a number of ways, including the elimination of obstacles to growth, or by encouraging and/or facilitating other activities that could induce growth. Examples of projects likely to have growth inducing impacts include extensions or expansions of infrastructure systems beyond what is needed to serve project-specific demand, and development of new residential subdivisions or office complexes in areas that are currently only sparsely developed or are undeveloped. In addition, as set forth in the *CEQA Guidelines*, increases in the population may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental effects. The *CEQA Guidelines* also state that it must not be assumed that growth in an area is necessarily beneficial, detrimental or of little significance to the environment. Induced growth is considered a significant impact only if it directly or indirectly affects the ability of agencies to provide needed public services or if it can be demonstrated that the potential growth significantly affects the environment, that is, that it would result in construction that would adversely affect the environment.

As discussed in **Section 3.14, Population and Housing**, the Plan includes transportation and land use strategies that guide new population growth within existing urbanized areas, HQTAs, underutilized urban areas, and existing suburban town centers. The Plan would strategically target growth near jobs and transit. However, the improved accessibility from the Plan's transportation projects and strategies could also facilitate population and economic growth in areas of the region that are currently not developed, despite policies designed to limit such development. It should be noted that the Plan would result in an overall increase in total VMT which would be expected due to the large increase in regional population, but the more efficient land use patterns and strategies included in the Plan would result in a decrease in per capita VMT compared to the No Project.

Because several variables influence growth, it is difficult to determine how the Plan alone would affect growth. As described in Chapter 3.0, the Plan would affect each environmental issue area directly through transportation projects and strategies and indirectly through land use and strategies that would create a more compact development pattern than if no Plan were in place. Factors that would potentially induce population growth include roads, highways, freeways, rail, and other transportation improvements that provide access to previously undeveloped areas. HOV projects would not be expected to induce growth as they are adding to an existing freeway instead of creating a new freeway. The availability of adequate water supplies, the availability of sewage treatment facilities, the availability of

developable land, the types and availability of employment opportunities, housing supply and costs, commuting distances, cultural and recreational amenities, climate, and local government growth policies contained in general plans and zoning ordinances would also induce population growth. These are contributing factors to consider when evaluating whether the Plan would, in and of itself, induce population growth, but are not necessarily an indication that the Plan is growth inducing.

As discussed above, total population is expected to remain the same with or without the Plan. Generally, the Plan accommodates growth in a manner substantially consistent with local general plans, regional values and visions, and state and federal laws. The Plan would provide greater access to more of the region than the No Project Alternative due to transportation projects and strategies; however, targeting growth in the HQTAs would limit the geographic spread of growth.. Therefore, in general, the Plan could influence and possibly induce growth into specific parts of the region (including areas that are partially urbanized already) by providing new or expanded access. Overall, the Plan would accommodate and facilitate growth in the region.

6.0 LIST OF EIR PREPARERS

Impact Sciences, Inc, has prepared this environmental document under contract to the Southern California Association of Governments. Persons directly involved in the review and preparation of this report include:

6.1 LEAD AGENCY

Southern California Association of Governments

900 Wilshire Boulevard, Suite 1700
Los Angeles, CA 90017

Executive Management

Kome Ajise, Executive Director
Debbie Dillon, Chief Strategy Officer
Darin Chidsey, Chief Operating Officer
Basil Panas, Chief Financial Officer
Joann Africa, Chief Counsel
Julie Loats Shroyer, Chief Information Officer
Sarah Jepson, Acting Director of Planning & Programs
Art Yoon, Director of Policy & Public Affairs

Project Team

Ping Chang, Manager of Compliance and Monitoring
Roland Ok, Senior Regional Planner
Karen Calderon, Associate Regional Planner
Anita Au, Associate Regional Planner
Justine Block, Deputy Legal Counsel

6.2 EIR PREPARER

Impact Sciences, Inc.

811 W. 7th Street, Suite 200
Los Angeles, CA 90017

Jessica Kirchner Flores, AICP, ENV SP, Managing Principal
Doug Kim, AICP, Principal
Lynn Kaufman, CLA, Associate Principal
Jared Jerome, Senior Technical Specialist
Kaitlyn Heck, Air Quality Specialist
Kevin Varzandeh, Project Manager
Raul Castillo, MPL, Staff Planner
Kara Hines Yates, MPS, Publications Manager

6.3 IN ASSOCIATION WITH

Sirius Environmental

ZEV	Zero-Emission Vehicle

8.0 INTRODUCTION

This document provides chapters to be added to the Draft Program Environmental Impact Report (PEIR) to comprise the Final PEIR for Connect SoCal, also known as the 2020-2045 Regional Transportation Plan / Sustainable Communities Strategy (“Plan” or “Project”). This document, together with the Draft PEIR and its technical appendices, comprise the Final PEIR. The document has been prepared by the Southern California Association of Governments (SCAG) in accordance with the California Environmental Quality Act (CEQA).

In accordance with *CEQA Guidelines* Section 15132, the Final PEIR consists of the following:

- (a) The Draft PEIR or a revision of the draft;
- (b) Comments and recommendations received on the Draft PEIR either verbatim or in summary;
- (c) A list of persons, organizations, and public agencies commenting on the Draft PEIR;
- (d) SCAG’s responses to significant environmental points raised in the review and consultation process; and
- (e) Any other information added by SCAG (including minor changes to the PEIR).

A Mitigation Monitoring and Reporting Program is also required, and will be a separate document that must be adopted by SCAG upon certification of the PEIR, pursuant to Public Resources Code Section 21081.6 and *CEQA Guidelines* Section 15097.

The evaluation and response to comments are important elements to the CEQA process, as they allow the following: (1) the opportunity to review and comment on the methods of analysis contained within the Draft PEIR; (2) the ability to detect any omissions which may have occurred during preparation of the Draft PEIR; (3) the ability to check for accuracy of the analysis contained within the Draft PEIR; (4) the ability to share expertise; (5) the ability to discover public concerns.

This document provides revisions to the Draft PEIR made in response to comments, staff review, and/or changes to the proposed project. These revisions also correct, clarify, and amplify the text of the Draft PEIR, as appropriate, and do not alter the conclusions of the Draft PEIR.

8.1 CEQA PROCESS

Notice of Preparation and Public Scoping

A Notice of Preparation (NOP) for this PEIR was issued on January 23, 2019, by SCAG for a 30-day public review period. Two scoping meetings were held on February 13, 2019, at 3:00 pm to 5:00 pm, and at 6:30 pm to 8:00 pm. The meetings were convened in SCAG's main office in Los Angeles, with videoconferencing available at SCAG regional offices in Imperial, Orange, Riverside, and San Bernardino Counties. Videoconferencing was made available at two additional locations in the Cities of Palm Desert (Coachella Valley Association of Governments) and Palmdale. The purpose of these meetings was to provide early consultation for the public to express concerns about the project, acquire information, and make recommendations on issues to be addressed in the PEIR.

The NOP was sent to the State Clearinghouse on January 23, 2019; posted with the County Clerks for the six counties in the SCAG region; and distributed to various federal, state, regional and local government agencies, and other interested agencies, organizations, and individuals. The NOP was made available on SCAG's website at <https://www.connectso-cal.org/Documents/PEIR/NOP-PEIR-ConnectSoCal.pdf>. The NOP was published in 12 newspapers, including the Los Angeles Times, and additional newspapers that address the large geographic reach and diverse population within the SCAG region.

SCAG also conducted 28 open house workshops on the Plan between June and July 2019. The goals of these events were to share the purpose of Connect SoCal, introduce and provide information on policies and strategies under consideration, describe the performance outcomes of the different policy choices, and receive input from participants.

Notice of Availability of the Draft PEIR

The Draft PEIR was submitted to the State Clearinghouse Office of Planning and Research and circulated for public review beginning on December 9, 2019, and ending on January 24, 2020 (SCH # 20199011061), and a Notice of Completion was posted with each of the County Clerks for the six counties in the SCAG region. The PEIR was circulated primarily using electronic mail to more than 2,700 interested parties. The PEIR was mailed directly to approximately 200 interested parties, including federal, state, regional and local agencies, organizations, and major libraries in the region using the U.S. Postal Service certified mail service. Additionally, SCAG placed copies of the Draft PEIR at the offices of SCAG and electronic copies at the 56 public libraries throughout the region and posted the Draft PEIR on its website.

The PEIR was available at the following SCAG Regional Office locations:

SCAG Main Office
900 Wilshire Boulevard, Suite 1700,
Los Angeles, CA 90017

SCAG Riverside County Regional Office
3403 10th Street, Suite 805
Riverside, CA 92501

SCAG Imperial County Regional Office
1405 N. Imperial Avenue, Suite 1
El Centro, CA 92243

SCAG San Bernardino County Regional Office
1170 West 3rd Street, Suite 140
San Bernardino, CA 92410

SCAG Orange County Regional Office
600 South Main Street, Suite 906
Orange, CA 92868

A public workshop was held on January 9, 2020, from 2:00 pm to 3:30 pm at SCAG's Los Angeles Office located at 900 Wilshire Blvd., Ste 1700. This workshop was also a webinar which was available for the public via internet.

Responses to Comments on the Draft PEIR

CEQA Guidelines Section 15088 requires SCAG to evaluate comments on significant environmental issues received from parties that have reviewed the Draft PEIR and to prepare a written response. As stated in *CEQA Guidelines* Sections 15132 and 15362, the Final PEIR must contain the comments received on the Draft PEIR, either verbatim or in summary, a list of persons commenting, and the response of the Lead Agency to the comments received.

A total of 53 comment letters were received by SCAG during the comment period. Among the 53 comment letters, there were 262 unique comments directly related to the Draft PEIR.¹ The responses do not significantly alter the Project, change the Draft PEIR's significance conclusions, or provide new information regarding substantial adverse environmental effects not already analyzed in the Draft PEIR. Instead, the information presented in the responses to comments "merely clarifies or amplifies or makes insignificant modifications" in the Draft PEIR, as is permitted by *CEQA Guidelines* Section 15088.5(b).

In the course of responding to comments, certain portions of the Draft PEIR have been modified slightly for further clarification. The comments and modifications have not identified the existence of: (1) a significant new environmental impact that would result from the Project or an adopted mitigation measure; (2) a substantial increase in the severity of an environmental impact; (3) a feasible project alternative or mitigation measure not adopted that is considerably different from others analyzed in the Draft PEIR that would clearly lessen the significant environmental impacts of the Project; or (4)

¹ SCAG received a total 327 comments, 66 of which were considered redundant (i.e., cross-referencing comments from other local jurisdictions or agencies). A complete list and copy of comments are provided in the Final PEIR.

information that indicates the public was deprived of a meaningful opportunity to review and comment on the Draft PEIR (*CEQA Guidelines*, subdivision 15088.5(a). Consequently, SCAG finds the clarifications made to the Draft EIR in the Final EIR do not collectively or individually constitute significant new information within the meaning of PRC, section 21092.1 and *CEQA Guidelines*, section 15088.5. Recirculation of the Draft PEIR or any portion thereof, is, therefore, not required.

The written responses to commenting public agencies shall be provided at least ten (10) days prior to the certification of the Draft PEIR (*CEQA Guidelines* § 15088(b)). SCAG provided the Final PEIR to commenters on **March 27, 2020**, and made the document available for review on the Project web site at: <https://www.connectsocial.org/Pages/Final-2020-PEIR.aspx>

Final PEIR Certification and Approval

Prior to considering the Project for approval, SCAG, as the Lead Agency, will review and consider if the information presented in the Final PEIR:

- (a) Has been completed in compliance with CEQA;
- (b) Has been presented to the SCAG Regional Council as the decision-making body for the Lead Agency, which reviewed and considered it prior to approving the Project; and
- (c) Reflects SCAG's independent judgment and analysis (CEQA Guidelines Section 15090)

If and when the Final PEIR is certified, the SCAG Regional Council may proceed to consider Plan approval (CEQA Guidelines § 15090). Prior to approving the Project, SCAG must make written findings and adopt statements of overriding considerations for each unmitigated significant environmental effect identified in the Final PEIR in accordance with Sections 15091 and 15093 of the CEQA Guidelines.

If the Final PEIR is certified followed by the Plan approval, SCAG will file a Notice of Determination (NOD) with the Office of Planning and Research and the County Clerks of Los Angeles, Orange, Riverside, San Bernardino, Ventura, and Imperial (CEQA Guidelines § 15094).

8.2 REFINEMENTS TO THE PLAN SINCE PUBLICATION OF THE DRAFT PEIR

Modifications to the Draft Connect SoCal Project List

The Draft Connect SoCal Project List has been refined/updated since the publication of the Draft Plan and Draft PEIR. Generally, changes to the project list are one of the following:

- New projects that were not included in the Connect SoCal Project list.

- Existing projects in the Connect SoCal Project list that were requested to be removed.
- Existing projects in the Connect SoCal Project list that have:
 - a revised description (including completion year, cost or minor change to scope), and/or
 - a revised schedule.

SCAG received input on the Draft Project List from six County Transportation Commissions (CTCs) as part of the Connect SoCal update and finalization process. During the comment period for the Draft Plan, input was received from the six CTC's regarding modifications to the Final Project List. The provided updates reflect the latest Connect SoCal project information at the time and are part of the finalization process by SCAG and the CTCs for the Final Connect SoCal Project List. Connect SoCal includes over 4,000 individual capital projects and programs across the region across all modes of transportation over the next 25 years. During the public review period, SCAG received requests from the county transportation commissions to modify more than 170 projects (which represents less than 1 percent of total projects). Projects removed were due to duplicative entries. Notable projects that were removed between the Draft and Final Connect SoCal are as follows:

- 1TR103 – California High-Speed Rail Phase 1 (Duplicative)
- 1H0101 – Add 1 HOV lane SR-14
- 4M0714 – I-15 Mohave Interchange
- LA0G1099 – High Desert Corridor (Duplicative)
- LA0G901- Historic LA Streetcar

New projects that were added between the Draft and Final Connect SoCal are as follows:

- 1200P005 – Terminal Access Improvement on Harbor Scenic Drive
- 2200G001 – BNSF Line
- 200T004 – Replacement of 40 Buses
- 3200L300 – Railroad Crossing Safety Improvements
- 3200P200 – Metrolink low/zero emission technology trains
- 4A07004 – Widen US-395 from I-15 to SR 18 (Palmdale Rd)
- ORA120507 – Widen Route 74 (Ortega Highway)

Accordingly, SCAG re-ran the travel demand and emission model with the updated transportation network. The plan outcome from these revisions resulted in incremental improvement in VMT, delay and economic metrics which are discussed under the changes to Performance Measures section of the Final Connect SoCal Plan.

Improvements to Performance Outcome

Comments were received from the California Air Resources Board (ARB) on performance outcomes and the GHG target analysis. In response, SCAG added data for the years 2020 and 2035 for the VMT per capita performance measure to better align with state GHG reduction target years in the main book as well as Performance Measures Technical Report. In addition, final modeling data results from both the SCAG Regional Travel Demand Model and the Scenario Planning Model offered improved performance in some significant areas of Connect SoCal, including VMT per capita (5.0% reduction from 4.2%) and daily delay per capita (25.7% reduction from 22.4%). Several of the economic opportunity indicators also were improved by the final model runs, with the benefit/cost ratio for Connect SoCal investments increasing from 1.54 to 2.06, and the annual number of new jobs generated by improved regional economic competitiveness increasing from 195,500 to 264,500.

Adjustments to the Sustainable Communities Strategy (SCS)

SCAG received many comments related to the SCS. Several comments raised concerns regarding housing affordability, climate change and certain GHG reduction strategies. Other comments sought clarity on the Connect SoCal Growth Vision. In response to comments, the Sustainable Communities Strategy has updated SCAG's Growth Vision and modified land use patterns in the Sustainable Communities Strategy, which resulted in adjustments to HQTAs in the region.

SCAG used the performance of each scenario as well as input gathered through the public workshops to refine the final growth vision for the Plan. This vision aims to increase mobility options and reduce the need for residents to drive by locating housing, jobs, and transit closer together. The final Plan focuses growth within jurisdictions near destinations and mobility options and promotes an improved jobs-housing balance to reduce commute times.

SCAG revised forecasted development pattern, by initiating a peer review with local jurisdictions regarding population, household, and employment growth at the sub-jurisdictional level (i.e. transportation analysis zone (TAZ) level) prior to the release of the draft Connect SoCal plan. Technical refinements were made to the Forecasted Development Pattern in Connect SoCal that included adjustments to growth due to entitlements and maximum planned capacities. "Locally envisioned

growth” was used in some instances to further Connect SoCal’s Growth Vision of reducing the need for residents to drive by locating housing, jobs and transit closer together - helping to assure that Connect SoCal’s land use and growth strategies recognize local input, promote sustainable transportation options, and support equitable and adaptable communities.

The revised forecasted development pattern directs growth to Priority Growth Areas (PGAs) near existing and planned transit, within existing job centers, in communities with existing and planned infrastructure to support more walkability and use of alternative transportation modes, and in areas identified for jurisdictional expansion (i.e. spheres of influence). The final growth vision includes entitled projects, reflects the local input growth totals and follows currently adopted local plans to allocate growth within the existing general plan maximums. Growth through 2045 was reduced in and redirected from constrained areas (e.g. very high severity fire risk areas, farmland, protected open space, wildlife corridors, areas at risk for near-term sea level rise, flood hazard areas, etc.). No changes were made to the underlying policies or strategies presented in the Draft Connect SoCal which would constitute a major change in the Project Description.

Modifications to Transportation Finance

The Connect SoCal proposes investment of approximately \$639 billion to maintain, operate and improve the region’s multimodal transportation system through 2045. Approximately \$500 billion is expected to be available through existing funding sources projected out to 2045. The balance of almost \$139 billion is expected to be available through implementation of innovative funding sources proposed in the Connect SoCal, which will require significant actions at the local, regional, state and federal level in the coming decade through collaborative efforts.

Many comments were focused on clarifying details on the financial model, implementation guidelines for new revenue sources and need for more evaluation, including assurances on distribution of funds and consideration of impacts of fees on different segments of the population. In response to comments, text clarifications were made regarding assumptions for the financial model and guidelines for implementation of new revenue sources. Modifications to transportation finance does not affect the environmental analysis as it serves to provide the reader background information on funding sources rather than information on physical changes to the environment.

Clarifications on Transportation Conformity

On the Transportation Conformity Analysis Technical Report, in response to comments, a new challenge titled “Meeting Federal Air Quality Standards” has been added to Chapter 2 of the Connect SoCal Plan to

highlight the challenge for the South Coast region to meet federal air quality standards by the near-term statutory deadline, its potential impacts, and the need for a comprehensive and coordinated regional solution. In the interim, U.S. EPA recently allowed for the use of emissions adjustment factors proposed by ARB for EMFAC 2014 (which is the emissions model used by SCAG to demonstrate transportation conformity of the Draft Connect SoCal prior to issuance of SAFE Rules by U.S. EPA) to comply with SAFE Rule Part 1 for transportation conformity determination in California. The Final Plan uses adjusted factors with respect to air quality emissions and meets the required conformity tests pursuant to the proposed adjustment factors for the EMFAC 2014.

8.3 EFFECTS OF THE REFINEMENTS TO THE PLAN

The SCAG models described above are used to provide gross estimates of regional environmental parameters (in particular VMT, criteria pollutant emissions and GHG emissions). However, the inputs to these models are subject to variability (location and density of land uses, travel patterns, fuel make up, pricing assumptions and many more). Because of this, minor changes to assumptions result in minor changes to modeling results and are not statistically significant. As noted above, SCAG has made several refinements to Connect SoCal including to land use patterns, transportation projects and policies (alternatives would be similarly affected). None of these refinements result in substantial changes to the information presented in the Draft PEIR, including modeling results. Nonetheless, below is a summary description of each topic area analyzed within the PEIR and how the changes described above would change.

Aesthetics and Views

As described above, the Final Plan includes generally the same transportation network as the Draft Plan (with the exceptions noted above), and therefore would have similar regional impacts on aesthetics and views. The Final Plan refines the focus of growth within jurisdictions near destinations and mobility options and promote an improved jobs-housing balance to reduce commute times, the potential for scenic resources conflicts are generally within rural and minimally developed areas. As such, the regional impacts would be similar to and within the range of impacts already analyzed in the Draft PEIR.

Regional-scale impacts to scenic resource and vista points would be the same under the Final Plan as with the Draft Plan. None of the analysis presented in Section 3.1 would be changed as a result of the refinements to the Plan. At the regional level, impacts would remain significant and unavoidable. The minor modifications to the Plan would have no impact on cumulative Aesthetic impacts at the regional level because the changes are minor and at the sub jurisdictional level.

Agriculture and Forestry

Based on the refinements to the Plan, the Estimated Maximum Direct Potential Loss of Important Agricultural Land as shown in Table 3.2-4 could change slightly, but at the regional scale such impacts would be negligible.

Air Quality

Region-wide criteria pollutant emissions under the Final Plan would generally go down due to the better performance of the Plan overall. The revisions reflected in the Final Plan would not change the conclusions presented in the Draft PEIR. The Final Plan air quality modeling addresses both the refinements to the Plan and ARB's EMFAC2014 off-model adjustment factors² necessary to account for the emission impacts of The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program effective November 26, 2019 (the rollback of California's waiver).³ The numbers represent a conservative scenario, if the California waiver is not rolled back, emissions would be similar to or better than the results presented in the Final Plan. Even using the conservative assumptions, the calculated emissions would not be substantially different from those presented in the Draft PEIR. These minor changes would not affect the findings of the PEIR, and overall impacts related to criteria pollutants would remain significant and unavoidable.

Biological Resources

The transportation network for the Final Plan would be similar to the network in the Draft Plan, therefore the regional-scale direct impacts of the Final Plan to biological resources would be the same as those identified in the Draft PEIR. The impacts to natural vegetation, sensitive species and communities, habitat connectivity, and riparian and wetland areas, would also be the same. The acres of critical habitat would be similar to the amount impacted in Tables 3.4-13, Acres of Critical Habitat for Listed Species Potentially Affected by Connect SoCal Major Transportation Projects. The number of listed plant species and wildlife species affected by the final Plan would be similar to those provided in Table 3.4-14 Records of Listed Plant Species within 500 Feet of Connect SoCal Projects and Table 3.4-15 Records of Listed Wildlife Species within 500 Feet of Connect SoCal Projects. Similarly, acres of sensitive and riparian habitat within 500 feet of Connect SoCal projects (Table 3.4-16) would not substantively change based on the modifications described above. Miles of blueline streams and acres of federally protected waterways within 500 feet of Connect SoCal Projects would also not substantively change (Table 3.4-17, Table 3.4-18,

² https://ww3.arb.ca.gov/msei/emfac_off_model_adjustment_factors_final_draft.pdf

³ <https://www.govinfo.gov/content/pkg/FR-2019-09-27/pdf/2019-20672.pdf>

and Table 3.4-19). Lastly acres used for wildlife movement (Table 3.4-20) would be minimally affected by the changes in the Final Plan. The changes in the Final Plan would not impact acres subject to HCP or NCPs.

Cultural Resources

The Final Plan would have a similar transportation network as compared to the Draft Plan, therefore, regional-scale direct impacts to cultural resources, including impacts to historical and archaeological, resources would be similar to those identified in the Draft PEIR. The Plan would continue to include regional land use and transportation strategies that focus new growth in urbanized areas. Many urbanized areas are older urban or suburban town centers where structures of architectural or historical significance are likely to be located. Therefore, regional-scale impacts would not change. Transportation projects considered in the Plan would continue to have the potential to impact the nearly 100,000 archaeological resources in the SCAG region (Table 3.5-1). The Plan would continue to focus growth in urban areas and impacts would not substantively change.

Energy

The changes to the Final Plan would result in minor changes to the energy numbers presented in the Section 3.6, Energy. These estimates of energy consumption are based on available consumption factors which are reasonably expected to change substantially over the coming years with increased focus on conservation and efficiency. The minor changes reflected in the Final Plan would not substantially affect the numbers presented in the Final PEIR.

Geology and Soils

Direct regional-scale impacts to geological resources in the Final Plan would be similar to those of the Draft Plan. Implementation of the Plan would result in projects exposed to both direct and indirect effects of seismic activities compared to existing conditions (which is not an impact under CEQA). The Plan would neither cause nor exacerbate existing geologic hazards, including the likelihood of fault rupture. This condition exists throughout the SCAG region as it is a seismically active area.

Regarding impacts related to soil suitability, erosion and stability, because projects would be required to comply with existing state and local jurisdiction permitting, regulatory, and grading processes as well as the application of BMPs, regional-scale impacts would be the same as identified in the Draft PEIR.

The potential regional-scale direct impacts on paleontological resources related to implementation of transportation projects and development projects anticipated to occur under the Plan and presented in the Draft PEIR would not change as a result of on the Plan refinements.

Greenhouse Gases

The Plan refinements and adjustments described above would result in minimal changes to the regional-scale GHG emission estimates presented in the Draft PEIR. Table 3.8-5, Greenhouse Gas Emissions from All On-Road Vehicles in the SCAG Region (Million Metric Tons per Year), CO₂ would be reduced slightly for light and medium-duty vehicles and heavy-duty vehicles. Similarly, total transportation section emissions would be slightly lower (Table 3.8-7). Overall, on-road-only emission would decrease based on the Final Plan. The Plan would continue to achieve GHG reduction targets of 8 and 19 percent (Table 3.8-10). For Table 3.8-11, Residents and VMT (2019 and 2045), the reduction in VMT per capita would be 8.4 percent for light duty vehicles and 4.8 percent for all vehicles. This is similar to numbers presented in the Draft Plan. As stated in Section 3.8, Greenhouse Gases, CARB has indicated that even if all MPOs meet their regional SB 375 GHG targets, the state would not be able to meet the statewide GHG reduction goals of AB 32, SB 32, and the Scoping Plan. As recognized by CARB, MPO's do not have land use authority to implement additional VMT reductions. Furthermore, SCAG has no control or authority over the other key sectors (e.g., energy, industry, water, waste and agriculture) in meeting the AB 32, SB 32, and Scoping Plan targets. Assuming existing available emission factors, GHG emissions in the SCAG region are not on track to achieve targets identified in AB 32, SB 32 and the Scoping Plan. This would continue to be the case with the Final Plan.

Hazardous Materials

The Final Plan includes the same land use strategies that encourage infill and redevelopment and generally the same transportation network; therefore, transportation of hazardous materials would be similar to those described in the Draft PEIR. Regional-scale impacts related to the routine transport, use, or disposal of hazardous materials, the risk of upset of hazardous materials, risk of disturbing contaminated sites during construction, and the risk of release of hazardous materials within one-quarter mile of a school would not change from what is described in the Draft PEIR.

Hydrology and Water Quality

The Final Plan would have generally the same transportation projects and land use strategies as the Draft Plan, and as such, hydrology impacts including violation of water quality standards, potential to decrease groundwater supplies, alternation of an existing drainage pattern, and flood hazards would generally be

the same. While Plan refinements would result in an incremental increase in the amount greenfields converted to urban uses, at the regional level the impacts would not substantively change from what is described in the Draft PEIR.

Land Use

The transportation strategies in the Plan, such as emphasis on complete streets and TDM strategies would continue to have limited potential for dividing established communities because they are generally expected to occur in established communities. Many of these strategies (i.e., bike lanes, pedestrian access) improve connectivity. As land gets converted from urban or agricultural uses, there would continue to be the potential for infrastructure or land developments to divide existing communities. This impact would not substantially change with the refinements to the Plan described above.

With regard to conflict with existing plans, land use policies and strategies in the Plan would continue to encourage development of underutilized areas (infill, etc.). Development patterns, would continue to be supported by transportation investments that emphasize system preservation and enhancement, active transportation, and land use integration, and are generally consistent with local land use plans, goals, and policies calling for higher density, compact, mixed-use development that may be served by high-quality transit, bicycle and pedestrian improvements. There would continue to be the potential for inconsistencies between SCAG's land use strategies and local planning documents that could potentially lead to physical environmental impacts. The refinements to the Plan would not substantively change the analysis presented in the PEIR.

Mineral Resource

Change to transportation projects contained in the Plan and refinements to growth patterns would continue to require substantial amounts of aggregate resources for construction purposes, continuing to constitute a significant impact. The refinements to the Plan would not substantively change the analysis presented in the PEIR.

Noise

The Final Plan includes similar transportation projects and strategies as well as land use strategies as the Draft Plan. As a result, the Final Plan would have similar noise impacts as the Draft Plan. The potential for generation of substantial temporary or permanent increases in ambient noise or vibration would be similar to the Draft Plan, since the Final Plan would have generally the same transportation projects as the Draft Plan. The growth pattern is also similar to the Draft Plan meaning that generally the same

impacts would occur and for a regional scale analysis, the Plan refinements would not substantively change the analysis.

Regarding aviation noise, the Final Plan would have a similar transportation network and growth pattern as the Draft Plan, as a result, it is expected that sensitive receptors would continue to be impacted by airport noise and as for the draft Plan, the Final Plan would not exacerbate this impact.

Population and Housing

Minor modifications were made to the population, households and employment numbers. Some of the numbers were revised due to rounding and other refinements during the public review process. The analysis of impacts focuses on the Plan's potential to result in unplanned population growth. The Final Plan continues to include land use strategies and transportation projects and supporting strategies that generally encourage population growth in urbanized areas and HQTAs. Generally, most jurisdictions have started planning for increases in density in urban areas and the Plan builds on local input (and is not intended to result in re-designation of areas where such re-designation is not approved by the local agency). There continues to be the potential for the Plan's strategies to influence population growth in areas where local general plans have not yet been updated to reflect such growth.

Regarding potential to displace housing, construction of transportation projects that require expansion of existing or designation of new ROWs would continue to have the potential to result in the displacement of existing people and housing, necessitating the construction of replacement housing. The Final Plan continues to include generally the same transportation network and growth pattern, as such impacts would remain the same.

Public Services (Fire, Police, Schools, Libraries)

As described in Sections 3.15-1, 3.15-2, 3.15-3 and 3.15-4, impacts to public services are largely population driven. As described under the preceding section (Population and Housing), only minor refinements to the population forecasts occurred. The analysis presented in the public services sections is regional in nature and generally discusses the potential for impacts to occur as a result of the increased population. As the population numbers have not substantively changed, the analysis presented in Sections 3.15-1, 3.15-2, 3.15-3 and 3.15-4 remains the same.

Parks and Recreation

As described in Sections 3.16, impacts to parks and recreational facilities are largely population driven. As described under the preceding section (Population and Housing), only minor refinements to the population forecasts occurred. The analysis presented in the parks and recreation section is regional in nature and generally discusses the potential for impacts to occur as a result of the increased population resulting in overuse of existing parks, primarily in urban areas. As the population numbers have not substantively changed, the analysis presented in Section 3.16 remains the same.

Transportation

As described above, the refinements to the Plan have generally resulted in incrementally better Plan performance. These changes are fully described in the Plan. These minor changes do not substantively change the analysis presented in the PEIR.

Tribal Cultural Resources

Transportation projects and anticipated growth under the Plan would continue to have the potential to cause a substantial adverse change in the significance of tribal cultural resources in the SCAG region, defined in Public Resources Code section 21074, as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe. The Final Plan would have a similar transportation network and growth pattern as the Draft Plan. Therefore, the impacts would be the same as in the PEIR.

Utilities and Service Systems

As described in Sections 3.19-1, 3.19-2, and 3.19-3, impacts to utilities and service systems are largely population driven. As described under the preceding section (Population and Housing), only minor refinements to the population forecasts occurred. The analysis presented in the utilities and service systems sections is regional in nature and generally discusses the potential for physical impacts to occur as a result of the increased population. As the population numbers have not substantively changed, the analysis presented in Sections 3.19-1, 3.19-2, and 3.19-3 remains the same.

Wildfire

Transportation projects and anticipated development projects would continue to be located in wildfire-prone areas which could continue to potentially exacerbate wildfire risks and thereby expose project occupants to pollutant concentrations from wildfires or the uncontrolled spread of wildfires, particularly

those populations living down wind of the fire. The Final Plan has generally the same transportation and growth pattern, therefore, impacts would remain the same as in the PEIR.

Cumulative Impacts

At the regional level, the cumulative analysis of impacts would not change. The potential for the Plan to combine with other regional plans to create impacts would remain the same as described in the PEIR. The Final Plan results in minor modifications that do not substantively change the analysis of any of the impact areas (as described above). Therefore, cumulative impacts would remain the same as in the PEIR.

8.4 CONTENT OF THE FINAL PEIR

As discussed above, the primary intent of the Final PEIR is to provide a forum to air and address comments pertaining to the analysis contained within the Draft PEIR. Pursuant to *CEQA Guidelines* Section 15088, SCAG has reviewed and addressed all comments received on the Draft PEIR by the comment period deadline. Included within the Final PEIR are the written comments that were submitted during the public comment period.

In order to adequately address the comments provided by interested agencies and the public in an organized manner, this Final PEIR includes the following chapters and appendices:

Section 8.0, Introduction: This chapter provides a brief introduction to the Final PEIR and its contents.

Section 9.0, Responses to Comments: This chapter provides a list of commenting agencies, organizations, and individuals. Responses to all comments on the Draft PEIR are also included in this chapter. Some of the comment letters received on the Draft PEIR also provide comments on the Plan (not the anticipated environmental impacts). These Plan-related comments are addressed separately. Where changes were necessary to the PEIR, the changes were incorporated into this section.

Section 10.0, Corrections and Additions: This chapter provides a list of corrections and additions to the Draft PEIR. None of the changes significantly impact the conclusions presented in the Draft PEIR.

The Final PEIR also includes the previously circulated Draft PEIR.

8.5 REVIEW AND CERTIFICATION OF THE FINAL PEIR

Consistent with CEQA (Public Resource Code Section 21092.5), responses to agency comments are being forwarded to each commenting agency 10 days prior to certification of the Final PEIR. In addition,

responses are also being distributed to all commenters who provided an address. Additionally, the Final PEIR can be downloaded at www.connectsocial.org.

9.0 RESPONSES TO COMMENTS

9.1 FINAL PEIR PROCESS

The Draft Program EIR (PEIR) was submitted to the State Clearinghouse Office of Planning and Research and circulated for public review beginning on December 9, 2019, and ending on January 24, 2020 (SCH # 20199011061) and a Notice of Completion was posted with each of the County Clerks for the six counties in the SCAG region and distributed to various federal, state, regional, and local government agencies, and other interested agencies, organizations, and individuals. The PEIR was circulated primarily using electronic mail to more than 2,700 interested parties. The PEIR was mailed directly to approximately 200 interested parties, including federal, state, regional and local agencies, organizations and major libraries in the region using the U.S. Postal Service certified mail service. Additionally, SCAG placed copies of the Draft PEIR at the offices of SCAG and electronic copies at the 56 public libraries throughout the region and posted the Draft PEIR on its website.

The PEIR was available at the following SCAG Regional Office locations:

SCAG Main Office
900 Wilshire Boulevard, Suite 1700,
Los Angeles, CA 90017

SCAG Riverside County Regional Office
3403 10th Street, Suite 805
Riverside, CA 92501

SCAG Imperial County Regional Office
1405 N. Imperial Avenue, Suite 1
El Centro, CA 92243

SCAG San Bernardino County Regional Office
1170 West 3rd Street, Suite 140
San Bernardino, CA 92410

SCAG Orange County Regional Office
600 South Main Street, Suite 906
Orange, CA 92868

A public workshop was held regarding the Connect SoCal Plan (“Plan”) Draft PEIR on January 9, 2020 from 2:00 pm to 3:30 pm at SCAG’s Los Angeles Office located at 900 Wilshire Boulevard, Suite 1700. This workshop was also a webinar which was available for the public via internet.

The Draft PEIR was made available for public review at the above-referenced locations until January 24, 2020, for a period of 46 days (December 9, 2019–January 24, 2020). A total of 52 comment letters were received by SCAG during the comment period. Among the 52 comment letters, there were 262 unique comments directly related to the Draft PEIR.¹

¹ SCAG received a total 327 comments, 66 of which were considered redundant (i.e, cross-referencing comments from other local jurisdictions or agencies).

This section of the EIR contains a summary of the distribution process for the Draft EIR and a listing of the parties that provided comments during the public review period. The commenters are divided into the following categories:

1. Sovereign Nations
2. Federal Agencies
3. State Agencies
4. Regional Agencies
5. Subregional Agencies
6. County Transportation Commissions
7. Organizations
8. Individuals

Table 9.0-1, List of Commenters on the Draft PEIR, provides a list of the comment letters received in response to the Draft PEIR.

The responses to comment letters are provided in the front portion of this document with original bracketed comment letters following at the end. For the purposes of identifying and responding to comments on the Draft PEIR, individual letters are numbered as shown in **Table 9.0-1** (top right-hand corner of the first page of each letter) and the individual comments within each letter are assigned a bracketed comment number. For example, the first comment in the comment letter from the U.S. EPA is labeled **Comment FED 1-1**.

Where responses result in a change to the EIR text, table or graphic, the response indicates that a change is made and where the change is made, and the resulting change is identified in **Chapter 10.0, Corrections and Additions**. Chapter 10 shows additions to text in underline and deletions in ~~striketrough~~ format. Where a new graphic or table is entirely new the information is not underlined as new, but rather the Final PEIR indicates that the table information is being replaced. The Final PEIR including all comment letters is available online along with the rest of the PEIR at: <https://www.connectsocal.org/Pages/Final-2020-PEIR.aspx>.

Several commenters on the Connect SoCal PEIR indicated in the subject line of their letter that they were providing comments on the Draft PEIR but the substance of their letter included comments on both the Draft PEIR and Connect SoCal or comments only on Connect SoCal. Pursuant to California Environmental Quality Act (CEQA) Guidelines Section 15088(a), SCAG is required to evaluate and address only those comments on environmental issues received from public agencies and other interested parties who reviewed the Draft PEIR. SCAG recognizes the importance of public participation and as such, Plan specific comments are addressed through SCAG's online form system which documents and tracks all Plan related comments by sub-category (Goods Movement, Environmental Justice, Conformity Analysis, etc.). Each comment related to the Plan was given a submission ID number (e.g., Submission ID 16285) which was logged and each comment on the Plan responded to as part of the final Plan.

Public participation is a key component of the regional transportation planning process; SCAG encourages public participation and maintains the integrity of input received from local jurisdictions. Commenters who are reviewing the responses to comments to the PEIR and are also interested in Plan related changes can look up the Plan related responses by searching for their submission ID number within the **Comments and Responses Appendix**, which is a sub-appendix of the Final Connect SoCal **Public Participation and Consultation Appendix**. Responses to comments and revisions to Connect SoCal are available via the web at: <https://www.connectsocal.org/Pages/Connect-SoCal-Final-Plan.aspx>.

This Final PEIR, together with the Final Connect SoCal Plan, will be submitted to the SCAG Regional Council for review, and the SCAG Regional Council will consider certification of the Final PEIR and approval of the Plan.

9.2 MASTER RESPONSES

As a result of public review of the Draft PEIR, some themes in comments submitted to SCAG recurred in multiple letters. This subsection provides “Master Responses” for issues that recurred in multiple comment letters. The Master Responses address multiple similar or related comments and themes and provide a comprehensive reply as well as additional information that may have been requested by any individual comment. The responses to the individual comment letters cite the Master Responses as appropriate. Master Responses for this Final PEIR are as follows:

Master Response No. 1: General Comments and Non-CEQA Issues

The Draft Program Environmental Impact Report for Connect SoCal (“PEIR”) was circulated for a 45-day public review period, from December 9, 2019 to January 24, 2020. Fifty-two (52) comment letters on the Draft PEIR were received by SCAG during the comment period. Several of the comment letters contained only comments on the Draft PEIR, while others contained comments on both the Draft PEIR and Draft Plan or comments only on the Draft Plan.

Pursuant to California Environmental Quality Act (CEQA) Guidelines §15088(a), SCAG is required to evaluate comments on environmental issues received from public agencies and other interested parties who reviewed the Draft PEIR. It is important to note that CEQA requires good faith written responses to all “comments on environmental issues,” but not all comments (*City of Irvine v County of Orange* (July 6, 2015) 238 Cal. App. 4th 526). As such, the PEIR provides responses to comments directly related to the environmental analysis that is the subject of the PEIR.

Comments for Connect SoCal were re-routed to SCAG’s online form system which documents and tracks all Plan related comments by sub-category (Goods Movement, Environmental Justice, Conformity Analysis, etc.). Each comment related to the Plan was given a submission ID number (e.g., *Submission ID 0001549*) and has been logged appropriately for Planning staff to review and respond to through the Connect SoCal review process.

Purpose of EIR and EIR Process

CEQA’s statutory framework sets forth a series of analytical steps intended to promote the fundamental goals and purposes of environmental review – information, participation, mitigation, and accountability. The purpose of an EIR is to provide public agencies and the public in general with detailed information about the effect that a project is likely to have on the physical environment, to list ways in which any significant adverse effects might be minimized, and to indicate alternatives that reduce any identified adverse impacts (Public Resources Code Section 21061). Thus, the purpose of this EIR is to evaluate potential impacts on the environment resulting from the Proposed Plan and to identify mitigation

measures and alternatives that would avoid or substantially lessen significant environmental impacts while attaining most of the objectives of the Plan.

Pursuant to the California Public Resources Code Section 21091(d), SCAG considered all comments received on the Draft PEIR and this document provides written response describing the “disposition of each significant environmental issue that is raised by commenters.” *CEQA Guidelines* Section 15088 provides further guidance on the preparation of response to comments and indicates that while lead agencies must evaluate all comments received on a Draft PEIR they need only respond to comments related to significant environmental issues associated with a project. *CEQA Guidelines* Section 15204 further provides that lead agencies in responding to comments do not need to provide all the information requested by commenters, as long as a good faith effort at full disclosure is made in the EIR. *CEQA Guidelines* Section 15204 recommends that commenters focus on the sufficiency of the EIR in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated. Section 15204 further indicates that commenters should provide an explanation and evidence supporting their comments. An effect shall not be considered significant in the absence of substantial evidence supporting such a conclusion (*CEQA Guidelines* Section 15064). CEQA case law has held that lead agencies are not obligated to undertake every suggestion given to them and are also not required to conduct every test or perform all research, study, and experimentation recommended by commenters. Under CEQA, the decision as to whether an environmental effect should be considered significant is reserved to the discretion of the lead agency based on substantial evidence in the record.

Adequacy of Analysis

The focus of SCAG’s responses to comments received on the Draft PEIR is the “disposition of significant environmental issues raised” in the comments (*CEQA Guidelines* Section 15088(c)). Detailed responses are not necessarily provided for comments that do not relate either to significant environmental issues or adequacy of the analysis in the PEIR. This includes comments that raise issues that are not environmental impacts as identified by CEQA (e.g., socioeconomic concerns), or relate to unsupported opinions regarding the adequacy of the PEIR analysis and/or the PEIR’s findings of significance.

CEQA was recently amended to reflect recent case law to clarify that CEQA is focused on the analysis of impacts of the project on the environment and not impacts of the environment on the project.² So for example, geotechnical issues are only of concern with respect to an analysis under CEQA, if a project

² See California Supreme Court’s decision in *California Building Industry Association v Bay Area Air Quality Management District*, (S213478, December 17, 2015) and California Court of Appeals decision in *California Building Industry Association v Bay Area Air Quality Management District*, (August 12, 2016).

could exacerbate existing conditions. Or with respect to residential uses located in proximity to a freeway, impacts of existing air pollution need only be addressed in a CEQA document if a project would exacerbate existing conditions. That is not to say that geotechnical concerns and freeway pollution are not concerns to be addressed in the entitlement process, they are just addressed outside the CEQA process. The Connect SoCal PEIR evaluates these existing conditions in relation to the Plan in order to determine if the Plan has the potential to exacerbate impacts.

The analysis in the Connect SoCal PEIR is based on scientific and factual data which has been reviewed by the lead agency and reflects its independent judgement and conclusions. CEQA permits disagreements between experts with respect to environmental issues addressed in an EIR. As stated in Section 15151 of the *CEQA Guidelines*, disagreement among experts does not make an EIR inadequate. The courts have looked not for perfection but for adequacy, completeness and a good faith effort at full disclosure.

Plan Comments

This PEIR is not intended or required to provide justification for Connect SoCal. Rather, this PEIR is an informational document that is intended to provide public agencies and the public with detailed information about the effect that the Plan is likely to have on the environment. This PEIR also identifies ways in which the significant effects of the Plan might be minimized and identifies alternatives to the Plan. The PEIR is not a vehicle for making changes to the Plan absent the proposed change reducing one or more identified significant adverse environmental impacts. Requests for changes to the Plan on individual properties are addressed outside the CEQA process.

Opinions and General Support for, or Opposition to, the Project

A number of comments raise issues that are not within the purview of CEQA, such as suggestions for changes to the Plan unrelated to potential significant adverse environmental impacts. The commenters often raise issues that are important to the decision-making process but are not properly addressed as part of the CEQA process. In addition, several commenters provide their opinion(s) that impacts be considered significant or that the significance conclusions in the EIR be revised but do not provide substantial evidence in support of their opinions. Commenters also express their opinions in support or opposition to the Plan, or outline concerns associated with specific features or provisions of the Plan that do not relate either to significant environmental issues or adequacy of the environmental analysis in the EIR.

While SCAG welcomes all comments, opinions and expressions of opposition or support unrelated to physical environmental impacts, these comments are appropriately addressed outside the CEQA process.

The purpose of the PEIR is to present objective information as to the Proposed Plan's potential physical environmental impacts. Moreover, the purpose of allowing the public and agencies to comment on a Draft PEIR is to allow any errors to be identified and corrected. Opinions concerning issues not addressed by CEQA, unsupported opinions regarding environmental issues already addressed in an EIR, as well as expressions of opposition or support for a project, are made a part of the administrative record and are forwarded to the decision-makers for their consideration in taking action on the project, but they are not responded to in a CEQA document.

Master Response No. 2: Program EIR vs. Project EIR

The Connect SoCal PEIR is a programmatic document that provides a region-wide assessment of the potential significant environmental effects of implementing policies, strategies, projects, and programs included in Connect SoCal. CEQA allows that a Program EIR, "may be prepared on a series of actions that can be characterized as one large project and are related either (1) geographically, (2) as logical parts of the chain of contemplated actions, (3) in connection with issuance of rules, regulations, plans or other general criteria to govern the conduct of a continuing program, or (4) as individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects which can be mitigated in similar ways" (*CEQA Guidelines* § 15168). The PEIR for Connect SoCal offers regional scale analysis of the impacts of the Plan and provides mitigation measures to be implemented by SCAG at the regional level, and mitigation measures for subsequent, site specific environmental review, including project-level EIRs and/or Environmental Impact Statements (EISs) prepared by implementing agencies for individual projects as well as General Plans.

The focus of the environmental analysis in the PEIR is on potential regional-scale impacts associated with implementation of Connect SoCal as a whole. Connect SoCal includes individual transportation projects and provides land use policies set forth in the SCS component of the Plan. Because the Plan and PEIR is programmatic in nature and regional in approach, it does not include site-specific analysis of any project contained in Connect SoCal. Many of the individual transportation projects included in the Plan are early in the development phase, and detailed project/site specific analysis is not appropriate at this time without undue speculation. (See *CEQA Guidelines* § 15126.6(f)(3)).

While the PEIR identifies a number of significant impacts at the regional level, these impacts must be separately assessed at the project level to determine whether specific project conditions may result in significant impacts at the local or sub-regional level. Subsequent project-level environmental analyses will determine whether or not an individual project has significant, project-level impacts requiring the consideration of project-level mitigation measures.

Use of a program-level approach ensures consideration of the cumulative effects of the transportation projects contemplated over the 25-year planning horizon and avoids duplicative reconsideration of the basic policy consideration in the Plan related to land use patterns, alternative modes of travel, active transportation, and sustainability. As specified by Section 15168(c) of the *State CEQA Guidelines*, subsequent activities analyzed in the PEIR must be examined to determine whether an additional environmental document must be prepared. If a later activity would have effects that were not examined in the PEIR, a new initial study would need to be prepared leading to determine the appropriate level of environmental compliance documentation pursuant to CEQA (See *CEQA Guidelines* § 15002(k)).

Master Response No. 3: Baseline Conditions

Environmental impacts for the PEIR were determined by applying the thresholds of significance which compare future Plan conditions to the existing environmental setting (See *CEQA Guidelines* §15126.2(a)). The PEIR must identify significant impacts that would be expected to result from implementation of the Plan. Significant impacts are defined as a “substantial or potentially substantial, adverse change in the environment” (Public Resources Code § 21068).³ Significant impacts must be determined by applying explicit significance criteria to compare the future Plan conditions to the existing environmental setting (*CEQA Guidelines* § 15126.2(a)).⁴ The existing setting is described in detail in each resource section of Chapter 10.0 of this document, and represents the most recent, reliable, and representative data to describe current regional conditions at the time of publication of the NOP for the PEIR, January 23, 2019. In most instances, the most recent available data was for 2018 or 2019. For population, land use and related modeling analyses (air quality, transportation and noise), base year information is collected every four years as part of the Plan. The base year for the Plan is 2016. For purposes of the PEIR, 2019 data has been estimated based on an interpolation of 2016 to 2045 projections. Available data that differs from this generalized explanation and used to determine existing conditions is specified in each resource section in Chapter 3.0 of this document.

The existing environmental setting was described in detail for each of the resource categories (see **Chapter 1.0, Introduction**, and **Chapter 3.0, Environmental Analysis**, for further clarification) and represents the most recent and representative data to describe current regional conditions during the publication of the NOP for the PEIR.

SCAG agrees that, “the public and decision makers are entitled to the most accurate information on projects practically possible, and the choice of a baseline must reflect that goal.” (*Communities for a Better*

³ California Legislative Information. *Public Resources Code – PRC, Division 13. Environmental Quality, Chapter 2.5. Definitions [21060-21074]*.

⁴ CEQA. *Article 9. Contents of Environmental Impact Reports*.

Environment v. South Coast Air Quality Management District (2010) 48 Cal.4th 310). The *Neighbors for Smart Rail vs. Exposition Metro Line Construction* lawsuit challenged Metro's use of the future no project condition instead of the existing condition for assessing project impacts. The Court ruled that a lead agency has discretion to omit existing conditions analyses by substituting a baseline consisting of environmental conditions projected to exist solely in the future, but to do so the agency must justify its decision by showing an existing conditions analysis would be misleading or without informational value.

While SCAG uses existing conditions as the baseline to assess the significance of potential environmental impacts, as is the default under CEQA, the PEIR nevertheless identifies Future No Project (i.e., future no build) impacts compared to Future Plan impacts for the information of the public and decision makers. Adding anticipated increases in traffic to existing conditions (and using existing emission factors) would be unreasonable; SCAG is no more responsible for all the growth in the region than it is responsible for changes in emissions factors. SCAG conservatively analyzes changes in the region between 2019 and 2045 as a whole in the context in which they could reasonably occur.

Master Response No. 4: Technical Process/Modeling

Transportation modeling for the Plan is based on SCAG's Regional Travel Demand Model, which is an activity-based model that meets all the requirements of the Transportation Conformity Rule, specifically 40 CFR 93.122(b). To calculate greenhouse gas emissions, results from the Regional Travel Demand Model are input to ARB's Emission Factors (EMFAC 2014) model, which was approved by U.S. EPA on Dec. 14, 2016. Although U.S. EPA recently approved a newer version of the model, EMFAC2017, on August 15, 2019, a two-year grace period had been established by U.S. EPA to allow EMFAC2014 for regional conformity analysis through August 15, 2021 [see 40 CFR sec. 93.111(c)]. The regional emissions analysis for Draft Connect SoCal started in early 2019, long before the approval of EMFAC2017. For those areas which require budget tests, the Plan emissions values in the summary tables below utilize the rounding convention used by ARB to set the budgets (i.e., any fraction rounded up to the nearest ton), and are the basis of the conformity findings for these areas.

Additionally, in order to conservatively account for the emission impact of the federal "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program," all the plan and no-build emissions reflect the EMFAC2014 off-model adjustment factors released by ARB on November 20, 2019.⁵

⁵ Note that while the SAFE Rule caused FHWA and FTA to temporarily cease conformity findings pending direction from EPA, EPA recently issued such direction when it approved CARB's off-model adjustment factors for EMFAC 2014 modeling. (See Letter from US EPA to FHA and FTA dated March 12, 2020 re: Appropriate Model for Transportation Conformity in California). As such, FHWA and FTA is expected to resume transportation conformity determinations.

Transportation conformity is required by the federal Clean Air Act to ensure that federally-supported transportation activities conform to or are consistent with the State's air quality implementation plan for meeting the federal health-based air quality standards. To comply with the CAA in achieving the NAAQS, State Implementation Plans (SIPs) are required to be developed for federal nonattainment and maintenance areas. A SIP may include two important components relative to transportation conformity requirements – motor vehicle emissions budgets (for all criteria pollutant SIPs) and TCMs (for ozone and CO SIPs only). The emissions budgets set an upper limit which transportation activities (for SIP purposes, motor vehicles are also known as “on-road mobile sources”) are permitted to emit. The regional emissions analysis presented in the Connect SoCal Transportation Conformity Analysis uses EMFAC2014.

To the extent possible, the Plan and the PEIR aim to be consistent with one another, as such, the PEIR also uses EMFAC 2014 for the analysis. SCAG's transportation demand model, which provides the basis for the HRA, is highly complex with myriad inputs and adjustments. To recreate the complete SCAG transportation demand model using EMFAC 2017, which had not been approved at the time the analysis for the Plan or the PEIR had commenced, would undoubtedly create confusion and schedule delay. For these reasons, the PEIR uses EMFAC 2014. Regarding the utility of the Plan's conformity determination with EMFAC 2014, the process for amendments and project conformity determinations is vetted through SCAG's Transportation Conformity Working Group. At this time, there is no proposed change in the process for project review.

SCAG's regional transportation modeling area covers the entire SCAG region, including the Counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. SCAG's modeling area is divided into 11,267 Transportation Analysis Zones (TAZs) with an additional 40 external cordon stations, 12 airport nodes, and 31 port nodes for the Ports of Los Angeles and Long Beach. The SCAG model was peer reviewed and developed based on the 2012 California Household Travel Survey. A comprehensive model validation was also performed to ensure the model properly replicates base year (2016) travel conditions, which is the base year for Connect SoCal.

Modeling input and assumptions for SCAG's modeling include but are not limited to socioeconomic data, highway networks, and transit networks. This also includes all projects which were featured in the Plan's Project List Appendix which were provided by the six County Transportation Commissions (CTCs) in the SCAG region. It is important to emphasize that Connect SoCal does not primarily focus on specific or local projects but analyzes the transportation network of the entire region.

To achieve federal transportation conformity, SCAG is required to model regionally significant and federally supported projects contained within the Federal Transportation Improvement Program (FTIP).

SCAG is aware that some of the projects are currently under environmental review and that a preferred alternative has yet to be determined. Upon determination of the preferred alternative, SCAG will work with applicable local jurisdictions to amend the RTP/SCS as necessary to update the project description and associated modeling analysis.

The forecasted land use development patterns are based on Transportation Analysis Zone (TAZ) level data utilized to conduct required modeling analysis. Data at the TAZ level or at a geographically smaller than the jurisdictional level are advisory only, and non-binding, since SCAG sub-jurisdictional forecasts are not adopted as part of the Plan. The data is controlled to be within the density range of local general plans and/or based upon input received from local jurisdictions. For purposes of evaluating a local project's eligibility to utilize CEQA streamlining opportunities, lead agencies have the sole discretion to determine project consistency with Connect SoCal.

The EMFAC2014 (approved by U.S. EPA in December 2015) model is a computer model capable of estimating both current year, back-cast and forecasted emission inventories for calendar years 2000 to 2050. EMFAC estimates the emission rates of 1965 and newer vehicles, powered by gasoline, diesel or electricity. Emission inventory estimates are made for 51 vehicle classes segregated by usage and weight. EMFAC calculates the emission rates of CO₂ and other criteria pollutants, such as ROG, NO_x, PM₁₀, PM_{2.5}, SO_x, and also CH₄ for 45 model years for each vehicle class within each calendar year, for twenty-four (24) hourly periods, and each month of the year, for each district, air basin, county and sub-county in California.

The CARB Vision Scenario Planning Tool is another computer model that was used to determine multiple pollutants (CO₂, PM_{2.5}, NO_x and ROG) for the transportation system-wide categories such as locomotives, and ships. It is based on California specific data from different CARB official emission inventories, such as off-road mobile sources (i.e., locomotives, and Ocean-Going Vessels).

To determine regional CO₂ and other criteria pollutants for the "On-road" transportation sector which included Light and Medium-duty vehicles (LMDV; vehicles with weight class less than 8,500 lbs), Heavy duty trucks (HDT; Trucks with weight class greater than 8,501 lbs) and all buses, SCAG runs the EMFAC2014 model using the output from the trip-based regional transportation demand model. In order to compare with the regional GHG emissions targets derived using EMFAC2007 (in 2010), the EMFAC2014 model GHG emissions outputs have been converted to EMFAC2007 equivalents applying ARB's adjustment methodology.

For CO₂ equivalent (CO_{2e}) estimation, the three main Greenhouse Gases (GHGs): CO₂, Methane (CH₄) and Nitrous Oxide (N₂O) from both "On-road" and "Off-road" transportation sector are obtained from

EMFAC2014 and ARB's Vision tool respectively. The "Off-road" transportation sector includes rail, aviation and Ocean-Going Vessel (OGV). Standard ratios are used to convert the GHGs into CO_{2e}. These ratios are based on the Global Warming Potential (GWP) of each gas which describes its total warming impact relative to CO₂. For example, GWP for CH₄ is 25, meaning that one ton of CH₄ will cause the same amount of warming as 25 ton of CO₂. After all GHGs are converted, they are aggregated as the regional total CO_{2e}.

SCAG's Scenario Planning Model (SPM) was used to assist in scenario planning and determining output for the SCS. SPM is a data management, land use planning and modeling tool built on the open source version of UrbanFootprint platform (UF 1.5), which was originally developed by Calthorpe Analytics in partnership with SCAG and other California Public Agencies. SPM enables the creation and organization of local and regional data, plan and policies, facilitates scenario creation and editing and estimates a wide range of potential benefits resulting from alternative transportation and land use strategies.

SPM has been deployed as two separate web services: Data Management (DM) tool and Scenario Development and Analysis (SD) tool. SPM-DM provides a common data framework within which local planning efforts can be easily integrated and synched with regional plans. Using a variety of data management and review options, the user (local jurisdictions) can explore data, export attributes and edit configured layers. SPM-DM was released in November 2018 to all 197 local jurisdictions in the SCAG region in support of SCAG's local input and envisioning process for the Connect SoCal. To assist cities and counties in using the tool, a total of 21 hands-on training sessions in a classroom setting have been provided throughout the region. SPM-SD includes a suite of tools and analytic engines that facilitate scenario creation and editing with advanced analytic capabilities and allow meaningful comparison across different land use and transportation options. Starting with the 2016 RTP/SCS, SPM-SD has been used in providing directional and order-of-magnitude impacts of local land use and policy decisions that would assist in the development of regional plans and associated scenario analysis.

Please refer to the Transportation Conformity Analysis Technical Report and the Sustainable Communities Strategy Technical Report for further clarifications regarding methodology, model inputs and assumptions.

Master Response No. 5: Approach to Mitigation Measures

CEQA requires that SCAG identify all feasible mitigation measures in the PEIR that will avoid or substantially lessen the significant environmental effects of the project.^{6,7,8} CEQA, however, does not

⁶ California Legislative Information, *Chapter 1. Policy [21000-21006]*.

⁷ California Legislative Information. *Chapter 2.6. General [21080-21098]*.

require a lead agency to undertake identified mitigation measures, even if those measures are necessary to address a project's significant environmental effects, if the agency finds that the measures "are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency"⁹ *City of Marina v. Bd. of Trustees of the Calif. State Univ.* (2006) 39 Cal.4th 341, 366; see also *Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439). Under these circumstances, the lead agency may find that the measures "can and should" be implemented by the other agency or agencies said to have exclusive responsibility/jurisdiction over the measures (*City of Marina*, 39 Cal.4th at 366). As the *CEQA Guidelines* explain, the "finding in subsection (a)(2) shall not be made if the agency making the finding has concurrent jurisdiction with another agency to deal with identified feasible mitigation measures or alternatives."¹⁰

Furthermore, SB 375 specifically provides that nothing in an SCS supersedes the land use authority of cities and counties, and that cities and counties are not required to change their land use policies and regulations, including their general plans, to be consistent with the SCS or an alternative planning strategy.¹¹ Moreover, cities and counties have plenary authority to regulate land use through their police powers granted by the California Constitution, art. XI, §7, and under several statutes, including the local planning law,¹² the zoning law,¹³ and the Subdivision Map Act.¹⁴ As such, SCAG has no concurrent authority/jurisdiction to implement mitigation related to land use plans and projects that implement the Plan. With respect to the transportation projects in the Plan, these projects are to be implemented by Caltrans, county transportation commissions, local transit agencies, and local governments (i.e., cities and counties), and not SCAG. SCAG also has no authority/jurisdiction to require these agencies to implement project-specific mitigation measures.

In litigation challenging SANDAG's adoption of its 2050 Regional Transportation Plan/Sustainable Communities Strategy, the California Court of Appeal found that "[a]n EIR may not defer the formulation of mitigation measures to a future time, but mitigation measures may specify performance standards which would mitigate the project's significant effects and may be accomplished in more than one specified way." *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2014) 231 Cal. App. 4th 1056, 1089 (partially reversed on other grounds by *Cleveland National Forest Foundation v. San*

Diego Assn. of Governments (2017) 3 Cal.5th 497¹⁵

CEQA Guidelines section 15126.4(a)(1)(B) codifies this concept:

“Formulation of mitigation shall not be deferred until some future time. The specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project’s environmental review provided that the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be considered, analyzed, and potentially incorporated in the mitigation measure. Compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on substantial evidence in the record, to reduce the significant impact to the specified performance standards.”

In this case, the project-level mitigation measures could be considered deferred mitigation for the Plan, however, since SCAG has no authority to impose project-level mitigation, it will be up to local lead agencies, to determine and commit to the appropriate mitigation measures (and performance standards) for the individual projects. Note that this PEIR does not rely on the project-level mitigation measures being implemented in making significance findings (since the measures are within the jurisdiction of another agency and cannot be implemented by SCAG). As discussed in more detail below, consistent with *CEQA Guidelines* section 15091(a)(2), SCAG has identified project-level mitigation measures that such agencies “can and should” adopt as appropriate and feasible. Local lead agencies would coordinate with permitting agencies (e.g., air quality management districts, California Coastal Commission, California Department of Fish and Wildlife, etc.) and adopt and implement appropriate mitigation measures required based on the specific conditions of the project in compliance with applicable planning, zoning and environmental protection regulations.

¹⁵ CEQA case law has also held that deferral of the specifics of mitigation is permissible where the lead agency commits itself to mitigation and, in the mitigation measure, either describes performance standards to be met in future mitigation or provides a menu of alternative mitigation measures to be selected from in the future (*California Native Plant Society v. City of Rancho Cordova* (2009) 172 Cal.App.4th 603 [the details of exactly how the required mitigation and its performance standards will be achieved can be deferred pending completion of a future study]; *Riverwatch v. County of San Diego* (1999) 76 Cal.App.4th 1428, 1448–1450 [a deferred approach may be appropriate where it is not reasonably practical or feasible to provide a more complete analysis before approval and the EIR otherwise provides adequate information of the project’s impacts]; *Sacramento Old City Assn. v. City Council of Sacramento*, *supra*, 229 Cal.App.3d at 1028–1029 [deferral of agency’s selection among several alternatives based on performance criteria was appropriate]).

Some commenters have suggested compliance with existing regulations may not be considered mitigation because compliance is already required. However, such regulations do reduce environmental impacts and are sometimes identified herein where appropriate, to provide information on how potential impacts are reduced. In some cases, as indicated in the PEIR, regulatory compliance is enough to reduce impacts to a level of less than significance. In other cases, mitigation is proposed to ensure and/or specify the means of compliance with regulations that lack specificity. In any event, requiring compliance with existing regulations as mitigation is consistent with CEQA. “[A] condition requiring compliance with regulations is a common and reasonable mitigation measure and may be proper where it is reasonable to expect compliance.” *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 234 Cal. App. 4th 214, 246 (quoting *Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884, 906). Indeed, in many cases, the regulations provide the standard for future (project-level) mitigation to satisfy CEQA. *See id.* (“These regulations [requiring the development of hatchery genetic management plans] provide sufficient performance standards to satisfy CEQA.”). However, in many jurisdictions the identification of appropriate performance standards may be specific to local conditions. Mitigation measures are subject to the same rules regarding level of detail appropriate to the EIR being prepared. In this case, the PEIR addresses a large-scale region with a variety of projects spread over more than 20 years. As such, this PEIR identifies program-wide measures for implementation by SCAG. In addition, the PEIR identifies project-level mitigation measures for lead agencies to consider, as applicable and feasible, in subsequent project-specific design, CEQA review, and decision-making processes. It is ultimately up to the lead agency to determine the appropriateness of the mitigation measure based on project-specific circumstances. As appropriate and authorized by the *CEQA Guidelines* and case law, the program-wide mitigation measures included in this PEIR are less detailed than those that would be part of a project EIR and the selection of detailed mitigation measures is properly deferred to future project-specific CEQA reviews.

The project-level mitigation measures identified by SCAG (or comparable measures) “*can and should*” be considered by lead agencies in project-specific environmental review documents as appropriate and feasible. This language mirrors *CEQA Guidelines* section 15091(a)(2), and it is assumed that each lead agency for specific projects would have the ability to impose and enforce these measures (i.e., that they can implement them). Lead agencies for specific projects are responsible for developing project specific mitigation measures and ensuring adherence to such mitigation measures.

While the PEIR strives to provide as much detail as possible in the mitigation measures, some flexibility must be maintained to present mitigation approaches for impacts occurring over a large geographic scope and caused by a wide variety of transportation and land use activities. CEQA case law provides that a first-tier EIR may contain generalized mitigation criteria (see, e.g., *Koster v. County of San Joaquin* (1996) 47

Cal.App.4th 29). In addition, in each resource area, the PEIR identifies mitigation measures which lead agencies “can and should” consider in assessing and mitigating project-specific impacts as appropriate and feasible. SCAG then identifies examples of project-level mitigation measures that may be required by lead agencies. Lead agencies may also identify other comparable measures capable of reducing impacts below the specified threshold.

For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226, or for projects otherwise tiering off this PEIR, the project-level mitigation measures described in this PEIR (or comparable measures) can and should be considered and adopted by lead agencies (and project sponsors) during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require lead agencies to adopt mitigation, and it is ultimately the responsibility of the lead agency to determine and adopt project-specific mitigation as appropriate and feasible for each project.

The project-level mitigation measures used in this PEIR recognize the limits of SCAG’s authority; distinguish between SCAG commitments and project-level responsibilities and authorities; optimize flexibility for project implementation; and facilitate CEQA streamlining and tiering where appropriate on a project-by-project basis determined by each lead agency.

Compliance with existing regulations, such as the Uniform Building Code and California Building Code may not be considered mitigation because compliance is already required. However, such regulations do reduce environmental impacts and are sometimes identified herein where appropriate, to provide additional information on the how potential impacts are reduced. In some cases, as indicated in the PEIR, regulatory compliance is enough to reduce impacts to a level of less than significance. In other cases, mitigation is proposed to ensure and/or specify the means of compliance with regulations that lack specificity. In any event, requiring compliance with existing regulations as mitigation is consistent with CEQA. “[A] condition requiring compliance with regulations is a common and reasonable mitigation measure and may be proper where it is reasonable to expect compliance.” *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 234 Cal. App. 4th 214, 246 (quoting *Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884, 906). Indeed, in many cases, the regulations provide the standard for future (project-level) mitigation to satisfy CEQA. *See id.* (“These regulations [requiring the development of hatchery genetic management plans] provide sufficient performance standards to satisfy CEQA.”)

Master Response No. 6: Vehicle Miles Traveled (VMT) Analysis

Overview

With a continuously growing regional population, now exceeding 19 million residents, the containment of vehicle miles traveled (VMT) growth and the associated greenhouse gas (GHG) emissions generated by motor vehicles presents a major challenge for the SCAG region. SCAG is actively working with its jurisdictions on a variety of fronts, including the development and implementation of aggressive VMT reduction strategies. It is understood that focusing on any singular strategy for reducing GHG is insufficient for meeting our regional GHG targets, and that efforts toward reducing VMT do not constitute the entirety of mobile source GHG emissions reduction opportunities. However, other strategies, including the development of clean vehicle technologies and adoption of cleaner vehicle fuel standards (as well as GHG emission reductions associated with stationary and other sources), are beyond SCAG's regional planning purview. For this reason, SCAG's planning efforts toward reducing GHG emissions to meet our regional climate goals are focused largely, but not exclusively, on containment of VMT growth. The reduction of regional GHG emissions is among the highest priorities of SCAG's 2020 RTP/SCS (Connect SoCal). The integrated program of projects, plans, and strategies contained within Connect SoCal provide a solid foundation for making significant progress toward achievement of our regional GHG reduction objectives.

Background

In response to growing concerns regarding the consequences of climate change and the role of VMT in the generation of GHG emissions, the California state legislature passed Senate Bill 743 in 2013. SB 743 required the adoption of a new methodology to replace motor vehicle delay, measured by 'Level of Service' (LOS), for evaluating transportation impacts under the CEQA review process. The new methodology was required to facilitate GHG emissions reduction; encourage development of compact, transit-oriented communities; and promote the provision and enhancement of bicycle and pedestrian facilities and amenities.

Statewide implementation of the SB 743 CEQA transportation impact assessment provisions, combined with other regulations aimed at reducing VMT, are expected to generate VMT reduction benefits which will reduce GHG emissions produced by motor vehicles throughout the state. The *CEQA Guidelines* were updated as of January 1, 2019 to specify VMT as the metric to be used for determining the significance of transportation impacts.¹⁶ It should be noted that SCAG has traditionally undertaken VMT analysis as it is considered to be most appropriate for regional-scale analysis. While LOS analysis may be useful in

¹⁶ *CEQA Guidelines* § 15064.3

determining the efficiency of local intersections, it is not a viable tool for assessing the efficiency of a regional transportation system. For these reasons, SCAG considers VMT analysis to be the most appropriate tool for evaluating the overall performance of the regional transportation network and for evaluating and meeting our regional GHG reduction goals.

In November of 2018, CARB released its 2018 California’s Sustainable Communities and Climate Protection Act Progress Report, recognizing the importance of realizing and measuring the benefits identified through SB 375 planning work.¹⁷ Key findings of the report include that while positive gains have been made to improve the alignment of transportation, land use, and housing policies with state goals, the data suggests that more action is necessary for attaining our climate goals. CARB indicates their regional 2035 GHG emissions reduction targets under SB 375 are not adequate to fully meet the goals of the 2017 Scoping Plan for the cars and light-duty trucks. Collectively, CARB determined that if the state’s 18 MPOs all met the SB 375 GHG emissions reduction targets set in 2018, a 19 percent reduction in per capita GHG (from cars and light-duty trucks) would be achieved by 2035. In the target re-setting report, CARB expressed that to meet the statewide reduction goals set forth by SB 32 and the 2017 Scoping Plan, the state would need to reduce per capita GHG emissions from cars and light-duty trucks by 25 percent by 2035, resulting in a six percent gap between the 19 percent emissions reduction targets set for the regions (averaged for the 18 MPOs and compared to a baseline year of 2005). Therefore, even with meeting CARB’s SB 375 GHG emissions reduction target, a six percent gap compared to the state’s 25 percent reduction goal remains.

As CARB notes, “[a]n RTP/SCS that meets the applicable SB 375 targets alone will not produce the GHG emissions reductions necessary to meet state climate goals in 2030 nor in 2050”.¹⁸ CARB has also noted that greater reductions in VMT will be required to make up the six percent gap in GHG emissions targets. Further, according to the 2018 Sustainable Communities Progress Report, “California – at the state, regional, and local levels – has not yet gone far enough in making the systemic and structural changes to how we build and invest in communities that are needed to meet state climate goals.” It will require collaboration among all levels of government and the MPOs to identify the additional VMT reductions needed to achieve the state’s climate goals. MPOs need to maintain a leadership role in the GHG reduction efforts within their region, working closely with their local jurisdictions, with the

¹⁸ CARB. 2017. *Final Staff Report Proposed Update to the SB 375 Greenhouse Gas Emission Reduction Targets*. Available online at: https://ww3.arb.ca.gov/cc/sb375/final_staff_proposal_sb375_target_update_october_2017.pdf?ga=2.217174102.1993336916.1570127197-1229197864.1566229390, accessed October 4, 2019.

understanding that MPOs do not have the land use authority or the resources to meet this extraordinary challenge alone.

OPR and CARB have both published recommendations for reducing VMT reductions at the project level which may provide a means to close the gap between GHG reductions achieved through SCS implementation and the GHG reductions necessary to meet the state's goals. As additional GHG reductions from the transportation sector become increasingly difficult to achieve, it is possible that a cap-and-trade style strategy may prove to be a viable method for further reducing transportation-related emissions through a market-based carbon trading mechanism applied at a regional level.¹⁹ Implementation of such a cap-and-trade program remains speculative at the time of writing this PEIR, however. Additionally, and as recognized by CARB, MPOs do not have land use authority to implement additional VMT reductions. Furthermore, SCAG has no control or authority over other key GHG producing sectors (e.g., energy, industry, water, waste and agriculture) in meeting the AB 32, SB 32, and Scoping Plan targets.

Recognizing the potential impact SB 743 may have on reducing regional GHG emissions, SCAG is committed to providing the needed policy guidance and technical assistance to ensure its successful implementation at the local level throughout our region. In addition to the multiple workshops and stakeholder meetings hosted by SCAG throughout the SB 743 development process, SCAG has included SB 743 implementation assistance among the eligible project types for our Sustainability Grant Program (SGP). Three such grants were awarded by SCAG for SB 743 implementation projects for the City of Temecula, the San Bernardino County Transportation Authority (SBCTA), and the City of Los Angeles Department of Transportation (LADOT). These grant-funded efforts seek to ease the transition to the VMT assessment methodology for our local jurisdictions and to provide an implementation template for other local agencies throughout our region.

In addition to the SGP grants, SCAG, in collaboration with LADOT, has been awarded a \$500,000 Caltrans Sustainable Communities grant to establish a pilot demonstration for a VMT Mitigation Exchange or Bank program. This pilot program seeks to evaluate the viability of implementing a regional or subregional VMT mitigation mechanism that would permit project-level VMT impacts to be counterbalanced by equivalent VMT mitigation activities in other areas of that region. If successful, a VMT Exchange or Bank program may allow certain transportation or land use development projects that

¹⁹ In June 2015, fuels (gasoline, diesel, and natural gas) were covered under the Cap-and-Trade programs, which would require fuel suppliers to reduce GHG emissions by supplying low carbon fuels or purchase allowances to cover the GHG emissions produced when conventional petroleum-based fuel is burned. Therefore, a program is already in place within the Cap-and-Trade program to reduce GHG emissions from the transportation section. (See: CARB. *California's Cap and Trade Program: Fuel Facts*. Available online at: https://ww3.arb.ca.gov/cc/capandtrade/guidance/facts_fuels_under_the_cap.pdf, accessed October 23, 2019.)

generate VMT above locally-identified thresholds, to mitigate such impacts. The VMT exchange program would then be employed to implement or finance feasible VMT mitigation activities (possibly in other areas of the region) to reduce the VMT impact to a less than significant level.

Master Response No. 7: Regional Housing Needs Assessment

The PEIR evaluates the environmental effects of implementation of Connect SoCal, and specifically analyzes reasonably foreseeable regional growth as identified in the Connect SoCal Growth Forecast and planned for in the SCS. As discussed in the PEIR, Connect SoCal and this PEIR address reasonably foreseeable households in the SCAG region. The population and households are distributed in accordance with the growth forecast as described in the Demographics and Growth Forecast Technical Report in the Plan. Furthermore, while state planning law requires the SCS to identify areas sufficient to house the 8-year RHNA need pursuant to Government Code section 65080(b)(2)(B)(iii) it is important to recognize that the RHNA allocation of housing need is a distinct and separate process set forth under state housing law, Government Code section 65584 et seq. The RHNA requirements address the mandate to plan for housing units to further the statutory objectives. The RHNA establishes “minimum housing development capacity that cities and counties are to make available via their land use powers to accommodate growth within a planning period.”

As will be discussed in more detail below, in contrast to Connect SoCal, the RHNA process is explicitly exempt from CEQA pursuant to Government Code section 65584(g), *CEQA Guidelines* § 15283, and *CEQA Guidelines* section 15282(r). As such, the comments that assert that the RHNA determination should be addressed in this PEIR are incongruous with the regulatory framework of the RHNA.

RHNA Background

As discussed in the Connect SoCal Master Response No. 1, the 2016-2045 Growth Forecast undergirding Connect SoCal provides an assessment of the reasonably foreseeable future patterns of employment, population, and household growth in the SCAG region given demographic and economic trends, and existing local and regional policy priorities. The Connect SoCal Growth Forecast begins with an assessment of regional demographic and economic trends and uses a variety of spatially-explicit data sources—including local land use plans—to assess where growth is most likely to occur within the region, emphasizing a balance between future employment, population, and households. Between November 2017 and October 2018, SCAG staff met one-on-one with all 197 local jurisdictions in the region to solicit additional information for improving the accuracy of the preliminary forecast at several intervals (2016, 2020, 2030, 2035, and 2045). Further refinements were made at the small area (i.e., sub-jurisdictional) level to reflect regional sustainability goals and policies through the scenario development process.

The legislative changes of 2018 modified the nature of the regional housing need determination for the 6th Cycle RHNA. Specifically, Government Code 65584.01(b) et seq. explicitly added measures of household overcrowding and housing cost burden to the list of factors to be considered by the California Department of Housing and Community Development (HCD) for the determination of housing need. These new measures (overcrowding and cost burden) are not included in the Connect SoCal Growth Forecast because they are not direct inputs to the growth forecasting process and are independent of employment and population projections. In contrast, they reflect additional latent housing needs in the current population (i.e. “existing need”).

Thus, the 6th Cycle RHNA regional housing need total of 1,341,827, as determined by HCD, consists of both “projected need,” which is intended to accommodate the growth of population and households during the 6th Cycle RHNA (2021-2029), as well as “existing need.” On January 13, 2020, HCD’s finding that SCAG’s draft RHNA methodology furthered the statutory objectives of RHNA, reflected that the determination is separated into “projected need” and “existing need” components. On March 5, 2020, SCAG Regional Council adopted the draft RHNA methodology as the final methodology for the 6th Cycle RHNA.

Connect SoCal and the 6th Cycle RHNA

The RHNA identifies anticipated housing need over a specified eight-year period and requires that local jurisdictions make available sufficient zoned capacity to accommodate this need. Actual housing production depends on a variety of factors external to the identification of need through RHNA—local jurisdictions frequently have sufficient zoned capacity but actual housing construction exceeds or fails to achieve RHNA targets due to market and other external forces. For example, per HCD’s most recent Annual Progress Reports covering new unit permits through 2018, the region’s low and very-low income permits totaled 19,328 units (2,494/year) compared to the RHNA allocation of 165,579 units (21,365/year). In contrast, the Connect SoCal Growth Forecast is an assessment of the most likely future pattern of growth given, among other factors described above, the availability of zoned capacity. This contrast is further attenuated since the legislative changes of 2018 have resulted in a 6th Cycle RHNA regional determination which includes significant new measures of “existing need.”

“Projected Need” Portion of the 6th Cycle RHNA

The “projected need” portion of the 6th Cycle RHNA is derived from the Connect SoCal Growth Forecast. Specifically, the Connect SoCal Growth Forecast projects 469,725 additional households in the SCAG region over 2021-2029 (Growth Forecast prorated for the 8.25-year RHNA planning period). After subtracting an estimate of household growth occurring on tribal lands (2,767), the remaining 466,958

households represent occupied housing units, to which two adjustment factors are added: vacancy need (14,467 units) and replacement needs (23,545 units) to yield a total of 504,970 housing units reflecting “projected need” for the 6th Cycle RHNA.

Table 9.0-2
Relationship between Regional Forecasted Households and RHNA “Projected Need”

Projected Household Growth, 7/2021 – 10/2029	469,725
Tribal Land Growth Estimate	-2,767
Vacancy Need	+14,467
Replacement Need	+23,545
Housing Unit Need to Accommodate Projected Growth (“Projected Need”)	504,970

Since only occupied housing units (households) generate travel demand, they are the primary focus of Connect SoCal’s analysis. Additional housing units (to account for vacancy need and replacement need) associated with this household projection will be accommodated by local jurisdictions within the same areas.

Connect SoCal identifies areas within the SCAG region sufficient to house all the population in the region, including the projected population growth of 3.7 million and household growth of 1.6 million through 2045, the plan horizon year (see Table 5 in the Sustainable Communities Strategy (SCS) Technical Report and Table 13 of the Demographics & Growth Forecast Technical Report). The same areas sufficient to accommodate all the region’s household growth through 2045 will also be sufficient to accommodate the eight-year projection or the “projected need” portion (504,970 units) of the 6th Cycle (2021- 2029) RHNA.

Accordingly, Connect SoCal meets state planning law requirements, specifically Government Code 65080(b)(2)(B)(ii) and (iii) which require that Connect SoCal’s Sustainable Communities Strategy shall:

- (ii) Identify areas within the region sufficient to house all the population of the region, including all economic segments of the population, over the course of the planning period of the regional transportation plan taking into account net migration into the region, population growth, household formation and employment growth
- (iii) Identify areas within the region sufficient to house an eight-year projection of the regional housing need for the region pursuant to Section 65584

“Existing Need” Portion of the 6th Cycle RHNA

In accordance with Government Code Section 65080(b)(2)(B)(iii), as discussed above, Connect SoCal’s SCS identifies areas within the region sufficient to house an eight-year *projection* of the RHNA need, meaning the “projected need” portion (504,970 units) of the 6th Cycle (2021- 2029) RHNA. State planning law does not explicitly require the SCS to identify areas in the region sufficient to house the “existing need” portion of the RHNA. Additionally, for the reasons discussed in this section, existing need could not be reflected within Connect SoCal or the PEIR.

In HCD’s January 13, 2020 letter finding that SCAG’s draft RHNA methodology furthered the statutory objectives of RHNA, HCD identifies the “existing need” as 836,857 units which equals the total regional housing need (1,341,827 units) minus the projected need (504,970 units). The existing need primarily reflects regional measures of overcrowding, cost burden and vacancy.

The 6th Cycle RHNA allocation at the jurisdiction level will not be finalized until October 2020 following an appeals process which may result in changes of to the RHNA at the jurisdictional level. Following adoption of SCAG’s Final RHNA allocation in October 2020, local jurisdictions must update their housing elements (as needed) to provide sufficient zoned capacity for the total 6th Cycle allocation pursuant to state guidelines. Updated housing elements are due in October 2021. The updated housing elements must identify specific locations where potential new housing can be accommodated. Pursuant to Government Code Section 65583(c)(1)(A), local jurisdictions will have until January 2025 to complete any necessary rezoning to accommodate their RHNA allocation. Until this planning work is done at the local level, it would be speculative for Connect SoCal to make assumptions about potential development levels and patterns that includes the 6th Cycle “existing need.” As a result, it would be speculative for the PEIR to make assumptions about the environmental effects of these units.

As discussed above, SCAG’s RTP/SCS Growth Forecast process always incorporates extensive input and data including the most up-to-date local land use information, policy responses, demographic, and economic data in order to determine the most likely future pattern of regional growth. As such, the information necessary to assess the feasibility, quantity, and location of additional household growth stemming from the 6th Cycle of RHNA’s “existing need” allocation will not be available until October 2021 at the earliest and likely later than that for some jurisdictions. Additionally, the identified “existing need” portion of the 6th Cycle RHNA does not impact the region’s projected population, used in the SCS and evaluated in the PEIR, as the “existing need” addresses additional latent housing needs in the existing population rather than implying future population growth. For these reasons, the “existing need” cannot be reflected in Connect SoCal.

However, SCAG will allocate total regional housing need (“existing need” and “projected need”) consistent with the SCS. SCAG’s adopted RHNA methodology for allocating “existing need” focuses on transit and job access (i.e., assign 50% based on jurisdiction’s share of the region’s population within HQTAs and 50% based on a jurisdiction’s share of the region’s jobs that can be accessed within a 30-minute commute) which is aligned with the strategies and policies underlying the regional development pattern in the SCS. As such, in compliance with Government Code section 65584.04(m)(1), SCAG will allocate the “existing need” (as well as the “projected need”) as part of the total RHNA determination, consistent with the development pattern in the SCS.

RHNA is not a Cumulative Project under CEQA

The PEIR evaluates reasonably foreseeable regional growth as identified in the Connect SoCal Growth Forecast and forecasted development patterns reflected in the SCS. The RHNA is not a separate cumulative project under CEQA. The RHNA provides housing need information for the same geographic area as the SCS and a portion of the same time frame as the SCS (the RHNA addresses the first eight years of the SCS 25-year planning timeframe). As indicated in the discussion above, local jurisdictions have not yet had the opportunity to review their housing allocations and assimilate that information into their planning process. Once local housing elements are updated to accommodate the identified housing need, a new growth forecast can be prepared. Without the revised housing elements followed by an updated Growth Forecast, the identified housing need remains only speculative in terms of what may reasonably be expected to be constructed and therefore, is not appropriate for analysis within the PEIR (including as an alternative).

Pursuant to Government Code section 65584(g), RHNA determinations made by HCD and SCAG are specifically exempt from CEQA:

“(g) Notwithstanding any other provision of law, determinations made by the department, a council of governments, or a city or county pursuant to this section or Section 65584.01, 65584.02, 65584.03, 65584.04, 65584.05, 65584.06, 65584.07, or 65584.08 are exempt from the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code).”

This has always been the case, since the original adoption of the housing element law (SB 1282) in 1989. “Determinations made by the department, a council of governments, or a local government pursuant to this section are exempt from the provisions of the California Environmental Quality Act, which is provided for in Division 13 (commencing with Section 21000) of the Public Resources Code.”

The *CEQA Guidelines* also codified this provision in 1989: “CEQA does not apply to regional housing needs determinations made by [HCD], a council of governments, or a city or county pursuant to Section 65584 of the Government Code.” (*CEQA Guidelines* § 15283). It was later also included as a statutory exemption pursuant to CEQA Guidelines section 15282(r) (“Determinations made regarding a city or county’s regional housing needs as set forth in Section 65584 of the Government Code.”).

The RHNA requires MPOs to determine the share of the total regional housing needs borne by a city or unincorporated areas of counties for all economic sectors of housing and to ensure that sufficient zoning capacity is made available to meet this need. This is a planning exercise that does not result in physical impacts to the environment. Once the allocation is addressed in a jurisdiction’s housing element, the revised housing element is then subject to CEQA review either on its own or as part of a general plan. The housing element of a general plan must identify actions that will be taken to make sites available to accommodate the local government’s allocated share of the regional housing need. According to Govt. Code sec. 65583(c)(1): “To achieve the state’s housing objectives, the law requires each local jurisdiction to zone adequate numbers of sites to accommodate the regional housing burden allocated to it, so that every local jurisdiction shares in the obligation to accommodate the statewide housing need.” (*San Franciscans for Livable Neighborhoods v. City and County of San Francisco*, 26 Cal. App. 5th 596, 610 (2018)).

Finally, as discussed above, the PEIR evaluates reasonably foreseeable growth from 2019 to 2045. The PEIR already evaluates a large amount of growth at a programmatic regional level and identifies significant impacts for most topical areas. While accommodating additional growth may not change the findings of significant impacts identified in the PEIR, the modeling results would likely change. Nevertheless, without advance knowledge of the distribution of regional population and household growth reflecting also existing need and whether, when, and how these housing new units would be constructed, such an analysis is infeasible and would be entirely speculative at this time.

Master Response No. 8: Alternatives

The formulation of Connect SoCal has been guided by several engagements over the last several years with regional stakeholders, including the involvement of thousands of Southern Californians through one-on-one local data review sessions with jurisdictions, regional planning working groups, outreach to traditionally underrepresented groups through community-based organizations, and numerous public workshops. Plan refinements are based on the Connect SoCal’s Final Growth vision, which reflect jurisdictional-level input on future development received from towns, cities, and counties. To help the region achieve sustainable outcomes, Connect SoCal’s Final Growth Vision will focus growth within jurisdictions near destinations and mobility options, and promote an improved jobs-housing balance to reduce commute times. This is reflective of Connect SoCal’s Core Vision: to build upon and expand land

use and transportation strategies established over several planning cycles to increase mobility options and achieve a more sustainable growth pattern.

SCAG developed three alternatives for analysis in the PEIR. Each alternative consists of a transportation network element and a land use pattern element and is aligned in part with the scenarios for developing the Plan (See Section 2.0, Project Description, for further details). The following alternatives are evaluated:

1. No Project Alternative
2. Existing Plans-Local Input Alternative
3. Intensified Land Use Alternative

The No Project Alternative is aligned with the Trend/Baseline Scenario, while the Existing Plans-Local Input Alternative is aligned with the Existing Plans-Local Input Scenario. The Intensified Land Use Alternative incorporates the Plan's transportation network and land use strategies from the accelerated tomorrow scenario.

SCAG did not identify additional alternatives that were rejected. As such, three alternatives were identified for comparative analysis: The No Project Alternative and two other potentially feasible RTP/SCS alternatives, one that increases greenfield development (Existing Plans-Local Input Alternative) and one that places additional emphasis on infill development and transit (Intensified Land Use Alternative).

The No Project alternative, required to be analyzed under CEQA, assumes the projected land use pattern and planned transportation improvements would be consistent with those set forth in the 2016 RTP/SCS and that investments would cease beyond what is currently programmed. The two other alternatives allow for analysis variation in projected land use pattern and planned transportation improvements that could realistically be expected to occur over the Plan horizon. The alternatives reflect different growth patterns and different investment decisions for the transportation system.

Each of the alternatives and the Plan is based on local input. The growth patterns for the Plan, No Project and Existing Plans-Local Input alternatives are all consistent with adopted general plans and zoning. The Intensified Land Use alternative increases density beyond existing general plans.

A more detailed description of each of these alternatives, followed by a comparative analysis of how well the alternative would achieve the project objectives and the relative level of environmental impact associated with each alternative as compared to implementation of Connect SoCal is provided in Section 4.0, Alternatives.

9.3 RESPONSES TO COMMENTS RECEIVED ON THE DRAFT PEIR

Numbered responses to each comment received are provided followed by the original bracketed comment letters. Individual comments within each letter are numbered and the response is given a matching number.

Letter SOV 1: Santa Ynez Band of Chumash Indians Tribal Elders' Council

Tribal Elders' Council Governing Board

P.O. Box 517

Santa Ynez, CA 93460

December 27, 2019

Response SOV 1-1

The comment indicates that the Santa Ynez of Chumash Indians does not request any additional consultation. No additional response is required.

Letter SOV-2: San Manuel Band of Mission Indians

Jessica Mauck
Cultural Resources Analyst
26569 Community Center Drive
Highland, CA 92346

January 6, 2020

Response SOV 2-1

The commenter identifies updated acreages for the San Manuel Reservation. See **Chapter 10.0, Corrections and Additions**, for this revision made to Section 3.11, Land Use and Planning (p 3.11-21).

Letter FED 1: U.S. Environmental Protection Agency Region IX

Debbie Lowe Liang
Environmental Review Section (ENF-4-2)
75 Hawthorne Street
San Francisco, California 94105
415-947-4155

January 23, 2020

Response FED 1-1

This comment is a set of general introductory remarks restating the role of the U.S. EPA and its support of SCAG's goals. It presents no environmental issues within the meaning of CEQA and no specific response is required. The comment will be included as part of the record and made available to the decision makers prior to a final decision on the proposed project.

Response FED 1-2

For responses related to the Connect SoCal Plan, please refer to Submission ID 0001464 of the Final Connect SoCal Plan.

Response FED 1-3

The comment includes a suggestion to add the SCAG EJ Toolbox as a suggested resource in relevant project-level mitigation measures. As project-level measures are anticipated to be implemented by the local jurisdiction, SCAG has added the EJ Toolbox as a resource for project level mitigation measures for air quality, greenhouse gas, and noise. See **Chapter 10.0, Corrections and Additions**, for revisions to Section 3.3, Air Quality (p 3.3-67) (new measure aa) and Section 3.8, Greenhouse Gases (p 3.8-72) (new measure k) and to Section 3.13, Noise (p 3.13-39) (new measure y).

Response FED 1-4

For responses related to the Connect SoCal Plan, please refer to Submission ID 0001464 of the Final Connect SoCal Plan.

Response FED 1-5

The comment requests additional information regarding the proposed Southern California Disadvantaged Communities Planning Initiative described in SMM AQ-1 including entities that would participate, potential eligibility criteria and the community engagement strategy. A significant challenge to the development and implementation of the RTP/SCS is the lack of comprehensive countywide and local active transportation plans which serve as the basis for regional active transportation planning. SCAG aims for all local jurisdictions to have high-quality, local active transportation plans as inputs to the regional planning process. The Southern California Disadvantaged Communities Planning Initiative

plays a critical role in achieving this goal by providing funding to develop a low-cost, high-impact model which leverages SCAG's staff, data, and outreach resources to deliver context-sensitive plans in high-need, low-resourced cities and unincorporated areas. Once developed, those plans can be integrated into existing and emerging regional active transportation infrastructure and frameworks. As part of the project, this model will be operationalized through the development of plans in seven communities and refined to provide a sustainable resource for SCAG staff to partner with local agencies to develop local active transportation plans.

Plan development is guided by robust community engagement, including the development of a Community Advisory Committee informing the direction of planning efforts (comprised of City staff, non- profits and community members), website development, community trainings, bicycle and pedestrian counts, a Living Preview Go Human Demonstration Event and feedback opportunities, artistic feedback installations, as well as postcards and web and print communications.

The following jurisdictions are included in SCAG's Disadvantaged Communities Active Transportation Planning Initiative: City of Stanton, City of Calipatria, City of Santa Fe Springs, Unincorporated Saticoy, City of Perris, City of Highland, City of Adelanto.

Jurisdictions were selected based on Disadvantaged Community scores, using the following criteria: SB 535/CalEnviroScreen Score, Environmental Justice Area Score, Communities of Concern Score, Native American Tribal Lands Score, and Median Income Score. Outreach was conducted with County Transportation Commissions to further refine priorities and staff assessed jurisdiction interest and capacity to participate in the initiative.

SCAG will extend our coordination with the U.S. EPA if it wishes to participate in the Southern California Disadvantaged Communities Planning Initiatives.

Regarding the commenter's recommendations on PMM-AQ-1(q), the measure has been revised. See **Chapter 10.0, Corrections and Additions**, for revisions to page 3.3-67 of Section 3.3, Air Quality. Regarding PMM-AQ-1(o), the measure already requires a traffic plan to "minimize traffic flow interference from construction activities" and "minimize obstruction of through-traffic lanes."

Response FED 1-6

The comment supports the robust set of mitigation measures provided in Section 3.8, Greenhouse Gases, and encourages the consideration of measures including in PMM GHG-1 in environmental justice communities. The mitigation measures included in the PEIR should be applied as applicable and feasible in all communities. Please see **Chapter 10.0, Corrections and Additions**, for revisions to page 3.8-72 of Section 3.8, Greenhouse Gas Emissions. New measure “k” encourages project sponsors to use the EJ Toolbox for potential measures to address impacts specific to low income/minority communities.

Response FED 1-7

The EPA requests a copy of the Final Plan and Final PEIR. Commenter will receive notice of the availability of the Final Plan and Final EIR and scheduled actions on the Connect SoCal Plan and PEIR.

Letter STA 1: California Department of Transportation

Paul Albert Marques
Deputy District Director for Planning
District 7
100 S. Main Street, Suite 100
Los Angeles, CA 90012

January 23, 2020

Response STA 1-1

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001549-0001553* of the Final Connect SoCal Plan.

Response STA 1-2

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001549-0001553* of the Final Connect SoCal Plan.

Response STA 1-3

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001549-0001553* of the Final Connect SoCal Plan.

Response STA 1-4

The commenter requests that the hyperlink in footnote 75 (page 3.17-55) be corrected to remove “on October 25” from the clickable hyperlink. See **Chapter 10.0, Corrections and Additions**, for revisions to page 3.17-55 of Section 3.17, Transportation Traffic and Safety.

Response STA 1-5

The commenter requests clarification as to whether the discussion of the regional HOV system and park and ride system (Section 3.17, Transportation Traffic and Safety, page 3.17-8) includes High Occupancy Toll (HOT)/express lanes. The discussion of the regional HOV system including the identification of vehicle miles in Table 3.17-6 does include HOT/express lanes. However, there are an additional 160 miles of HOT lanes.

Response STA 1-6

The commenter identifies a potential location for a wildlife crossing at Conejo Grade around Camarillo and Thousand Oaks that should be looked at. The PEIR does not identify specific wildlife crossing locations, but Mitigation Measure PMM BIO-4 (m) and (n) does include wildlife crossings and fencing as potential mitigation:

“(m) Evaluate the potential for installation of overpasses, underpasses, and culverts to facilitate wildlife movement in cases where a roadway or other transportation project may interrupt the flow of species through their habitat. Provide wildlife crossings in accordance with proven standards, such as FHWA’s Critter Crossings or Ventura County Mitigation Guidelines and in consultation with wildlife corridor authorities.”

and

“(n) Install wildlife fencing where appropriate to minimize the probability of wildlife injury due to direct interaction between wildlife and roads or construction.”

Mitigation Measure PMM BIO-4 identifies a number of wildlife mitigation strategies that lead agencies could use to mitigate impacts on wildlife.

Response STA 1-7

The commenter suggests that SCAG, Metro and Caltrans should fund projects that will improve culverts for wildlife use in rural areas of Ventura County. SCAG does not have authority to mandate agencies to fund specific mitigation measures and SCAG does not have project authority to impose mitigation measures.

Response STA 1-8

The commenter identifies additional possible wildlife crossings. See **Response STA 1-6**.

Response STA 1-9

The commenter identifies the need for fencing and habitat connectivity at a specific location. See **Response STA 1-6**.

Response STA 1-10

The commenter identifies the need for habitat connectivity at a specific location. See **Response STA 1-6**.

Response STA 1-11

The commenter indicates that access to parks and open space needs to be improved and suggests that buses at discount rates be provided to take people from the inner-city. Mitigation measure PMM REC-1 includes increasing the accessibility to natural areas and lands. SCAG does not have authority to mandate that agencies fund specific mitigation measures and SCAG does not have project authority to impose mitigation measures.

Response STA 1-12

The commenter indicates that beyond light rail and other transportation projects, agencies located in downtown Los Angeles and other large cities should consider alternative working hours and equip their staff to telecommute. SCAG does not have authority to mandate agencies to fund specific mitigation measures and SCAG does not have project authority to impose mitigation measures. Mitigation Measure PMM TRA-1 includes a number of Transportation Demand Management (TDM) strategies – alternative working hours and telecommuting can also help reduce VMT that would be appropriate mitigation for individual projects to include.

Response STA 1-13

The commenter indicates that Cal-Fire should have fire education for areas in cities that border open spaces and that training should be given to volunteers. Mitigation Measure PMM WF-1 (a) includes, “Launch fire prevention education for local cities and counties such that local fire agencies, homeowners, as well as commercial and industrial businesses are aware of potential sources of fire ignition and the related procedures to curb or lessen any activities that might initiate fire ignition. SCAG does not have authority to mandate agencies to fund specific mitigation measures and SCAG does not have project authority to impose mitigation measures on other agencies.

Response STA 1-14

The commenter suggests that SCAG encourage cities to capture and treat rainwater and release it in to dry ravines. SCAG does not have authority to mandate agencies to fund specific mitigation measures and SCAG does not have project authority to impose mitigation measures on other agencies. SCAG does have a Sustainability Program that is described in Mitigation Measure SMM USWS-1 and includes land use strategies that result in “Improved water quality, groundwater recharge and watershed health.” Mitigation measures have been revised to include strategies for stormwater and rainwater collection, infiltration, treatment and release. See **Chapter 10.0, Corrections and Additions**, for revisions to page 3.19.3-20 of Section 3.19.3, Utilities and Service Systems.

Letter STA 2: California High Speed Rail Authority

Margaret (Meg) Cederoth
Director of Planning and Sustainability
California High Speed Rail Authority
770 L Street, Suite 620
Sacramento, CA 95814

January 23, 2020

Response STA 2-1

The commenter provides introductory text. No specific response is required.

Response STA 2-2

For responses related to the Connect SoCal Plan, please refer to Submission ID 0001442 of the Final Connect SoCal Plan.

Response STA 2-3

The comment suggests Appendix 2.0 List of Plan Project be updated to reflect project costs for California High-Speed Rail Phase 1 system to \$38.96 billion. Revisions have been made to the Plan, please refer to the revised Connect SoCal Project List.

Response STA 2-4

The comment suggests Appendix 2.0 List of Plan Projects be updated to remove California High Speed Rail Phase 2 ENV/PE be removed from the financially constrained project list. Revisions have been made to the Plan, please refer to the revised Connect SoCal Project List.

Response STA 2-5

The commenter provides contact information. No specific response is required.

Letter REG 1: John Wayne Airport

Lea U. Choum, Planning Manager
John Wayne Airport
3160 Airway Avenue
Costa Mesa, CA 92626

January 23, 2020

Response REG 1-1

This comment is a set of general introductory remarks restating the role of the John Wayne Airport, its participation in the RTP process as well as detailed to specific data submitted to SCAG by JWA. It presents no environmental issues and no specific response is required. The comment will be included as part of the record and forwarded to decision makers for their consideration in taking action on the Plan. No specific response is required.

Response REG 1-2

The comment suggests specific edits to Appendix 3.13 Aviation Noise Technical Report. Page 12 of Appendix 3.13 is revised to reflect to reflect the location of single-family land uses. See **Chapter 10.0, Corrections and Additions**, for Appendix 3.13 page 12 and 15.

Response REG 1-3

The comment suggests specific edits to Appendix 3.13 Aviation Noise Technical Report. Page 15 of Appendix 3.13 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 12 and 15.

Response REG 1-4

The commenter provides contact information. No specific response is required.

Letter REG 2: South Coast Air Quality Management District

Wayne Nastri, Executive Officer
South Coast Management District
21865 Copley Drive
Diamond Bar, CA 91765

January 24, 2020

Response REG 2-1

This commenter provides introductory remarks and references detailed comments below. No specific response is required. Individual comments are responded to below.

Response REG 2-2

The comment refers to detailed comments on the Connect SoCal Plan attached to the letter with respect to the attainment challenge and the need for a new detailed approach to goods movement. For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001483, 0001506, and 0001515* of the Final Connect SoCal Plan.

Response REG 2-3

This comment provides a general summary of the comments below regarding potential under-estimated air quality impacts and use of SCAQMD's threshold for health risk assessment, these comments are responded to in detail below.

Response REG 2-4

The SCAQMD states that the agency will work collaboratively with SCAG to implement the Plan. No specific response is required.

Response REG 2-5

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001483, 0001506, and 0001515* of the Final Connect SoCal Plan.

Response REG 2-6

The comment introduces Attachment 2 of the SCAQMD comment letter, which includes comments to the Draft PEIR. No specific response is required.

Response REG 2-7

The comment summarizes the Plan and anticipated growth within the region. No response is required.

Response REG 2-8

The commenter summarizes their concern that the Draft PEIR incorrectly compared on-road mobile source emissions for the existing conditions without the proposed project (2019) and the future conditions with the proposed project (2045) to determine significance. Commenter indicates that as a result, the emission reductions anticipated to occur independently of the Plan as a result of adopted state and federal regulations are improperly credited to the Plan. See **Response REG 2-18** for a comprehensive response to the issues raised in this summary comment. See also **Master Response 3 Baseline Conditions**.

Response REG 2-9

The commenter summarizes their concern that the Draft PEIR fails to compare the SCAQMD's portion of on-road mobile source emissions to the SCAQMD's regional significance thresholds to determine significance. See **Response REG 2-19** for a comprehensive response to the issues raised in this summary comment.

Response REG 2-10

The commenter summarizes their concern that the air quality analysis in the Draft PEIR included two analysis years: baseline (2019) and buildout year (2045). The SCAQMD recommends that interim analysis years (2020, 2030, and 2035) also be included within the analysis. See **Response REG 2-20** for a comprehensive response to the issues raised in this summary comment.

Response REG 2-11

The commenter summarizes their concern that the Draft PEIR discusses the SCAQMD's 2016 AQMP's forecasted emissions but did not quantify emissions from implementing Connect SoCal's transportation strategies for off-road emissions or land use strategies. The commenter asserts that since greenhouse gas (GHG) emissions were quantified for off-road vehicles, building energy, and water-related energy consumption, the air quality analysis is inconsistent with the GHG analysis and off-road emissions should be quantified. See **Response REG 2-21** for a comprehensive response to the issues raised in this summary comment.

Response REG 2-12

The commenter summarizes that the Draft PEIR failed to evaluate a scenario where construction activities overlap with operational activities. See **Response REG 2-22** for a comprehensive response to the issues raised in this summary comment.

Response REG 2-13

The commenter summarizes their concern that the Draft PEIR's health risk analysis failed to utilize the SCAQMD's CEQA significance threshold of 10 in a million. See **Response REG 2-23** for a comprehensive response to the issues raised in this summary comment.

Response REG 2-14

The commenter summarizes their recommendations regarding providing more information on the implementation and monitoring of Tier 4 construction equipment mitigation. See **Response REG 2-24** for a comprehensive response to the issues raised in this summary comment.

Response REG 2-15

The commenter summarizes their recommendations that SCAG include additional project-level mitigation measures to reduce on-road mobile source emissions. See **Response REG 2-25** for a comprehensive response to the issues raised in this summary comment.

Response REG 2-16

The commenter summarizes their recommendations that SCAG include project-level mitigation measures for off-road mobile sources. See **Response REG 2-26** for a comprehensive response to the issues raised in this summary comment.

Response REG 2-17

The commenter summarizes their concern that the Draft PEIR fails to include a discussion on how to disclose health risks and reduce exposures when new sensitive land uses are sited within 500 feet of freeways and recommends that the Draft PEIR include a discussion on the mobile source HRA analysis and health risk reduction strategies. See **Response REG 2- 27** for a comprehensive response to the issues raised in this summary comment.

Response REG 2-18

The comment suggests that the use of 2019 as the CEQA baseline to compare emissions to the Plan buildout in 2045 may have led to an underestimation of the air quality impacts resulting from Plan implementation and incorrectly assigns reduction credit of air emissions anticipated to occur independently of the Plan as a result of adopted state and federal regulations to the Plan. The SCAQMD recommends that the Draft PEIR compare emissions with and without the proposed project in interim analysis years and at full project buildout.

SCAG is responsible for providing a blueprint for transportation projects and land use development in the six-county region through the horizon year of 2045. Connect SoCal is a planning document that supports a combination of transportation and land use strategies to achieve reductions in emissions. As noted in the PEIR, on-road vehicle emissions are anticipated to decrease by the horizon year (2045). These reductions can be attributed to CARB regulations and efforts at implementing cleaner fuel standards and promoting lower emitting vehicles (CARB regulatory measures are listed on Section 3.3, Air Quality, [p 3.3-39 to 3.3-42]). The emission reductions from CARB regulations would occur regardless of the Plan. Evaluating a 2045 baseline condition in which only air quality reductions that can be attributed to the Plan, as recommended by the SCAQMD, would not provide valuable information to the public as the Connect SoCal Plan cannot be separated from any future scenario. The Plan does not take credit for any air quality rules, regulations, or technologies but includes them within the future year reductions as these controls cannot be separated from future emissions. Similarly, the EIR cannot separate out all emissions anticipated to occur only as a result of the Plan and compares all emissions in the future to all emissions occurring under existing conditions, thus providing a conservative analysis. For informational purposes the PEIR also compares future conditions with the Plan to future conditions without the Plan. Note that the emission results reported in the PEIR have accounted for the impact of the federal SAFE Vehicles Rule Part I.

The commenter recommends that SCAG revise the air quality analysis to calculate emissions in years 2020, 2030, and 2035 (GHG analysis years) with the Plan and emissions in those years without the Plan. See **Response REG 2-20** for a detailed response to the SCAQMD's recommendation regarding analysis of interim years between now and the Plan horizon year (2045).

Response REG 2-19

The commenter indicates that the PEIR should have compared the SCAQMD's portion of on-road mobile source emissions to the SCAQMD's regional thresholds in order to determine significance.

SCAQMD's thresholds were derived to apply to individual projects and not entire plan-level impact assessments. This is evident from their use in the SCAQMD's *1993 CEQA Thresholds Guide*, which

includes screening tables for individual land use development. Although the screening tables are obsolete because they were based on outdated emission factors, it is clear that the thresholds were intended to apply to specific projects. The SCAQMD has not developed thresholds more relevant to plan-level documents and, as a result, the thresholds are not appropriate for this type of analysis. Review of approved projects within the SCAQMD's jurisdiction demonstrates that these emission thresholds were used for specific land use development projects. The SCAB is approximately 4.2 million acres. Using the same thresholds for a single project covering a few acres and a regional transportation plan covering the entire SCAB region is not reasonable.

Rather than use thresholds appropriate to individual projects, the PEIR uses any increase in criteria pollutant emissions as the threshold of significance for the SCAG region. (This threshold is thus lower than SCAQMD's project thresholds.) This threshold is appropriate because of the large reductions in emissions anticipated to occur as a result of the state and federal emission controls previously discussed. Section 3.3, Air Quality (p 3.3-61), summarizes the significance finding as follows:

While the SCAG region may see an increase in PM_{2.5}, PM₁₀ and SO_x emissions, the SCAQMD, AVAPCD, ICAPCD, and MDAQMD have not established regional thresholds to determine significance. The air districts within the SCAG region have only established project-level thresholds (see Table 3.3-9, Table 3.3-10, and Table 3.3-11). Therefore, individual projects must compare anticipated project emissions to the thresholds for the air district within which they are located in order to determine significance on the project-level. Because mobile source emissions of PM₁₀ and PM_{2.5} will increase (PM₁₀ would increase in Imperial, Orange, Riverside, and San Bernardino Counties and PM_{2.5} would increase in Imperial, Riverside, and San Bernardino Counties), largely as a result of increased total VMT, and SO_x would increase in the region at least through 2031, the Plan could contribute to an air quality violation. Further, there is the potential for individual projects to exceed local standards during construction and/or operation for several pollutants. Therefore, this impact is considered to be significant.

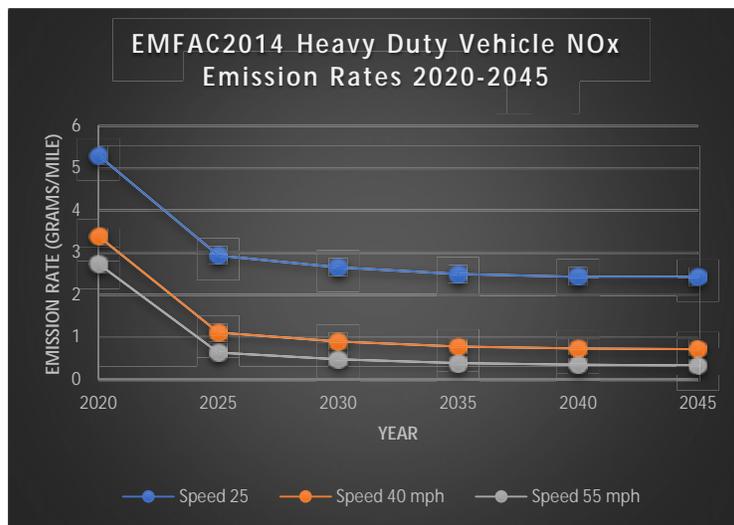

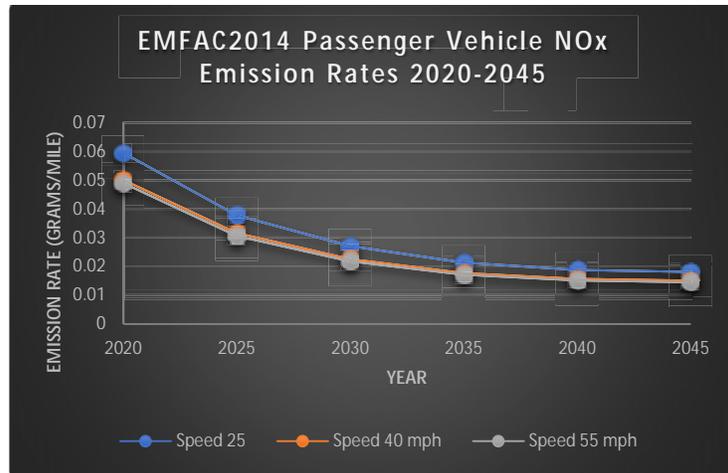

Response REG 2-20

The commenter indicates that the PEIR should have evaluated interim years of project implementation (2020, 2030, and 2035) to ensure that peak emissions are captured. Typically, an interim year analysis is undertaken for certain types of land use development projects that have known increments of development (e.g., a master plan with an identified number of residences to be constructed in specifically identified 5-year increments). However, for the Plan, the anticipated timing of new transportation and land use development projects is uncertain; the PEIR discloses reasonably expected development at the horizon of 2045. SCAG has a long-standing partnership with the SCAQMD and would welcome the opportunity to work with the air district to better align the AQMP with the Plan and PEIR.

GHG emissions were estimated for 2020 and 2035 because of the regulatory requirements to meet specific targets in these years. However, some assumptions had to be made regarding energy consumption rates, emission rates, etc. in order to provide best effort at emission estimates for these years. As explained in the GHG analysis methodology, “[w]hile the analysis considers regulations, programs, and policies currently in place, there is substantial uncertainty in projecting emissions for future horizon years.” (see Section 3.3, Air Quality (p 3.8-60)). Also, “as noted in the discussion above, the analyses of GHG emissions sources presented herein, even for transportation, do not fully take into account changes to fuels and technology that are expected to substantially reduce emissions compared to what is presented here.” Presenting such an analysis of GHGs allows for comparison of GHG emissions based on different types of development (MF housing is more efficient than single-family housing), so the analysis illustrates that the land use strategies reduce emissions, but the analysis does not provide a reasonable estimate of emissions because of the uncertainties.

The proposed transportation and anticipated land use development projects are spread across the entire six county region representing SCAG. The shorter the time increment of forecasts the less reliable they become. Economic cycles dramatically affect building and transportation and therefore regional-scale emissions. SCAG cannot reasonably anticipate if growth would be linear or sporadic between 2019 and 2045 or if the growth patterns would be similar across the entire region. Given the uncertainty in year-to-year growth, interim year emissions analyses are not useful.

On-road mobile source operational emission estimates were performed by SCAG, using EMFAC2014. (See **Master Response No. 4 Technical Process/Modeling** for discussion regarding the use of EMFAC2014) The emission rates built into the software account for incremental implementation of emission controls and fleet turnover, with emission rates substantially decreasing following the year 2020. As an example, the charts below show passenger vehicle and truck emission rates by year for NOx. The figures confirm the SCAQMD statement that the emission rates of vehicles, trucks, and equipment are generally higher in earlier years as more stringent emission standards and technologies have not been fully implemented, and fleets have not fully turned over. The emission rates sharply decline between 2020 and 2025 and then slowly decline between 2025 and 2045. Given the relatively small change in emission rates between 2025 and 2045, it is not anticipated that evaluating the Plan’s emissions in 2020, 2030, or 2035 would result in significantly different emission estimates than presented in Table 3.3-13, On-Road Mobile Source Criteria Air Pollutant Emissions by County – Existing Condition (2019) vs. Plan (2045). Characterizing an interim year scenario would not provide the public with any more valuable information than what is already presented.

Response REG 2-21

The commenter indicates that the PEIR inappropriately uses the SCAQMD’s 2016 AQMP forecasts of annual average off-road mobile emissions and stationary source emissions for years 2019, 2022, 2023, 2025, and 2031 in the Basin as a proxy for these emissions throughout the SCAG region. The SCAQMD states that the use of the 2016 AQMP forecasts is inappropriate.

CEQA does not require perfection, but rather adequacy, completeness, and a good faith effort at full disclosure. (See *CEQA Guidelines* § 15151). The forecasts contained in the AQMPs represent the best available information since SCAG is not responsible for, nor has expertise relevant to forecasting emissions from all the sources under the jurisdiction of the AQMPs.

SCAQMD indicates that the SCAQMD’s 2016 emissions are projections based on a 2012 base year therefore SCAG has discussed existing emissions but did not properly assess the incremental air quality impacts of direct emissions from implementing the Plan’s transportation strategies for off-road mobile

sources or land use strategies. Connect SoCal Plan is a ground-transportation plan and SCAG is responsible for evaluating on-road mobile source emissions from implementation of the Plan. Air quality management districts are responsible for evaluating future emissions from off-road and stationary sources. According to the 2016 AQMP Final PEIR,

At the regional level, the SCAQMD is responsible primarily for non-vehicular sources and has limited authority over mobile sources (e.g., fleet regulations, incentives for accelerated vehicle turnover, reduction in average vehicle ridership, etc.). In addition, the SCAQMD has lead responsibility for developing stationary, some area, and indirect source control measures and coordinating the development and adoption of the 2016 AQMP.²⁰

SCAQMD (and other air districts) provide forecasts (as appropriate and applicable) of emissions from these sources as part of the AQMP update process. SCAG relies on the AQMDs to provide these estimates. The Plan is not anticipated to substantially alter off-road mobile or stationary source emissions. The RTP/SCS and AQMPs are complementary documents that regulate different sources of air emissions.

The commenter indicates that the 2016 AQMP only projects emissions until 2031 which is inappropriate for evaluating the Connect SoCal Plan with a planning horizon until year 2045. As indicated above, the SCAQMD is responsible for evaluating emissions from off-road mobile and stationary sources. The 2016 AQMP evaluates these emissions through 2031 because at that point the region is forecast to meet attainment for the federal 8-hour ozone standard. Use of the SCAQMD AQMP information provides an indication of how emissions are expected to change over at least a portion of the Connect SoCal Plan timeframe. SCAG's analysis is qualitative but uses this information to inform the analysis.

The commenter indicates that since SCAG covers six counties and five air pollution control districts, using SCAQMD's 2016 AQMP emissions as a proxy for the region is incorrect as only a portion of the region's emission were evaluated. While, the SCAB region geographically makes up approximately 17.3% of the SCAG region, the SCAB region is home to over 17 million people.²¹ This is approximately 90% of the population in the SCAG region (based on the 2016 population). Furthermore, the SCAQMD includes all of Orange County, the majority of Los Angeles County, and the non-desert portions of Riverside and San Bernardino Counties. Looking at on-road mobile source emissions from just Los Angeles and Orange Counties from Table 3.3-13 demonstrates that these two counties represent approximately 66% of the SCAG area's annual ROG emissions, 57% of the SCAG area's annual NOx emissions, 68% of the SCAG

²⁰ SCAQMD. 2016. *2016 AQMP Final Program EIR*, see p. 2-7.

²¹ SCAQMD. *About*. Available online at: <http://www.aqmd.gov/nav/about>, accessed February 6, 2020.

area's winter CO emissions, and 66% of the SCAG area's annual PM10, PM2.5, and SOx emissions under existing conditions. The percentages of horizon year emissions generated in Los Angeles and Orange Counties compared to the SCAG region is similar to existing conditions. Therefore, since the majority of the population resides within the SCAB and the majority of emissions are generated within the SCAB, it was determined that the emissions identified in the 2016 AQMP would serve as a good proxy for the remaining portions of the region. In addition, a discussion of the stationary source and off-road mobile emissions from the VCAPCD, AVAQMD/MDAQMD, and the ICAPCD is included under Impact 2 of Section 3.3, Air Quality.

See **Chapter 10.0, Corrections and Additions**, for the following changes: 1) Information regarding the VCAPCD, AVAQMD/MDAQMD, and the ICAPCD's forecasted annual average emissions from their respective AQMPs is added to Section, 3.3, Air Quality (p 3.3-55 to 3.3-59); 2) Information regarding off-road mobile source emissions forecasted from these AQMPs is added to Section 3.3, Air Quality (page 3.3-61 to 3.3-63.; 3). Information regarding stationary source emissions forecasted from these AQMPs is added to Section 3.3, Air Quality (page 3.3-64 to page 3.3-66. 4). Information summarizing the forecasted annual average emissions from these AQMPs is added to page 3.3-69.

The commenter indicates that quantifying air quality emissions, emissions from both construction and operations should be calculated and SCAG should use its best efforts to identify and quantify a worst-case construction and operational air quality impact scenario. The SCAQMD further states SCAG should develop a construction scenario for land use development and quantify these emissions and compare the emissions to the air districts' regional air quality CEQA significance thresholds in order to determine significance. The Connect SoCal Plan includes a 25-year buildout for the 38,000 square mile SCAG region. At this time no more construction details are known and due to the size of the region and duration of the Plan, and as such, estimating a construction schedule for individual projects as well as the associated emissions would be speculative. Also, emissions from the equipment used for existing construction, will get cleaner over time and it is likely that total emissions associated with construction will decrease over the course the Plan. The PEIR provides a qualitative discussion of construction emissions, and as noted, "SCAQMD does account for estimated construction emissions from off-road construction equipment within the 2016 AQMP." See **Response REG-22** for a more detailed comment regarding the speculative nature of calculating these emissions. Moreover, as discussed in **Response REG 2-20**, the worst-case operational emissions will likely occur during the baseline year due to emission reductions for light-duty and heavy-duty trucks increasingly taking affect as time progresses.

The commenter recommends that SCAG quantify off-road vehicle emissions and add those emissions to on-road sources to determine the level of significance. As noted above, the SCAQMD states within the 2016 AQMP that the SCAQMD is responsible for non-vehicular sources and for developing stationary,

some area, and indirect source control measures. Review of the SCAQMD's 2016 AQMP Final PEIR demonstrates that on-road mobile source emissions were estimated based on SCAG's 2016-2040 RTP/SCS. However, the off-road emissions were estimated based on emissions inventories from CARB for off-road equipment which includes construction, mining, gardening and agricultural equipment, ocean-going vessels, commercial harbor craft, locomotives, and cargo handling equipment. The SCAQMD estimated aircraft operations with coordination with the local airport authorities. Thus, SCAG relies on SCAQMD's data for estimating off-road mobile source emissions and a discussion of these emissions based on the SCAQMD's 2016 AQMP is included within the Draft PEIR. Other air districts provide less information than SCAQMD; a discussion of off-road mobile source emissions from all air districts within the SCAG region based on available information is included in the PEIR (see Section 3.3, Air Quality (p 3.3-55 to 3.3-66)).

Response REG 2-22

The commenter indicates that since the Plan is expected to occur over a period of 20 years (actually 25 years), overlapping construction and operation impacts from transportation and land use projects is reasonably foreseeable and should be evaluated and compared to the SCAQMD mass daily thresholds for operations. The comment is based on the concept that when specific development is reasonably foreseeable, the Lead Agency should identify potential air quality impacts and sources of air pollution that could occur.

As discussed in **Response 2-21**, construction activity is occurring at present with construction equipment that has higher emissions rates than will occur in the future. Further as discussed in **Response 2-20**, specific development of individual projects (size, construction activity and timing) in the future is not reasonably foreseeable as there is no comprehensive timeline for individual projects within the six-county region. The anticipated timing of land use changes and new development is uncertain, especially over short time frames because of the effect of economic cycles, and therefore, the PEIR focuses on identifying reasonably foreseeable on-road mobile source emissions in the Plan's horizon year (2045), see Table 3.3-13, On-Road Mobile-Source Criteria Air Pollutant Emissions by County – Existing Condition (2019) vs Plan (2045).

The exercise of estimating existing and future construction activity for purposes of estimating changes in emissions would be speculative and would involve evaluating the incremental increase in daily construction activity (i.e., specific inventories of equipment and haul trucks under existing conditions as well as with and without implementation of the Connect SoCal Plan in the horizon year as well as interim years) across the entire SCAG region. Without a comprehensive understanding of the schedules and sizes of individual projects, this exercise would not bolster the programmatic discussion of regional air quality

impacts that is already provided (See **Master Response No. 2 Program EIR vs Project EIR**). As discussed above, the AQMDs are responsible for regulating emissions from non-mobile sources as well as construction vehicles. The PEIR provides a qualitative discussion of construction emissions as well as total emissions based on SCAQMDs estimates of total emissions in the SCAB (through the year 2031) contained in the AQMP EIR.

Note that in recent publicly available plan-level environmental documents for projects within the SCAQMD jurisdiction, construction emissions were not quantified.²²

Response REG 2-23

The commenter indicates that the Draft PEIR's method of determining the significance of the health risk is incorrect. The Draft PEIR determined that the health risk posed to sensitive receptors near freeway segments would be less than significant due to the decrease in cancer risk from baseline emissions. The commenter asserts that the SCAQMD's CEQA significance threshold of 10 in a million should be used to determine significance.

Contrary to the commenter's statement, SCAQMD's cancer risk threshold was used to determine project impacts. The SCAQMD's thresholds state that the cancer risk threshold is "Maximum Incremental Cancer Risk \geq 10 in 1 million."²³ Review of Table 9, Maximum Exposed Individual Residential Cancer Risk for 30-Year Exposure in Appendix 3.3, Health Risk Technical Report, demonstrates that the incremental cancer risk from baseline conditions (2019) and Project Build-out (2045) will decrease at each segment and therefore will not exceed an incremental cancer risk of 10 in a million. Comparing baseline conditions (2019) and Project Build-out (2045) demonstrates that the cancer risks will be reduced from anywhere from 5.7 in a million (Segment 9) to 80.6 in a million (Segment 16). Therefore, since the incremental cancer risk does not exceed 10 chances in a million and actually decreases as compared to baseline emissions, the health risk posed to receptors near these heavily trafficked roadways remains less than significant. See also **Response REG 2-18** regarding the appropriate baseline for comparison of impacts.

²² Santa Monica Downtown Community Plan Draft EIR (2017) available at <https://www.smgov.net/Departments/PCD/Environmental-Reports/Downtown-Community-Plan-Program-EIR/>, Pomona General Plan Update and Corridor Specific Plan (2013) available at: https://www.ci.pomona.ca.us/mm/comdev/plan/pdf/GPUP-DEIR-Volume_I.pdf, San Pedro Community Plan Draft EIR (2012) available at <https://planning.lacity.org/development-services/eir/san-pedro-new-community-plan-0>, or were quantified but were not combined with operational emissions (e.g., South Glendale Community Plan Draft EIR (2017) available at <https://www.glendaleca.gov/government/departments/community-development/planning/community-plans/sgcp-eir>.

²³ SCAQMD. *South Coast AQMD Air Quality Management Thresholds*. Available online at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2>.

Response REG 2-24

The commenter recommends revisions to PMM-AQ-1 q) to provide more details on the requirement for Tier 4 construction equipment, provide guidance on project-level implementation and monitoring, and facilitate CEQA streamlining and tiering from the PEIR for subsequent, project-level environmental analyses. See **Chapter 10.0 Corrections and Additions** for changes to Section 3.3, Air Quality (p 3.3-67).

Response REG 2-25

The commenter provides a list of project-level mitigation measures to be included in the PEIR. See **Chapter 10.0, Corrections and Additions**, for changes to Section 3.3, Air Quality (p 3.3-67), and mitigation measures added to the PEIR.

The following suggested measures are not incorporated into the Final PEIR. An explanation is provided for each measure:

- Require zero-emissions (ZE) or near-zero (NZE) on-road haul trucks such as heavy-duty trucks with natural gas engines that meet CARB's adopted optional NO_x emissions standard at 0.02 grams per brake horsepower-hour (g/bhp-hr), if and when feasible. At a minimum, require that vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export) that meet CARB's 2010 engine emissions standards at 0.01 g/bhp-hr of particulate matter and 0.20 g/bhp-hr of NO_x emissions or newer, cleaner trucks. When requiring ZE or NZE on-road haul trucks, SCAG should include analyses to evaluate and identify sufficient power and supportive infrastructure available for ZE/NZE trucks in the Energy and Utilities and Service Systems Sections of the Final PEIR, where appropriate. To monitor and ensure ZE, NZE, or 2010 model year or newer trucks are used, require that operators maintain records of all trucks associated with the operation, and made these records available to SCAG upon request. The records will serve as evidence to prove that each truck called met the minimum 2010 model year engine emission standards. Alternatively, require periodic reporting and provision of written records by operators, and conduct regular inspections of the records to the maximum extent feasibly and practicable.

This suggested mitigation measure would require a massive turnover of the private on-road haul truck vehicle fleet from older engines to new zero-emissions or near-zero emission trucks. These trucks are not readily available across the SCAG region and not in the numbers that would support the intensity of construction activities that will occur under the Connect SoCal Plan and across the entire SCAG region. The SCAQMD already has rules that are relevant to certain vehicle fleets (e.g., Rule 1196 (Clean On-Road Heavy-Duty Public Fleet Vehicles) and the CARB has regulations applicable to truck emissions (e.g., Heavy-Duty (Tractor-Tractor) Greenhouse Gas Regulation).

- Enter into applicable bid documents, purchase orders, and contracts to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with CARB policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify

construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the site. To further ensure that drivers understand the vehicle idling requirement, post signs at the site, where appropriate, stating that idling longer than five minutes is not permitted.

Most construction projects located within the SCAG region are required to comply with SCAQMD 403 (Fugitive Dust), which ensures comprehensive control of fugitive dust emissions in the South Coast Air Basin. Restrictions on idling are already required²⁴ and PMM AQ-1 bullet (l) includes minimizing idling to 5 minutes to save fuel and reduce emissions.

- Require at least 5 percent of all vehicle parking spaces include electric vehicle (EV) charging stations, or at a minimum, require the appropriate infrastructure to facilitate sufficient electric charging for passenger vehicles and trucks to plug-in. Electrical hookups should be provided at the onsite vehicle stop for to plug in any onboard auxiliary equipment. Electrical panels should be appropriately sized to allow for future expanded use.

Mitigation Measure PMM GHG-1 (See Section 3.8, Greenhouse Gases) already includes reference to CALGreen including installing electric charging stations (bullet ix).

Response REG 2-26

The commenter provides a further list of project-level mitigation measures to be included in the PEIR to address off-road mobile source emissions. See **Chapter 10.0, Corrections and Additions**, for changes to Section 3.3, Air Quality (page 3.3-67) and mitigation measures added to the PEIR.

The following measure is not incorporated into the Final EIR.

- Encourage and incentivize aircraft operators to route the cleanest aircraft engines to serve the South Coast Air Basin.

As explained in the Connect SoCal Aviation and Airport Ground Access Technical Study, “as a metropolitan planning organization (MPO), SCAG by definition is primarily a regional surface transportation planning agency.” The following measure goes beyond the scope of SCAG’s authority and is not under SCAG’s jurisdiction. The SCAG region has seven commercial airports and 40 reliever, general aviation, and other public use airports. Three of these airports service not only domestic flights, but also international flights. SCAG is an MPO focused on surface transportation, as a result, does not have the authority to develop mitigation to encourage the cleanest aircraft to serve the SCAB region.

²⁴ The Diesel-Fueled Commercial Motor Vehicle Idling Airborne Toxic Control Measure (ATCM) was adopted in 2006 by the California Air Resource Board (CARB) to limit the idling of diesel-fueled commercial motor vehicles to reduce diesel emissions. See the following (accessed February 19, 2020):

<http://scap1.org/Air%20Reference%20Library/Comm%20Vehicle%20Idling%20Facts.pdf>
<https://ww3.arb.ca.gov/regact/hdvidle/hdvidle.htm>

Response REG 2-27

The commenter indicates that since implementation of the Plan would result in the development of new transportation projects near existing sensitive receptors or locating new receptors near transportation projects, a mobile source health risk analysis (HRA) should be performed to disclose the potential health risks for new sensitive land uses that will be sited within 500 feet of freeways or other sources of pollution.

As the commenter notes there have been a number of court rulings that emphasize that CEQA should address impacts of the project on the environment and not impacts of the environment on the project, the court found that in particular impacts of locating sensitive receptors near freeways is not a significant impact unless the project exacerbates the impact.²⁵ As discussed in the PEIR (summarized on Section 3.3, Air Quality (page 3.3-80)), health risk associated with mobile source emissions would decrease substantially over the timeframe of the Plan. See also **Response REG 2-18** regarding appropriate baseline. However, also as summarized on page 3.3-80 emissions from construction are considered significant as construction would occur where projects occur and would impact individual sensitive receptors. Since CEQA does not require evaluation of impacts of the environment on a project each lead Agency must determine how to best protect future residents in proximity to sources of TACs. As noted in the Section, 3.3, Air Quality (page 3.3-73):

Consistent with CARB recommendations, it is anticipated that local governments would limit growth within 500 feet of freeways and/or address potential health concerns through appropriate design requirements. For example, in the City of Los Angeles, all new mechanically ventilated buildings located within 1,000 feet of freeways are required to install air filtration media that provides a Minimum Efficiency Reporting Value (MERV) of 13. [See Los Angeles Municipal Code § 99.04.504.6.] In addition, properties within 1,000 feet of freeways are subject to an advisory notice regarding adverse health impacts resulting from chronic exposure to vehicle exhaust and particulate matter. ...

The HRA performed for the PEIR is summarized on Section 3.3, Air Quality (p 3.3-72 through 3.3-80), and presented in full in Appendix 3.3, Health Risk Assessment Technical Report. The HRA includes calculations of the cancer risks to the most impacted existing sensitive receptors (residential, worker, school, day care, and senior care facility) as a result of mobile-source emissions. The transportation segments were chosen based on the highest volumes of heavy-duty trucks and the proximity of sensitive receptors. The risks were calculated for receptors within 1,000 meters of the transportation segment, with the most impacted receptors being closest to the source of emissions. Since the sixteen segments analyzes

²⁵ California Supreme Court's decision in *California Building Industry Association v Bay Area Air Quality Management District*, (S213478, December 17, 2015) and California Court of Appeals decision in *California Building Industry Association v Bay Area Air Quality Management District*, (August 12, 2016).

are anticipated to have the highest heavy-duty truck volumes, the health risk analysis provides a conservative cancer risk estimate for receptors within 500 feet of a freeway.

The commenter also provides project-level mitigation measures to be included in the Final PEIR to address off-road mobile source emissions. See **Chapter 10.0, Corrections and Additions**, for changes to page 3.3-67 and mitigation measures added to the PEIR.

Response REG 2-28

The commenter requests detailed written responses to their comments and that statements be supported by factual information and that if changes to mitigation measures are found infeasible substantial evidence be provided for rejecting them. The commenter is referred to the responses above. See also **Master Response No. 2 Program EIR vs. Project EIR**.

Letter REG 3: Ventura County Air Pollution Control District

Nicole Collazo
Planning Division
669 County Square Drive
Ventura, California

January 23, 2020

Response REG 3-1

This comment provides introductory text summarizes the Connect SoCal project. No specific response is required.

Response REG 3-2

The comment suggests adding “motor vehicle” to the table heading. See **Chapter 10.0, Corrections and Additions**, for Section 3.3, Air Quality (p 3.3-19).

Response REG 3-3

The comment relates to air quality threshold b in the Appendix G checklist. While the specific question is not required under CEQA, lead agencies have discretion to use thresholds specific for their project. (See *CEQA Guidelines* Section 15064.7(b) “Lead agencies may also use threshold on a case-by case basis). In this case, the threshold “violate any air quality standard or contribute to an existing or projected air quality violation” was selected by SCAG as it affords an opportunity to disclose regional air quality impacts and the relationship to air quality standards. See also **Master Response 2: Program EIR vs. Project EIR**.

Response REG 3-4

The comment clarifies nonattainment status for SSAB. See **Chapter 10.0 Corrections and Additions** for Section 3.3, Air Quality (p 3.3-56).

Response REG 3-5

The comment updates information regarding Ventura County’s CAP. See **Chapter 10.0 Corrections and Additions** for Section 3.3, Air Quality (p 3.8-49).

Response REG 3-6

The comment suggests an edit to Table 3.8-4, California Jurisdictions Addressing Climate Change. See **Chapter 10.0, Corrections and Additions**, for Section 3.3, Air Quality (p 3.8-58).

Response REG 3-7

The comment provides details of the Thomas Fire that occurred in December of 2017 and burned 281,893 acres which was bigger than the Woolsey Fire (November 2018, burned 96,949 acres) discussed on page

3.8-67. The comment does not raise a new issue but rather provides information on another illustration of the issue already discussed in the PEIR. No specific response is required.

Letter SUB 1: Orange County Council of Governments

Stacy Berry, Chair
Orange County Council of Governments (OCCOG)
3972 Barranca Parkway, Ste. J127
Irvine, CA 92606

January 23, 2020

Response SUB 1-1

This comment is a set of general introductory remarks. It presents no environmental issues within the meaning of CEQA and no specific response is required. Individual comments are responded to below. The comment will be included as part of the record and made available to the decision makers prior to a final decision on the proposed project.

Response SUB 1-2

This comment expresses support for comments from OCTA, TCA, and Center for Demographic Research. Commenter is referred to specific responses for those letters.

Response SUB 1-3

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001465, 0001467-0001469, 0001475, 0001476, 0001479, 0001480, 0001482, 0001484-0001486, 0001488, 0001490, 0001491, 0001493-0001495, and 0001497* of the Final Connect SoCal Plan.

Response SUB 1-4

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001465, 0001467-0001469, 0001475, 0001476, 0001479, 0001480, 0001482, 0001484-0001486, 0001488, 0001490, 0001491, 0001493-0001495, and 0001497* of the Final Connect SoCal Plan.

Response SUB 1-5

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001465, 0001467-0001469, 0001475, 0001476, 0001479, 0001480, 0001482, 0001484-0001486, 0001488, 0001490, 0001491, 0001493-0001495, and 0001497* of the Final Connect SoCal Plan.

Response SUB 1-6

The comment expresses opposition to PEIR alternatives that do not use local input. Commenter is referred to **Master Response No. 8 Alternatives**. As described in Chapter 4.0 Alternatives, of the PEIR, SCAG as the lead agency is required to develop a reasonable range of alternatives that are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives or would be more costly. In accordance with the *CEQA Guidelines*, the following factors may be used to eliminate alternatives from consideration by the lead agency: (1) failure to meet most of the basic project objectives; (2) infeasibility, or (3) inability to avoid significant environmental impacts. Generally, the alternatives represent a progression of land use and transportation investments, such that the Existing-Plans Local Input Alternative includes the most dispersed land use and fewest transportation investments and Intensified Land Use Alternative represents the most compact land use pattern but maintains the same transportation investments as the Plan. Connect SoCal falls in between these two alternatives. As stated above, all alternatives analyzed accommodate the same amount of regional growth as the Plan.

The Plan and Alternative 2 Existing Plans Local Input, both incorporate local input with respect to growth forecasts. As part of preparation of the Final Plan and Final PEIR the local input growth forecasts for the Plan have been refined to further reflect the wishes of local jurisdictions including input received to reflect existing development agreements, entitlements, and projects recently completed or under construction.

The comment also requests additional information on the datasets and RHNA methodology. See **Master Response No. 7: Regional Housing Needs Assessment**.

Response SUB 1-7

The comment suggests SCAG avoid naming specific technologies in the Plan and PEIR. Please see **Master Response No. 1: General Comments and Non-CEQA Issues**. Where specific technologies are identified, they are used as examples of the types of technologies that could occur. In many instances, providing a name for a technology (i.e., Uber or Lyft) assists the reader in understanding the referenced technology; SCAG is not expressing a preference for these particular technologies. Commenter is also referred to **Master Response No. 5: Approach to Mitigation Measures** which clarifies that mitigation measures are intended to be flexible, as such any technology can be replaced with a comparable technology that achieves the same result.

Response SUB 1-8

The comment indicates that opinion, as well as dramatic and biased language should be removed from the PEIR. The PEIR is a factual unbiased document. No language is intended to be biased, or overly dramatic. The PEIR generally represents an overview of the science of a topic and presents it within the seriousness of the context. The comment and its associated attachment include specific suggested text changes. These changes are incorporated where appropriate. See **Responses SUB 1-17** through **SUB 1-65** and responses to **Letter ORG-9** from the Center for Demographic Research.

Response SUB 1-9

The comment suggests specific changes to all mitigation measures. Commenter is referred to **Master Response No. 5: Approach to Mitigation Measures**. Consistent with the provisions of § 15091(a)(2) of the *State CEQA Guidelines*, the scope of SCAG’s responsibility as a Lead Agency to identify feasible mitigation measures is described in Section 1.6 of the Introduction to the PEIR. Similarly, Section 1.6 of the Introduction to the PEIR describes the limits of SCAG’s authority and the discretion of Lead Agencies responsible for the consideration of approval of subsequent projects. Furthermore, SB 375 specifically provides that nothing in an SCS supersedes the land use authority of cities and counties, and that cities and counties are not required to change their land use policies and regulations, including their general plans, to be consistent with the SCS or an alternative planning strategy.²⁶ Moreover, cities and counties have plenary authority to regulate land use through their police powers granted by the California Constitution, art. XI, §7, and under several statutes, including the local planning law,²⁷ the zoning law,²⁸ and the Subdivision Map Act.²⁹ As such, SCAG has no concurrent authority/jurisdiction to implement mitigation related to land use plans and projects that implement the Plan. With respect to the transportation projects in the Plan, these projects are to be implemented by Caltrans, county transportation commissions, local transit agencies, and local governments (i.e., cities and counties), and not SCAG. SCAG also has no authority/jurisdiction to require these agencies to implement project-specific mitigation measures.

Regarding the request to delete “can and” from “can and should consider” in the project-level mitigation measures, see **Master Response No. 5: Approach to Mitigation Measures**.

²⁶ California Legislative Information. *Public Resources Code – PRC, Division 13. Environmental Quality, Chapter 2.5. Definitions [21060-21074]*.

²⁷ California Legislative Information. *Chapter 3. Local Planning 65100-65763*.

²⁸ California Legislative Information. *Chapter 4. Zoning Regulations 65800-65912*.

²⁹ California Legislative Information. *Division 2 Subdivisions 66410-66499.38*.

Regarding the recommendation to add “consider where applicable and feasible” to all mitigation measures, in the methodology for each technical section, there is the following paragraph which applies to all mitigation measures:

*The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects **as applicable and feasible**. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.*

Consistent with CEQA requirements and the intent of SCAG, the PEIR does not require mitigation measures that are inapplicable or infeasible. Rather the PEIR presents options for projects that wish to use the PEIR for streamlining purposes. Mitigation measures are written in broad and general terms so that they may be tailored to project-specific circumstances and the judgment of local jurisdictions.

Response SUB 1-10

The comment relates to mitigation measures that overlap with regulations. Refer to **Master Response No. 5: Approach to Mitigation Measures**.

Response SUB 1-11

The comment suggests replacing the word “cities” with the word “jurisdictions” where appropriate. It is generally understood that the SCAG region includes both cities and counties, a sentence has been added to the Introduction to add “and counties” after the word “cities” See **Chapter 10, Corrections and Additions**, for Chapter 1.0, Introduction (p 1.0-3).

Response SUB 1-12

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001465, 0001467-0001469, 0001475, 0001476, 0001479, 0001480, 0001482, 0001484-0001486, 0001488, 0001490, 0001491, 0001493-0001495, and 0001497* of the Final Connect SoCal Plan. The first use of an acronym in the PEIR is usually spelled out. Both the PEIR and Plan also include a glossary and many sections define technical terms at the beginning of each section (i.e., Section 3.3, Air Quality – Definitions).

Response SUB 1-13

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001465, 0001467-0001469, 0001475, 0001476, 0001479, 0001480, 0001482, 0001484-0001486, 0001488, 0001490, 0001491, 0001493-0001495, and 0001497* of the Final Connect SoCal Plan.

SCAG has provided the corrected sources for the requested tables. See **Chapter 10 Corrections and Additions**.

Response SUB 1-14

The comment relates to measures that include new fees and/or taxes. Please refer to **Master Response No. 5: Approach to Mitigation Measures** as well as **Response 1-9** above which clarify that mitigation measures can be replaced with any comparable measure and are therefore not strictly required to be implemented as drafted. Lead agencies have the full discretion to apply those measures that are appropriate and feasible. The mitigation approach in this PEIR recognizes the importance of project-level mitigation measures to minimize project-level significant effects while maintaining flexibility for consideration and/or implementation by project-level lead agency. With respect to financing, fees and taxes, local lead agencies are responsible for drafting, implementing and developing a nexus study including documenting the anticipated effectiveness of a fee or tax.

Response SUB 1-15

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001465, 0001467-0001469, 0001475, 0001476, 0001479, 0001480, 0001482, 0001484-0001486, 0001488, 0001490, 0001491, 0001493-0001495, and 0001497* of the Final Connect SoCal Plan.

Response SUB 1-16

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001465, 0001467-0001469, 0001475, 0001476, 0001479, 0001480, 0001482, 0001484-0001486, 0001488, 0001490, 0001491, 0001493-0001495, and 0001497* of the Final Connect SoCal Plan.

Response SUB 1-17

The comment relates to the heading of the commenter's table and requires no response.

Response SUB 1-18

The comment relates to PEIR mitigation measures. Please see **Master Response No. 5: Approach to Mitigation Measures**.

Response SUB 1-19

The comment suggests an update to the regional investment number. See **Chapter 10, Corrections and Additions** for Executive Summary (p ES-4).

Response SUB 1-20

The comment suggests adding the words “to replace the gas tax” to the discussion. The suggested edit was not made as the statement suggested is not relevant to the text. Please see **Response SUB 1-14**.

Response SUB 1-21

The comment suggests adding toll roads to the list of roadways. See **Chapter 10.0 Corrections and Additions** for Executive Summary, page ES-11.

Response SUB 1-22

Commenter suggests that air quality mitigation measures defer to AQMDs or local jurisdictions. See **Master Response No. 5: Approach to Mitigation Measures** as well as **Response SUB 1-9**. Note that two air districts as well as many jurisdictions did comment on the PEIR. SCAQMD had suggestions for additional mitigation which have been incorporated (Please refer to **Responses REG 2-25 to 2-28** and **Chapter 10.0, Corrections and Revisions**).

Response SUB 1-23

The comment relates to mitigation measure PMM AES-3 (b) the measure has been revised to reflect the comment. See **Chapter 10.0, Corrections and Additions**, for page 3.1-40 of the PEIR.

Response SUB 1-24

The comment relates to the analysis under Impact AQ-1 provided in the Executive Summary. Commenter is referred to Section 3.3, Air Quality (p 3.3-51 through 3.3-53), which provides the substantial evidence for the less than significant conclusion regarding the potential to conflict with or obstruct implementation of applicable air quality plans. As stated on page 3.1-52, the goals of the air quality management plans and attainment plans are to establish a strategy for achieving the standards by a set date by listing all feasible control measures, including transportation control measures. These control measures help advance the attainment date and are financially, economically, and socially feasible. As standards become more stringent over time, achieving the standards becomes a moving target that the air quality districts, and air-related plans must continue to chase. At this current snapshot of time (2019), the Plan would not

conflict with the existing air-related plans since it will align with feasible Transportation Control Measures (TCMs). SCAG coordinates with air districts in the region to ensure that air quality management plans (and air pollution control plans) are consistent and comprehensively address air pollution from all sources (as appropriate) in the SCAG region. For example, the 2016 SCAQMD AQMP was developed in alignment with the 2016 RTP/SCS, incorporating the latest scientific, technological, and regulatory information and planning assumptions as of January 17, 2017. Revisions are not required.

Response SUB 1-25

The comment relates to PMM AQ-1. Rule 403 is discussed in the regulatory framework in Section 3.3, Air Quality. As stated on Section 3.3, Air Quality (p 3.3-44), “The SCAQMD, AVAQMD, and MDAQMD have adopted Rule 403, Fugitive Dust, which requires the implementation of best available fugitive dust control measures during construction and operational activities capable of generating fugitive dust emissions from on-site earth-moving activities, construction/demolition activities, and mobile equipment traveling on paved and unpaved roads.³⁰ Similarly, VCAPCD has adopted Rule 55, Fugitive Dust,³¹ and ICAPCD has adopted Rule 800, General Requirements for Control of Fine Particulate Matter (PM10),³² and Rule 801, Construction and Earthmoving Activities, to reduce fugitive dust.³³” Rule 403 does not need to be called out in any specific measure as compliance with Rule 403 is mandatory and assumed to occur. Revisions are not required.

Response SUB 1-26

Commenter references PMM AQ-1(q) and requests clarification with respect to AQMD. There are no current requirements to use Tier 4 construction equipment and no requirements regarding use of equipment near sensitive receptors. See **Master Response No. 5: Approach to Mitigation Measures** and **Response SUB 1-9** above.

³³ ICAPCD. 2005. *Rule 801 Construction and Earthmoving Activities*. Accessed online at: <https://www.co.imperial.ca.us/AirPollution/RULEBOOK/RULES/1RULE801.pdf>, accessed August 23, 2019.

Response SUB 1-27

The comment suggests mitigation measures should refer to permitting agencies and local regulations for biological resources. As stated on page 3.4-70 of the PEIR, all projects within the SCAG region would be subject to the provisions of the Federal and State ESAs, as well as Sections 1900–1913, 3511, 4150, 4700, 5050, 5515 of the State Fish and Game Code and Sections 80071–80075 of the State Food and Agriculture Code. Similar language referring to each of the resource agencies is included in each of the biological resources impact discussions, see page 3.4-77 and 3.4-83.

Further, measure PMM BIO-2 refers to USFS, CDFW, USFWS, local jurisdictions, local agencies, and landowners. Measure PMM BIO-3 refers to SWRCB, CDFW, USACE, therefore, no revisions are required. Refer to **Master Response No. 5: Approach to Mitigation Measures**.

Response SUB 1-28

The comment relates to analysis of Impact AQ-4 in the Executive Summary section of the PEIR. Refer to Section 3.3, Air Quality, (p. 3.3-81 through 3.3-84), which states, odor sources within the SCAG region, such as wastewater treatment facilities, landfills, and agricultural operations, are controlled by county and city odor ordinances and air district rules that prohibit nuisance odors and identify enforcement measures to reduce odor impacts to nearby receptors. These ordinances and rules are enforced by the air pollution control districts and local law enforcements. For example, SCAQMD, MDAQMD, and AVAQMD Rule 113; VPAPCD Rule 74.2; and ICAPCD Rules 101 and 424, *Architectural Coatings*, limit the amount of volatile organic compounds from architectural coatings and solvents to further reduce the potential for odiferous emissions. SCAQMD also provides rules to establish odor management practices and requirements from solid waste transfer stations, material recovery facilities, and rendering facilities in Rule 410, *Odors from Transfer Stations and Material Recovery Facilities*,³⁴ and Rule 415, *Odors from Rendering Facilities*.³⁵ Additionally, SCAQMD and MDAQMD's Rule 402;^{36, 37} VCAPCD's Rule 51;³⁸ and IPAPCD's Rule 407³⁹ *Nuisance* establishes that no person shall discharge any source of air

³⁴ South Coast Air Quality Management District. 2006. *Rule 410. Odors from Transfer Stations and Material Recovery Facilities*. Available online at: <https://ww3.arb.ca.gov/drdb/sc/curhtml/r410.pdf>, accessed October 30, 2019.

³⁵ South Coast Air Quality Management District. 2017. *Rule 415. Odors from Rendering Facilities*. Available online at: <https://ww3.arb.ca.gov/drdb/sc/curhtml/r415.pdf>, accessed October 30, 2019.

³⁷ MDAQMD. 1977. *Rule 402 Nuisance*. Available online at: <http://mdaqmd.ca.gov/home/showdocument?id=290>, accessed November 15, 2019.

³⁸ VCAPCD. 2004. *Rule 51- Nuisance*. Available online at: <http://www.vcapcd.org/Rulebook/Reg4/RULE%2051.pdf>, accessed November 15, 2019.

³⁹ ICAPCD. 1999. *Rule 407 Nuisances*. Available online at: <https://ww3.arb.ca.gov/drdb/imp/curhtml/r407.pdf>, accessed November 15, 2019.

contaminants that may cause harm or nuisance to the public. In order to hold any facility accountable for nuisance rules, the air quality management districts allow the public to report any air quality problems within the district including odor complaints.⁴⁰ As such, the Plan would be required to adhere to these rules and implementation of the Plan would not be expected to result in substantial odor emissions or affect a substantial number of people when compared to existing conditions. Therefore, the impact would be less than significant, and the consideration of mitigation measures is not warranted.

Response SUB 1-29 and SUB 1-31, SUB 1-32, SUB 1-35 through 1-37, 1-39 and 1-40, SUB 1-45 through SUB 1-49

The commenter requests adding the language “where applicable and feasible” to the following mitigation measures: PMM BIO-1, PMM BIO-2, PMM BIO-3, PMM BIO-4, PMM BIO-5, PMM BIO-6, PMM CULT-1, PMM GEO-1, PMM CULT-2, PMM GEO-1, PMM GHG-1, PMM NOISE-2, PMM TRA-1, PMM TCR-1. See **Chapter 10.0, Corrections and Additions**, for the Executive Summary, pages 2.0-18 through 2.0-71.

Response SUB 1-32

The comment provides information that occasionally nationwide permits are revoked and Special Area Management Plans (SAMPs) are required and this should be reflected in Mitigation measure PMM BIO-4. See **Chapter 10.0, Corrections and Additions**, for the Executive Summary, for the requested change to page 3.4-85.

Response SUB 1-34

The commenter indicates that the PEIR (p 2.0-31) indicates that there are three Congestion Pricing strategies and that two were included in 2012 and 2016 RTP/SCS documents. Commenter asks which two and if measures previously implemented were effective or if new measures are required. See **Chapter 10.0, Corrections and Additions**, for Chapter 2.0 Project Description (p. 2.0-31). Additionally, of the three pricing strategies, the development of express lanes has been implemented. Mileage-based user fees and the development of cordon/area pricing have yet to be implemented but will likely occur in the future.

Response SUB 1-38

The comment requests an edit to Chapter 2.0 Project Description to add the term “toll roads.” See **Chapter 10.0, Corrections and Additions**, for page 2.0-35.

⁴⁰ South Coast Air Quality Management District. 2019. *Odor Complaints and Nuisance Violations*. Available online at: <http://www.aqmd.gov/home/news-events/community-investigations/sunshine-canyon-landfill/odor-complaints>, accessed October 30, 2019.

Response SUB 1-41 through SUB 1-44

The commenter suggests the “less than significant” impact conclusions for Geology and Soils should be re-evaluated but does not raise a specific concern regarding the analysis in the PEIR. Commenter is referred to Section 3.7, Geology and Soils, which states, implementation of the Plan would not exacerbate existing geologic hazards including fault rupture because the SCAG region is a seismically active area, and this condition exists throughout the region. Furthermore, there are numerous regulations in place to reduce such risks to any planned development or transportation project. Regarding unstable soils, page 3.7-38 indicates that hazards associated with unstable soils or geologic units are dependent on site-specific conditions, as well as the specific nature of the individual project proposed. However, implementation of transportation projects and development projects anticipated to occur under the Plan would not be expected to exacerbate existing conditions with respect to geologic units and existing soils. With adherence to grading permit and building code requirements, including seismic design criteria as required by the CBC, transportation projects and anticipated development projects would be designed to minimize potential risks related to unstable soils and geologic units. No revisions are necessary.

Response SUB 1-50

The comment relates to the hierarchy of SCAG committees. This comment does not raise an environmental issue within the meaning of CEQA. See **Chapter 10.0, Corrections and Additions for Chapter 2.0, Project Description** (p 1.0-4).

Response SUB 1-51

The comment requests deleting a sentence regarding city and county general plans being required to be consistent. See **Chapter 10.0, Corrections and Additions**, for Section 3.11, Land Use and Planning (p 3.11-12).

Response SUB 1-52

The comment suggests additional text be added with respect to the RHNA (Section 3.11, Land Use Planning, (p 3.11-32)). SCAG objected to the HCD Regional Housing Need Determination in its letter dated September 18, 2019. The letter may be viewed at: <http://www.scag.ca.gov/programs/Documents/RHNA/SCAG-Objection-Letter-RHNA-Regional-Determination.pdf>. Additionally, the suggested edit goes beyond the scope of what is necessary to describe the RHNA process. Commenter is also referred to **Master Response No. 7: Regional Housing Needs Assessment**.

Response SUB 1- 53

The comment suggests a minor text edit to clarify housing need is determined by the RHNA process. See **Chapter 10.0, Corrections and Additions** for Section 3.11, Land Use and Planning (p 3.11-32).

Response SUB 1-54 and SUB 1-55

The comment asks questions regarding RHNA allocations and alternatives in the PEIR. With regards to allocation, allocation refers to the jurisdictional number by income category. A jurisdiction's RHNA allocation is derived by distributing the regional housing need to each of the 197 jurisdictions in the region using the RHNA allocation methodology adopted by the SCAG Regional Council on March 5, 2020. For further details of the adopted RHNA methodology, please see www.scag.ca.gov/rhna. Additionally, a jurisdiction is required to site and zone for housing to meet its RHNA allocation. Commenter is also referred to **Master Response No. 7: Regional Housing Needs Assessment** and **Master Response No. 8 Alternatives**.

Response SUB 1-56

The comment requests clarifications regarding RHNA on page 3.11-33.

The comment takes issue with the statement that the RHNA does not necessarily encourage or promote growth (Section 3.14, Population and Housing, p 3.14-14, 4th paragraph).

The RHNA quantifies and allocates the determination of housing need during specified planning periods, at various income categories for each city and county in the region, in accordance with state housing law. Cities and counties then address this need through the process of updating, if necessary, the housing elements of local General Plans. This planning process is intended to accommodate the determined housing need, not necessarily encourage or promote growth. The RHNA objectives of "promoting infill development" and "the encouragement of efficient development patterns..." is to accommodate need in a sustainable manner.

The RHNA objectives of "promoting infill development" and "the encouragement of efficient development patterns..." is to accommodate growth in a sustainable manner. Commenter is referred to **Master Response No. 7 Regional Housing Needs Assessment**.

Response SUB 1-57

The comment provides a suggested edit on Section 3.11, Land Use and Planning (p 3.11-33), regarding the RHNA process. With regards to allocation, please refer to **SUB 1-52**. The suggested edit adds unnecessary detail to the sentence and therefore was not made. Commenter is referred to **Master Response No. 7: Regional Housing Needs Assessment**.

Response SUB 1-58

The comment provides a suggested edit on Section 3.14, Population and Housing (p 3.14-13), regarding the RHNA process. The suggested edit goes beyond the scope of what is necessary to describe the RHNA process. Commenter is referred to **SUB 1-52** and **Master Response No. 7: Regional Housing Needs Assessment**.

Response SUB 1-59

Regarding page Section 3.14, Population and Housing, (p 3.14-15 paragraph 2), the commenter asks if the existing needs portion of the 6th cycle RHNA will be consistent with Connect SoCal for the comparable period as stated in the referenced location. See **Master Response No. 7: Regional Housing Needs Assessment**.

Response SUB 1-60

The commenter indicates that the discussion of the RHNA on Section 3.14, Population and Housing (p 3.14-1 paragraph 1), is “extremely vague for an estimated 900,000 housing units of existing need”. The commenter is referred to **Master Response No. 7: Regional Housing Needs Assessment**.

Response SUB 1-61

The commenter expresses disagreement with HCD’s RHNA determinations and methodology. Commenter indicates that HCD ignores Government Code Section 65584.01(a). It is important to note that SCAG objected to the HCD Regional Housing Need Determination in its letter dated September 18, 2019. The objection letter could be viewed at:

<http://www.scag.ca.gov/programs/Documents/RHNA/SCAG-Objection-Letter-RHNA-Regional-Determination.pdf>.”

The commenter is referred to **Master Response No. 7: Regional Housing Needs Assessment**.

Response SUB 1-62

Commenter takes issue with the sentence (on page 3.11-33) that the RHNA does not necessarily encourage growth. See **Response 1-56**. See also **Master Response No. 7 Regional Housing Needs Assessment**.

Response SUB 1-63

The commenter expresses disagreement with HCD's RHNA determinations and methodology. It is important to note that SCAG objected to the HCD Regional Housing Need Determination in its letter dated September 18, 2019. The objection letter could be viewed at: <http://www.scag.ca.gov/programs/Documents/RHNA/SCAG-Objection-Letter-RHNA-Regional-Determination.pdf>. The commenter is referred to **Master Response No. 7: Regional Housing Needs Assessment**.

Response SUB 1-64

Regarding the existing needs portion of the RHNA, commenter references Section 3.11, Land Use and Planning (p 3.11-33), the commenter asks again (as in **Comment SUB-59**) if the existing needs portion of the 6th cycle RHNA will be consistent with Connect SoCal for the comparable period as stated in the referenced location. See **Master Response No. 7: Regional Housing Needs Assessment**.

Response SUB 1-65

The commenter requests the reference to the Orange County Central Coastal National Community Conservation Plan (NCCP) / Habitat Conservation Plan (HCP). This information is added to Section 3.4, Biological Resources (p 3.4-58); see **Chapter 10.0, Corrections and Additions**.

Response SUB 1-66

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001465, 0001467-0001469, 0001475, 0001476, 0001479, 0001480, 0001482, 0001484-0001486, 0001488, 0001490, 0001491, 0001493-0001495, and 0001497* of the Final Connect SoCal Plan.

Letter TRANS 1: Los Angeles County Metropolitan Authority

Los Angeles County Metropolitan Authority
Kalieh Honish
Executive Officer, Long Range Planning
Metro Countywide Planning & Development
One Gateway Plaza
Los Angeles, CA 90012

January 21, 2020

Response TRANS 1-1

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001311, 0001312, 0001344, 0001347, 0001450, 0001454, and 0001559* of the Final Connect SoCal Plan.

Response TRANS 1-2

The comment suggests SCAG assist jurisdictions in SB 743 implementation. Mitigation Measure SMM TRA-3 on Section 3.17, Transportation, Traffic and Safety (p 3.17-62), of the PEIR outlines a SCAG initiated SB 743 implementation program. The grant-funded project, co-sponsored by SCAG and LADOT, seeks to provide technical and mitigation strategy development guidance to local jurisdictions in the six-county SCAG region to facilitate implementation of the VMT-based CEQA transportation impact analysis provisions of SB 743.

Response TRANS 1-3

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001311, 0001312, 0001344, 0001347, 0001450, 0001454, and 0001559* of the Final Connect SoCal Plan.

Letter TRANS 2: Orange County Transportation Authority

Warren Whiteaker
Orange County Transportation Authority

Undated

Response TRANS 2-1

The comment presents a technical change to replace “\$633.9 billion” with “638.6 billion.” Refer to **Chapter 10.0, Corrections and Additions**, for the Executive Summary page ES-4.

Response TRANS 2-2

The comment presents an editorial change. Refer to **Chapter 10.0 Corrections and Additions** for the Executive Summary.

Response TRANS 2-3

The comment presents a suggested edit, refer to **Chapter 10.0 Corrections and Additions** for Executive Summary and page 2.0-35.

Response TRANS 2-4 through TRANS 2-14 and TRANS 2-16 through 2-18

The comments suggest adding “where applicable and feasible” to mitigation measures PMM BIO-1, PMM BIO-2, PMM BIO-3, PMM BIO-4, PMM BIO-5, PMM BIO-6, PMM CULT-1, PMM CULT-2, PMM GEO-1, PMM GHG-1, PMM HYD-4, PMM NOISE-2, PMM TRA-1, PMM TCR-1. See **Response to Comment SUB 1-9**.

Response TRANS 2-15

The comment asks for clarification as to whether PMM HYD-4 (regarding raising roadbeds for new highways and rail facilities 1 foot above the 100-year base flood elevation) applies only to bridges. As for all mitigation measures, each lead agency would determine the necessity and applicability of this mitigation measure.

Response TRANS 2-19

The comment suggests reformatting Table 2.0-3. The purpose of the table is to provide general information regarding the expenditures, the reformatting is not necessary and does not raise an environmental concern within the meaning of CEQA. No revision was made.

Response TRANS 2-20

The comment requests updates to Figures 2.0-5, 2.0-8, 2.0-11 and 2.0-18. The referenced figures were updated as part of the Plan's final refinements. The refinements do not change the analysis within the PEIR which provides regional analysis. Commenter is referred to the Plan for the final figures.

Letter TRANS 3: San Bernardino County Transportation Authority and San Bernardino Council of Governments

San Bernardino County Transportation Authority
San Bernardino Council of Governments
1170 W. 3rd Street, 2nd Floor
San Bernardino, CA 92410

January 27, 2020

Response TRANS 3-1

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001308, 0001502, 0001509, 0001511 and 0001513* of the Final Connect SoCal Plan.

Response TRANS 3-2

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001308, 0001502, 0001509, 0001511 and 0001513* of the Final Connect SoCal Plan.

Response TRANS 3-3

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001308, 0001502, 0001509, 0001511 and 0001513* of the Final Connect SoCal Plan.

Response TRANS 3-4

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001308, 0001502, 0001509, 0001511 and 0001513* of the Final Connect SoCal Plan.

Response TRANS 3-5

The comment requests clarification regarding VMT and GHG data presented within the RTP/SCS and the PEIR. Several factors that occurred during the development of the two documents may have resulted in data being presented slightly differently (due to the PEIR using earlier versions of model runs and rounding numbers differently). However, there is no difference between the VMT, GHGs or other performance measures associated with the Plan and the PEIR. As the documents are generally prepared in tandem due to the timeframe for publication, the data may be slightly different in each document. Since publication of the Draft EIR, the calculations and a number of tables have been revised. See **Chapter 8.0 Introduction** for a summary of the changes. Also, the PEIR sometimes presents data for different years, such as 2019 due to the CEQA requirement to use existing conditions. However, as stated, there is no difference between the VMT, GHGs and other performance measures.

Response TRANS 3-6

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001308, 0001502, 0001509, 0001511 and 0001513* of the Final Connect SoCal Plan

Response TRANS 3-7

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001308, 0001502, 0001509, 0001511 and 0001513* of the Final Connect SoCal Plan

Response TRANS 3-8

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001308, 0001502, 0001509, 0001511 and 0001513* of the Final Connect SoCal Plan

Response TRANS 3-9

The comment relates to matching VMT data between the Plan and the PEIR. See Response TRANS 3-5. For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001308, 0001502, 0001509, 0001511 and 0001513* of the Final Connect SoCal Plan.

Response TRANS 3-10

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001308, 0001502, 0001509, 0001511 and 0001513* of the Final Connect SoCal Plan.

Response TRANS 3-11

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001308, 0001502, 0001509, 0001511 and 0001513* of the Final Connect SoCal Plan.

Letter TRANS 4: Transportation Corridor Agencies

Michael A. Kraman, Chief Executive Officer
Transportation Corridor Agencies
125 Pacifica, Suite 100
Irvine, CA 92618

January 23, 2020

Response TRANS 4-1

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001449* of the Final Connect SoCal Plan.

Response TRANS 4-2

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001449* of the Final Connect SoCal Plan.

Response TRANS 4-3 through TRANS 4-9

The comments suggest clarifications to the PEIR regarding the existing and planned inter-operable priced transportation network. The Final PEIR updates all text changes to the Chapter 2.0 Project Description. Please refer to **Chapter 10.0, Corrections and Additions**, for numerous changes to Chapter 2.0 Project Description.

Response TRANS 4-10

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001449* of the Final Connect SoCal Plan.

Response TRANS 4-11

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001449* of the Final Connect SoCal Plan.

Response TRANS 4-12

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001449* of the Final Connect SoCal Plan.

Letter LOC 1: County of Los Angeles Department of Parks and Recreation

Ju Lng Chien, Park Planner
Planning and Development Agency
1000 S. Fremont Avenue, Unit #40
Alhambra, CA 91803

January 16, 2020

Response LOC 1-1

This comment is a set of general introductory remarks. No specific response is required.

Response LOC 1-2

The comment includes information regarding the Los Angeles Countywide Parks and Recreation Needs Assessment. This information is incorporated into the PEIR on Section 3.16, Parks and Recreation (p 3.16-18). See **Chapter 10.0, Corrections and Additions**, for that page.

Response LOC 1-3

The comment includes information regarding the Transit to Parks Strategic Plan (2019). This information is incorporated into the PEIR on Section 3.16, Parks and Recreation (p 3.16-18). See **Chapter 10.0 Corrections and Additions**, for that page.

Response LOC 1-4

The comment relates to parks to people ratios and the number of parks in the County on Section 3.16, Parks and Recreation (p 3.16-9), of the PEIR. The discussion is revised to reflect this comment. See **Chapter 10.0 Corrections and Additions**, for that page.

Response LOC 1-5

The comment provides a correction to the number of parks in the County as listed on Section 3.16, Parks and Recreation (p 3.16-10). See **Chapter 10.0 Corrections and Additions**, for that page.

Response LOC 1-6

The commenter provides contact information. No specific response is required.

Letter LOC 2: County of Ventura, Resource Management Agency

Linda Blackburn, Senior Planner
Long Range Planning Section
Ventura County Planning Division
800 S. Victoria Avenue
Ventura, CA. 93009

January 22, 2020

Response LOC 2-1

This comment provides introductory remarks. No specific response is required.

Response LOC 2-2

The comment states the Draft EIR did not include language which would address impacts on the County's Locally Important Species or communities, nor were they considered "special status species." The language in the PEIR included information to address potential impacts to "special status species." Specific language for Ventura County was included in the regulatory framework for local jurisdictions specifically that: "The Ventura County Code of Ordinances has established one ordinance related to biological resources. The Resources Element of the Ventura County General Plan has established one goal and two policies related to biological resources. The one code, one goal, and six supporting policies relevant to SCAG projects provide protection to native trees, sensitive species, sensitive habitats, wildlife corridors, and locally important species/communities."

Due to the scope and scale of the six county-wide SCAG region, analyses were limited to plants and animals listed in regional databases with georeferenced known locations (such as the California Natural Diversity Data Base, or CNDDDB). The impact analysis reviewed potential environmental impacts to sensitive biological resources from a regional perspective and is programmatic in nature. As such, Lead Agencies for each individual project will determine the level of environmental review required at the subsequent project-level evaluation of individual projects.

Project specific analysis and reporting will be required, and specific environmental documents are to be prepared that must consider local regulations, as outlined in project level mitigation measures, for example when a project will:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

Existing conditions and impact analyses did include oak (*Quercus* spp.) and California (also known as black) walnut (*Juglans californica*) and various oak woodland and walnut plant communities, provided such information was available from regional databases. These species and communities were identified in Ventura County and impact analysis (from the broad scale of this PEIR) indicated that 0 acres of walnut communities, 44 acres of coast live oak, and 35 acres of valley oak communities were located within 500 feet of preliminarily identified “Major Transportation Projects”. As indicated in the PEIR, the regional records are incomplete and likely do not show all sensitive species and habitats present in a given area and project specific surveys should be required by the local Lead Agency for subsequent project-level evaluation of individual projects. See **Master Response No. 2: Program EIR vs Project EIR** and **Response to Comment ORG-8**.

Response LOC 2-3

The commenter refers to the County’s Initial Study Assessment Guidelines. As described in **Master Response No. 2: Program EIR vs. Project EIR**, the Connect SoCal PEIR is a programmatic document that provides a region-wide assessment of the potential significant environmental effects of implementing policies, strategies, projects, and programs included in Connect SoCal. Because the PEIR is programmatic in nature and regional in approach, it does not include site-specific analysis of any project contained in Connect SoCal, nor does it proscribe a specific approach that should be undertaken in any particular jurisdiction. Each jurisdiction is required to comply with CEQA and is encouraged to do so in a manner that is consistent with local guidelines. See also **Master Response No. 5: Approach to Mitigation Measures**, mitigation measures provide flexibility so that each jurisdiction can tailor their approach as appropriate.

Response LOC 2-4

The comment suggests SCAG should analyze the Plan with respect to Ventura County General Plan goals. See **Response REG 4-3** above. The SCAG jurisdiction is comprised of 191 cities and six counties all of which have numerous policies in their general plans. As described in the Plan, SCAG engaged with local, state and federal agency partners to develop the Plan. SCAG worked closely with local governments throughout the region to collect and compile data on land use and growth trends. This “Bottom-Up Local Input and Envisioning Process,” formed the basis for projections and strategies in

Connect SoCal. SCAG staff held one-on-one meetings with the region's 197 towns, cities and counties. In addition to seeking feedback on regional forecasts of population, household and employment growth, SCAG gathered data on land use, protected natural lands, farmland, flood areas and coastal inundation, regional bikeways, regional truck routes, planned major transit stops, high quality transit corridors, future transit priority areas, and other local data. In addition to the jurisdictions themselves, the data came from county assessors' offices, county transportation commissions, and state and federal partners. Although the Plan was developed through the collaborative process, determinations of consistency with individual jurisdictions policies are not required or appropriate at the program level. Moreover, SB 375 does not require consistency between the SCS and city or county general plan, community plan, specific plan, or local zoning ordinance.

The Plan does not identify specific development locations and even for transportation projects, detailed project information is not available. Impact BIO-3 starting on Section 3.4, Biological Resources (page 3.4-80), programmatically evaluates impacts of the Plan on wetlands. Mitigation measures are identified (starting on page 3.4-84), and impacts are found to be significant and unavoidable at the regional level (pages 3.4-85 to 3.4-86). See **Master Response No. 2: Program EIR vs. Project EIR**.

Response LOC 2-5

The comment provides specific edits to mitigation measures included in the PEIR. See **Chapter 10.0, Corrections and Additions**, for pages 3.4-72, 3.4-90, with respect to changes to the mitigation measures in response to this comment. While changes were made to the mitigation measures to modify the general language, inclusion of language specific to Ventura County requirements was not included. The reasoning for this is, as described in Chapter 1.0 Introduction, page 1.0-32, it is the intent of SCAG to allow project sponsors to use mitigation measures identified or comparable measures (as determined by the project sponsor/local jurisdiction). Project level mitigation measures contained within the PEIR are programmatic in nature, and therefore, references to any specific jurisdiction's requirements should be included by the jurisdiction at the project level. See also **Master Response No. 5: Approach to Mitigation Measures**.

Response LOC 2-6

This comment provides contact information. No specific response is required.

Response LOC 2-7

The comment provides land use policy analysis for Ventura County and indicates that Ventura County staff concurs with the PEIR's finding regarding land use consistency. No specific response is required.

Response LOC 2-8

The comment relates to solid waste tonnage provided in See **Chapter 10 Corrections and Additions** on page 3.19.1-1, Section 3.19, Solid Waste, Solid Waste, Table 3.19.1-1, Solid Waste Tonnage within the SCAG Region (2018). Please see **Chapter 10.0, Corrections and Additions**, for changes to the table.

Response LOC 2-9

The commenter concurs with PMM USWW-1. No specific response is required.

Response LOC 2-10

The comment relates to Ventura County's requirements related to specific projects requiring infrastructure improvements and the need to consult with Ventura County Planning Division. See **Master Response No. 2: Program EIR vs. Project EIR**.

Response LOC 2-11

This comment is a copy of the PEIR NOP comment letter and provides introductory text, and provides background information concerning local input and requests special consideration of farmland. Commenters input was considered as part of Plan and PEIR preparation. Loss of farmland is discussed in Impact AG-1 as well as AG-5, and mitigation is identified starting on page 3.2-22 as well as on page 3.2-30 on Section 3.2, Agriculture and Forestry. Impacts related to loss of farmland regionwide are found to be significant and unavoidable. See also **Master Response No. 2: Program EIR vs. Project EIR**.

Response LOC 2-12

The comment provides details regarding the Saticoy Area Plan and requests specific changes to the Project List/FTIP. See **Response LOC 2-7** above.

Letter LOC 3: Ventura County Public Works

Anthony Ciuffetelli, RMA Planner
County of Ventura, Watershed Planning and Permits Division
800 South Victoria Avenue
Ventura, CA 93009

December 6, 2019

Response LOC 3-1

The comment summarizes the Connect SoCal project. No specific response is required.

Response LOC 3-2

The commenter provides information specific to project permitting in Ventura County relative to compliance with Ventura County Watershed District policies. Please refer to **Master Response No. 2: Program EIR vs. Project EIR**. Section 3.10, Hydrology and Water Quality, includes project-level mitigation measures, PMM HYD-1 and PMM HYD-2 and Section 3.4, Biological Resources, includes measures PMM BIO-1, PMM BIO-2 and PMM BIO-3 which all relate to wetlands and water quality. As stated throughout the PEIR, jurisdictions can and should implement project level mitigation included in the PEIR at the project level as appropriate and determined by each lead agency.

Response LOC 3-3

The commenter provides information specific to flood hazards and FEMA mapping in Ventura County. See **Response REG 6-2** above and **Master Response No.2: Program EIR vs. Project EIR**. Section 3.10, Hydrology and Water, includes measure PMM HYD -3 related to flooding.

Response LOC 3-4

The commenter indicates requirements for projects in the Coastal Zone relative to coastal hazards and sea level rise in Ventura County. See **Responses REG 6-1** and **REG 6-2** above and **Master Response No. 2: Program EIR vs. Project EIR**. Coastal Flooding and Sea level rise are discussed starting on page 3.10-22; Coastal Commission guidance is discussed starting on Section 3.10, Hydrology and Water Quality (p 3.10-38). Impacts associated with sea level rise are discussed starting on Section 3.10, Hydrology and Water Quality (p 3.10-66). A map showing areas vulnerable to sea level rise (including areas within Ventura County is presented in Figure 3.10-3, Areas Vulnerable to Sea Level Rise. Projects must be implemented in accordance with all local, state and federal requirements including any requirements specific to coastal zones.

Letter LOC 4: City of Costa Mesa

Huntington Beach, CA 92648

January 23, 2020

Response LOC 5-1

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001393* of the Final Connect SoCal Plan.

Response LOC 5-2

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001393* of the Final Connect SoCal Plan

Response LOC 5-3

The comment relates to HQTAs. In response to this and similar comments, SCAG has revised the HQTAs within the Plan. Maps showing the revised locations of HQTAs are provided in the Plan. However, as discussed in Chapter 8.0 Introduction, the revisions to the HQTAs do not affect the regional level analysis provided in the PEIR. No revisions are necessary.

The comment relates to the Connect SoCal Project List. See **Master Response No. 1: General Comments and Non-CEQA Issues**. Projects featured in the Plan's Project List Appendix were provided by the six County Transportation Commissions (CTCs) for Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura. The projects provided by the CTCs are regarded as regionally significant and/or anticipated to receive (or already receiving) federal funds. In addition, the CTCs anticipate that these projects will be initiated or completed by the Plan's horizon year in this case, 2045. For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001393* of the Final Connect SoCal Plan.

Response LOC 5-4

The comment relates to the RHNA and the allocation of the 5th and 6th cycles. Refer to **Master Response No. 7: Regional Housing Needs Assessment**.

Response LOC 5-5 through LOC 5-10

The comment expresses support for comments from OCCOG and OCTA. Please refer to letters **SUB-1** and **TRANS-2** for responses.

Response LOC 5-11

This comment is a closing paragraph thanking SCAG for the opportunity to comment on the Plan and the PEIR. No specific response is required and no revisions are necessary.

Letter LOC 6: City of Indio

Letter LOC 10: City of Lancaster

Candice Vander Hyde

Response LOC 10-1

The comment relates to the Connect SoCal Project List. Please refer to **Master Response No. 1: General Comments and Non-CEQA Issues**. Projects featured in the Plan's Project List Appendix were provided by the six County Transportation Commissions (CTCs) for Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura. Updates to the project list are coordinated through SCAG planning staff and are not comments on the PEIR. For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001375* of the Final Connect SoCal Plan.

Letter LOC 11: City of Los Angeles, Department of Transportation (LADOT)

Seleta J. Reynolds, General Manager
Department of Transportation

January 16, 2020

Response LOC 11-1

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001304 and 0001555* of the Final Connect SoCal Plan.

Response LOC 11-2

The comment generally summarizes the findings of Section 3.8, Greenhouse Gas Emissions, and suggests that SCAG continue to partner with state and local agencies to pursue solutions that reduce regional VMT. As described throughout the Plan and PEIR, SCAG uses a “bottom up” approach and committee involvement to shape the strategies within the Plan (See Chapter 2.0 Project Description). SCAG encourages LADOT to work closely with SCAG during the next four years to develop new and innovate strategies to reduce GHG emissions. The comment also expresses support for the mitigation measures included on Section 3.17, Transportation, Traffic and Safety (p 3.17-62 to 3.17-64), of the PEIR.

Response LOC 11-3

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001304 and 0001555* of the Final Connect SoCal Plan.

Response LOC 11-4

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001304 and 0001555* of the Final Connect SoCal Plan.

Response LOC 11-5

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001304 and 0001555* of the Final Connect SoCal Plan.

Response LOC 11-6

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001304 and 0001555* of the Final Connect SoCal Plan.

Response LOC 11-7

This comment is a set of summary remarks. No specific response is required.

Letter LOC 12: City of Mission Viejo

Dennis Wilberg, City Manager
Office of the City Manager
City of Mission Viejo
200 Civic Center
Mission Viejo, CA

January 22, 2020

Response LOC 12-1

This comment is a set of general introductory remarks. No specific response is required.

Response LOC 12-2

The comment requests quantification of GHG emission reductions per alternative for 2020 and 2035. The comment further states that SCAG internally shifts, within jurisdictions, future growth proximate to Priority Growth Areas resulting in a land use distribution that differs from the Local Input distribution. See **Master Response 8: Alternatives** and **Master Response 5: Regional Housing Needs Assessment**. Due to the various complexities of the model as well as the gross nature of estimates, SCAG has elected to discuss GHG emissions among alternatives qualitatively. *CEQA Guidelines* Section 15126.6(d) allows that alternatives be discussed at a lesser level of detail than the project.

Response LOC 12-3

The commenter requests clarification on the discussion of alternatives presented in the PEIR. Specifically, the statement that the Connect SoCal Plan and the Intensified Land Use Alternative would conflict with AB 32 and SB 32 despite meeting the targets. As discussed in Section 3.8, Greenhouse Gases, of the PEIR (p. 3.8-73), pursuant to Appendix G of the *CEQA Guidelines*, a significant GHG impact is identified if the Plan could conflict with applicable GHG reduction plans, policies, or regulations. Transportation projects and anticipated development under the Plan would be subject to complying with SB 375, SB 743, AB 32, and SB 32. SB 375 requires MPO's to meet per capita emission reduction by 2020 and 2035 as compared to the base year of 2005. AB 32 and SB 32 are statewide reduction goals aimed at reducing emissions to 1990 levels by 2020 and reducing emissions to 40% below 1990 levels by 2030, respectively. The Plan will meet the reduction goals set forth by CARB pursuant to SB 375 (19 percent by 2035). However, CARB has indicated that achievement of the SB 375 goals is insufficient for the transportation sector to meet the state's overall GHG reduction goals, achievement of the statewide goal would require a 25 percent per capita emissions reduction among all MPOs which CARB recognizes is infeasible. SCAG's 19 percent GHG emissions reduction goal results in a six percent gap. In addition, without additional information as to how other sectors (energy, water-related energy and other sources of emissions) would reduce

emissions to meet targets, the Plan would not be consistent with AB 32 and SB 32. As a result, the impact would be significant and unavoidable.

Response LOC 12-4

The comment relates to statements in the PEIR referencing the CARB progress report which stated that even if all MPOs meet regional SB 375 GHG targets, the state would not be able to meet the statewide GHG reduction goals of AB 32, SB 32, and the Scoping Plan (PEIR page 3.8-80). The commenter requests information on any policy, target or performance measures for the SCAG region related to GHG that may be imposed on local governments. SCAG's authority under SB 375 and other state and federal laws has not changed. CARB has not provided SCAG with specific VMT performance targets, and has only provided SCAG (and other MPOs) with GHG reduction targets under SB 375. Further SB 375 targets are regional targets and not local GHG reduction targets to be applied at the local level. It is however SCAG's role to work closely with local jurisdictions in the attainment of regional targets set by CARB. This process is fully described in the Connect SoCal plan as part of the "bottom up" planning process. Commenter is also referred to Response **LOC 12-3** above regarding statewide progress on achieving the targets set by CARB.

Response LOC 12-5

Comment suggests removing "can and should" language from the PEIR. Refer to **Response SUB 1-9** and **Master Response No. 5: Approach to Mitigation Measures**.

Response LOC 12-6

This comment is a set of general remarks. No specific response is required.

Letter LOC 13: City of Moreno Valley

Letter LOC 16: City of Yorba Linda

David Brantley, Community Development Director
City of Yorba Linda
4845 Casa Loma Avenue
Yoba Linda, CA 92866

January 21, 2020

Response LOC 16-1

The comment provides introductory statements. No response is necessary.

Response LOC 16-2

The commenter states the RHNA growth and need is inconsistent with the Connect SoCal forecast. With regards to allocation, allocation refers to the jurisdictional number by income category. A jurisdiction's RHNA allocation is derived by distributing the regional housing need to each of the 197 jurisdictions in the region using the RHNA allocation methodology adopted by the SCAG Regional Council on March 5, 2020. For further details of the adopted RHNA methodology, please see www.scag.ca.gov/rhna.

The commenter is also referred to **Response Sub 1-54** and **Sub 1-55** and **Master Response No. 7: Regional Housing Needs Assessment**.

Response LOC 16-3

The comment requests an edit to Section 3.14, Population and Housing, specifically related to the guiding principles. This change is made. Refer to **Section 10.0, Corrections and Additions**, for page 3.14-9.

Response LOC 16-4

The comment takes issue with the statement that the RHNA does not necessarily encourage or promote growth (Section 3.14 Population and Housing (p 3.14-14, 4th paragraph). Commenter is referred to **Response SUB 1-56**.

Response LOC 16-5

The comment relates to the 6th cycle of the RHNA and whether it will be consistent with the Connect SoCal for the comparable period. Refer to **Master Response No. 7: Regional Housing Needs Assessment**.

Response LOC 16-6

The comment relates to the 6th cycle of the RHNA. Refer to **Master Response No. 7: Regional Housing Needs Assessment**.

Response LOC 16-7

The comment suggests the RHNA methodology is a reasonable alternative. SCAG disagrees that the RHNA methodology is a CEQA alternative. The RHNA is a planning process and cannot be used as a reasonable growth forecast. Once the allocation has gone through the local planning process of being included in local housing elements, those numbers become part of the local input process SCAG uses for developing the growth forecast which ultimately is used in the SCS. Refer also to **Master Response No. 7: Regional Housing Needs Assessment.**

Response LOC 16-8

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001557* of the Final Connect SoCal Plan.

Response LOC 16-9

The comment is a summary of the letter. Comments are responded to individually above.

Letter ORG 1: Coalition for a Safe Environment

California Kids IAQ
Community Dreams
EMERGE
American Legion Post #6
Wilmington Improvement Network
San Pedro & Peninsula Homeowners Coalition
NAACP - San Pedro-Wilmington Branch #1069
St. Philomena Social Justice Ministry

January 24, 2020

Response ORG 1-1

The comment requests a 30-day extension for the public comment period. SCAG provided notice to interested parties in accordance with *CEQA Guidelines* Section 15085. As such, an extension is not necessary or warranted. The Connect SoCal Plan process including the PEIR process is tightly scheduled and an extension of the PEIR review period could result in unnecessary delay.

Response ORG 1-2

The comment suggests the PEIR include a section on environmental justice and disadvantaged communities. Connect SoCal includes an Environmental Justice (EJ) Technical Report. As identified in the EJ Technical Report, SCAG identified 18 performance indicators and conducted analyses of existing and future social and environmental equity in the region in various areas of analysis, which are environmental justice areas, Senate Bill 535 (SB 535) disadvantaged communities, and communities of concern. The EJ Technical Report concludes that Connect SoCal implementation will not result in disproportionate or adverse impacts on low income and minority populations in most performance areas. Specifically, conditions will improve regionally for EJ communities in accessibility to employment and services and parks and educational facilities, impacts along freeways and high-traffic roads, and travel time and travel distance savings. Current conditions analyses for active transportation hazards, climate vulnerability and public health indicate that EJ communities incur a higher risk of adverse impacts while current condition analyses on jobs-housing imbalance and neighborhood change and displacement indicate EJ communities will experience improvements or not be impacted. The regional and local emissions impact, roadway noise impacts and rail-related impact analyses show adverse impacts at the local level for certain regions but improvements at a regional level. The EJ Technical Report also finds the Plan has yielded positive results in travel time and travel distance reductions for the region and EJ communities, specifically in less spending time on driving and more on transit; as such, more people will be using public transportation to reach their essential destinations (e.g. job, shopping, recreation, etc.) as the result of more integrated transit system

An EJ Toolbox is also provided which includes recommended practices and approaches for performance areas that may result in disproportionate adverse impacts on EJ communities and can be a resource to local jurisdictions or EJ stakeholders to combat disproportionately adverse impacts on EJ communities. The EJ Toolbox has been added to the following measures PMM AQ-1 aa), PMM GHG-1, and PMM NOISE-1. See **Chapter 10.0, Corrections and Additions**, for page 3.3-67, 3.8-72, and page 3.13-39. CEQA requires that where General Plans have been updated to include policies relevant to EJ, that the CEQA analysis should address consistency with those policies. This is a recent requirement and few if any general plans have been updated to address EJ. Therefore, it was not possible to undertake an evaluation of Plan consistency with such polices as of yet. In general, there is no requirement to include a separate EJ analysis within CEQA documents as CEQA is focused on physical impacts on the environment. However, EJ issues may be a factor in considering individual projects. The commenter is referred to the EJ Technical Report for evaluation of EJ impacts on communities in the SCAG region.

Response ORG 1-3

The comment refers to redline mark-up of the PEIR provided by the commenter. These comments are responded to individually below.

Response ORG 1-4

The comment suggests edits to the introductory paragraph. Refer to **Chapter 10.0, Corrections and Additions**, for Section 3.3, Air Quality (p 3.3-1).

Response ORG 1-5

The comments are editorial opinions – no changes were made.

Response ORG 1-6

The comment requests EJ information on cancer risk. The commenter is referred to the EJ Report which includes public health indicators. Specifically, Table 33 Criterion Exposure by Geography Relative to all Census Tracts in the State. The table shows the performance of the greater SCAG region for the selected criteria. SCAG performs relatively better for the instances of PM2.5 Concentrations in the air than all other variables. This could be due to the fact that the SCAG region is very large, and 98 percent of the region's population live in Urban Areas, which represent only 13 percent of the region's overall land area. Further, commenter is referred to Appendix 3.3, Health Risk Assessment included in the PEIR which evaluates risk associated with the Plan.

Response ORG 1-7

The comment states the PEIR is in non-compliance with AB 32 because SCAG does not require transportation projects to comply. Regarding AB 32, the commenter is referred to Section 3.8, Greenhouse Gases. As stated on Section 3.8, Greenhouse Gases (p 3.8-39), in December 2017, CARB adopted California's 2017 Climate Change Scoping Plan (2017 Scoping Plan Update), which outlines the proposed framework of action for achieving California's SB 32 2030 GHG target: a 40 percent reduction in GHG emissions by 2030 relative to 1990 levels. The 2030 target is intended to ensure that California remains on track to achieve the goal set forth by Executive Order B-30-15 to reduce statewide GHG emissions by 2050 to 80 percent below 1990 levels.

As stated on Section 3.8, Greenhouse Gases (p 3.8-39) of the PEIR, "[T]he 2017 Scoping Plan Update identifies key sectors of the implementation strategy, which includes improvements in low carbon energy, industry, transportation sustainability, natural and working lands, waste management, and water. Through a combination of data synthesis and modeling, CARB determined that the target statewide 2030 emissions limit is 260 MMTCO_{2e}, and that further commitments will need to be made to achieve an additional reduction of 50 MMTCO_{2e} beyond current policies and programs. Key elements of the 2017 Update include a proposed 20 percent reduction in GHG emissions from refineries and an expansion of the Cap-and-Trade program to meet the aggressive 2030 GHG emissions goal and ensure achievement of the 2050 limit set forth by E.O. B-30-15."

For the transportations sector, the 2017 Update indicates that while most of the GHG reductions will come from technologies and low carbon fuels, a reduction in the growth of vehicle miles traveled (VMT) is also needed. The 2017 Update indicates that stronger SB 375 GHG reduction targets will enable the State to make significant progress toward this goal, but alone will not provide all of the VMT growth reductions that will be needed. It notes that there is a gap between what SB 375 can provide and what is needed to meet the State's 2030 and 2050 goals. The 2017 Update recommends that local governments consider policies to reduce VMT, including: land use and community design that reduces VMT; transit-oriented development; street design policies that prioritize transit, biking, and walking; and increasing low carbon mobility choices, including improved access to viable and affordable public transportation and active transportation opportunities.

As discussed in Section 3.17, Transportation, Traffic and Safety, CARB and OPR have recommended project-level VMT thresholds of significance in their guidance documents for use in evaluating traffic impacts in CEQA documents. These thresholds are intended to meet statewide GHG emissions targets through VMT reductions from the transportation sector. Both CARB and OPR acknowledge that MPO's are tasked with meeting SB 375 GHG emissions targets, and while CARB has determined that meeting

these targets will not be sufficient to attain state climate goals, more can be done at the project level. At the project level, lead agencies may consider CARB, OPR and other recommended thresholds of significance and determine which ones are appropriate and feasible for an individual project. The discussion of GHG impacts below considers the potential for the region as a whole to meet the CARB and OPR targets.

Further, SCAG does not have approval authority over any of the projects in the Plan. Rather, the projects are selected by the local jurisdictions including cities, counties and county transportation commissions. See **Master Response No. 1: General Comments and Non-CEQA Issues**, **Master Response No. 2 Program EIR vs. Project EIR**, and **Master Response No. 5: Approach to Mitigation Measures**.

Response ORG 1-8

The comment refers to the contents and requirements of AB 617 and asserts that SCAG is in non-compliance with AB 617 because it rubber-stamps and approves all projects and does not require transportation and infrastructure projects to comply with AB 617. AB 617 requires CARB, in consultation with air districts, to select communities for community air monitoring and/or the preparation of community emission reduction programs. AB 617 specifies that the highest priority areas shall be disadvantaged communities with high cumulative exposure burden for criteria pollutants and toxic air contaminants. In response to AB 617, CARB has established the Community Air Projection Program to reduce exposure in communities most impacted by air pollution. While SCAG is monitoring this program, it is not directly involved in implementation of AB 617. Also, SCAG has no specific authority to approve or disapprove transportation projects within the Plan. See **Master Response No. 1 General Comments and Non-CEQA Issues**, **Master Response No. 2: Program EIR vs. Project EIR**, and **Master Response No. 5: Approach to Mitigation Measures**.

Response ORG 1-9

The comment states SCAG approves all projects. On the contrary, SCAG has no specific authority to approve or disapprove transportation projects within the Plan. The comment identifies summaries of SB 44 (comprehensive plan for reducing GHGs from medium and heavy-duty vehicles), SB 210 (develop a heavy-duty inspection and maintenance program for non-gasoline heavy duty truck) and provides summary information regarding SB 375 (regarding SCS requirements that are discussed on page 3.8 -31 in the Regulatory Framework section of the analysis of Greenhouse Gasses). The additional information provided by the commenter further illustrates how the State of California regulates emissions. The PEIR does not identify each and every regulation that would reduce emissions in the state but rather summarizes key regulations applicable to the analysis. Refer to **Master Response No. 1: General**

Comments and Non-CEQA Issues, Master Response No. 2: Program EIR vs. Project EIR, and Master Response No. 5: Approach to Mitigation Measures.**Response ORG 1-10**

The commenter states that SCAG is in non-compliance with Our County – Los Angeles County Sustainability Plan. While there is no specific mandate for the Plan to be consistent with any local plan, SCAG undertook a comprehensive “bottom up” planning approach to ensure overall compatibility with local and regional plans such as the Our County plan (see Chapter 2.0 Project Description). The commenter is referred to Section 3.11, Land Use and Planning (p 3.11-45), which states, “[w]hile the Plan was developed primarily from assumptions derived from local general plans and input from local governments and transportation agencies, SB 375 does not require local land use policies, regulations or general plans to be consistent with the Plan. Also, although the transportation projects and land use strategies included in the Plan are generally compatible with county- and regional-level general plans, local general plans may not have been updated since SCAG’s last adopted 2016 RTP/SCS. As such, it is likely that there could be incompatibilities with existing general plans in the region.

SCAG has no authority to adopt, approve, implement, or otherwise regulate local land use plans or individual projects that are listed in the Connect SoCal Plan. SB 375 specifically provides that a regional transportation plan does not supersede the land use authority of cities and counties. In addition, cities and counties are not required to change their land use plans and policies, including general plans, to be consistent with the Plan. Rather, SB 375 requires the projections of a regional land use pattern integrated with the transportation network and the provision of strategies and recommended policies to reduce per capita GHG emissions from automobiles and light trucks. Local governments reserve their land use authority and may incorporate, as appropriate, the recommended land use strategies, guiding principles, and policies include in the Plan.”

Response ORG 1-11

The comment suggests roles for SCAG in implementing mitigation measures. SCAG does review and submit comments on regionally significant projects through its Intergovernmental Review (IGR) process. As part of this process, projects are reviewed for overall compatibility with Plan policies. SCAG also recommends mitigation measures through this PEIR process. These measures are for both SCAG and local jurisdictions. SCAG’s seeks to work cooperatively and collaboratively with its member agencies. SCAG decisions are made by the SCAG Regional Council which is comprised of representatives of member agencies. Commenter is also referred to **Master Response No. 5: Approach to Mitigation Measures.**

Response ORG 1-12

The comment relates to the role of SCAG. SCAG does not have approval authority over individual projects included in the Plan. Each project undergoes environmental review at the local or state level, depending on the lead agency. SCAG is not the lead agency for any project within the Plan and therefore does not approve environmental documents for projects. Many of the projects included in the Plan have not yet undergone environmental review as they are still in the planning phase. They are programmed within the Plan to allow for federal and/or local funding but there is not sufficient information at that stage to evaluate potential environmental impacts. Further, the Connect SoCal PEIR is a program level document that consists of regional analysis. It does not evaluate any one project in particular detail. It would be speculative to attempt to assess environmental impacts of those projects that have not yet undergone environmental review. See **Master Response No. 2: Program EIR vs. Project EIR**. The PEIR identifies significant impacts to air quality because of anticipated regional increases in certain criteria pollutant emissions and SCAG's lack of authority to impose project-level mitigation measures, and therefore the inability of SCAG to determine if impacts of individual projects would be mitigated to a less than significant level.

Response ORG 1-13

Commenter suggests mitigation measures related to zero emissions. The suggested mitigation measures have not been included for the following reasons, SCAG does not currently have expertise, staffing or funding to create a zero-emissions technology clearinghouse. SCAG, however, does encourage the commenter to participate in SCAG's Emerging Technology Committee which does seek ways to encourage new technologies such as zero emissions technology. Commenter also suggests a mitigation measure for SCAG to request health impact assessments to develop a public health baseline for the region. This measure would not mitigate any particular impact identified within the PEIR and is not within SCAG's purview. However, the comment will be forwarded to the decision maker for their consideration in taking action on the Plan.

Response ORG 1-14

The comment implies SCAG knows the future construction activity of projects in the region. While SCAG maintains a project list, the details of many of the projects are unknown as the projects are still in the planning phase. As such, the specific size and location of future construction activity within the SCAG region is uncertain. See **Master Response No. 2: Program EIR vs. Project EIR**.

Response ORG 1-15

The comment provides a reference for recent reports. The comment does not raise an environmental issue within the meaning of CEQA. The comment will be forwarded to the decision maker for their consideration in taking action on the Plan. See **Master Response No. 1: General Comments and Non-CEQA Issues**.

Response ORG 1-16

The comment suggests the PEIR should include a reference to CARB's Air Quality and Land Use Handbook. Commenter is referred to Section 3.3, Air Quality (p 3.3-42), of the PEIR which includes a summary of this report.

Response ORG 1-17

The comment suggests the PEIR should include a reference to SCAQMD Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning. While this document is referenced in several locations in the PEIR Section 3.3 Air Quality, has been updated in **Chapter 10.0, Corrections and Additions** (see changes for page 3.11-38), to provide a full citation to the report.

Response ORG 1-18

The comment requests the above references be added to the PEIR. See **Responses ORG 1-15 through ORG 1-17** above.

Response ORG -19

The commenter suggests the PEIR define the terms "clean up green up" and "buffer zone" in the Land Use section, however, these terms are not used within the land use section. Therefore, no change was made.

Response ORG 1-20

The commenter suggests several terms to be defined in the land use section of the PEIR. Environmental Justice area is defined in the RTP Glossary, disadvantaged communities are defined on page 2 of the Environmental Justice Technical Report. The definition of cumulative impacts is provided in Section 3.21 Cumulative Impacts of the PEIR.

Letter ORG 2: Diamond Bar – Pomona Valley Sierra Club Task Force, Angeles Chapter

Cynthia Robin Smith
Diamond Bar – Pomona Valley Sierra Club Task Force, Angeles Chapter

Response ORG 2-1

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001543* of the Final Connect SoCal Plan.

Response ORG 2-2

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001543* of the Final Connect SoCal Plan.

Response ORG 2-3

The comment provides information on sensitive species specific to the Diamond Bar area and requests the included information be added to the PEIR and Plan. Due to the scope and scale of the six county-wide SCAG region, analyses were limited to plants, animals, and habitats listed in regional databases with georeferenced known locations (such as the California Natural Diversity Data Base, or CNDDDB). The impact analysis reviewed potential environmental impacts to sensitive biological resources from a regional perspective and is programmatic in nature. As such, Lead Agencies for each individual project will determine the level of environmental review required for subsequent project-level evaluation of individual projects.

Section 3.4, Biological Resources, Figure 3.4-2, Sensitive Wildlife Species Reported in the SCAG Region, does capture and show CNDDDB records of gnatcatchers within the northern portion of the City of Diamond Bar Natural Open Space Area (record from 2017), but as this is a regional analysis these are difficult to see at this scale. As indicated in the PEIR, the regional records are incomplete and likely do not show all sensitive species or habitats present in a given area and project specific surveys should be required by the Lead Agency for subsequent project-level evaluation of individual projects. The updated City of Diamond Bar biological information should be included in these future studies. See **Master Response No. 2: Program EIR vs. Project EIR**.

Response ORG 2-4

Response ORG 4-2

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001443* of the Final Connect SoCal Plan.

Response ORG 4-3

The comment is a set of general objections to the PEIR. Individual comments are responded to below. For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001443* of the Final Connect SoCal Plan.

Response ORG 4-4

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001443* of the Final Connect SoCal Plan.

Response ORG 4-5

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001443* of the Final Connect SoCal Plan.

Response ORG 4-6

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001443* of the Final Connect SoCal Plan.

Response ORG 4-7

The comment presents a set of general objections to the Connect SoCal land use plan and states the PEIR should evaluate the environmental consequences of an “economically infeasible” Plan. SCAG’s land use plan was developed in partnership with demographers, local jurisdictions, and housing experts and represents several years of collaboration and research. While it may be true that current housing prices in

many parts of Southern California are beyond the reach of moderate and low wage workers, it is wholly speculative to suggest that these conditions and other theoretical conditions such as “an explosion of ‘supercommuters’” are attributable to the Plan. An economic impact analysis is not appropriate under CEQA unless physical changes to the environment attributable to the project could occur as a result. Section 21082.2(c) of the Public Resources Code states that lead agencies need not consider: “evidence of social or economic impacts which do not contribute to, or are not caused by, physical impacts on the environment.” As such, the PEIR does not speculate as to economic conditions, but rather it evaluates the reasonably foreseeable environmental consequences based on reasonable assumptions. The commenter is referred to Section 3.14, Population and Housing, which discusses the issues such as displacement and gentrification and the fact that there is no reasonable method to identify how many people could be displaced and where they could move to and therefore no feasible way to identify any potential impacts on transportation, air and noise as a result of these changes (pages 3.14-27 to 3.14-28).

Response ORG 4-8

The comment is a set of general objections to the Plan’s strategies and CARB’s GHG reduction targets. The Connect SoCal Plan and PEIR does not establish regional or project-level VMT reduction targets. SCAG along with other MPOs in the state are required, pursuant to SB 375, to develop a SCS to meet established GHG reduction targets by using a combination of VMT reducing strategies. As recognized by CARB, MPOs do not have land use authority to implement additional VMT reductions. As such, CARB has issued project-level VMT reduction targets to further reduce GHG emissions. While the commenter may disagree with CARB and its project-level VMT targets, and the use of VMT reduction strategies in the Plan, SCAG nonetheless is required to develop an SCS and address GHG reduction targets through reductions in per capita VMT. Refer to **Master Response No. 6: Vehicle Miles Traveled (VMT Analysis)**.

Response ORG 4-9

The comment references a lawsuit filed against CARB and suggests adverse physical impacts would occur as a result of higher housing costs. SCAG disagrees with the commenters premise that the construction of infill housing would necessarily result in higher housing prices overall and additional physical impacts. This PEIR analyzes the potential physical impacts of the anticipated build out of the Plan through 2045 and analyzes a variety of housing types, urban, suburban, rural, townhome, apartment accessory dwelling unit. All types of housing, including affordable and market rate housing, are captured within the analysis in this document. The impacts of housing, growth, and transportation are all linked together over the course of the Plan. While there could be some variation in better/worse impacts depending on the land use pattern ultimately adopted by the region (as demonstrated in the alternatives analysis), in general impacts of housing (all housing) are captured within this PEIR. The PEIR appropriately analyzes the environmental effects of what is reasonably foreseeable to occur as a result of

the Plan. The Plan was developed by numerous experts in housing and demographics who identify expected Plan outcomes based on professional expertise. For additional information regarding housing affordability, please refer to the Sustainable Communities Strategy Technical Report of the Final Connect SoCal Plan.

Response ORG 4-10

The comment relates to the RHNA process and the PEIR cumulative analysis. Again, SCAG disagrees with the commenter that the existing need is cumulative to the Plan. Refer to **Master Response 7: Regional Housing Needs Assessment**.

Response ORG 4-11

The comment relates to mitigation measures. SCAG has identified both SCAG mitigation measures and mitigation measures for project sponsors. Commenter is referred to **Master Response 5: Approach to Mitigation Measures** and to the Executive Summary of the PEIR which includes a listing of SCAG and project level mitigation measures.

Response ORG 4-12

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001443* of the Final Connect SoCal Plan. For additional information regarding affordable housing, please refer to the revised Sustainable Communities Strategy report of the Final Connect SoCal Plan.

Response ORG 4-13

The comment presents a summary of the commenter's above comments regarding the PEIR. These comments are responded to individually above.

Response ORG 4-14

The comment presents a set of general objections to CARB and SCAG. These comments are responded to individually above.

Response ORG 4-15

The commenter suggests SCAG advocate for a one-year extension for its conformity determination and PEIR to pursue legal action. SCAG has undertaken the Plan and the RHNA processes with opportunities for full participation of its member agencies and stakeholders, and the approval and guidance of state and federal agencies as applicable.). At this time, SCAG does not see a reason to delay approval of Connect SoCal and the PEIR at the risk of a conformity lapse. SCAG's current conformity finding on its 2016 RTP/SCS expires in June 2020. Pursuant to the federal Clean Air Act and the federal Transportation Conformity Regulations, the Connect SoCal is required to receive federal approval of its final

transportation conformity determination by June 1, 2020. In addition, there is no statutory nor regulatory provisions for any extension of transportation conformity determination. Finally, contrary to the commenter's assertion, SANDAG did not receive a one-year extension for its conformity determination.

With regards to the PEIR, the PEIR was available beginning December 9, 2019 through January 24, 2020, for a total of 46 days. *CEQA Guidelines* Section 15105 states, "[t]he public review period for a draft EIR shall not be less than 30 days nor should it be longer than 60 days except in unusual circumstances.

As demonstrated in the responses herein, SCAG has prepared a lawful and effective Plan and associated PEIR; there is no reason for a one-year extension or legal action.

Response ORG 4-16

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001443* of the Final Connect SoCal Plan.

Los Angeles, CA 90045

January 24, 2020

Response ORG 6-1

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001438* of the Final Connect SoCal Plan.

Response ORG 6-2

The comment relates to the public comment period for the PEIR. The PEIR was available beginning December 9, 2019 through January 24, 2020, for a total of 46 days. *CEQA Guidelines* Section 15105 states, “[t]he public review period for a draft EIR shall not be less than 30 days nor should it be longer than 60 days except in unusual circumstances. When a Draft EIR is submitted to the State Clearinghouse for review by state agencies, the public review period shall not be less than 45 days, unless a shorter period, not less than 30 days, is approved by the State Clearinghouse.” No unusual circumstances have occurred which would justify extending the comment period.

Response ORG 6-3

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001438* of the Final Connect SoCal Plan.

Response ORG 6-4

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001438* of the Final Connect SoCal Plan. The comment suggests LAX is the fourth busiest airport rather than the fifth. See 10.0 Corrections and Additions for page 1.0-4.

Response ORG 6-5

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001438*. The comment suggests noise contours for reliever airports should be included in Appendix 3.13. Reliever airports represent a minor percentage of regional aviation noise, and therefore were not evaluated. The comment also asks if emissions for these airports are accounted for in the GHG and air quality sections. Emissions associated with these airports are captured within the AQMP and other regional scale air quality documents which are complementary to the Plan. Please refer to the revised Aviation Technical Report of the Final Connect SoCal Plan.

Response ORG 6-6

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001438* of the Final Connect SoCal Plan.

Response ORG 8-6

The Draft Program Environmental Impact Report (PEIR) found that implementation of the Plan would have significant and unavoidable impacts to species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service (Impact BIO-1, Section 3.3, Biological Resources). At the time of the preparation of the PEIR, mountain lions were not candidate or listed species by the California Department of Fish and Wildlife (CDFW) or the U.S. Fish and Wildlife Service. Discussions for listing this species are currently underway with CDFW. However, as stated above, at time of the preparation of this PEIR, mountain lions are not listed.

In addition, due to the scope and scale of the analysis of the six county-wide SCAG region, analyses were limited to plants, animals, habitats, and other natural resource information listed in regional databases with georeferenced known locations (such as the California Natural Diversity Data Base, or CNDDB). Data for mountain lions are not currently tracked in these databases. The impact analysis reviewed potential environmental impacts to sensitive biological resources from a regional perspective and is programmatic in nature. As such, Lead Agencies for each individual project will determine the level of environmental review required for subsequent project-level evaluation of individual projects. Should mountain lions be listed or a candidate species in the future, or if otherwise required by the Lead Agency, it will need a full analysis in project-specific environmental documents.

The PEIR also found that the Plan would interfere substantially with the movement of any native resident or migratory fish or wildlife species, such as mountain lion, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites and would result in a significant and unavoidable impact (Impact BIO-4, Section 3.3, Biological Resources). Numerous project level mitigation measures were identified for migratory species (including mountain lions). These measures included consulting with “wildlife corridor authorities”; counties, cities, and other local organizations; USFS, CDFW, and USFWS and other agencies for projects that could impact wildlife corridors or migration for project planning. The PEIR also included project-specific mitigation measures to: design proposed projects to minimize impacts to wildlife movement and habitat connectivity and preserve existing and functional wildlife corridors; conduct site-specific analyses of opportunities to preserve or improve habitat linkages with areas on- and off-site; analyze habitat linkages/wildlife movement corridors on a broad scale to avoid critical narrow choke points that could reduce function of recognized movement corridor; require review of construction drawings and habitat connectivity mapping by a qualified biologist to determine the risk of habitat fragmentation; pursue mitigation banking to preserve habitat linkages and corridors; design projects to promote wildlife corridor redundancy by including multiple connections between habitat patches; evaluate the potential for installation of overpasses, underpasses, and culverts to create wildlife crossings in cases where a roadway or other transportation project may interrupt the flow of species through their habitat; to provide wildlife crossings in accordance with proven standards; and, where avoidance is not feasible, to design sufficient conservation measures through coordination with local agencies and the regulatory agencies (i.e., USFWS or CDFW) and in accordance with the respective counties and cities general plans to establish plans to mitigate for the loss of fish and wildlife movement corridors and/or wildlife nursery sites.

The potential for climate change to heighten impacts to natural resources, endangered, threatened, or sensitive species and wildlife movement was discussed in several parts of the biology sections and impact analysis for natural resources. Future specific projects should at a minimum include consideration for

rising sea levels, increased temperatures, decreased water availability and/or altered precipitation patterns, and invasive species infestations. As described in the PEIR, special status species are most susceptible to climate change due to their small population sizes and, often, specific suitable habitat conditions required for their survival. The combination of project impacts and climate change can further reduce available habitat, reduce movement opportunities for wildlife, provide new corridors for invasive species infestations, and increase the risk of fires in open space to the detriment of special status species. Several project-level mitigation measures are recommended to help address some impacts of climate change including habitat restoration, invasive species control plans, wildlife corridor redundancy, artificial movement corridors, and other measures.

Response ORG 8-7

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001444 and 0001445* of the Final Connect SoCal Plan.

Letter ORG 9: Center for Demographic Research

Deborah Diep, Director
Center for Demographic Research
1121 N. State College Blvd, Suite 238
Fullerton, CA 92833

January 24, 2020

Response ORG 9-1

The comment provides a set of introductory comments. No specific response is necessary. For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001560 and 0001561* of the Final Connect SoCal Plan.

Response ORG 9-2

The comment provides further introductory comments. No specific response is necessary.

Response ORG 9-3

The comment requests clarification on the identified terms. The following terms are defined in the RTP/SCA glossary: Livable Corridors, Neighborhood Mobility Areas. The remaining terms have been added to the glossary See Chapter 10.0 Corrections and Additions for page 7.0-1. Definitions for “orientation”, “timing” “mobility options” and “destinations” are not provided as they are common terms.

Response ORG 9-4

The sources for tables have been updated as appropriate. See **Chapter 10.0, Corrections and Additions**.

Response ORG 9-5

The comment suggests all interpolated data should be marked in tables. See **Master Response No. 3: Baseline Conditions**. As described in the master response, the base year for the Plan is 2016. For purposes of the PEIR, 2019 data has been estimated based on an interpolation of 2016 to 2045 projections. Available data that differs from this generalized explanation and used to determine existing conditions is specified in each topical section in Chapter 3.0, Environmental Impact Analysis and Mitigation Measure.

Response ORG 9-6

The comment requests clarification regarding lane miles. See **Chapter 10.0, Corrections and Additions**, for page ES-9.

Response ORG 9-7

The comment requests an edit. The requested edits were not made as they are not necessary to the text.

Response ORG 9-8

The comment suggests replacing the word “foresee” with “envision.” The comment suggests an edit. See **Chapter 10.0, Corrections and Additions**, for page ES-9.

Response ORG 9-9

The comment suggests adding the words “to replace the gas tax”. The suggested edit was not made. See response to **SUB 1-14** and **SUB 1-20**.

Response ORG 9-10 through ORG 9-23

Refer to **Response SUB 1-9** regarding “where applicable and feasible” language in mitigation measures.

Response ORG 9-24

The comment relates to SCAG committees. Refer to **Response SUB 1-50**.

Response ORG 9-25

The comment suggests all interpolated data should be marked in tables. Refer to **Response ORG 9-5**.

Response ORG 9-26

The comment points to a typographical error. See **Chapter 10.0 Corrections and Additions** for page 1.0-13.

Response ORG 9- 27

The comment requests clarification on the accelerated tomorrow alternative. See **Chapter 10.0, Corrections and Additions**, for page 1.0-15.

Response ORG 9-28

The comment provides suggested edits. See **Chapter 10.0, Corrections and Additions**, for page 3.11-3.

Response ORG 9- 29

The comment provides suggested edits. See **Chapter 10.0, Corrections and Additions**, for page 3.11-5.

Response ORG 9- 30

The comment relates to SCAG committees. Refer to **Response SUB 1-50**.

Response ORG 9- 31

The comment suggests an edit. See **Chapter 10.0 Corrections and Additions**, for page 3.11-12.

Response ORG 9-32

The comment suggests an edit. See **Chapter 10.0 Corrections and Additions**, for page 3.11-15.

Response ORG 9-33

The comment suggests an edit. See **Chapter 10.0, Corrections and Additions** for page 3.11-20.

Response ORG 9-34

The comment requests clarification on the coastal zone. See **Chapter 10.0, Corrections and Additions** for page 3.11-22.

Response ORG 9-35

The comment suggested additional language regarding the HCD RHNA determination to page 3.11-32 of the PEIR. Refer to **Response to SUB 1-52**.

Response ORG 9-36

The comment suggests an edit to page 3.11-32 of the PEIR. See **Chapter 10.0 Corrections and Additions** for page 3.11-32.

Response ORG 9-37

The comment suggests additional narrative for page 3.11-33 regarding the HCD and RHNA process. Refer to **Response SUB 1-52**.

Response ORG 9- 38

The comment suggests an edit that is not necessary.

Response ORG 9-39

The comment requests clarification on regional policies. In the context of this sentence “regional policies” refers to policies that go beyond local jurisdictions. Examples include promote a green region, promoting low emission technologies, planning for growth near transit investments, and promoting the redevelopment of underperforming retail development. Additional policies are in Chapter 2.0 Project Description of the PEIR and in the Plan.

Response ORG 9-40

The comment requests clarification on the statement regarding individual numbers. See **Chapter 10.0 Corrections and Additions** for page 3.11-45.

Response ORG 9- 41

The comment provides suggested edits, see **Chapter 10.0 Corrections and Additions** for page 3.11-45.

Response ORG 9- 42

The comment requests clarifications on where general plans are applicable. General plans are applicable within each city or county. According to state law, “[d]ecisions involving the future growth of the state, most of which are made and will continue to be made at the local level, should be guided by an effective planning process, including the local general plan, and should proceed within the framework of officially approved statewide goals and policies directed to land use, population growth and distribution, development, open space, resource preservation and utilization, air and water quality, and other related physical, social and economic development factors.” (Gov Code § 65030.1) Because general plans apply within cities and counties, areas outside of a city or county, such as federally managed lands, might not be subject to general plans.

Response ORG 9-43

The comment suggests an edit. See **Chapter 10.0, Corrections and Additions**, for page 3.14-1.

Response ORG 9- 44

The comment requests additional information added to the definition of “housing” provided on page 3.14-1. Details requested including source information are provided on page 3.14-1.

Response ORG 9-45

The comment requests clarification on why jurisdictions may have different housing unit definitions. Local jurisdictions have discretion in terms of how a housing unit is defined.

Response ORG 9-46

The comment requests an update to the source on page 3.14-2. The source used to determine the approximate number of residents in the SCAG region was determined in 2018 and was referenced properly. No update is needed. See also **Master Response No. 3: Baseline Conditions**.

Response ORG 9- 47

The comment requests modifications to the sources in Table 3.14-1, Population Growth in the SCAG Region (2000-2019). All sources have been updated as appropriate.

Response ORG 9- 48

The comment suggests an edit. See **Chapter 10.0, Corrections and Additions**, for page 3.14-4.

Response ORG 9- 49

The comment requests modifications to the source for Table 3.14-2. See **Chapter 10.0, Corrections and Additions**, for page 3.14-4.

Response ORG 9- 50

The comment suggests edits to the source information regarding household income. The data and source as stated are correct.

Response ORG 9- 51

The comment suggests edits to source information for Table 3.14-3, Household Size in the SCAG Region (Persons). See **Chapter 10.0, Corrections and Additions**, for page 3.14-5.

Response ORG 9- 52

The comment suggests edits to source information for Table 3.14-4, Poverty Rates in the SCAG Region (1990-2017). See **Chapter 10.0, Corrections and Additions** for page 3.14-6.

Response ORG 9- 53 and ORG 9-54

The comment relates to source information for Table 3.14-5, 2019 Employment by County, 3.14-6, Employment Growth for 2000 to 2019, Table 3.14-7, Unemployment Rates and 3.14-8, 2019-2045 Population, Households, and Employment Projections in the SCAG Region. Table sources have been updated as appropriate; see **Chapter 10.0 Corrections and Additions**.

Response ORG 9- 55

The comment relates to guiding principles of the Plan. See **Chapter 10.0 Corrections and Additions** for page 2.0-21.

Response ORG 9- 56

The comment relates to RHNA. See **Responses SUB 1-58 and SUB 1-52 and Master Response No. 7: Regional Housing Needs Assessment**.

Response ORG 9-57

The comment presents a text change. See **Chapter 10.0, Corrections and Additions**, for page 3.14-20.

Response ORG 9-58

The comment presents a text change. See **Chapter 10.0, Corrections and Additions**, for page 3.14-23.

Response ORG 9- 59

The comment presents a text change portions of the text were not changed as the suggested word choice did not accurately reflect the intent of the statement. Refer to **Chapter 10.0, Corrections and Additions**, for page 3.14-27.

Letter ORG 10: Climate Resolve

Jonathan Parfrey Executive Director
Climate Resolve
525 Hewitt St.
Los Angeles, Ca 90013

January 24, 2020

Response ORG 10-1

The comment provides a set of introductory comments. No specific response is necessary. For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001558* of the Final Connect SoCal Plan.

Response ORG 10-2

The commenter asserts that it is insufficient to use 2012 GHG emission data in 2020 and recommends SCAG blend-in CARB data to evaluate emissions. See **Response ORG 10-16** for a more detailed response to this summary comment.

Response ORG 10-3

The commenter states that the Public Health subsection, on Section 3.8, Greenhouse Gases (page 3.8-16), of the Draft PEIR, is insufficient and includes recommendations. See Response ORG 10-18 for a more detailed response to this summary comment.

Response ORG 10-4

The commenter states that an assessment of compliance with SB 379, SB 1000, and LHMPs should be added to Table 3.8-4 California Jurisdictions Addressing Climate Change in the SCAG Region (2019). The commenter states that Climate Resolve is willing to share this information with SCAG. See **Response ORG 10-22** for a more detailed response to this summary comment.

Response ORG 10-5

The commenter states that Final PEIR should state California's current position on GHG reduction, specifically referring to EO B-55-18 that commits the state to carbon neutrality by 2045. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 3.8-37.

Response ORG 10-6

The comment suggests specific edits to Section 3.8, Greenhouse Gases, that relates to GHG emissions. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 3.8-1.

Response ORG 10-7

The comment suggests specific edits to Section 3.8, Greenhouse Gases, related to GHG emissions. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions** for page 3.8-1.

Response ORG 10-8

The comment suggests specific edits to Section 3.8, Greenhouse Gases, related to GHG emissions. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions** for page 3.8-2.

Response ORG 10-9

The comment suggests specific edits to Section 3.8, Greenhouse Gases, relates to GHG emissions. Section 3.8 is revised to reflect this comment. See **Chapter 10.0 Corrections and Additions**, for page 3.8-3.

Response ORG 10-10

The comment suggests specific edits to Section 3.8, Greenhouse Gases, related to GHG emissions. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 3.8-5.

The commenter also states that SCAG should have included peer-reviewed climate studies with their analysis. A discussion of the State of California’s Fourth Climate Assessment is included in Section 3.8. See **Chapter 10.0, Corrections and Additions**, for page 3.8-5.

Response ORG 10-11

Climate Resolve notes that on Section 3.8, Greenhouse Gases (p 3.8-6), SCAG referenced global glacier loss and recommends that SCAG cite California specific glacier loss information from the 2018 OEHHA climate indicators and cite the report for migration of species. This information was added to Section 3.8, Greenhouse Gases. See **Chapter 10.0, Corrections and Additions**, for page 3.8-6.

Additionally, Climate Resolve recommends that reference 10 be updated to more recent snowmelt information. The change to snowmelt information from California’s Fourth Climate Change Assessment has been made in Section 3.8, Greenhouse Gases. See **Chapter 10.0, Corrections and Additions**, for page 3.8-6.

Response ORG 10-12

The comment suggests specific edits to Section 3.8, Greenhouse Gases, related to GHG emissions. Additionally, the commenter recommends adding reference to a wildfire study by Jin, Randerson, et al and reports published by the Southern California Coastal Water Research Project. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 3.8-8.

Response ORG 10-13

The comment suggests adding regionally specific studies related to flood events. A discussion of the flood risks presented in the Santa Ana Watershed Basin is included in Section 3.8, Greenhouse Gases. See **Chapter 10.0, Corrections and Additions**, for page 3.8-9. The Los Angeles Basin and Southeast Basin Studies were not included in this discussion as these studies only evaluated the future water demand and supply and did not address flooding events in the region.

Response ORG 10-14

The comment suggests including an analysis of the global cumulative GHG emissions. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 3.8-11.

Response ORG 10-15

The commenter asserts that Table 3.8-3, GHG Emissions in California (2000 and 2017) is based on IPCC GHG emissions data and questions why CARB data was not used within the table. However, the numbers in the Table 3.8-3 reflect CARB's latest GHG data, the information is simply split by IPCC category. The table states that the total GHG emissions within the state of California in 2017 was approximately 424.1 MMT CO₂e, comprised of 39.8% transportation emissions. Similarly, review of CARB's *California Greenhouse Gas Emissions Inventory: 2000-2017* Report demonstrates that CARB estimated the state's 2017 GHG emissions to be 424 MMT CO₂e and transportation accounts for 40%. Therefore, CARB data was used within Table 3.8-3 and revisions are not required.

Response ORG 10-16

The commenter asserts that it is incorrect to use 2012 GHG data to analyze emissions within the SCAG region and suggests using statewide GHG emissions. As stated in Section 3.8, Greenhouse Gases, the most recent GHG emissions data by sector for the SCAG region is from 2012. This information was appropriately used. More recent statewide emissions are presented in Table 3.8-3 to demonstrate emissions by sector across the state, however the information from 2012 is to demonstrate the difference in GHG sector emissions that make up the SCAG region as compared to the state. Section 3.8 was revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 3.8-14.

Response ORG 10-17

According to the SCAQMD's Appendix VI: Black Carbon Measurements at Fixed Sites from the *MATES IV Final Report*, black carbon is a component of both fine and coarse particulate matter (PM₁₀ and PM_{2.5}). While black carbon is unregulated, federal and state regulations of PM_{2.5} and PM₁₀ have resulted in significant declines in PM concentrations. Regulations and reduction strategies can control atmospheric concentrations of black carbon either by directly reducing diesel emissions or indirectly by reducing total

PM emissions.⁴¹ The Port of Los Angeles and the Port of Long Beach each have created incentive programs in order to reduce diesel emissions at the ports from ships, including: (1) Vessel Speed Reduction in order to reduce ship speeds up to 40 nautical miles from entering the harbor; (2) Port of Los Angeles Environmental Ship Index to provide financial incentives for ships with the newest engines; (3) Port of Long Beach's Green Ship Incentive Program to provide financial incentives for ships with the newest engines; and (4) Shore Power requiring ships to plug into the electrical grid while loading and unloading cargo rather than idling with auxiliary engines.⁴²

In the Final PEIR, project-level mitigation has been added to PMM-AQ-1 to encourage relevant projects to engage in these programs, which will reduce diesel emissions and black carbon at the ports. Therefore, while black carbon emissions are not specifically quantified within the Draft PEIR, they are expected to decrease by the Plan horizon year. See **Chapter 10.0, Corrections and Additions**, for page 3.8-15.

Response ORG 10-18

The comment suggests that the "Public Health" sub-section is insufficient and recommends relevant studies in order to enhance the section. The comment also suggests specific edits to Section 3.8, Greenhouse Gases, which relates to GHG emissions. Section 3.8 is revised to reflect this comment. See **Chapter 10.0 Corrections and Additions** for page 3.8-16.

Response ORG 10-19

The comment suggests specific edits to Section 3.8, Greenhouse Gases, related to GHG emissions. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 3.8-17.

The comment also suggests that the seven adaption strategies listed to shift community design are insufficient and SCAG should consider including more strategies. As stated within the Draft PEIR, SCAG is not limited to the strategies listed with Section 3.8, Greenhouse Gases. Regardless, Section 3.8 is revised to reflect this comment. See **Chapter 10.0 Corrections and Additions**.

Response ORG 10-20

The comment suggests specific edits to Section 3.8, Greenhouse Gases, which relates to state regulations. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 3.8-27.

⁴¹ SCAQMD. *Appendix VI Mates IV Final Report*. Available online at: <http://www.aqmd.gov/docs/default-source/air-quality/air-toxic-studies/mates-iv/f-appendix.pdf?sfvrsn=7>, accessed February 19, 2020.

⁴² Clean Air Action Plan. *Ships*. Available online at: <https://cleanairactionplan.org/strategies/ships/>, accessed February 19, 2020.

Response ORG 10-21

The comment suggests specific edits to Section 3.8, Greenhouse Gases, which relates to local regulations. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 3.8-49.

Response ORG 10-22

The comment suggests specific edits to Section 3.8, Greenhouse Gases, which relates to local regulations. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**, for page 3.8-51

The comment also requests SCAG to updated Section 3.8, Greenhouse Gases, to include hyperlinks within Table 3.8-4, California Jurisdictions Addressing Climate Change in the SCAG Region (2019), to direct readers to an individual plan and not to the municipalities' websites. Many municipalities include several reduction plans. For example, the City of Burbank includes a GHG Reduction Plan, Climate Action Plan, Sustainability Plan, General Plan Policy, and General Plan Implementation Measures that all address GHG emissions in the City. Providing the hyperlink to the municipality's website allows readers to find each of these documents instead of linking the reader to one of them.

The comment suggests adding columns to Table 3.8-4 that identifies municipalities that include GHG reduction policies and/or climate change adaptation strategies within their general plans to sense how well each general plan assesses climate change. The table already includes columns to list municipalities that include GHG policies or adaption strategies within the General Plan, see columns titled "General Plan Policy" and "General Plan Implementation Measures." SCAG acknowledges that some cities prepare an adaptation plan or resilience plan within the general plans, however the intent of the table is to demonstrate which municipalities are providing policies, programs, and plans to reduce GHG emissions and prepare for climate change, not the extent to which the General Plan addresses these issues.

The comment suggests adding an assessment of compliance with SB 379, SB 1000, and LHMPs which can be provided by Climate Resolve. SCAG thanks Climate Resolve for being willing to share this information and may request this information for the analysis of future documents.

Response ORG 10-23

The comment suggests specific edits to Section 3.8, Greenhouse Gases, which relates to GHG emissions. Section 3.8 is revised to reflect this comment. See **Chapter 10.0, Corrections and Additions**.

Response ORG 10-24

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001558* of the Final Connect SoCal Plan.

Letter ORG 11: Daniel Burruel

Daniel Burruel
Keep Nuevo Rural

No Date

Response ORG 11-1

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001309* of the Final Connect SoCal Plan. The comment is generally supportive of open space conversation and wildlife corridors and expresses opposition to a specific project in the unincorporated community of Nuevo. SCAG does not have land use authority to approve or disapprove local plans. See **Master Response No. 2: Program EIR vs. Project EIR.**

Letter ORG 12: UNITE HERE

Charles Du, Staff Attorney
 UNITE HERE Local 11
 464 Lucas Ave, Suite 201
 Los Angeles, CA 90017

January 24, 2020

Response ORG 12-1

The commenter introduces themselves and their interests. No specific response is required. For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001448* of the Final Connect SoCal Plan.

Response ORG 12-2

The commenter introduces the specific comments below. See specific responses below. For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001448* of the Final Connect SoCal Plan.

Response ORG 12-3

The commenter questions the GHG targets and references Table 3.8-10, SB 375 Analysis. Table 3.8-10 identifies per capita GHG emissions from cars and light duty trucks (in accordance with SB 375) for the years 2005 (Baseline), 2020 (Plan) and 2035 (Plan) and identifies reductions 2020 Plan compared to 2005 baseline and 2035 Plan compared to baseline. Table 3.8-10 shows that the SCAG Region would achieve the emissions reductions targets (-8% 2005 to 2020 and - 19% 2005 to 2035). The SB 375 reduction targets are established by CARB in accordance with the requirements of SB 375. SB 375 is discussed starting on Section 3.8, Greenhouse Gases (p 3.8-31). CARB Target Setting is a complex process involving many steps. Commenter is referred to the CARB web site for further information on target setting.⁴³ CARB does not set specific targets for individual counties or other jurisdictions within the SCAG region. SCAG has not developed such targets either. Individual jurisdictions within the SCAG region are responsible for ensuring consistency with the RTP/SCS and associated targets. SB 375 included CEQA streamlining provisions for certain types of projects (See Chapter 1.0, Introduction (p 1.0-23)).

Response ORG 12-4

The commenter questions what type of projects the SB 375 targets are applicable to. As noted in **Response ORG 12-3** above, individual jurisdictions may use the SB 375 targets as they see fit. SB 375 provides CEQA streamlining for transit priority projects as well as residential and mixed-use residential projects.

⁴³ <https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/regional-plan-targets>; accessed February 14, 2020

Response ORG 12-5

The commenter questions how the term “per capita” is to be applied – whether to residential or residents and employees. At the regional scale the per capita calculation is total miles divided by total population; therefore, at the regional scale only residents are included in the calculation. However, at smaller scales, each jurisdiction must determine how to calculate per capita emissions for employment and mixed-use projects. Ignoring emissions from projects that include an employment component may lead to GHG impacts of an individual project being underestimated.

Response ORG 12-6

The commenter asks about the trajectory of emissions. The trajectory is for SB 375 and total GHG emissions to continue decreasing. SB 375 does not have interim target years or target years beyond 2035. However, other regulations have targets for total emissions for interim years and years beyond 2035 – see discussion starting on Section 3.8, Greenhouse Gases (p 3.8-73) regarding consistency of the Proposed Plan with these regulations.

Response ORG 12-7

The commenter asks why EMFAC2007 is used to calculate 2005 emissions and EMFAC2014 is used for 2020 and 2035. EMFAC2007 includes emission factors for the year 2005; EMFAC 2014 does not. EMFAC2014 was the most recent emission factor modeling tool available when analysis of the Connect SoCal Plan began. See **Master Response No. 4: Technical Process/Modeling**.

Response ORG 12-8

The commenter refers to Table 3.8-11, Population and VMT (2019 and 2045), and how “targets” identified in this table were developed. Table 3.8-11 identifies total population, total VMT and VMT per capita for light duty vehicles and all vehicles. The table does not identify targets, it identifies results of the SCAG modeling. See **Master Response No. 4: Technical Process/Modeling** regarding SCAG’s overall modeling process.

Response ORG 12-9

The commenter asks about whether these VMT “targets” are for all project types. See **Response LOC 12-4**. Also, as discussed in **Response ORG 12-3** above the emissions are calculated based on total VMT in the region divided by total population in the region. As indicated in **Response ORG 12-5**, at scales smaller than the region, different jurisdictions may choose to calculate GHG emissions from an individual project based on both residential population and employment in order to appropriately assess project impacts.

Response ORG 12-10

The commenter asks about the trajectory of VMT reductions and interim year targets. SCAG is not required to meet any regional VMT reduction target, rather only the GHG reduction targets set by CARB. Section 3.8, Greenhouse Gases, Table 3.8-10, SB 375 Analysis, shows 2020 and 2035 GHG reductions. Similarly, the trajectory of per capita VMT is downward. . Other jurisdictions have recommended VMT targets, see discussion starting on Section 3.17 Transportation, Traffic and Safety (p 3.17-53).

Response ORG 12-11

The commenter asks to clarify if the VMT are from residential population or also employees. See **Response ORG 12-9**.

Response ORG 12-12

The commenter asks what data/metrics are specific to employee trips. As noted in **Response ORG 12-9**, SCAG calculates per capita VMT only based on total population. For jurisdictions that evaluated per capita VMT for employment projects, each jurisdiction must decide on relevant data and calculation methodology.

Response ORG 12-13

The commenter asks about VMT projections for residential and employee populations and disaggregated data for cities and counties within the SCAG Region. SCAG did not calculate VMT at a scale smaller than the region. Each jurisdiction is responsible for determining consistency with the Connect SoCal Plan including the regional GHG targets. Each jurisdiction is responsible for assessing transportation/VMT impacts for individual projects in accordance with methodologies established by each jurisdiction. See **Master Response No. 2 Program EIR vs. Project EIR**.

Response ORG 12-14

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001448* of the Final Connect SoCal Plan.

Response ORG 12-15

The commenter provides introductory text to the specific comments (12-16 through 12-21) below, regarding four specific SCAG GHG mitigation measures (SMM GHG-1 through SMM GHG-4, Section 3.8, Greenhouse Gases [p. 3.8-68]). See responses to specific comments below.

Response ORG 12-16

The commenter questions language in the mitigation measures and whether the language represents enforceable performance standards. The mitigation measures require SCAG to “continue to work with”

local agencies, “encourage efficient design” and “pursue partnerships.” SCAG is a regional agency with no authority over local jurisdictions. The mitigation measures include enforceable language (SCAG can monitor whether they have worked with local agencies, encouraged efficient design and sought out partnerships. See **Master Response No. 5: Approach to Mitigation Measures**.

Response ORG 12-17

The commenter asks what would be required to satisfy the measures. To satisfy these mitigation measures SCAG must be able to document that they worked with local agencies, encouraged efficient design and sought out partnerships. SCAG monitors mitigation measures through two primary ways, first, SCAG has prepared a mitigation monitoring and reporting program for this PEIR which details the measure and the party responsible for monitoring implementation. Second, SCAG comments on project level EIRs of regional significance through its Intergovernmental Review (IGR) process. As part of this process, SCAG can comment on project level mitigation measures.

Response ORG 12-18

The commenter asks what specific criteria can be used to objectively determine compliance with the measures. To document compliance with these measures SCAG can use meeting minutes, published programs, policies and grants as well as other documentation of their efforts to comply with these measures. See **Response ORG 12-17**.

Response ORG 12-19

The commenter asks what specific performance-based criteria apply to non-specific measures. The mitigation measures are written in order to allow each jurisdiction to apply performance criteria based on their individual location, constraints and specific priorities and judgments. See **Master Response No. 5: Approach to Mitigation Measures**

Response ORG 12-20

The commenter asks why the mitigation measures do not require specific actions to meet specific reduction targets. The reason that SCAG does not include specific targets for local jurisdictions is because SCAG has no authority over local jurisdictions and imposing such targets on local jurisdictions would be outside SCAGs jurisdiction and authority. In addition, each jurisdiction in the SCAG region has vastly different circumstances, determining appropriate targets for each jurisdiction would require considerable data as well as local-level decision-making to determine what is appropriate. See **Master Response No. 5: Approach to Mitigation Measures**.

Response ORG 12-21

The commenter asks what mitigation measures were found infeasible. During the development of the PEIR, SCAG sought input from the agencies, organizations and the public on the scope of the environmental document. SCAG also held public workshops specifically to gain input on the mitigation measures. During that process, SCAG did not identify any mitigation measures that were found infeasible. SCAQMD suggested mitigation measures that SCAG is not incorporating into the Final PEIR. In each instance SCAG explains why it has not added the measure. See **Responses REG 2-25** and **REG 2-26**.

Response ORG 12-22

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001448* of the Final Connect SoCal Plan.

Response ORG 12-23

Commenter references comments above and requests notice of all CEQA actions or hearings. See detailed responses above. Commenter will receive notice of the availability of the Final EIR and scheduled actions on the Connect SoCal Plan and PEIR.

Response ORG 13-6

For responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001455 and 0001463* of the Final Connect SoCal Plan.

Response ORG 13-7

For additional information regarding housing affordability, please refer to the Sustainable Communities Strategy Technical Report of the Final Connect SoCal Plan. Also, for responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001455 and 0001463* of the Final Connect SoCal Plan.

Response ORG 13-8

For additional information regarding housing affordability, please refer to the Sustainable Communities Strategy Technical Report of the Final Connect SoCal Plan. Also, for responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001455 and 0001463* of the Final Connect SoCal Plan.

Response ORG 13-9

For additional information regarding housing affordability, please refer to the Sustainable Communities Strategy Technical Report of the Final Connect SoCal Plan. Also, for responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001455 and 0001463* of the Final Connect SoCal Plan.

Response ORG 13-10

For additional information regarding housing affordability, please refer to the Sustainable Communities Strategy Technical Report of the Final Connect SoCal Plan. Also, for responses related to the Connect SoCal Plan, please refer to *Submission IDs 0001455 and 0001463* of the Final Connect SoCal Plan.

Response ORG 13-11

The comment provides a set of general remarks regarding Connect SoCal and SB 375 targets. See **Master Response No. 1: General Comments and Non-CEQA Issues.**

Response ORG 13-12, 13-13, and 13-14

The comment asserts that the PEIR fails to identify feasible mitigation measures for the reasonably foreseeable consequence of the implementation of the Plan and fails to disclose the scale and significance of unavoidable adverse impacts. See **Master Response No. 2: Program EIR vs. Project EIR**; the PEIR appropriately evaluates the Connect SoCal Plan at the regional scale, identifies significant impacts and appropriately identifies feasible mitigation measures. See **Master Response No. 5: Approach to Mitigation Measures.**

Section 3.15, Public Services, and Section 3.19, Utilities and Service Systems, both evaluate the potential impact the Plan could have on infrastructure and associated service systems. Such impacts include inadequate wastewater treatment capacity, water supply, impacts from construction of new facilities and so on. The PEIR generally recognizes that more growth and development in urban areas would affect existing infrastructure (the aging of which is a pre-existing issue).

The PEIR states the following in Chapter 4.0, Alternatives (p 4.0-48), “[f]or purposes of this PEIR, the impacts associated with reducing global GHG emissions and regional air pollutants must be examined alongside the other adverse impacts that are caused by increasing the density and intensity of the region’s development patterns and, for example, bringing people closer to sources of air pollutants such as transit corridors and freeways (even though these sources would have fewer emissions in the future, despite increasing traffic, due to emission controls). The tension between CEQA’s mandate to reduce all types of impacts to the maximum extent feasible, and the statutory mandates of reducing GHG emissions under AB 32, SB 32 and SB 375, is a well-recognized CEQA compliance challenge.⁴⁴ CEQA does not provide any legal mechanism for “weighting” environmental impacts, and scoring some categories of impacts as “more important” and others as “less important.” Instead, CEQA is structured to require the disclosure of all impacts for each alternative and the Plan, to foster informed decision making and to disclose the inherent trade-offs between different types and magnitudes of impacts associated with different alternatives.

Please refer to Section 3.13, Noise, for discussion of potential noise impacts associated with the Plan as well as Section 3.3, Air Quality, for a discussion of potential air quality impacts associated with the Plan. Although the land use pattern is generally known, site specific impacts cannot be reliably identified, nor is it appropriate for a program level document to do so. The PEIR generally identifies the types of impacts that could occur over the lifetime of the Plan and conservatively identifies such impacts as being significant and unavoidable.

First of all, the reasonably foreseeable demolition and displacement of existing uses in or near transit stations and corridors were examined at the regional level for the SCAG region as a whole (see, for example, qualitative discussion of construction air quality impacts, Section 3.3, Air Quality [page 3.3-54]).

Second, with respect to the purported increase in “supercommuters,” this assertion is speculative. See **Response ORG 4-7**.

Third, with respect to the assertion that there will remain no practical, fixed route public transit options to serve the distantly-residing construction workers and other middle-class households, this again is speculative. Connect SoCal includes \$66.8 billion dollars in transit, and \$136 billion is dedicated to system maintenance. In addition to funding specifically for transit, Connect SoCal includes a comprehensive set of policies, strategies, and multi-modal services and infrastructure investments to

⁴⁴ Adams, Tom (California League of Conservation Voters), and Amanda Eaken and Anne Nothoff (Natural Resources Defense Council). 2010. Tackling California’s Global Warming Challenge: A Guide to SB 375, by Tom Adams (California League of Conservation Voters), p. 24. Available at: <https://www.nrdc.org/sites/default/files/sb375.pdf>

support all modes of travel and promote a reduction in single-occupancy vehicle (SOV) travel to help the region meet its mobility and sustainability goals. Connect SoCal prioritizes growth near high quality transit, to maximize the effectiveness of the region’s existing and planned transit system. The commenter also cites a report from UCLA.⁴⁵ The report in fact states that density makes transit service *more* effective by putting large numbers of trip origins and destinations close to transit. Additionally, UCLA states that the evidence regarding neighborhood change and transit use is “far from conclusive” and “warrants substantial further research.” SCAG is currently working with UCLA to further study the effects of neighborhood change on transit use.

Finally, commenter asserts that the PEIR fails to analyze impacts related to out-migration caused by the draft Connect SoCal’s foreseeable worsening of the housing supply and affordability crises. SCAG disagrees with the commenters premise that the construction of infill housing would necessarily result in higher housing prices overall. While many factors contribute to the high cost of housing in California, housing prices can reasonably be anticipated to be reduced overall through the consistent addition of housing stock and increases in supply, consistent with standard economic theories. As such, these assertions are speculative. For additional information regarding affordable housing, please refer to the Sustainable Communities Strategy Technical Report of the Final Connect SoCal Plan.

In sum, it would be speculative for the PEIR to identify the potential localized impacts referenced by Commenter that could occur as a result of the Plan as there are countless factors that would affect such impacts. For example, factors such as speed of housing development, timing for transportation projects, changes in technology (i.e., micro transit, etc.) as well as external factors such as market conditions and even legislation being considered at the state level are uncertain. As such, the specific potential impacts raised by commenter are not “reasonably foreseeable.” It is not the role of the PEIR to speculate as to which of these factors might interact with any other of these factors, but rather to evaluate the broad programmatic impacts that are reasonably foreseeable. See **Master Response No. 2: Program EIR vs. Project EIR**.

Response ORG 13-15

The comment relates to mitigation measures. The PEIR includes mitigation measures for SCAG and for project sponsors. Refer to **Master Response No. 5: Approach to Mitigation Measures** and the Executive Summary which lists all proposed mitigation measures. The commenter suggests measures such as reducing housing costs through accelerated and by-right approvals. While SCAG does not have land use authority to create by-right approvals, SCAG does offer CEQA streamlining opportunities through this

⁴⁵ UCLA, “Falling Transit Ridership: California and Southern California,” available at: <https://www.its.ucla.edu/2018/01/31/new-report-its-scholars-on-the-cause-of-californias-fallingtransit-ridership/>

PEIR (see Chapter 1.0 Introduction) which can create accelerated approvals. Further, Section 3.14 includes a number of measures (SMM POP-1 through SMM POP-4) aimed at reducing the cost of housing through technical assistance.

Response ORG 13-16

The comment asserts that the PEIR does not analyze the foreseeable failure of VMT reduction policies and suggests SCAG should look at other methods of GHG reduction beyond VMT. The commenter provides no substantial evidence to support the claim that VMT strategies (identified and supported by the State of California and numerous other organizations as an appropriate GHG reduction strategy) will fail. The PEIR focuses on GHG reductions from the transportation network because SCAG is a Metropolitan Planning Organization (MPO) responsible for regional transportation planning. SCAG does not have purview over land use, ships, trains or stationary sources, as such contemplating VMT reduction measures for areas other than transportation would be far outside SCAG's mandate. Further, CARB has set GHG reduction targets for SCAG (and other MPOs) to reduce transportation related GHG emissions. VMT is the primary tool SCAG uses to reduce GHG emissions as VMT and GHGs are closely tied and VMT is related to transportation.

Response ORG 13-17

The comment relates to the Regional Housing Needs Assessment. Refer to **Master Response 7: Regional Housing Needs Assessment**. SCAG disagrees that the existing need is in fact cumulative to the Plan.

Response ORG 13-18

The comment suggests that the draft PEIR should be revised to include an alternative consistent with the issues raised in the letter.

Chapter 4.0 Alternatives includes the rationale for the selection of alternatives (page 4.0-1 and 4.0-2). As discussed, the range of alternatives required in an EIR is governed by a "rule of reason." Therefore, the EIR must evaluate only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the proposed project. An EIR does not need to consider an alternative whose effects cannot be reasonably ascertained and whose implementation is remote and speculative. SCAG selected a total of three alternatives to the project that would be feasible and would obtain the project objectives. These alternatives consisted of a number of variables related to land use and transportation including compact or infill development, amount of development in HQTAs, location and intensity of transit service, and level of investment in TDM. Generally, the alternatives represent a progression of land use and transportation investments, such that the Existing-Plans Alternative includes the most dispersed land use and fewest transportation investments and Intensified Land Use Alternative represents the most compact land use pattern but maintains the same transportation investments as the Plan. Consideration of alternatives requires careful

examination of the multiple facets of each alternative. For example, while urban development may preserve farmland or other natural resources, it could place a burden on urban parks, schools, police and fire services, and aging infrastructure. There is no evidence presented by the commenter that suggests the impacts of the suggested “ameliorative” housing alternative would be any different than those presented in Chapter 4.0. Therefore, there is no need to evaluate such an alternative.

Response ORG 13-19

The comment is a summary of issues raised in the letter. Please refer to **Responses ORG 13-13 through 18** above. SCAG disagrees that the PEIR is deficient and requires recirculation.

Response ORG 13-20 and 13-21

The comment presents opinions and summary comments. Please refer to **Responses ORG 13-13 through 18** above.

Response ORG 15-1

The comment relates to wildlife corridors. The PEIR found that the Plan would interfere substantially with the movement of native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites and would result in a significant and unavoidable impact (Impact BIO-4). Numerous project level mitigation measures were identified for migratory species. These measures included consulting with “wildlife corridor authorities”; counties, cities, and other local organizations; USFS, CDFW, and USFWS and other agencies for projects that could impact wildlife corridors or migration for project planning. The Plan included project specific mitigation measures to: design proposed projects to minimize impacts to wildlife movement and habitat connectivity and preserve existing and functional wildlife corridors; conduct site-specific analyses of opportunities to preserve or improve habitat linkages with areas on- and off-site; analyze habitat linkages/wildlife movement corridors on a broad scale to avoid critical narrow choke points that could reduce function of recognized movement corridor; require review of construction drawings and habitat connectivity mapping by a qualified biologist to determine the risk of habitat fragmentation; pursue mitigation banking to preserve habitat linkages and corridors; design projects to promote wildlife corridor redundancy by including multiple connections between habitat patches; evaluate the potential for installation of overpasses, underpasses, and culverts to create wildlife crossings in cases where a roadway or other transportation project may interrupt the flow of species through their habitat; to provide wildlife crossings in accordance with proven standards; and, where avoidance is not feasible, to design sufficient conservation measures through coordination with local agencies and the regulatory agencies (i.e., USFWS or CDFW) and in accordance with the respective counties and cities general plans to establish plans to mitigate for the loss of fish and wildlife movement corridors and/or wildlife nursery sites. Please refer to **Response ORG 8-6**.

For responses related to the Connect SoCal Plan, please refer to *Submission ID 0001361* of the Final Connect SoCal Plan.

Response IND 5-5

With respect to the transportation projects in the Plan, these projects are to be implemented by Caltrans, county transportation commissions, local transit agencies, and local governments (i.e., cities and counties), and *not* implemented by SCAG. Additionally, because the focus of the environmental analysis in the PEIR is on a regional scale, site-specific analysis of the projects contained in the Connect SoCal Project List are not individually analyzed (see **Master Response No. 2: Program EIR vs Project EIR**). Congestion is considered in Section 3.17, Transportation, and noise is considered in Section 3.12, Noise.

Att.: Ping Chang, Manager

Re: Connect SoCal NOA of DEIR

Dear Mr.Chang:

Thank you for contacting the Tribal Elders' Council for the Santa Ynez Band of Chumash Indians in regards to the above mentioned project.

At this time, the Elders Council requests no further consultation on this project; however, if supplementary literature reveals additional information, or if the scope of the work changes, we kindly ask to be notified.

Thank you for remembering that at one time our ancestors walked this sacred land.

Sincerely Yours,

The Tribal Elders' Council Governing Board

From: Jessica Mauck
To: ["chang@scag.ca.gov"](mailto:chang@scag.ca.gov)
Subject: 2020 draft Connect SoCal PEIR
Date: Monday, January 6, 2020 9:34:00 AM

Hi Ping,

Thank you for contacting the San Manuel Band of Mission Indians (SMBMI) regarding the above referenced project. SMBMI appreciates the opportunity to review the project documentation, which was received by our Cultural Resources Management Department on 13 December 2019. SMBMI has no concerns or comments for your agency in regard to this project, except to note that the San Manuel Reservation is actually 1123.68 acres (as written in a letter supplied to the Tribe by the BIA in 2019). The 673 acres noted within the PEIR is a very old number – unfortunately, the BIA has not been able to retain regularly updated lists of reservation land for public use. While this is not necessarily a massive alteration for your document, I wanted to point out the correct number, just in case you felt it needed to be updated for the purpose of your study.

Thank you,

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

January 23, 2020

Southern California Association of Governments
Attn: Roland Ok, Senior Regional Planner
900 Wilshire Boulevard, Suite 1700
Los Angeles, CA 90017

Subject: EPA Comments on the Connect SoCal 2020-2045 Regional Transportation
Plan/Sustainable Communities Strategy and Programmatic Environmental Impact Report

Dear Mr. Ok:

The U.S. Environmental Protection Agency has reviewed the Southern California Association of Governments Connect SoCal 2020-2045 Draft Regional Transportation Plan/Sustainable Communities Strategy and Draft Programmatic Environmental Impact Report. The EPA supports SCAG's goals of incorporating environmental and community considerations in the regional transportation planning process. Early integration of comments from regulatory and resource agencies can result in greater opportunities to reduce environmental and public health impacts associated with future transportation projects. The EPA provides the below feedback following our limited review of plan elements related to goods movement, environmental justice, and air quality.

1

Comments on the RTP/SCS

Goods Movement

Consistent with previous SCAG RTPs, Connect SoCal emphasizes the need to deploy zero and near-zero emission technologies, with the ultimate goal of transitioning to ZE technologies, in order to reduce air quality impacts from the region's freight system. It also highlights the importance of providing necessary supportive infrastructure and considering lifecycle impacts associated with these technologies. Pages 60-67 of the Goods Movement Technical Report describe numerous local, state, and federal initiatives to advance clean freight technologies, such as the California Sustainable Freight Action Plan, the South Coast Air Quality Management District's proposed Facility-Based Mobile Source Measures, and the San Pedro Bay Ports' 2017 Clean Air Action Plan Update. Specific roles identified for SCAG and partner entities, described on pages 68-69, include convening stakeholders to discuss battery manufacturing and disposal, coordinating with partners to include charging and fueling infrastructure in regional projects, and securing funding for technology evaluation and demonstration. The EPA strongly supports the efforts to transition to a ZE/NZE goods movement network described in the RTP. Such efforts will be critical to reducing public health impacts associated with ambient air pollution and assisting the South Coast Air Basin in attaining National Ambient Air Quality Standards.

2

Recommendation: Consider incorporating robust ZE/NZE deployment strategies in any planned freight-related capacity-enhancing projects, particularly those that would be located near

sensitive receptors and/or in heavily burdened communities.

2

Environmental Justice

EJ Toolbox

The Environmental Justice Technical Report examines 18 performance indicators within four geographic scopes to thoroughly evaluate the RTP's impact on EJ populations. The performance indicators are conveyed through four broader groups: impacts to quality of life, health and safety, commute, and transportation costs. Geographic scopes include the SCAG region, EJ Areas, Senate Bill 535 Disadvantaged Communities, and Communities of Concern. The report utilizes an array of data visualization methods, including maps that identify areas that have undergone significant changes over the years in relation to EJ communities and tables that convey how wildfire and flood risk vary by race and economic status. The findings of the report indicate that, for many performance indicators, the RTP would improve conditions for low-income and/or minority populations; however, it would also result in some disproportionate impacts to EJ communities, such as increases in emissions, noise, and rail impacts in certain areas. The EJ Toolbox included on pages 167-177 offers potential measures to address impacts to low-income and/or minority communities for various impact areas, including air quality, climate vulnerability, and noise.

3

Recommendation: Consider including the SCAG EJ Toolbox as a suggested resource in relevant project-level mitigation measures in the Final PEIR.

Congestion Pricing

The RTP incorporates three congestion pricing strategies, including the development and expansion of express lane networks, a proposal to establish a mileage-based user fee, and the use of Cordon/Area Pricing. As explained in the Environmental Justice Technical Report, the introduction of a mileage-based user fee could alleviate some disproportionate burden on low-income drivers because "it allows lower income households to pay the same price per mile as other groups, whereas the gasoline tax does not"; however, the report also acknowledges that a user-based fee would nonetheless be regressive in nature, as such fees would comprise a larger percentage of lower-income drivers' incomes than for drivers of higher income groups (p. 165).

Recommendations:

- Consider including a discussion of potential methods to address any disproportionate impacts to low income drivers that could result from the proposed congestion pricing programs (e.g., subsidizing the purchase of required transponders, waiving monthly maintenance fees, allowing the use of cash to open and replenish toll accounts, etc).
- Include a detailed description of any equity assessments that have been completed for existing congestion pricing programs in the region. Describe the key findings of each study and any approaches taken to reduce disproportionate impacts to low-income motorists.
- Encourage partner agencies to conduct equity assessments for planned congestion pricing programs.

4

Comments on the PEIR

Air Quality Mitigation Measures

The mitigation measures included in the Connect SoCal PEIR are classified into two types: those that SCAG would commit to implement, and those that would be considered by implementing agencies during project-level planning. The EPA supports SCAG Mitigation Measures Air Quality-2 and AQ-3, which confirm SCAG's continued commitment to evaluate public health outcomes through the transportation planning process, specifically through the Public Health Working Group, and to analyze air quality impacts, particularly in vulnerable communities, such as near-roadway communities. The EPA also supports SCAG's interest in improving active transportation in disadvantaged communities as indicated in SMM-AQ-1. We suggest elaborating on this program in the Final PEIR.

Recommendation: Provide additional details about the proposed Southern California Disadvantaged Communities Planning Initiative described in SMM AQ-1, including the entities that would participate in the initiative, potential eligibility criteria for applicants, and the community engagement strategy that would be employed.

Project MM-AQ-1 describes an array of emissions controls that lead agencies would consider in order to reduce construction-related emissions, including fugitive dust controls, idling restrictions, and the use of Tier 4 equipment in projects within 500 feet of certain sensitive land uses.

Recommendations:

- Consider incorporating a goal to minimize community impacts in PMM-AQ-1(o).
- Consider encouraging the use of ZE/NZE technologies, where feasible and appropriate, in PMM-AQ-1(q).

Greenhouse Gas Mitigation Measures

We support the robust set of mitigation measures to address greenhouse gas emissions listed on pages 3.8-68 - 3.8-72, many of which would yield the co-benefit of reducing criteria pollutant emissions. Project-level measures for consideration include the incorporation of green building features (e.g., energy-efficient construction materials, installation of energy-efficient lighting systems, use of highly-reflectivity building materials), the use of Best Available Control Technologies during construction (e.g., lighter-colored pavement, planting of shade trees, deployment of ZE/NZE technologies), and measures to encourage bicycle and public transit use.

Recommendation: Encourage the consideration of measures included in PMM-GHG-1 in environmental justice communities.

The EPA appreciates the opportunity to provide feedback for consideration during the regional transportation planning process. We hope this feedback will lead to improved environmental and public

*Making Conservation
a California Way of Life.*

January 23, 2020

Mr. Kome Ajise
Executive Director
Southern California Association of Governments
900 Wilshire Blvd., Ste. 1700
Los Angeles, CA 90017

Dear Mr. Ajise:

The California Department of Transportation (Caltrans) wishes to thank the Southern California Association of Governments (SCAG) for the opportunity to review and comment on the Draft Connect SoCal, 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Draft Program Environmental Impact Report (PEIR).

1

Caltrans applauds SCAG's use of innovative techniques and methodologies in engaging constituents within its six-county jurisdiction through its "Bottom-Up Local Input and Envisioning Process". Building upon the previous 2016 RTP/SCS, the Draft Connect SoCal plan boldly implements sustainable planning strategies aimed to increase active transportation plans and products, increase ridership and use of various forms of transit, improve the infrastructure of goods movement, reduce congestion and Vehicle Miles Traveled (VMT), and create more diverse and affordable housing; while reducing greenhouse gases and advancing healthy communities amongst other transformative efforts.

The Draft Connect SoCal plan was distributed to Caltrans' Headquarters and Districts 7 (Los Angeles and Ventura Counties), 8 (San Bernardino and Riverside Counties), 11 (Imperial County), and 12 (Orange County). The offices within each District and Division were given the opportunity to review and comment on the Draft RTP/SCS and Draft PEIR documents according to the California Regional Transportation Plan Guidelines.

2

Connect SoCal's core vision coupled with its goals and guiding principles helps to further an interconnect region. Moreover, SCAG's commitment to strengthen previous investments in our multi-modal transportation system and with focused direction for future plan investments results in increasing the region's overall resiliency, prosperity and competitiveness.

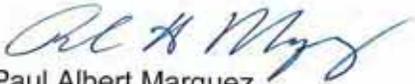

Specific comments on the Draft RTP/SCS chapters and appendices are included in Attachment A and specific comments on the PEIR are included in Attachment B.

Mr. Kome Ajise
January 23, 2020

January 23, 2020
Page 3

Attachment A

Caltrans Headquarters – Office of State Planning

- The introduction is clear and informative on the regulations that guide the RTP development process however, RTP's are also influenced by the policies leveraged by the State. Suggest including additional language on SB 391 (2009) which also requires the California Department of Transportation to prepare the California Transportation Plan (CTP), California's long-range transportation plan. Reference to the CTP would illustrate the interrelationship between regional and statewide transportation objectives – highlighting how major metropolitan areas, rural areas, and state agencies can coordinate planning efforts to achieve critical statewide goals. Consider the following:

“To better coordinate with the State, Connect SoCal was developed to align with The California Transportation Plan (CTP). The CTP is a long-range statewide level transportation plan that combines regional transportation and land-use plans to produce a unified multimodal strategy to achieve our collective vision of a lasting and well-integrated transportation system that benefits both people and goods over the next 25 years.”

- While the plan is visually appealing and easy to read, consider including discussion on other Caltrans modal plans where necessary. With regards to the transportation complexities that exist throughout the State, differentiating the statewide goals from local/regional needs helps emphasize the challenges associated with transportation targets set forth by the State. Doing so also highlights the strategies proposed within the Connect SoCal to address transportation shortfalls within the SCAG region.

3

Caltrans Headquarters – Aviation & Aeronautics

- Land use and zoning around airports is an important element to consider and guidance can be found in the California Airport Land Use Planning Handbook (Handbook). Land use compatibility with an adopted general plan is the responsibility of each Airport Land Use Commission (ALUC). Airport Land Use Compatibility Plans should be regularly updated and reference current general plans to prevent incompatible land uses that encroach upon or threaten airport operations. Airports enable the movement of people and goods. They allow a community access to the nation's air transportation system. Airports are a valuable community resource enabling public services, such as medical transport and law enforcement. Future uses may include freight and package delivery as the use of Unmanned Aerial Systems (UAS) develops.
- Traffic congestion is one of the leading issues in transportation planning. The emerging concept urban air mobility (UAM) is expected to provide a new solution by making use of the three-dimensional airspace to transport passengers and goods in urban areas. Airport Shuttle and Air Taxi markets are viable markets. We are aware of Uber announcing Los

Mr. Kome Ajise
 January 23, 2020
 Page 4

Angeles as one of the first cities to offer Uber Air flights, with the goal of beginning demonstrator flights in 2020 and commercial operations in 2023. The City of Los Angeles is creating an aerial mobility network integrated with its other transportation systems and investments.

- UAM largely is dependent on vertical takeoff and landing (VTOL) operations in urban areas. UAM application is to build well-distributed infrastructures to support VTOL aircraft operations. Those infrastructures are heliports and vertiports (or sky ports), where VTOL aircrafts take off and land, onboard or disembark passengers, and get charged. The Federal Aviation Administration has Advisory Circular 150/5390-2C to provide guidance on permitting and siting heliports.
- Significant legal/regulatory, certification, permitting/licensing, infrastructure, and weather constraints exist for currently operating aircraft. Vertiport or heliport locations should be carefully reviewed with consideration of its impact on potential UAM demand, safety, environmental impacts, land uses, energy distribution and demand, and transportation system performance.
- Can SCAG's RTP/SCS draw from Air Cargo projections and congestion/demand management strategies to formulate planning for logistics impacts from the growing consumer demand for home deliveries?

Please note below the following Codes for implementation in the Aviation input into the SCAG Draft RTP and its Aviation Technical Appendix:

- PUBLIC UTILITIES CODE – PUC- - -
- DIVISION 9. AVIATION [21001 - 24451]
- (Division 9 added by Stats. 1953, Ch. 151)
- ARTICLE 3.5. Airport Land Use Commission [21670 - 21679.5]
- (Article 3.5 added by Stats. 1967, Ch. 852)
- SCAG also note: 21670.2.
- Sections 21670 and 21670.1 *[These are the sections that require ALUCs in any county with public-use airports—DOC]* do not apply to the County of Los Angeles. In that county, the county regional planning commission has the responsibility for coordinating the airport planning of public agencies within the county. In instances where impasses result relative to this planning, an appeal may be made to the county regional planning commission by any public agency involved. The action taken by the county regional planning commission on an appeal may be overruled by a four-fifths vote of the governing body of a public agency whose planning led to the appeal. <http://planning.lacounty.gov/aluc>
- And, to clarify, our Cal. Aviation System Plan (CASP) update is not for the 2016 Policy Element directly. We're following a required 5-year update cycle, but the Plan will embark on a new course without "elements;" instead aligning with CTP 2050 to assist inter-modal goals.

3

Mr. Kome Ajise
January 23, 2020
Page 5

Caltrans Headquarters – Office of Regional Planning

The Office of Regional Planning (ORP) would like to commend SCAG for their vivid and creative approach to demonstrating SCAG's 20-year vision for the future.

Overall, the page references on the RTP Checklist included whole chapters and entire technical reports. We recommend that SCAG reference specific page numbers for each question on the RTP Checklist with their Final RTP submission.

Below are the following comments in reference to the RTP Checklist Contents:

General

- #2. The document identifies several strategies but does not delineate whether they are short-range and long-range strategies/actions (23 CFR 450.324(b)).
- #3. There is mention of the elements required throughout the report, but as a public document this checklist should reference more specific pages instead of whole chapters and technical reports. Also, the report doesn't have specific sections dedicated to each element i.e. policy, action, and financial (California Government Code Section 65080). These elements should be clearly defined and easily accessible by specific page numbers.
- #4(a). The referenced pages are missing the general location of uses and building intensities. (HQ referring to the page numbers that SCAG identified on the RTP Checklist. SCAG should ensure 4(a) of the RTP Checklist is fully addressed, specifically, the general location of uses and building intensities within the region).
- #4(b). There is a lot of information to decipher and it is not clear that SCAG identified areas within the region sufficient to house all the population of the region, including all economic segments of the population over the course of the planning period of the regional transportation plan taking into account net migration into the region, population growth, household formation and employment growth.
- #4(h). SCAG identified one map on page 23 of their SCS Technical Report (HQ is referring only to the SCS. It seems that SCAG labeled all of their appendices with "Technical Report," but the specific requirement in RTP Checklist 4(h) refers to the SCS requirement). This does not set forth a forecasted development pattern for the region, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the ARB.
- #7. The outdated RTP Checklist that SCAG provided did not include question 7. Please provide the appropriate page references with an updated checklist.

Mr. Kome Ajise
 January 23, 2020
 Page 6

Consultation/Cooperation

- #3. It is difficult to clearly determine that SCAG consulted with the appropriate State and local representatives including representatives from environmental and economic communities; airport; transit; freight during the preparation of the RTP (23 CFR 450.316(b)). Please identify the specific pages for reference.
- #4. Please ensure that the final plan includes reference that federal lands within its jurisdictional boundary involve the federal land management agencies during the preparation of the RTP (23 CFR 450.316(d)).
- #5. It is difficult to determine where the RTP specifies that the appropriate State and local agencies responsible for land use, natural resources, environmental protection, conservation and historic preservation were consulted (23 CFR 450.324(g)).
- #6. Please include specific page reference that the RTP includes a comparison with the California State Wildlife Action Plan and (if available) inventories of natural and historic resources (23 CFR 450.324(g)(1&2)).
- #15. It is not clear that the RTP will be adopted on the estimated date provided in writing to State Department of Housing and Community Development to determine the Regional Housing Need Allocation and planning period (start and end date) and align the local government housing element planning period (start and end date) and housing element adoption due date 18 months from RTP adoption date (Government Code 65588(e)(5)).

Programming/Operations

- The outdated RTP Checklist that SCAG provided did not include a *Programming/Operations Section*. Please provide the appropriate page references for each question on the updated checklist.

Financial

- #4. It is difficult to determine which projects are regionally significant. Please ensure that all regionally significant projects are identified (Government Code 65080(4)(A)).
- #9. In the Transportation Finance Technical Report neither TCMs or SIP is mentioned. Please ensure that the final RTP address the specific financial strategies required to ensure the identified TCMs from the SIP can be implemented (23 CFR part 450.324(f)(11)(vi)).

Caltrans Headquarters – Office of Freight Planning

Overall, much of the Plan, specifically the Goods Movement Technical Report, includes vague and broad statements that are either not supported directly by data, analysis, or supporting evidence, or are supported with indirect and loosely (at best) related data and analysis. When data is sourced, it is cited in a way that makes it impossible to fact-check it or replicate the analyses. The language is so broad and vague that the plan does not leave the reader with a

Mr. Kome Ajise
 January 23, 2020
 Page 7

clear understanding of how the system works. For example, each goods movement mode is independently discussed within its section, and the plan is missing a section (discussion) that ties together and analyzes all the freight modes for a true multimodal freight system. The Plan's structure, styles, multicolor headings are confusing to read and difficult to identify the section relationships (e.g., main and subsections). We have listed main comments below.

Draft Connect SoCal

- Broad and a Vague Content with Limited Supporting Data and Analysis
- Page 74 through 82, A significant portion of the main body includes broad and sweeping claims with limited, if any supporting data and analysis.
- Page 81, Table 3.3, SCAG Region Airport Passenger Forecast for 2020–2045 (no citation)
- Significant portions of supporting data are either not cited or not properly cited. As a result, this data cannot be checked for accuracy, and the analysis cannot be replicated. For charts with multiple data sources, one cannot determine what source is attached to the data.
- Provide professional citations. For example, see page 78, Truck Bottleneck Relief Strategy and Industrial Warehouse & Distribution Centers
- Missing Significant Freight Information
- Chapter 4 is missing a discussion of National Highway Freight Program funding and the Trade Corridor Enhancement Program.

Goods Movement Technical Report (GDPR)

The Goods Movement Technical Report contained very little technical information. We expected to find supporting data, analysis, and methodologies for planning the regional freight system. Instead, the information was only slightly more detailed than what we found within the main document. In fact, the GMTR included very little supporting evidence, and sources are not cited in a way that allowed the reader to fact-check or replicate the analysis.

- A section for Pipelines, a key and critical freight mode recognized by the U.S. Department of Transportation as well as the California Department of Transportation, is not included within this report. Include a Pipeline section with the other freight modal sections (e.g., Rail, Seaports, Airports, Highways)
- Significant portions of the main body and the GMTR include broad and sweeping claims with limited, if any supporting data and analysis. For example, there is no direct supporting data and evidence included in the e-commerce section. We see broad statements such as e-commerce has greatly increased, and that e-commerce has negatively impacted

Mr. Kome Ajise
 January 23, 2020
 Page 8

neighborhoods. However, we did not see any direct supporting evidence. We expected to see the number of increased trips related to e-commerce, but instead, we saw an increase in the dollars spent. This data does not support that there are more trips, as customers may be buying more expensive items or more items that are delivered on the same trip. Also, all forms of e-commerce a lump together. For example, Amazon purchases that are ordered online and delivered directly to the customer are combined with purchases that are ordered online at places like Target, Walmart, and Best Buy, where the customer can choose to pick up their purchase at the store. The store pick-up purchases are similar to the Sears Catalog (started in 1893) when customers ordered out of a catalog via the mail and picked up their purchases at Sears. We recommend separating the different types of "e-commerce" and addressing them individually.

- Page 5, First Paragraph: Define goods movement dependent jobs and provide examples for the industries
- Page 5, First Paragraph, "Jobs in goods movement dependent industries are generally well-paying, with annual average compensation in the construction, manufacturing, and wholesale trade sectors outpacing the average annual compensation for all regional industry sectors.": Support with specific data (not just averages) so that we can see the range in pay to the job. Using averages can greatly skew the results (e.g., low wage jobs offset by CEO salaries). Also, support with more data, including data sources (including reports, data tables) so that the analysis can be replicated.
- Page 6, Maintaining the Long-term Economic Completeness of the Region: Either provide useful information, data, and analysis or delete this section.
- Page 6, Promoting Local and Regional Job Creation and Retention: Provide supporting evidence and data. Provide the specific number of jobs that are created by the ports as well as the number of regional jobs created by "international trade activities." Define International trade activities. Also, link the infrastructure to the economy.
- Page 17, Distribution Centers, Warehousing and Transloading Facilities: This section includes unsupported statements and claims. Include supporting evidence and data, and professionally source and cite the data.
- Page 17, Consumer Base, "This growth in residents and income is expected to drive consumer spending and demand for goods, increasing pressure on the regional transportation network.": Support with evidence and data, and professionally cite the data source(s).
- Page 26, Highlight Area, Trade in the SCAG Region, First Paragraph: Define "current Administration" by giving its name. Also, is it regional, state, or federal?
- Most of the supporting data is either not cited or not properly cited. As a result, this data cannot be checked for accuracy, and the analysis cannot be replicated. For charts with

Mr. Kome Ajise
 January 23, 2020
 Page 9

multiple data sources, there is no way to determine what source is attached to the data. Provide professional citations. For example, when using the US Census data, include the Program (American Factfinder), the table (e.g., DP05), and the date(s) or when using the US DOT data, include the Program (FHWA), the report, table, website, and the date(s). This is important so that a reader can fact-check the data and replicate the analysis. Without this critical information, the reader must question the validity of the data and analysis. Examples include but are not limited to:

- Page 4, Table 1
- Page 7, Improving the Safety of Goods Movement Activities and Highlight Area: regional Goods Movement Workforce Development
- Page 14 Exhibit 3
- Page 15, Table 2, footnote 6, 7, and 8
- Page 16, Figure 1, Airports, International Land Ports-of Entrée
- Page 17 Distribution Centers, Warehousing and Transloading Facilities, and footnotes 10 and 11
- Pages 18 and 19, Highlight Area, Seaports and Regional Trade Flows, Figure 2, and footnote 13
- Pages 20 to 34, Figure 3 to Figure 19, Footnotes 14, 17,18, 19, 20, 21, 22,23, 25,26, 30 (FAF Version?), 31,32,33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47,48

Miscellaneous Comments

- Page 3, What is Goods Movement? A pipeline, a key freight mode is missing from this section.
- Page 3, Broad Economic Benefits: As currently written, this section is not understandable. Consider rewriting this section to include a clear introduction, thesis statement, body paragraphs, a restatement of the thesis, and a conclusion.
- Page 3, Broad Economic Benefits - First Paragraph: Who uses "performance" as a proxy: Without a subject, the relevance of this statement is unclear. What is the difference between the performance of the logistics industry and the contributions of the five major industries? Why does SCAG consider contributions of the "five major industry sectors..." more closely associated? Why were the agriculture and service industries (e.g., repairpersons) not included?
- Page 3, Broad Economic Benefits, Second Paragraph: Clearly link this discussion within this paragraph to the introduction above. As it is currently written, it is unclear how the GRP/GDP are connected (or not) with the five major industrial sectors. Also, what is "this economic impact"? Define "this economic impact."
- Page 3, Broad Economic Benefits, Third Paragraph: Clearly link this discussion within this paragraph to the first, introduction paragraph. Are the "good movement dependent

Mr. Kome Ajise
 January 23, 2020
 Page 10

industries" the same as the "five major industry sectors"? If not, how are they different. What is the difference between a sector and an industry? A layperson and technical expert should be able to read this and understand. As this is currently written, neither can.

- Page 4, Table 1- Change in Average Annual Pay for Goods Movement Dependent Industries in the SCAG Region 2012-2016: The introduction sectors reference five sectors; this table includes seven sectors. Why?
- Page 5, First Paragraph: Define freight dependent jobs.
- Page 5, Regional Global Profile: Consider renaming this section the United States Global Profile as the narrative references the U.S. and not the SCAG region. Also, absent from this section is a discussion regarding the impacts of California's climate policies on So Ca Port's competitiveness with other U.S. and international ports.
- Page 5, Regional Global Profile - Second Paragraph: Consider rewriting this paragraph because it is confusing.
- Page 6, First Paragraph: Identify who expects them to grow and by how much? Support this statement with evidence.
- Page 6, Second Paragraph: Replace "recent" with a specific date and identify the specific shift(s) (e.g., percentages) and policies as well as the specific impacts of those shifts. It is not unusual for the federal reserve to adjust, so it is important that this statement is supported with evidence and a citation.
- Page 6, Goods Movement Vision: This vision is focused on freight movement; however, it should also focus on servicing the people (e.g., brings food and clothing to the people in the region). By focusing on throughput and other technical details, the basic needs that freight movement provides for are overlooked. It is helpful to plan for freight movement using a lens of what the region would look like without freight accessibility.
- Page 7, Increasing Freight and Passenger Mobility: Populate this section with useful information like specific strategies for improving goods movement and how the region is going to double rail volumes. Also, include the current freight performance by mode (or reference to a different section that contains that information) and what needs to be done to maintain that performance into the future.
- Page 7, Improving the Safety of Goods Movement Activities: Are there currently issues, if so, what are they?
- Page 7, Mitigating Environmental Impacts of Goods Movement Operations: Explain why and provide cited data, analysis, and evidence supporting this claim.

Mr. Kome Ajise
January 23, 2020
Page 11

- Page 7, Highlight Area: Regional Goods Movement Workforce Development, Second Paragraph, First Sentence: "Currently, the U.S. is nearing, or at, full employment": Provide properly cited data supporting this claim. Also, link this to the SCAG region.
- Page 9, First Paragraph: Define "dead-end-jobs."
- Page 9, Seaports First Paragraph: Footnote 2: The WSC is a group. Please include a specific source (interview, report) that is properly cited so that readers can find the documentation of this statement.
- Page 9, Seaports, "percent of all containers in the U.S. moving through the San Pedro Bay Ports.³ Despite some recent modest shifts in container volumes to other U.S., Canadian and Mexican ports, the total container volume for the San Pedro Bay Ports is still expected to grow to over 34 million by 2045, a 120 percent ...": How was this analysis performed. What is the data source (including citation)? Model type, name, version?
- Page 9, Seaports, "35 percent of the San Pedro Bay Ports' total import-related traffic. The other 65 percent is assumed...": Did this data also come from footnote 3? If not, source the data, and provide a professional citation.
- Page 9, Seaports, Third Paragraph – "deconsolidation of the contents": Define for laypersons.
- Page 9, Seaports, Third Paragraph – "Transloading allows for the movement of increased amounts of goods while...": This statement may or may not be correct. For example, it may be that the region has gotten to the point that the transportation system is so congested that there is no capacity to support any more trips (freight or other) regardless of container. So, provide data, analysis, and supporting evidence for this claim as it relates to the current and future SCAG freight system.
- Page 10, Railroads, First Paragraph, First Sentence, "Critical to the growth": Demonstrate how BNSF and UP are critical to SCAG's growth. For example, what functions do they play in SCAG's economy? Support with professionally cited data and evidence.
- Page 12, Second Paragraph: Who reduced the number of times freight itself (?) was handled, how was the freight handled, and what is the base year for the speed, efficiency, damage, and security. What year was the performance assessment developed that measured these items and identified that the efficiency and speed increased, the damage was reduced, and security became greater? Was the same base year and performance year used for all six intermodal terminals? Did all terminals follow the same methodology and use the same data? Support with professionally cited data and analysis.
- Page 12, "In addition to these intermodal terminals, there are railyards that serve carload traffic of various types. UP has a large carload freight classification yard at West Colton (at

Mr. Kome Ajise
 January 23, 2020
 Page 12

the east end.”: Does this section capture all the rail yards that serve carload traffic of various types?

- Page 15, Airports, First Paragraph: It appears that multiple data sources and perhaps years were used to produce the number included in this section. With this said, there is a real concern that the analysis is comparing "apples with oranges" or that selective data was used.
- Page 16, Figure 1 Air Cargo Tonnage through SCAG Regional Airports 2000- 2018: It appears that this table was constructed based on a mix of data and analysis that is not consistent. I suspect that this is a comparison of apples and oranges. See my comments regarding the data sources.
- Page 17, Supply Chains and the SCAG Region: Consider rewriting this section so that a layperson can understand. For example, what are product demand forecasting and production planning?

Caltrans District 7 – Freight Planning

Goods Movement Technical Report

- Last mile Delivery—page 2. METRO sponsored a conference in this regard, and it was also a focus in conjunction with INUF Conference in 2019. A more extensive discussion was expected. Additionally, no discussion provided on “First mile.”
- Page 16 of 32—Exhibit 3:
 - The “SR-206” shield should be Interstate 215. (same comment on exhibit 6 on page 52 of 132)
 - The “SR-30” shield should be SR-210.
 - The “I-210” shield that is shown to the right of the juncture of SR-57 and 210 should be SR-210 (Interstate 210 becomes SR-210 at the junction with SR-57.
 - Recommend the “county lines” are shown in different color as they are very similar to the highways not identified as part of the “Primary Highway Freight System.”
 - What year is the USDOT source?
 - NOTE: To the extent above information occurs in other exhibits, this should be considered a global comment.
- East-West Corridor—page 51. There is no “project scope” information, and no reference to any project(s) in the list of projects.

Mr. Kome Ajise
 January 23, 2020
 Page 13

- Appendix 1 of 1—page 123. Although multiple footnotes are from 2019, the discussion provided does not seem to include the most current information related to POLA (and possibly POLB) in this regard.

Caltrans District 7 – System Planning

- Page 34 - Exhibit 2.5 – There are lots of gradients in the LA/OC region; suggest doing a zoom box to show the land use breakdown in better detail.
- Page 40 - Figure 2.5/2.6 (and other graphs throughout) - Color choices for poor and good are very similar, which makes it hard to read tables quickly.
- Page 59: *Core Vision – Paragraph 1*: Fix-It First is commonly associated with the SHOPP program; suggest mentioning it here.
- *Planning for 2045* – typos in Line 1
- Page 69 - Active Transportation - “Walking and bicycling are accessible forms of transportation for people of all ages, abilities and socioeconomic backgrounds.” This is not technically for certain abilities. Line could be read as exclusionary.
- Page 77 – Express Lanes Table Line 3 - Los Angeles – I-405 – Add I-105 Express Lane (Should be add I-405 Express Lane?)
- Page 163 – Measure R – Measure R has no sunset as of Measure M’s approval.

3

Caltrans District 7 – Forecasting and Modeling

Draft Connect SoCal

- The goal of maintaining and rehabilitating the existing system is a laudable goal. The goal, according to SB-1, is to have 98% of the state highway system in each county operating at *Good* or *Better* condition by 2045. Table 1 on page 9 gives 47.9% of the statewide interstate highway system operating at *Good* in 2017. The only data in the report on pavement condition suggests a 3.4% drop over 2017-2022. How does the region intend to achieve the statewide level of performance when the current trend is downward?

Transit Technical Report

- Over the past 30 years, the SCAG region has made an unprecedented investment in transit infrastructure. Between 2007 and 2017, however, transit ridership has gone down by 19%. The projected goal of 1.6 billion transit trips in 2045, reflecting a 245% increase in transit ridership since 2015, seems rosy.

Mr. Kome Ajise
January 23, 2020
Page 14

- A common perception that transit is for the underclass seems to be an element here, but it isn't addressed.
- Calling for diligence against encroaching gentrification and good intentions regarding economic and environmental equity do not seem to have been enough so far to establish housing opportunities for all income levels. Relying upon the market forces that generated the current inequities to somehow solve them seems unrealistic. Markets prefer building housing for the higher income.
- There is a claim that you will get there from here, but the battle to provide affordable housing in Southern California is being lost, as witnessed by the tented encampments throughout the region, as well as the collapse every 20 years or so of the housing markets in the Antelope Valley, Inland Empire and the Victor Valley during recessions.
- The details on the 2020 RTP/SCS Travel demand modeling efforts in this report are scant. On page 2 of the Transportation Modeling conformity appendix, reference to the model as an Activity Based Model, and mentions that it has met federal requirements, and has been through a peer review process, but there aren't other details to assess the modeling efforts.
- Express Lanes are an important component of SCAG's planning for the highway system. The 2016 RTP assumes very high participation of 3+ Person Carpools on the Express Lane System. Those values are not realistic and give inaccurate estimates of future express lane person throughput, revenues generated and so forth. What are the values being generated in the SCAG 2020 RTP/SCS assignment model?
- The configuration of the No Build Highway Network mostly includes projects that I expected to see. The major changes seem to lay in the land use/transportation system interface which is the appropriate, but don't appear substantive enough to generate the massive behavioral changes envisioned.
- The report notes only one very general impediment to telecommuting. Specifically, it notes that some jobs are simply not amenable to telecommuting. That is true enough, but it reflects almost no examination of any specific impediments to telecommuting, nor how to overcome them. Questions of exercising oversight, handling liability issues are not addressed let alone resolved. No reference to specific financial, legal or social impediments to expanded telecommuting is mentioned. Yet, SCAG expects 9.5% of Home-Work trips to be eliminated through telecommuting.

3

Caltrans District 7 – LD-IGR/ Mass Transit

- Add an Executive Summary (that's a few pages longer than the summary on page 5)

Mr. Kome Ajise
 January 23, 2020
 Page 15

- In light of SB 743, it seems the following percentages should be reversed:
- - 22.8% Decrease in time spent in traffic delay per capita
 - 4.2% Decrease in daily miles driven per capita

Caltrans District 7 – Regional Planning

Draft Connect SoCal

- Page 2, under 'Our Plan'; in this section, commend SCAG for acknowledging the continuous partnership with the State (Department of Transportation) in advocating for implementation and funding for California's Active Transportation Program, resulting in the passage of Senate Bill 1.
- Page 2, SCAG identifies the region's multi-family shares declining from their peak in 2015. However, figure 2.4 illustrates 2017 as the peak year.
- Page 32, 'Present & Future Challenges', this section identifies Technical Reports for Connect SoCal. This section should include a weblink to the Technical Reports for reference purposes.
- Page 8, under 'What is Connect SoCal; in this section, the first paragraph discusses the Plan charting a path toward a more mobile sustainable and prosperous region. This section should include a visual graphic illustrating the connection between the key components.
- Page 20, SCAG identifies the two counties with the largest population growth (Riverside & Los Angeles), however this section should include the population growth throughout the SCAG region, including and identifying counties with disadvantage communities.
- Page 32, under 'Present and Future Challenges'; This section should include a weblink to the Technical Reports so interested parties can more easily see *how* the highlighted issues mentioned below are directly addressed by this plan.
- Page 32-33, under 'Affordable Housing'; This section brings up hurdles such as land use zoning that can make the development process expensive. Perhaps it would be beneficial to include some brief verbiage about how our region's zoning policies generally compare to other areas.
- Page 37, under 'Transportation Safety'; In the last sentence, it does not seem relevant or noteworthy to mention that lower speed crashes translate to a higher pedestrian survival rate. Instead, the plan should elaborate on how we can plan our transportation system in a way that encourages safe speeds since it has established that 30% of collisions result in unsafe speeds.

Mr. Kome Ajise
January 23, 2020
Page 16

- Page 38, this section identifies the historic catastrophic events data, however this section should include the effects of the catastrophic events as they corollate to transportation security.
- Page 41, the paragraph regarding funding transportation would have been enhanced by having a graphic showing the existing gap between cost of transportation and available dollars.
- Page 47, this section addresses trends and emerging challenges which must be done to reduce greenhouse gas and meet target goals. Commend SCAG for incorporating this segment as part of Connect SoCal to address additional alternative approaches to address regional challenges.
- Page 66, Table 3.1; Where can interested parties find more information on the listed Transit Capital Projects?
- Page 74, this section identifies the Project List Technical Report of financially constrained and unconstrained lists of projects. This section should include a weblink to the Project List Technical Reports for accessible reference purposes.
- Page 128, under 'VMT Per Capita'; Should verbiage be added to explain why the State is shifting towards VMT as opposed to Level of Service (LOS)? It could tie in with the promotion of in-fill development, multi-modal transportation options, etc.
- Page 150, Commend SCAG for identifying a framework to continue regional partnerships. Together the efforts will address regional challenges and an attempt to meet goals that deem unpredictable.
- SCAG is applauded for explaining Connect SOCAL concept and its connection to the RTP and its long-range goals. SCAG also noted that cities and counties adopting the spirit of the RTP into planning measures for their areas could help their eligibility for future funding grants.
- SCAG did a great job on discussion of the myriad of components that makeup an RTP.
- Suggest making the Environmental Justice/ Public Health Technical Report maps available as interactive maps for the public to view impacts in their communities as well as for comparative analysis.
- We applaud SCAG for considering the importance of an aging population (65+) in the Plan; 1 out of 5 residents in the SCAG region will make up this demographic (Page 17, Connect SoCal Draft). They are more susceptible to impacts in the focus areas listed in the Public Health Technical Report than is the general population.

Mr. Kome Ajise
 January 23, 2020
 Page 17

- Suggest more transparency, inclusion of sources, and studies concerning metrics such as those used to forecast “growth” regarding the job-housing balance (Page 45, EJ Technical Report) and “best practices” for time-based shopping and job accessibility (Page 58, EJ Technical Report).

Technical Reports (General)

- Passenger Rail: How does the Passenger Rail Report integrate CTP 2040 and the California State Rail Plan 2018 with regards to goals, policies and strategies?
- Transit: How does the Transit Technical Report integrate CTP 2040 and the Caltrans 2017 Statewide Transit Strategic Plan with regards to goals, policies, strategies and recommendations?
- Goods Movement: How does the Goods Movement Technical Report integrate CTP 2040 and the California Freight Mobility Plan with regards to goals, policies, strategies and recommendations?
- Aviation and Airport Ground Access: How does the Aviation and Airport Ground Access Technical Report integrate CTP 2040 and the California Aviation System Plan Policy Element 2016 with regards to goals, policies, strategies and recommendations?
- Active Transportation: Caltrans applauds SCAG on its robust and comprehensive commitment to Active Transportation. Caltrans praises SCAG for its many referencing of State of California and Caltrans documents relating to active transportation. Excellent sourcing and listing of CTP 2040, California Bicycle and Pedestrian Plan, various Caltrans District Level Active Transportation Plans, Caltrans State Highway Safety Plan, Caltrans Complete Streets Element Toolbox Guidebook, etc.
- Highways and Arterials: How does the Highways and Arterials Technical Report integrate CTP 2040 and the 2015 Interregional Transportation Strategic Plan and its programmed projects in the Interregional Transportation Improvement Program (ITIP) with regards to purpose, policies and considerations?

3

Performance Measures Technical Report

- Page 30, The report states that Environmental Quality is measured in terms of criteria air pollutant and GHG emissions. The EPA sets NAAQS for six common criteria pollutants, however only four (transportation related) pollutants are monitored in the SCAG region. What percentage of the overall criteria air pollutants do the other two pollutants contribute?
- In addition to criteria pollutants, the EPA identifies 9 priority air toxic compounds with mobile sources known as Mobile Source Air Toxins (MSAT). The nine priority compounds are: 1,3 – butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (PM), ethylbenzene, formaldehyde, naphthalene, and polycyclic organic matter (POM) which have the potential

Mr. Kome Ajise
 January 23, 2020
 Page 18

for adverse health effects. The Performance Measures technical report has no mention of these mobile source air toxins. They should be monitored and strategies for reduction of MSAT be implemented.

- Non-SOV mode share is included in the Environmental Quality outcome category. Would be helpful to have figures that show percent of people who have switched to this method of transport and projections for future conversions to this method and its overall impact on emissions.
- Emissions are estimated using results of the SCAG RTDM which are then inputted to the California Air resources Board (ARB) Emission Factors (EMFAC) model. Information on the accuracy, precision, and uncertainty values of the model would be helpful.
- Page 31 Differentiate between tropospheric ozone (ground/surface-level) which can have adverse health impacts on the community versus stratospheric ozone.
- Clearly define “reactive organic gases (ROG)” and identify which ones are the largest contributors to the formation of surface ozone levels in the SCAG area. Which reactive organic gases are being monitored?
- Ozone concentrations can reach unhealthy levels when the weather is hot and sunny with little or no wind. Tropospheric ozone formation is sunlight/temperature dependent. Report could use information on the effects that future climate change (possible increase in temperature) will have on tropospheric ozone production rates up to the year 2035. It is not clear if this change has been considered when running prediction models.
- Page 31 – Table 10, (SB 375) regional targets were updated by the Air Resources Board in 2018 to ensure consistency with the more stringent statewide reduction goals subsequently introduced by the California legislature and the Governor’s office.
- SB 375 Regional Plan Climate Targets through Sept. 20, 2018 for 2020 were -8%, that goal remained the same after the more stringent goals were introduced beginning Oct. 1, 2018. Was this goal met? If so, what strategies were successful in reaching this goal?
- However, for the 2035 goal, the goal before Oct. 1, 2018 was -13% and was changed to -19%. The newly adjusted goal has been made significantly higher. How has this affected planning to meet the 2035 goal now that it has been changed substantially? Is it feasible?
- Page 32, What criteria and associated weights are used in the SCAG Scenario Planning Model (SPM)?
- There is mention that for Connect SoCal. The scenario modeling capabilities have been enhanced. By what methods and criteria?

Mr. Kome Ajise
January 23, 2020
Page 19

Transportation Conformity Analysis Technical Report

- Page 3, State Implementation Plans (SIPs) - Connect SoCal must conform to the applicable SIPs [motor vehicle emissions budgets (for all criteria pollutant SIP's) and TCM's (for ozone and CO SIP's only)] in the SCAG region.
- Page 4, Federal Clean Air Act Designations in the SCAG Region - Differentiate between tropospheric and stratospheric ozone formation.
- Address the differences and severity between PM 10 and PM 2.5 health risks.
- It is crucial to provide information about the atmospheric lifetime of the criteria pollutants. Pollutants with long atmospheric lifetimes can survive in the environment for years which can greatly impact modeling efforts.
- Page 28 – end, Tables with ROG - Define Reactive Organic Gases/clarify if they are using the ARB definition along with its exemptions. (ROG usually means any compound of carbon) however the ARB has listed exemptions to ROG which would not be included in emission measurements. Alternatively, specify what compounds are being tested for/monitored and shown in the table under ROG.

Goods Movement Technical Report

- Currently, much of the SCAG region fails to meet federal ozone and fine particulate air quality standards as mandated by the federal Clean Air Act.
- Although zero-emissions vehicles seem to be the goal, the discussion on near-term improvements that can be implemented sooner and at a cheaper cost is appreciated. Zero-emission vehicles for goods movement are still at an early stage and require a lot of money for implementation including the planning and building of new infrastructure to support the energy needs of these technologies.
- It is important to explore other emission reduction strategies that can be implemented right away with relatively lower costs. (e.g. improvements to engine efficiency. Increase efficiency in internal combustion engines through engine technologies such as waste heat recovery which lowers fuel use).

Caltrans District 7 - Active Transportation

Draft Connect SoCal

- Page 54 - Livable Corridors Section:

Mr. Kome Ajise
 January 23, 2020
 Page 20

- This section focuses on BRT options to qualify an area as a “livable corridor”, but consideration should also be given to rail corridors as well.
 - There is no mention of landscaping, green scaping, shade trees or bioswales as a viable improvement for a livable corridor. These types of improvements can also help slow down traffic and improve the conditions for other street users.
- Page 69-70 - Active Transportation Section:
 - It would be helpful if the active transportation improvements section included more specific improvements (like the Transit Improvements section). Improvements to pedestrian facilities are important and should be noted.
 - There were many community concerns regarding the Venice Boulevard Great Streets project. We suggest using a much more successful example of a Great Street in this section.
 - More funding opportunities should be provided for community-based organizations to be “partners” or “co-leaders” with agencies to help ensure the community’s active transportation needs will be met.

Active Transportation Technical Report

- The terminology used in this technical report is not well explained or defined; please consider providing a Lexicon.
- We recommend providing more details on “green streets” and the value these offer towards a more sustainable future.
- Page 56 – Safety: The current safety goal (reduce traffic fatalities for all modes by three percent and serious injuries by 1.5 percent by 2050) is extremely conservative relative to the widespread adoption of “Vision Zero” at many federal, state and local agencies to reduce fatalities and serious injuries to zero.
- Page 59 - Pedestrian Infrastructure: Consider adding “reducing driveway conflicts” as part of Strategy 1 or 3 to reduce potential conflicts between pedestrians and drivers.
- Page 59 - Local Bikeway Infrastructure: Specify the types of “low-stress protected bikeway networks” facilities described in Strategy 1 that are preferred (e.g., Class I, II, III, or IV)
- Page 60 - First-Last Mile Infrastructure / SRTS Infrastructure: All policies should include an equity strategy to ensure future investments are going towards improving previously disinvested communities to increase safety for vulnerable road users.
- Page 64 - Safety Strategies: Consider historically disproportionate impact that increased enforcement/ policing has had on low-income communities of color in Safety Strategy 3 and

Mr. Kome Ajise
 January 23, 2020
 Page 21

Strategy 7. Enforcement should be tempered with appropriate, ongoing public engagement to avoid potential alienation and discrimination in these communities.

Caltrans District 7 – Division of Design

- The plan “sounds good” and at the same time very unrealistic.
- Assume reduction in car usages and VMTs, mainly thru “Transit Integration”. While in the past 10 to 12 years Transit Ridership has been decreasing in the region and nationwide.
- The use of this Plan/Strategy’s numbers will hide/lessen the impacts of Goods Movements mobility projects, Tolling Lanes with assumed future Demand, etc., and boasts the assumed benefits identified below (Region’s assumptions). See Regions unsupported/overestimated assumptions below (pushed as future “facts”).
 - SCAG’s region projected 19%, or 3.7 Million population increase in the Region over the next 25 years. This projection is likely to be low, if California’s economy maintains its strength.
 - According LA based Beacon Economics in the next 30 years, LA County would increase by 3.5 million and Riverside County will increase ~ 3.2 million.
 - <https://www.reuters.com/article/us-california-population/californias-population-to-hit-60-million-by-2050-idUSN0930091220070709>
- MODE SHIFT: The assumptions are based to a large degree upon the extent to which major mode shifts within the region can be accomplished. No reasonable and/or quantifiable data provided on that insures these shifts are highly probable to materialize, especially as transit ridership has been steadily declining in the past 12 years nationwide and throughout Southern California. With Technology leaps, driverless car sharing options are likely to lead to increases in vehicle miles traveled (VMT).
- The same with all past Plans, this Mobility Plan promises to “fix” the current challenges... With No Accountability, only to repeat in the next one while consuming Billions of tax dollars, which is very good for the economy.
- HIGH OCCUPANCY VEHICLE (HOV) AND TOLLING LANES: It is crucial to transparently address Inequity issues (Title VI, etc.), address the true Corridors’ mobilities prior to regional policies to increase the number of persons needed to ride for free in Tolling lanes. Need comprehensive and transparent impacts assessment on traffic congestion and on people impacted by these changes. Currently designed Tolling “Express” Lanes policy papers is skewed towards Tolling (“drives” the operational assessment). The operations should be based on, at a minimum, evaluating all freeway lanes together (included tolling). To be transparent, the operational analysis should address the Corridor (to include parallel arterials/local streets impacts).

Mr. Kome Ajise
 January 23, 2020
 Page 22

A recent example from Metro's I-105, EA 314500 PAED docs., Convert HOV lane and add a lane (for a 2-Tolling Lanes): The 2016 SCAG RTP/Sustainable Communities Strategy (scenarios include: Transit Integration, Livable Corridors, "Neighborhood Mobility Area" - walking/bicycling, Bike and car sharing, etc.). The Travel Demand Model year (2047) shows 17.2 % trip reduction (traffic #s lower than current counts). Metro/"PDT" said this was not a realistic forecast and implemented a strategy that translates into higher vehicle on the I-105 GP and Tolling lanes). Metro selected to use year (2027) TDM projections/congested #s, project opening year, and held these #s constant thru year (2047)! This Strategy justifies implementing the Tolling Project. At the same time to reduce the schedule and cost, it was argued that the Fwy Traffic Noise impacts would be much lower with reduced traffic demand, therefore no need to construct sound walls.

Caltrans District 8

Thank you for the opportunity to review Connect SOCAL the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy of the Southern California Association of Governments. We found the overall document to be generally well written, visually interesting to read and provided the results and finding on an array of regional planning issues from a lot of work that clearly took years of sustained, focused, directed effort.

It is our understanding that the United States currently faces a housing shortage in excess of some 7 million dwelling units. Of that 7 million+ dwelling unit shortage some 3.5 million units of the shortfall exists here in California. Beyond homelessness and increased use of limited existing square footage in our existing housing supply, the unprecedented housing shortage has created a range of social equity issues (lack of personal financial independence, homeownership etc.).

Since some 73 percent of Californians live in Southern California, the housing shortage is an extremely important issue with a range of impacts on the transportation system. The 2012 RHNA indicate a need for 412,000 new housing units. The 2018 RHNA indicates a need for some 1,340,000 million new housing units in Southern California. The draft Connect SOCAL document doesn't seem to indicate what the extent of this worsening crisis is here in Southern California.

As noted in the summary of Connect SOCAL the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy, the current severe housing shortage creates jobs/housing balance issues and the need for longer commutes and increased congestion on the overall transportation system.

On Pages 48-56 under the heading Sustainable Communities Strategies and Housing Supportive Infrastructure Connect SOCAL discusses sustainable development practices such as Center Focused Placemaking, Priority Growth Areas, Job Centers Transit Priority Areas, High Quality Transit Areas and Neighborhood Mobility Areas and discusses the housing crisis

Mr. Kome Ajise
 January 23, 2020
 Page 23

but provides little indication that the types of desired development listed above is happening on a large scale in the region.

Page 49 included a short list of ways Diverse Housing Choices could be encouraged. We commented in bold below on these strategies and recommended additional strategies related to housing and transportation caused by longer commutes and increased congestion caused by new housing.

- 1) Preserve and rehabilitate housing and prevent displacement. **Wouldn't preservation/rehabilitation occur due to supply and demand? Is displacement good if higher density is proposed?**
- 2) Identify opportunities for new workforce and affordable housing development. **Not really clear what this means? Do you mean Affordable housing for new members of the workforce?**
- 3) Create incentives and reduce regulatory barriers for building context sensitive accessory dwelling units to increase housing supply. **Would this be expected to create hundreds of thousands of new units.**
- 4) Provide support to local jurisdictions to streamline and lessen barriers to housing development that supports reduction of greenhouse gas emissions. **List ways to do this.**

Suggest policy support and reworking the Diverse Housing Choices section of the plan to include support of ideas like the following:

Support and reference The Ahwahnee Principles. <https://www.lgc.org/who-we-are/ahwahnee/principles/>

Support long lasting smart mobility decisions that improve the environment, create a vibrant economy and build communities not sprawl.

Support redevelopment of high density residential along transit served corridors.

Support having new housing be originally built with an accessory dwelling unit.

Support an overall trend to reduce of lot size minimums in the region by 20%.

Support the concept of building to the maximum density allowed in a residential zoning district rather to the minimum density.

Support a policy that wherever possible in all new specific plans placement of high density housing residential shall occur near planned schools, employment and retail areas.

Support a regional mode shift to walking and bicycling <https://dot.ca.gov/-/media/dot-media/programs/sustainability/documents/caltrans-strategic-mgmt-plan-033015-a11y.pdf>

Support the provision of designated areas for employment (beyond a few retail commercial and school sites) in all new specific plans.

Support the provision of connected street grid system by limiting cul-de-sac length to no more than 250 feet.

Support minimizing the size of a block, through the use of a block size maximum of 1,600 feet.

Support bike and pedestrian through block connectivity through subdivisions by providing one such connection every 600 feet.

Mr. Kome Ajise
 January 23, 2020
 Page 24

Support allowing 100 percent housing on vacant or abandoned property zoned for commercial retail use to help the viability of existing commercial uses (25 solutions article below).
 Support local jurisdictions efforts to provide a temporary 30% reduction on all residential impact fees for (3 -5 years) to encourage housing production.
 Support housing policy that provides net zero energy use that would build on the 1 million solar homes California has with a goal of greatly increasing this total (roughly 12.5 million dwelling units exist with a need for 3.5 million more dwelling units)
 Support allowing a reduction in setback standards to Uniform Building Code minimums on side yards and limit front and rear yard setbacks to no more than 10 feet.
 Support the elimination for any required covered off street parking to support development of more housing units.
 Support development of high density housing in unused portions of commercial shopping centers/office etc. parking lot areas.
 Support allowing a reduction in local public street width standards and/or to allow reduced width private streets to encourage infill development.
 Support increasing residential building height standards in residential zoning districts to allow greater building square footage.
 Support any regional efforts to develop the missing middle housing of the past few decades.
<https://missingmiddlehousing.com/>

In the Measuring our Progress portion of Connect SOCAL Pages 118-147 it seems reasonable to assume that much of the "progress" in congestion relief and other areas has to do with 91,000 people per year leaving the SCAG region due to the high cost of housing and other reasons since 2014 as noted on Page 16 of Connect SOCAL discussion on mega trends. Is this real progress or an abandonment trend that needs to be reversed?

<https://www.worldpropertyjournal.com/real-estate-news/united-states/washington-dc-real-estate-news/up-for-growth-national-coalition-econorthwest-holland-government-affairs-housing-underproduction-in-the-us-2018-housing-shortage-data-10842.php>

Mr. Kome Ajise
January 23, 2020
Page 25

Caltrans District 11

Draft Connect SoCal

- Truck Parking/Truck driver shortage: Please address and include truck parking needs in the SCAG region. In addition, the shortage of truck drivers is commonly cited as the number one problem in the trucking industry.
- Freight Projects List: Please include transportation projects that have been identified in the *2014 California-Baja California Border Master Plan* and the *Draft 2020 California Freight Mobility Plan*. Examples of projects that are missing in the Goods Movement Project List are: Forrester Road, Commercial Vehicle Inspection Facility modernization project at Calexico East Port of Entry (POE), bridge and highway realignment to Andrade POE, widen State Route 98 (SR-98) between Dogwood Road and V.V. Williams Ave., widen SR-98 between Ollie Ave. and Rockwood Dr., widen Menvielle Road to four lanes from Carr Road to SR-98, implement Border Wait Times System, and modernize existing truck parking/staging areas for near-zero to zero emission infrastructure truck shore power.
- National Freight Highway Network (NFHN): Please include and identify routes that have been designated as Critical Urban Freight Corridors and Critical Rural Freight Corridors. These are public roads in urbanized and rural areas which provide access and connection to the Primary Highway Freight System and the Interstate with other ports, public transportation facilities, or other intermodal transportation facilities.
- California Sustainable Freight Action Plan (CSFAP): Please describe how the RTP supports the goals and vision of the CSFAP. This State plan provides a vision for California's transition to a more efficient, more economically competitive, and less polluting freight transport system. Please include the Advanced Technology Corridors at Border POEs CSFAP pilot project as part of the RTP Goods Movement Environmental Conditions and Technology Advancement Strategies.
- Agriculture and Mining: Little is discussed regarding needs and availability of producing agricultural and mining (e.g., aggregate) commodities among border or rural areas of the region (Imperial and Coachella Valleys, Ventura, etc.). Safety, maintenance and asset management (e.g., State Highway Operation and Protection Program [SHOPP]) needs could be mentioned on lower-volume/seasonal routes impacted by heavy machinery movements/emissions.

Technical Reports

- Highways and Arterials Technical Report Page 8 references SB1 in the context of performance measures and Page 14 mentions the Proposition 1B Corridor Mobility Improvement Account (CMIA) requirements for Corridor System Management Plans (CSMP) and components of those documents. SB1s requirement of corridor plans is not addressed nor are the competitive programs such as Solutions for Congested Corridors

Mr. Kome Ajise
 January 23, 2020
 Page 26

Program (SCCP), Trade Corridor Enhancement Program (TCEP) and Local Partnerships. Although not impactful for the California Environmental Quality Act (CEQA), the discussion is important for future funding opportunities and possible planning efforts.

- Page 10, Transportation Safety & Security: Table 3 - Is Fatality and Injury prediction table approved by Caltrans?
- Table 1 – FTIP Projects – FTIP ID Number IMP140804: Route should be “8”, not “999”.
- Table 2 – Project Number IMP0042A: The Demo funds identified for this project have been repurposed to a different phase for SR98. As such, this project should be removed.
- Additional project: Please add: SR186 All American Canal Bridge – Replace bridge to accommodate two vehicle lanes, shoulders and pedestrian/bicyclist facilities. Cost \$40M; Construction Year 2027.
- Transit: There are no comments related to any specific projects; however, the District would like to recommend that consideration be given to include bicycle and pedestrian facility connections and protection by enhancing visibility of bicyclists and pedestrians as well as to provide wayfinding signage to guide the active transportation population to facilities to help them complete their trip.

Caltrans District 12

Draft Connect SoCal

- The Draft Connect SoCal Plan provides long term guidelines and strategies for the SCAG region. These guidelines and strategies should align with State goals as laid out in State planning documents such as the California Transportation Plan (CTP), California State Rail Plan, California Freight Mobility Plan (CFMP), California Aviation System Plan (CASP), and State Bicycle and Pedestrian Plan. As stated in our previous comment letter during the Notice of Preparation (NOP) process, dated February 22, 2019, we encourage the incorporation of State planning documents to align the 2020-2045 RTP/SCS with State goals.
- The SCAG region has many highly urbanized areas that have increasing traffic demand due to population growth and economic development and have limited available Right-of-Way (ROW) for transportation purposes. To enhance the operability of current facilities, strategies such as Managed Lanes would provide efficient usage of current capacity, improve travel times, reduce vehicle miles traveled (VMT), provide alternative means of transportation and may provide revenue for other transportation improvements. These strategies are consistent with state, regional and local goals and objectives. As stated in comment 10 of our previous comment letter, the Department requests SCAG review and incorporate the Orange County Managed Lanes Feasibility Study (MLFS) and the Orange

Mr. Kome Ajise
 January 23, 2020
 Page 27

County Managed Lanes Network Study (MLNS) in the 2020-2045 RTP/SCS. The recommendations from these studies have not been included in the 2020-2045 RTP/SCS. These studies and the proposed projects, including District 12's I-5 Managed Lanes Project, reflect SCAG's Goals and Guiding Principles found on pages 9 and 10 by placing a high priority on improving mobility and reliability. The Department requests that District 12's I-5 Managed Lanes Project, for the project approval and environmental document (PA/ED) component, be included in the final 2020-2045 RTP/SCS and also amended to the 2019 FTIP, per our October 2019 request to Orange County Transportation Authority (OCTA).

- Climate change impacts have become a major concern for planning agencies at all levels. As required by California Senate Bill 379, many regional and local planning agencies have started developing plans to address climate change issues. While the 2020-2045 RTP/SCS includes climate change considerations in multiple sections of the document, it should incorporate climate change plans from other agencies into the document. Further clarification should also be provided to establish which plans supersede. As requested in our previous comment letter, please review the Vulnerability Assessment for Orange County and coordinate with Caltrans for future implementation.
- Caltrans District 12 appreciates the robust and thorough discussion in the RTP's Active Transportation Technical Report and supports SCAG's efforts in encouraging Complete Streets. This technical report aligns with Caltrans' goals and objectives. Complete Streets infrastructure benefits all roadway users and promotes mobility, equity, accessibility and regional connectivity, all while decreasing congestion and improving air quality.

Active Transportation Technical Report

The following areas of the Active Transportation technical report that accompany the 2020-2045 RTP/SCS require consideration for revision:

- Page 3, first paragraph: under Section "Defining Active Transportation", add walking as part of the examples.
- Page 3, paragraph eight: consider making a distinction between traditional active transportation modes and micro-mobility modes.
- Page 5, Table 1 second row, second column: consider adding increased connectivity as part of the impacts.
- Page 7, paragraph eight: under Regional Significance consider discussing ADA-friendly infrastructure in one of the subsections. Active Transportation infrastructure also benefits ADA-reliant users by increasing these users' mobility and accessibility.
- Page 19, paragraph 4: verify the list of cities that currently have bike share programs. Some of the cities listed may no longer have these programs available. For example, the cities of

Mr. Kome Ajise
 January 23, 2020
 Page 28

Bellflower and Paramount had a partnership with dockless bikeshare company Ofo in 2017. However, Ofo has since backed out of the United States market.

- Page 79 and 85, Bicycle Master Plans, and Pedestrian Master Plans: the City of Irvine is currently developing an Active Transportation Plan and the City of Santa Ana has recently finalized its Active Transportation Plan. Additionally, the Orange County Transportation Authority has bikeway studies on four sub-areas of Orange County--North, West/Central, South and Foothills.
- Page 98, second paragraph and page 99 Exhibit 13: clarify that the City's protected bike lane along Bristol Street is a class IV facility and incorporate it into Exhibit 13.
- Southern California ports are seeing increased demand as trade with the Pacific Region continues to grow. SCAG should continue to plan for increased truck traffic within the region. Additionally, consider a discussion of the lack of available safe, secure and accessible parking for long distance freight vehicles. Projected growth of truck traffic and the demand for truck parking will continue to outpace the supply of public and private parking facilities.
- Due to the high number of residential developments, related functions such as micro-transit and micro-freight, need to be analyzed. Optimizing curb space locations and micro-freight and micro-transit routes may reduce congestion, VMT, and wait times for users. Additional multi-modal transportation options such as bus rapid transit and parallel light rail provide alternative options for travelers.
- The Department supports SCAG's efforts to create an integrated transit payment system, discussed in the Shared Mobility and Mobility as a Service section. Please coordinate with Caltrans since we are currently developing a similar statewide program. These efforts may improve the accessibility and affordability of transit services which may result in reduced emissions, VMT and congestion.
- Consider incorporating discussion of policies of various agencies to promote existing and future Park and Ride lots that may increase carpooling, bicycling and transit use as options for commuters. This would reduce VMT and congestion.
- Due to ROW constraints on the State Highway System (SHS), implementing Intelligent Transportation Systems strategies, as discussed in the core vision of the 2020-2045 RTP/SCS, would allow for enhanced capabilities to protect transportation systems and shorten response times, enhancing operations of the SHS.
- Review of the Project List has highlighted the following inconsistencies:
 - Project FTIP ID – ORA000820 – SR 57 Truck Climbing has a total Cost of \$164.2 million
 - Project FTIP ID – ORA131301 – SR 55 Add 1 Mixed Flow Lane from I-5 to SR 91 has a total Cost of \$151.1 million

Mr. Kome Ajise
January 23, 2020
Page 29

- Project FTIP ID – ORA131303 – SR 57 Orangewood to Katella has a total Cost of \$70.6 million
- Project FTIP ID – ORA131304 – I-405 Add 1 Mixed Flow Lane from I-5 to SR 55 has a total Cost of \$176 million

Attachment B

Caltrans District 7 – Environmental Planning

- Footnote 75: the hyperlink to the Induced Travel Calculator may need to be corrected by simply removing “on October 25” from the clickable hyperlink. The hyperlink currently includes the phrase “on October 25” when clicked. 4
- Page 3.17-8, Regional High-Occupancy Vehicle (HOV) System and Park and Ride System: please clarify if the HOV system described in this section includes the High Occupancy Toll (HOT) / express lanes. General information on the HOT lanes in the SCAG region (Los Angeles County in particular) and how HOT/Express and HOV lanes differ may be useful for this section. 5
- Wildlife Crossing: Besides the Liberty Canyon Wildlife Crossing that connects the Santa Monica Mountains to the open space of Simi Hills and Santa Susana Mountains, there is another opportunity for a different Wildlife Crossing at Conejo Grade around Camarillo and Thousand Oaks that needs to be looked at. 6
- SCAG, Metro, and Caltrans should fund projects that will improve culverts for wildlife usage, especially in the rural areas of Ventura County. 7
- There is also opportunity for wildlife crossings, connectivity, and corridor improvements on State Route 2 and Interstate 210 around La Cañada Flintridge, State Route 118, and State Route 126 around the Moorpark and Filmore area. 8
- Rocky Peak on State Route 118 needs fencing and habitat connectivity including corridor improvements for wildlife. 9
- Areas along Interstate 5 and State Route 14 at Sylmar, Granada Hills and north of Santa Clarita need open space to be connected (habitat connectivity) for wildlife movement. 10
- Access to public parks and open spaces need to be improved. Special buses at discount rate (to take people from inner-city to these parks) will be very helpful to inner-city parents and families since many inner-city neighborhoods are far from parks that have interesting resources. 11
- Besides light-rails and all proposed transportation projects, governmental agencies within Downtown Los Angeles and other large cities should consider alternative working hours and equip their staff to telecommute 3-4 times a month. This will improve lives and air quality. 12
- Cal-Fire should have fire continues education for areas in the cities that borders open spaces. Training should be giving to volunteers and people who are willing to assist Fire 13

Mr. Kome Ajise
January 23, 2020
Page 31

Officers and crew. We strongly encourage utility companies to place their utilities line underground (buried) in areas that are prone to wildfires.

13

- We believe some cities within SCAG's Region collect rainwater and run-off water. Since the average annual rainfall is between 12-22 inches, SCAG should encourage cities to capture rainwater, treat it and release it to our dry ravines.

CHIEF EXECUTIVE OFFICER

GAVIN NEWSOM
GOVERNOR

Kome Ajise
Executive Director
Southern California Association of Governments (SCAG)
900 Wilshire Blvd, Suite 1700
Los Angeles, CA 90017

Dear Mr. Ajise:

The California High-Speed Rail Authority (Authority) received the Public Notice of Availability letters from SCAG for the Connect SoCal Draft Plan and the Connect SoCal Draft Program Environmental Impact Report (PEIR), dated November 14, 2019 and December 9, 2019 respectively. Connect SoCal is SCAG's Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) for the Southern California region, covering the timeframe from 2020 to 2045.

The Authority has reviewed both the Connect SoCal Draft Plan and the Connect SoCal Draft PEIR, and respectfully provides SCAG with the following comments:

- Draft Plan, page 69: The Authority will release its Draft 2020 Business Plan in February 2020 for public review and comment. Final adoption of the 2020 Business Plan is expected at CHSRA's April 2020 Board meeting, for submittal to the State Legislature by May 1, 2020.
- Draft Plan, page 69: The Authority has not yet executed a Proposition 1A funding agreement with Los Angeles Metro for the LINK US project. The Authority, Metro, and the California State Transportation Agency (CalSTA) did execute a Memorandum of Understanding (MOU) in September 2019 which established a commitment for these agencies to work together cooperatively towards taking the necessary steps for this funding agreement to be established.
- Draft Plan, Passenger Rail Technical Report, page 13: The Authority 2018 Business Plan does include discussion of the Phase 2 system from Los Angeles to San Diego.
- Draft Plan, Passenger Rail Technical Report, page 14: Current schedules for the Authority's Southern California sections are as follows:
 - Bakersfield to Palmdale – Draft EIR/EIS documents are expected in early 2020, and Final EIR/EIS documents are expected in 2021.
 - Palmdale to Burbank – Draft EIR/EIS documents are expected in 2020, and Final EIR/EIS documents are expected in 2021.

- Burbank to Los Angeles – Draft EIR/EIS documents are expected in early 2020, and Final EIR/EIS documents are expected in 2021.
- Los Angeles to Anaheim – Draft EIR/EIS documents are expected in 2020, and Final EIR/EIS documents are expected in 2021.
- Draft Plan, Passenger Rail Technical Report, page 31: Same comment as the Draft RTP/SCS, page 69 regarding the LINK US project.
- Draft Plan, Passenger Rail Technical Report, page 34: There is no high-speed rail station planned in Sylmar.
- Draft Plan, Passenger Rail Technical Report, page 42: Same comment as the Draft RTP/SCS, Passenger Rail Technical Report, page 13 regarding the HSR Phase 2 system. Also, remove Madera and replace with Merced.
- Draft Plan, Project List Technical Report, page 128: The projected cost to complete California High-Speed Rail Phase 1 – ENV/PE is \$332 million for the Southern California project sections. This is consistent with the CHSRA 2019 Project Update Report (PUR), released in May 2019. COMPLETION YEAR – 2021, not 2017.
- Draft Plan, Project List Technical Report, page 242: The projected cost to complete the California High-Speed Rail Phase 1 system is \$38.96 billion for the Southern California project sections. This is consistent with the Authority 2018 Business Plan Capital Cost Basis of Estimate Report, released in June 2018.
- Draft Plan, Project List Technical Report, page 242: California High-Speed Rail Phase 2 – ENV/PE can be removed from the financially constrained RTP/SCS project list.
- Draft PEIR, Financially-Constrained RTP/SCS Projects, page 128: Same comment as the Draft RTP/SCS, Project List Technical Report, page 128. In addition, the Completion Year should be changed from 2017 to 2021.
- Draft PEIR, Financially-Constrained RTP/SCS Projects, page 243: Same two comments as the Draft RTP/SCS, Project List Technical Report, page 242.

In addition, we want to highlight related work that the Authority and SCAG have done in partnership with the City of Palmdale and the City of Burbank to help fund Station Area Planning efforts that will result in infrastructure and land use changes near future HSR stations and existing Metrolink stations, including the Palmdale Transit Area Specific Plan, and the Burbank Golden State Specific Plan. Both these efforts are ongoing and are related to Connect SoCal.

Draft Program EIR Comments - Connect SoCal 2020-2045 RTP/SCS
Attn: Roland Ok, Senior Regional Planner
Southern California Association of Governments
900 Wilshire Blvd., Suite 1700
Los Angeles, CA 90017

Dear Mr. Ok:

John Wayne Airport/Orange County (JWA) appreciates the opportunity to review and comment on the Southern California Association of Governments (SCAG) Draft Program EIR for Connect SoCal 2020-2045 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS). During the EIR preparation process, SCAG requested, and JWA submitted, specific aviation-related data for use in preparing the document. The data that JWA submitted to SCAG included, but was not limited to, JWA's legal agreement parameters including operational and capacity limits; current passenger, aircraft and cargo statistics; recent aviation forecast information; and JWA's most recent Economic Impact Study.

In reviewing the Aviation Appendix, the information regarding John Wayne Airport is generally accurate and consistent with the information we provided. We would like to suggest the following minor changes to Appendix 3.13 Draft Airport Noise Overview.

1. We suggest that the John Wayne Airport "location" section on page 12, be revised as follows: "There ~~is~~ are residential land uses interspersed among the commercial uses with single-family and multi-family land uses .25 miles south west of the runway. ~~and~~ There are also residential land uses (single family and multi-family) ~~beyond the commercial land use~~ approximately .75 miles to the north, .5 miles to the west, and one mile to the east. ~~and approximately .25 miles to the south.~~ Figure 6, John Wayne Airport Location, illustrates the airport relationship to these land uses."

Please note that Figure 6 does not show the location of the residential uses.

Figure 8 shows the residential uses south of the airport, but not to the west, north or east.

Re: Draft 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (Connect SoCal Plan) and Draft Program Environmental Impact Report

Dear Mr. Ajise:

Thank you for the opportunity to comment on SCAG’s Draft 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (Connect SoCal Plan) and the Draft Program Environmental Impact Report (PEIR). Attached are comments from the South Coast AQMD staff on the Connect SoCal Plan (Attachment 1) and the Draft PEIR for the Connect SoCal Plan (Attachment 2).

1

The 2023 attainment date for the 1997 federal 8-hour ozone standard represents a significant challenge to the South Coast Air Basin (Basin). This attainment challenge (including potential sanctions on highway funding) should be highlighted in the Plan as a regional priority. With goods movement accounting for a significant portion of the mobile source emissions in the Basin, there is a critical need for a new and innovative regional goods movement system that needs to be pursued and developed through a collaborative process. More detailed comments on goods movement are included in Attachment 1.

2

After a review of the Draft PEIR’s air quality and health risk analyses and supporting technical documents, the Draft PEIR likely under-estimated the air quality impacts of the Plan. The Draft PEIR improperly credits the Plan with emission reductions in air quality and health risks that will occur independent of the Plan due to adopted state and federal rules and regulations. Second, SCAG did not utilize South Coast AQMD’s CEQA significance threshold of for health risk impacts. More detailed comments on the Draft PEIR are included in Attachment 2.

3

We are fully committed to continuing to work collaboratively with SCAG and other stakeholders to achieve the vision outlined in this Plan.

4

Sincerely,

Wayne Natri
Executive Officer

Attachment 1 – Comments on Draft 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (Connect SoCal Plan)

Attachment 2 – Comments on Draft Program Environmental Impact Report for the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy

Attachment 1 - Comments on SCAG's Draft 2020-2045 Regional Transportation Plan /Sustainable Communities Strategy (Connect SoCal Plan).

Attainment of federal air quality standards, a regional priority - The South Coast Air Basin (Basin) is facing a daunting challenge to meet the upcoming deadlines for attaining the health-based federal ozone standards. NOx is the key pollutant causing high ozone levels in our region and must be reduced by 45% and 55% beyond all existing regulations by 2023 and 2031, respectively, to meet federal standards and achieve healthy air for the region. Because over 80% of the NOx in our region is from mobile sources, significant reductions have to come from goods movement sectors (i.e., trucks, cargo handling equipment, rail and ocean-going vessels). Aggressive regulations, advancements in technologies, innovative solutions and integrated land-use and transportation planning as well as coordinated efforts among all stakeholders, at local, state and federal levels are essential to achieve the needed reductions from goods movement activities. We strongly recommend that the challenge of attaining the federal air quality standards be presented in the Connect SoCal Plan as a regional priority calling for a regional solution.

Potential sanctions on transportation funding - On December 31, 2019, South Coast AQMD and California Air Resources Board submitted a jointly-developed Contingency Measure Plan (Plan) to the U.S. EPA to address the required NOx reductions for attaining the 1997 8-hour ozone standard in 2023. The Plan describes additional regulatory actions, programs, and incentive funding South Coast AQMD and CARB have developed to achieve additional emission reductions, and it highlights the critical need for federal regulatory actions and/or funding to address sources under federal jurisdiction (i.e., aircraft, ships, trains, out-of-state trucks), in order to achieve this standard. If U.S. EPA disapproves the Plan, a federal sanctions clock will be triggered, culminating in highway sanctions if the underlying deficiency cannot be corrected. The imposition of highway sanctions results in the loss of federal funds for transportation projects except for certain safety, transit, and air quality beneficial projects. It should be noted that the U.S. EPA does have the option, under the Clean Air Act section 110(m), to apply discretionary sanctions at any time after a disapproval is made. Given the detrimental impact of sanctions to regional transportation planning, we recommend that SCAG highlight the potential sanctions on transportation funding in the Connect SoCal Plan and provide an estimate of the potential impacts.

Need for new innovative regional freight transportation systems - Although goods movement in the SCAG region provides significant positive local, regional and even national economic benefits, it also brings major challenges, including adverse impacts on local and regional air quality, congestion, safety, and roadways. The projected growth in goods movement activity in the SCAG region will further exacerbate the existing conditions. Given the complex nature of the existing transportation networks used for moving import and export cargo, a comprehensive regional solution is needed to address these challenges while improving overall system efficiency. We believe that fundamental changes to the existing networks used for moving cargo need to be earnestly explored and considered.

To signal these needed changes, we recommend that the goods movement project list include at least a \$10 billion funding allocation to identify and deploy innovative zero-emission cargo movement system(s) through a collaborative stakeholder process. The proposed project in the

Connect SoCal Plan will highlight the critical need for a new and innovative goods movement system for the region and will facilitate solicitation of federal funding. South Coast AQMD is fully committed to participate in this process and provide technical assistance.

Ports container forecast – The Ports of Los Angeles and Long Beach handled 17.5 million twenty-foot equivalent unit (TEU) containers in 2018, which represents a 49% increase since the last recession in 2009. The 2016 Mercator Report has provided different container growth forecasts under high growth, expected, and low-growth scenarios. Although the projected growth is expected to continue until at least 2040, the Ports are projected to reach capacity before then. We recommend that the Connect SoCal Plan reflect the latest container forecast as well as identify a potential range of uncertainties based on different forecast scenarios which would also affect the port truck vehicle miles traveled (VMT) and associated emissions.

Goods Movement Environmental Strategy and Technology Advancement Plan – Although we fully support the proposed action plan for zero-emission (ZE) technologies, we recommend that the action plan be expanded to include near-zero (NZE) emission technologies with the acknowledgement that these technologies for medium-duty and heavy-duty trucks are currently in the commercial deployment phase, as discussed in the next section.

Near-term technologies commercially available now to be readily deployed within the next few years - Near-zero natural gas engine technologies are classified as one of the near-term truck technologies in the draft Goods Movement Technical Report (Appendix 1). However, natural gas engine models offered by Cummins Westport Inc. (CWI) are commercially available today and are certified to meet the optional low NOx standard of 0.02 g/bhp-hr. CWI offers the smaller L9N engine that is well suited for transit buses and refuse trucks as well as the larger 12L engine with up to 400 hp to support the demanding drayage duty cycles. In addition, CWI has recently received a CARB certification for their 6.7L engine to support the medium-duty vehicles segment which includes school buses, shuttles and medium-duty trucks. Additional fueling stations will be needed to support the expected increase in deployment of CNG trucks in the near term.

Battery electric trucks have also made significant progress in recent years, especially for the medium-duty vehicles sector. Captive fleets such as shuttles and delivery vans with fixed routes are a good match for this technology as their daily operations can be sufficiently supported by currently available products with 100 to 150 miles in operating range. In addition, because these vehicles are generally recharged overnight at their facilities, charging infrastructure needed to support these vehicles can be tailored based on the anticipated demand and provided in centralized locations. Based on the latest eligible vehicles list for the Hybrid and Zero Emission Truck and Bus Voucher Incentive Project (HVIP), there are several medium-duty trucks and vans that are commercially available for some applications and more products are expected to follow in the near future to support a wider range of vehicle types and vocations. As such, medium-duty battery electric trucks should be classified under the near-term technologies, bifurcating them from heavy-duty battery electric trucks which may require a longer timeline for commercialization. We recommend that these updates for be reflected in the Goods Movement Technical Report.

Encouraging and incentivizing deployment of NZE and ZE technologies - In addition to incentive funding offered by the California Air Resources Board and South Coast AQMD to help offset the higher purchase price of NZE and ZE trucks, a dedicated lane for these trucks on highways and surface streets as well as at port terminals and railyards can provide an effective non-monetary incentive measure to promote and accelerate deployment of NZE and ZE technologies. We recommend that these types of incentive measures (e.g., dedicated lanes, parking spots/curb areas for deliveries) be considered and incorporated into the proposed goods movement projects, where appropriate.

Zero-Emission Infrastructure Study - We appreciate SCAG's proposed study on charging infrastructure needed for electric trucks. This effort is timely and can work well in partnership with other efforts currently underway with the Public Utilities Commission¹ (PUC) and the California Energy Commission² (CEC). While those two efforts are focused on the needs and limitations of the electric grid, SCAG can provide a critical perspective and bring unique expertise as a regional transportation planning agency. We encourage SCAG to coordinate with PUC, CEC, and other key stakeholders including local utilities as this proposed study proceeds. We look forward to continuing to engage with SCAG on this effort.

¹ Proceeding R1812006 (Transportation Electrification Framework):

https://apps.cpuc.ca.gov/apex/f?p=401:56:0::NO:RP,57,RIR:P5_PROCEEDING_SELECT:R1812006

² CEC is conducting multiple efforts to evaluate transportation electrification needs, including through its current Integrated Energy Policy Report work, and through work to implement AB 2127.

Attachment 2 - Comments on SCAG’s Draft Program Environmental Impact Report for the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy.

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for SCAG and should be incorporated into the Final PEIR.

6

South Coast AQMD Staff’s Summary of Project Description

The 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) is a long-range transportation and land use plan for six counties and 191 cities in Southern California (Proposed Project). It takes into account the changing socioeconomic, transportation, financial, technological, and environmental conditions, and serves as a blueprint to guide the region’s future transportation and land use development for more than 20 years. It includes a plan of transportation investments and strategies to enhance the performance and safety of the region’s transportation network that comprises of highways, arterials, roadways, transit systems, rail, seaports, and airports. It integrates technologies for the transportation and movement of people and goods, including zero and near-zero emissions technologies and infrastructure. The Proposed Project also includes land use strategies that are coordinated with transportation strategies to accommodate a net growth of 3.2 million people, 1.4 million households, and 1.4 million jobs between 2019 and 2045¹ around job centers, transit priority areas, high quality transit areas, neighborhood mobility areas, and livable corridors. It balances transportation and land use strategies to meet the region’s needs in improving air quality and public health, reducing greenhouse gas emissions, and building a more sustainable, equitable, and economically vibrant future.

7

Summary of South Coast AQMD Staff’s Comments on the Air Quality and Health Risk Assessment Analyses in the Draft PEIR

Based on reviews of the Draft PEIR and supporting technical documents, South Coast AQMD staff has ten comments on the air quality and health risk analyses. A summary of these comments is provided as follows with additional details provided later in this attachment.

1. CEQA Baseline: SCAG quantified on-road mobile source emissions for the existing conditions without the Proposed Project (year 2019) and the future conditions with the Proposed Project (year 2045) and compared those emissions to determine the level of significance. Based on this analysis, the Proposed Project would mostly reduce emissions, except for PM2.5 and PM10 emissions in some parts of the region due to increases in vehicle miles travel (VMT) between 2019 and 2045 in all counties². This analysis approach improperly credits the Proposed Project with emission reductions in air quality and health risks that will occur independent of the Proposed Project due to adopted state and federal rules and regulations. SCAG should compare the emissions with the Proposed Project to the emissions without the Proposed Project in the same interim analysis years and use the comparison to determine the level of significance for the Proposed Project’s air quality impacts from on-road mobile sources.

8

¹ Draft PEIR. Page 2.0-14.
² *Ibid.* Pages 3.3-57 to 61.

- 2. Air Quality CEQA Thresholds of Significance: SCAG quantified the Proposed Project’s on-road mobile source emissions of criteria pollutants for the region but did not compare the South Coast AQMD’s portion of the emissions to South Coast AQMD’s regional air quality CEQA significance thresholds to determine the level of significance. Evaluation of air quality impacts, unlike some other impact areas, easily lends itself to quantification. Not only does quantification make it easier for the public and decision-makers to understand the breadth and depth of the potential air quality impacts, but it also facilitates the identification of mitigation measures required to reduce any significant adverse air quality impacts. SCAG should identify the South Coast AQMD’s portion of the on-road mobile source emissions and compare those emissions to South Coast AQMD’s regional air quality CEQA significance thresholds in the Final PEIR to determine the level of significance. 9

- 3. Interim Analysis Years: The air quality analysis in the Draft PEIR included only two analysis years: baseline year (2019) and buildout year (2045). The overall emission rates of vehicles and trucks are generally higher in earlier years as more stringent emission standards and cleaner technologies have not been fully implemented, and fleets have not fully turned over. With only two analysis years for air quality, the Draft PEIR did not fully and adequately disclose the peak daily emissions from on-road mobile sources. SCAG should include interim analysis years for the air quality analysis, corresponding to the same interim analysis years (i.e., year 2020, year 2030, and year 2035) that were used to quantify the Proposed Project’s greenhouse gas emissions. 10

- 4. Air Quality Impact Analysis: The Draft PEIR discussed the existing air quality conditions based on the South Coast AQMD’s 2016 AQMP forecasts, but did not quantify emissions from implementing the Proposed Project’s transportation strategies for off-road mobile sources (e.g., locomotives, ocean-going vessels, commercial harbor craft, cargo handling equipment, farm equipment, and aircraft³) or land use strategies. However, SCAG quantified GHG emissions for off-road vehicles (rail, aviation, and ocean-going vessels), building energy, and water-related energy consumptions but did not quantify emissions from criteria pollutants for these sources. Therefore, the analysis approach for air quality is not consistent with the GHG emissions analysis which included both on-road and off-road mobile sources, and should be revised in the Final EIR. 11

- 5. Air Quality Impacts from Overlapping Construction and Operational Activities: The Draft PEIR did not analyze a scenario where construction activities overlap with operational activities. Since the Proposed Project will be implemented over a period of 20 years, an overlapping construction and operation scenario from transportation and land use projects is reasonably foreseeable and should be analyzed in the Final PEIR. 12

- 6. Health Risk Assessment (HRA) Analysis: SCAG did not utilize South Coast AQMD’s CEQA significance threshold of 10 in a million to determine the level of significance for the Proposed Project’s health risk impacts. Even though some of the transportation segments that were selected for the HRA analysis show cancer risk that would substantially exceed the significance threshold (e.g., 41.3 in a million), SCAG found that the Proposed Project’s 13

³ *Ibid.* Page 3.2-6.

health risk impacts would be less than significant⁴ because cancer risk for each transportation segment in 2045 is significantly reduced when it is compared to that in 2019. This is an improper comparison to determine the level of significance for cancer risk and should be revised in the Final EIR. (See also Comment No. 1).

13

7. Project-level Air Quality Mitigation Measure: SCAG recommended the use of Tier 4 construction equipment by projects within 500 feet of residences, hospitals, or schools. To encourage the use of Tier 4 Final construction equipment by all types of transportation and land use projects, South Coast AQMD staff recommends the use of Tier 4 Final construction equipment and more information on the implementation and monitoring of this mitigation measure be provided in the Final EIR.

14

8. Additional Project-Level Air Quality Mitigation Measures for On-Road Mobile Sources: The Draft PEIR serves as the first-tier, programmatic level analysis that can provide guidance to subsequent, project-level environmental analyses. To facilitate this, South Coast AQMD staff recommends that SCAG include additional project-level mitigation measures for on-road mobile sources in the Final EIR. SCAG should also review the Community Emission Reduction Plans that are prepared pursuant to Assembly Bill 617 to explore whether additional mitigation measures can be identified and included in the Final EIR.

15

9. Additional Project-Level Air Quality Mitigation Measures for Off-Road Mobile Sources: The Draft PEIR did not include project-level air quality mitigation measures for off-road mobile sources (e.g., aircraft and ground service equipment, cargo handling equipment, locomotives, shore power and infrastructure, and ocean-going vessels). Since the Proposed Project includes transportation strategies for rail, seaports, and airports, SCAG should develop and include project-level mitigation measures or performance standards for off-road mobile sources as part of PMM-AQ-1 in the Final EIR.

16

10. Health Risk Reduction Strategies: Although the Proposed Project would result in development of new transportation projects near existing sensitive receptors or locating new receptors near transportation projects, the Draft PEIR did not include a discussion on how to disclose health risks and reduce exposures when new sensitive land uses are sited within 500 feet of freeways or other sources of air pollution. To provide guidance for subsequent, project-level environmental analyses, South Coast AQMD staff recommends that SCAG include a discussion on the mobile source HRA analysis and health risk reduction strategies in the Final PEIR.

17

South Coast AQMD staff’s detailed comments on the Draft EIR’s air quality analysis and health risk assessment are provided as follows.

1. CEQA Baseline

Under CEQA, baseline conditions exist at the time of the environmental review is initiated or as they exist at the time the Notice of Preparation (NOP) is published, if there is a published NOP. Notwithstanding this general rule, the use of future baseline is proper in some cases, when supported by substantial evidence in the record. Consideration of future conditions in

18

⁴ Ibid. Page 77.

determining whether a project’s impacts may be significant is consistent with CEQA’s rules regarding baseline, especially when the project has a long-term implementation schedule such as the Proposed Project. “[N]othing in CEQA law precludes an agency ... from considering both types of baseline—existing and future conditions—in its primary analysis of the project’s significant adverse effects.” (*Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 454.). “Even when a project is intended and expected to improve conditions in the long term—20 or 30 years after an EIR is prepared—decision makers and members of the public are entitled under CEQA to know the short- and medium-term environmental costs of achieving that desirable improvement. ... [¶] ... The public and decision makers are entitled to the most accurate information on project impacts practically possible, and the choice of a baseline must reflect that goal.” (See also *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310).

SCAG quantified the Proposed Project’s on-road mobile source emissions for the 2019 baseline year and the 2045 future year. The 2019 existing conditions were held constant (i.e. using emission rates from year 2019) and compared to the 2045 future year (i.e. using emission rates from the future year). SCAG found that ROG and NOx emissions with the Proposed Project in 2045 would be lower than the existing conditions in 2019, but PM2.5 and PM10 emissions would increase due to VMT increases across the region⁵. This approach using a comparison between the Proposed Project’s impacts in the future year (using emission rates from year 2045) and the 2019 baseline (using emission rates from year 2019) improperly credits the Proposed Project with emission reductions that will occur independent of the Proposed Project due to adopted federal and state rules and regulations, and clean vehicle and fuel technologies, since these rules, regulations, and technologies are expected to improve air quality over time, even in the absence of the Proposed Project, which SCAG has acknowledged in the Draft PEIR⁶. For example, the California Air Resources Board’s (CARB) current regulation for trucks and buses will provide significant near-term and long-term reductions in NOx emissions from trucks and buses, at 98 tons per day for 2023⁷. Since the Proposed Project anticipates that VMT will increase between 2019 and 2045 in all counties⁸, NOx emission reductions in year 2045 are likely due to implementation of CARB’s regulation and other efforts at promoting zero and near-zero emissions vehicles and cleaner fuel standards. Therefore, the baseline used to analyze the Proposed Project’s long-term air quality impacts from on-road mobile sources in the Draft PEIR likely led to an under-estimation of actual emission increases, and is misleading and uninformative.

18

The purpose of CEQA is to disclose environmental impacts from the Proposed Project to the public and decision makers to provide the public and decision makers with the actual changes to the environment from the activities involved in the Proposed Project. By taking credit for future emission reductions from existing air quality rules, regulations, and technologies that are not contributed by the Proposed Project, the Proposed Project’s air quality impacts are

⁵ *Ibid.* Pages 3.3-57 to 61.

⁶ *Ibid.*

⁷ California Air Resources Board. July 14, 2017. Trucks and Bus Regulation: On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation. Accessed at: <https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm>, and <https://www.arb.ca.gov/msprog/onrdiesel/documents/truckrulehealth.pdf>.

⁸ Draft PEIR. Pages 3.3-57 to 61.

likely underestimated. Therefore, South Coast AQMD staff recommends that SCAG revise the air quality analysis to calculate emissions in year 2019, year 2020, year 2030, year 2035, and year 2045 with the Proposed Project and emissions in those same years without the Proposed Project. These interim analysis years correspond to the same interim analysis years that SCAG used to quantify the Proposed Project’s greenhouse gas (GHG) emissions⁹. (See also Comment No. 3). SCAG should compare the emissions with the Proposed Project to the emissions without the Proposed Project in the same interim analysis years and use the comparison to determine the level of significance for the Proposed Project’s air quality impacts from on-road mobile sources.

18

2. Air Quality CEQA Thresholds of Significance

While CEQA allows that a Lead Agency may select a threshold to determine the level of significance, SCAG may not apply a threshold of significance in a manner that precludes consideration of substantial evidence demonstrating that there may be a significant effect on the environment. Evaluation of air quality impacts, unlike some other impact areas, easily lends itself to quantification. Not only does quantification make it easier for the public and decision-makers to understand the breadth and depth of the potential air quality impacts, but it also facilitates the identification of mitigation measures required to reduce any significant adverse air quality impacts. South Coast AQMD’s CEQA thresholds of significance for air quality provide a clear quantitative benchmark to determine the level of significance for a project’s air quality impacts. Therefore, for most projects within the South Coast AQMD’s jurisdiction, South Coast AQMD’s air quality CEQA significance thresholds for construction and operation¹⁰ are used to determine the level of significance of a project’s air quality impacts.

19

SCAG quantified the Proposed Project’s on-road mobile source emissions of criteria pollutants for the region but did not compare the South Coast AQMD’s portion of the emissions to South Coast AQMD’s regional air quality CEQA significance thresholds to determine the level of significance. Since the South Coast AQMD relies on SCAG’s air quality analysis for on-road mobile sources, South Coast AQMD staff recommends that SCAG identify the South Coast AQMD’s portion of the on-road mobile source emissions and compare those emissions to South Coast AQMD’s regional air quality CEQA significance thresholds in the Final PEIR to determine the level of significance. Using South Coast AQMD’s CEQA significance thresholds would clearly disclose the magnitude of air quality impacts from on-road mobile sources, facilitate the identification of feasible mitigation measures, strengthen the evaluation of the level of impacts before and after mitigation measures, and contribute to the selection of a range of reasonable alternatives to the Proposed Project based on the air quality impacts.

3. Air Quality Interim Analysis Years

The air quality analysis in the Draft PEIR included only two analysis years: baseline year (2019) and buildout year (2045). (See also Comment No.1). Although the Proposed Project may not be at the peak development capacity in earlier years, it is possible that due to higher

20

⁹ Draft PEIR. Section 3.8. Table 3.8-8. Page 3.8-64.

¹⁰ South Coast Air Quality Management District. March 2015. *South Coast AQMD Air Quality Significance Thresholds*. Accessed at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf>.

emission rates of vehicles and trucks in earlier years, peak daily emissions from on-road mobile sources may occur early and gradually decrease over time. The overall emission rates of vehicles and trucks are generally higher in earlier years as more stringent emission standards and cleaner technologies have not been fully implemented, and fleets have not fully turned over. Air quality is improving over time with substantial emission reductions occurring in later years. Therefore, South Coast AQMD staff recommends that SCAG include interim analysis years for the air quality analysis, corresponding to the same interim analysis years (i.e., year 2020, year 2030, and year 2035) that SCAG used to quantify the Proposed Project’s GHG emissions¹¹, to ensure the peak daily emissions are identified and adequately disclosed in the Final PEIR. The interim analysis years will also demonstrate progress in emission reductions over time from implementing the Proposed Project’s strategies and the air quality mitigation measures included in the PEIR.

4. Air Quality Impact Analysis Based on the South Coast AQMD’s 2016 AQMP Forecasts

As stated above, the Proposed Project includes transportation strategies and investments for the region’s transportation network of roads, highway, arterials, transit, rail, seaports, and airports. It also includes land use strategies to promote a more compact form of development. To analyze the air quality impacts, SCAG used the South Coast AQMD’s 2016 AQMP forecasts of annual average off-road mobile emissions and stationary source emissions for years 2019, 2022, 2023, 2025, and 2031 in the Basin as a proxy for these emissions throughout the SCAG region¹².

This analysis approach is not appropriate for three reasons. First, the 2016 AQMP forecasts are emission inventories and projections, using 2012 as the base year and air quality measures implemented since adopting the 2012 AQMP¹³. They provide the historic (since 2012) and existing air quality conditions in 2019 at the time the Draft PEIR was prepared. Therefore, SCAG discussed the existing air quality conditions, but did not properly assess the incremental air quality impacts of direct emissions from implementing the Proposed Project’s transportation strategies for off-road mobile sources (e.g., locomotives, ocean-going vessels, commercial harbor craft, cargo handling equipment, farm equipment, and aircraft¹⁴) or land use strategies. Second, the 2016 AQMP forecasts include emission projections until year 2031. Since the Proposed Project has a planning horizon until year 2045, it is not appropriate to use the 2016 AQMP forecasts, which are baseline conditions, to analyze the air quality impacts from the Proposed Project, which will be implemented beyond year 2031. Third, the Proposed Project covers a six-county region and includes five air quality and air pollution control districts, including the South Coast AQMD. In the Draft PEIR, SCAG used the 2016 AQMP forecasts for the South Coast AQMD as a proxy for emissions throughout the entire region but did not provide emissions from other air districts or explain why it was appropriate to use the South Coast AQMD’s forecasts as a proxy for the SCAG region. Even if using the 2016 AQMP forecasts is found to be an adequate analysis methodology, SCAG only analyzed a portion of the region within the South Coast AQMD. Therefore, South Coast

¹¹ Draft PEIR. Section 3.8. Table 3.8-8. Page 3.8-64.

¹² *Ibid.* Page 3.3-55.

¹³ South Coast AQMD. Final Program EIR for the 2016 AQMP. Page 2-13. Accessed at: <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2016/2016aqmpfpeir.pdf>.

¹⁴ *Ibid.* Page 3.2-6.

AQMD staff recommends that SCAG revise the air quality analysis in the Final PEIR based on the following recommendations.

Air Quality Analysis for Construction and Operational Air Quality Impacts

When specific development is reasonably foreseeable as a result of the goals, policies, and strategies in the Proposed Project, SCAG should identify any potential adverse air quality impacts and sources of air pollution that could occur using its best efforts to find out and a good-faith effort at full disclosure in the PEIR. The degree of specificity will correspond to the degree of specificity involved in the underlying activity which is described in the EIR (CEQA Guidelines Section 15146). When quantifying air quality emissions, emissions from both construction (including demolition, if any) and operations should be calculated. Preparing the CEQA analysis “necessarily involves some degree of forecasting. While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can” (CEQA Guideline Section 15144).

When the precise construction and operational scenarios are unknown, SCAG should use its best efforts to identify and quantify a worst-case construction and operational air quality impact scenario that is reasonably foreseeable at the time the Draft PEIR is prepared. While this comment may not change SCAG’s findings that the Proposed Project’s construction and operational air quality impacts would be significant and unavoidable¹⁵, a quantitative analysis will facilitate the goal and purpose of CEQA on public disclosure with useful information on the magnitude of air quality impacts that could occur from implementing the Proposed Project and foster meaningful public participation and informed decision making.

21

Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). As discussed in Section 2.0, *Project Description*, in the Draft PEIR, the Proposed Project anticipates an annual growth rate of 0.6 percent, resulting in a net growth of 3.2 million people, 1.4 million households, and 1.4 million jobs between 2019 and 2045¹⁶. To accommodate growth, SCAG has identified development potential around the region’s job centers, transit priority areas, high quality transit areas, neighborhood mobility areas, and livable corridors. Therefore, SCAG can and should use this information to develop a construction scenario for land use development. One way to calculate the Proposed Project’s construction emissions would be based on an estimated average annual level of development. SCAG should use the most current version of California Emission Estimator Model (CalEEMod)¹⁷ to quantify construction emissions and compare the emissions to air districts’ regional air quality CEQA significance thresholds to determine the level of significance.

Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular

¹⁵ *Ibid.* Pages 3.3-60 and 61.

¹⁶ Draft PEIR. Page 2.0-14.

¹⁷ South Coast AQMD. CalEEMod Version 2016.3.2. Accessed at: <http://www.aqmd.gov/caleemod/download-model>.

trips (e.g., on- and off-road tailpipe emissions and entrained dust). In Section 3.8, *Greenhouse Gases*, in the Draft PEIR, in addition to quantifying GHG emissions for on-road mobile sources, SCAG quantified GHG emissions for off-road vehicles (rail, aviation, and ocean-going vessels), building energy, and water-related energy consumptions in year 2019 (baseline year), year 2020 (with and without the Proposed Project), year 2030 (with the Proposed Project), year 2035 (with the Proposed Project), and year 2045 (with and without the Proposed Project)¹⁸. To be consistent with the GHG emissions analysis which included both on-road and off-road vehicles, and to provide a better and more complete understanding of the Proposed Project’s operational air quality impacts, South Coast AQMD staff recommends that SCAG quantify the Proposed Project’s operational emissions for off-road vehicles and add those emissions to on-road mobile source emissions to determine the level of significance in the Final PEIR. (See also Comment Nos 1 and 3). If emissions from off-road vehicles are not included in the Final PEIR, SCAG should provide reasons for not including them supported by substantial evidence in the record.

21

5. Air Quality Analysis – Overlapping Construction and Operational Activities

Based on a review of the air quality analysis, South Coast AQMD staff found that SCAG did not analyze a scenario where construction activities overlap with operational activities. Since implementation of the Proposed Project is expected to occur over a period of 20 years, an overlapping construction and operation scenario from transportation and land use projects is reasonably foreseeable. Therefore, South Coast AQMD staff recommends that SCAG discuss an air quality impact scenario where construction and operational activities overlap and make a significance determination in the Final PEIR; otherwise, SCAG has not discussed the Proposed Project’s air quality impacts from overlapping construction and operational activities that will likely take place during the implementation of the Proposed Project in the PEIR.

22

6. Health Risk Assessment (HRA) Analysis

Implementation of the Proposed Project would result in development of new transportation projects near existing sensitive receptors or locating new receptors near transportation projects¹⁹. SCAG conducted a mobile source HRA analysis to evaluate the cancer risk for residents from exposures to DPM emissions from 16 transportation segments throughout the SCAG region. As shown in Table 3.3-16 in the Draft PEIR, the highest cancer risk would be 41.3 in a million along Interstate 15 in the Victorville area in San Bernardino County (Segment 13: SB I-15 VIC), followed by 30.9 in a million along Interstate 710 in the Compton area in Los Angeles County (Segment 4: LA I-710)²⁰. Because cancer risk for each of transportation segment in 2045 is significantly reduced when it is compared to that in 2019, SCAG determined that the Proposed Project’s health risk impacts would be less than significant.

23

South Coast AQMD staff does not agree with SCAG’s significance determination. It is not appropriate to determine the level of significance for cancer risk based on a comparison between the existing condition (year 2019) and the future condition (year 2045). (See also

¹⁸ Draft PEIR. Pages 3.8-62 to 66.

¹⁹ *Ibid.* Page 3.3-76.

²⁰ *Ibid.* Table 3.3-16.

Comment No. 1 on CEQA Baseline). To determine the level of significance for cancer risk, South Coast AQMD staff recommends that SCAG compare the maximum exposed individual residential cancer risk for each of the transportation segments in 2045 to South Coast AQMD’s CEQA significance threshold of 10 in a million for cancer risk in the Final PEIR. As shown in Table 3.3-16, 12 of 16 transportation segments would exceed the CEQA significance threshold of 10 in a million for cancer risk.

23

7. Recommended Revisions Existing Project-Level Mitigation Measure (PMM-AQ-1 q))

SCAG included a project-level air quality mitigation measure (PMM-AQ-1 a) through q) for consideration by lead agencies that implement individual transportation and land use projects. South Coast AQMD staff recommends that SCAG incorporate the following revisions to PMM-AQ-1 q) in the Final PEIR. The recommended revisions will provide more details on the requirement for Tier 4 construction equipment, provide guidance on project-level implementation and monitoring, and facilitate CEQA streamlining and tiering as an option from the PEIR by subsequent, project-level environmental analyses, where appropriate.

- a) **PMM-AQ-1 q)** ~~Require projects within 500 feet of residences, hospitals, or schools to use Tier 4 Final equipment or better for all engines above 50 horsepower (hp). Include this requirement in applicable bid documents, purchase orders, and contracts. Successful contractor(s) must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. A copy of each unit’s certified tier specification or model year specification shall be available upon request at the time of mobilization of each applicable unit of equipment. Require periodic reporting and provision of written construction documents by construction contractor(s) to ensure compliance, and conduct regular inspections to the maximum extent feasible to ensure compliance. In the event that construction equipment cannot meet the Tier 4 Final engine certification, the Project representative or contractor must demonstrate through future study with written findings supported by substantial evidence that is approved by SCAG before using other technologies/strategies. Alternative applicable strategies may include, but would not be limited to, construction equipment with Tier 4 Interim or reduction in the number and/or horsepower rating of construction equipment and/or limiting the number of construction equipment operating at the same time. All equipment must be tuned and maintained in compliance with the manufacturer’s recommended maintenance schedule and specifications. All maintenance records for each equipment and their contractor(s) should be made available for inspection and remain on-site for a period of at least two years from completion of construction, unless the individual project can demonstrate that Tier 4 engines would not be required to mitigate emissions below significance thresholds.~~

24

8. Additional Recommended Project-Level Mitigation Measures

CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate significant adverse impacts. The Proposed Project is a blueprint for the region’s future development. The Draft PEIR for the Proposed Project serves as the first-tier, programmatic level analysis that can provide guidance to subsequent, project-level environmental analyses. Therefore, it

25

is the intent of SCAG that lead agencies for individual transportation and land use projects that may be eligible for CEQA streamlining incorporate project-level mitigation measures as feasible and appropriate to tier from the PEIR²¹.

On February 19, 2019, South Coast AQMD staff provided comments on the Notice of Preparation (NOP) for the Proposed Project, available at: <http://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2019/february/ALL190123-01.pdf>, and recommended specific air quality mitigation measures for SCAG to include in the Draft PEIR. South Coast AQMD staff incorporates by reference those recommended mitigation measures and requests that SCAG include them in the Final PEIR. Specifically, SCAG should include the following mitigation measures to reduce and accelerate the reduction of on-road mobile source emissions. The recommended mitigation measures are consistent with the Proposed Project’s goal of improving air quality and public health (Goal No. 5)²², provide guidance on the feasibility of mitigation measures with specific performance standards, and support the Draft PEIR’s intended use as the first-tier, programmatic environmental analysis to facilitate CEQA streamlining and tiering by subsequent, project-level environmental analyses.

- Require zero-emissions (ZE) or near-zero emissions (NZE) on-road haul trucks such as heavy-duty trucks with natural gas engines that meet CARB’s adopted optional NOx emissions standard at 0.02 grams per brake horsepower-hour (g/bhp-hr), if and when feasible. At a minimum, require that vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export) that meet CARB’s 2010 engine emissions standards at 0.01 g/bhp-hr of particulate matter and 0.20 g/bhp-hr of NOx emissions or newer, cleaner trucks²³. When requiring ZE or NZE on-road haul trucks, SCAG should include analyses to evaluate and identify sufficient power and supportive infrastructure available for ZE/NZE trucks in the Energy and Utilities and Service Systems Sections of the Final PEIR, where appropriate. To monitor and ensure ZE, NZE, or 2010 model year or newer trucks are used, require that operators maintain records of all trucks associated with the operation, and make these records available to SCAG upon request. The records will serve as evidence to prove that each truck called met the minimum 2010 model year engine emission standards. Alternatively, require periodic reporting and provision of written records by operators, and conduct regular inspections of the records to the maximum extent feasible and practicable.
- Encourage construction contractors to apply for South Coast AQMD “SOON” funds. The “SOON” program provides funds to applicable fleets for the purchase of commercially-available low-emission heavy-duty engines to achieve near-term reduction of NOx emissions from in-use off-road diesel vehicles. More information on this program can be found at South Coast AQMD’s website: <http://www.aqmd.gov/home/programs/business/business-detail?title=off-road-diesel-engines>.

25

²¹ *Ibid.* Page 2.0-40

²² *Ibid.* Page 2.0-21.

²³ Based on a review of the California Air Resources Board’s diesel truck regulations, 2010 model year diesel haul trucks should have already been available and can be obtained in a successful manner for the project construction California Air Resources Board. March 2016. Available at: <http://www.truckload.org/tca/files/ccLibraryFiles/Filename/000000003422/California-Clean-Truck-and-Trailer-Update.pdf> (See slide #23).

- Enter into applicable bid documents, purchase orders, and contracts to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy²⁴. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the site. To further ensure that drivers understand the vehicle idling requirement, post signs at the site, where appropriate, stating that idling longer than five minutes is not permitted.
- Require at least five percent of all vehicle parking spaces include electric vehicle (EV) charging stations, or at a minimum, require the appropriate infrastructure to facilitate sufficient electric charging for passenger vehicles and trucks to plug-in. Electrical hookups should be provided at the onsite vehicle stop for to plug in any onboard auxiliary equipment. Electrical panels should be appropriately sized to allow for future expanded use. Include analyses to evaluate and identify sufficient power available for zero emissions trucks and supportive infrastructures (e.g., EV charging stations) in the Energy and Utilities and Service Systems Sections of the Final PEIR, where appropriate.
- The Proposed Project includes areas that are heavily impacted by air pollution. Assembly Bill (AB) 617, which was signed into law in 2017, requires South Coast AQMD to work with community and other stakeholders to identify and address community concerns in disadvantaged communities suffering from disproportionate air pollution impacts generated from sources, such as marine ports, warehouses, railyard facilities, heavy-duty diesel trucks, and oil drilling and production facilities. Through the AB 617 program, each of the designated AB 617 communities and South Coast AQMD staff develop a Community Emissions Reduction Plan (CERP) that identifies air quality priorities and actions to reduce air pollution in the community. In September 2019, the South Coast AQMD's Governing Board approved three CERPs for the AB 617 communities of Wilmington, Carson, and West Long Beach; East Los Angeles, Boyle Heights, and West Commerce; and San Bernardino and Muscoy that were designated in 2018²⁵. In December 2019, two new AB 617 communities in the Southeast Los Angeles and the Eastern Coachella Valley were designated for inclusion in South Coast AQMD's AB 617 Program²⁶. South Coast AQMD staff recommends that SCAG review the CERPs²⁷ to explore whether additional mitigation measures can and should be included as part of PMM-AQ-1 in the Final PEIR for transportation and land use projects that may use the PEIR for CEQA streaming and tiering.

²⁶ *Ibid.*

²⁷ South Coast AQMD. Accessed at: <http://www.aqmd.gov/home/news-events/meeting-agendas-minutes/agenda?title=governing-board-meeting-agenda-september-6-2019>.

9. Since the Proposed Project includes transportation strategies for rail, seaports, and airports, SCAG should develop and include project-level mitigation measures for off-road mobile sources as part of PMM-AQ-1 in the Final EIR. If the specific details are impractical or infeasible to include, SCAG should develop and include performance standards that the off-road mobile source mitigation measures will achieve (CEQA Guidelines Section 15126.4(a)). Including the mitigation measures and performance standards for off-road mobile sources fulfills SCAG’s legal obligation as SCAG for the Proposed Project to comply with CEQA’s requirements for mitigation measures, serves as a guidance on the feasibility of mitigation measures that can and should be implemented by transportation and land use projects at the region’s seaports and airports, and supports tiering by subsequent, project-level environmental analyses. Specifically, South Coast AQMD staff recommends that the Final PEIR includes the following project-level mitigation measures or other comparable mitigation measures for aircrafts, ground service equipment, cargo handling equipment, locomotives, and ocean-going vessels in PMM-AQ-1.

Aircraft and Ground Service Equipment (GSE)

- Encourage and incentivize aircraft operators to route the cleanest aircraft engines to serve the South Coast Air Basin.
- Consider operational improvements to reduce taxi time and auxiliary power unit usage, where feasible. Additionally, consider single engine taxing, if feasible and as allowed per Federal Aviation Administration guidelines.
- Set goals to achieve a reduction in emissions from aircraft operations over the lifetime of the proposed project.
- Require the use of GSE that can operate on electric battery-power. If electric equipment cannot be obtained, require the use of alternative fuel, the cleanest gasoline equipment, or Tier 4, at a minimum.

Cargo Handling Equipment (CHE)

- Develop specific timelines for transitioning to zero emissions CHE. For example, South Coast AQMD staff recommends a step-down program to require any off-road equipment to be zero emissions first, followed by near-zero emissions, then Tier 4 alternative fuels, and then Tier 4 engine as a floor. The criteria for a step-down program can be based on availability of equipment at the time of purchase and cost of equipment compared to the Tier 4 floor after considering available incentive funds.
- Develop interim performance standards with a minimum amount of CHE replacement each year to ensure adequate progress.

Rail and Locomotives

- Offer incentives to encourage the use of on-dock rail.
- Provide the highest incentives for electric locomotives and then locomotives that meet Tier 5 emission standards with a floor on the incentives for locomotives that meet Tier 4 emission standards.

Shore Power and Infrastructure

- Use shore side electric power for ships, which may include tugboats and other ocean-going-vessels or develop incentives to gradually ramp up the usage of shore power.

Install the appropriate infrastructure to provide shore power to operate the ships. Electrical hookups should be appropriately sized.

Ocean-Going Vessels

- Maximize participation in the Vessel Speed Reduction Program for all vessels transiting within 40 nautical miles of Point Fermin in the region.
- Encourage the participation in the Green Ship Incentives.

26

10. Health Risk Assessment for New Sensitive Land Uses Near Freeways and Other Sources of Air Pollution and Health Risk Reduction Strategies

Notwithstanding the court rulings, South Coast AQMD staff recognizes that the lead agencies that approve CEQA documents retain the authority to include any additional information they deem relevant to assessing and mitigating the environmental impacts of a project. Because of South Coast AQMD staff’s concern about the potential public health impacts of siting sensitive populations within close proximity of freeways or other sources of air pollution, South Coast AQMD staff recommends that, prior to approving the project, lead agencies consider the impacts of air pollutants on people who will live in a new project and provide mitigation where necessary.

Implementation of the Proposed Project would result in development of new transportation projects near existing sensitive receptors or locating new receptors near transportation projects²⁸. To disclose the potential health risks for new sensitive land uses that will be sited within 500 feet of freeways or other sources of air pollution, South Coast AQMD staff recommends a mobile source HRA analysis be performed²⁹. Since the PEIR is intended to serve as the first-tier, programmatic analysis for projects in the region, South Coast AQMD staff recommends that SCAG include a discussion on the mobile source HRA analysis in the Final PEIR³⁰ to provide guidance for subsequent, project-level environmental analyses that will tier from the PEIR. Additionally, South Coast AQMD staff recommends that SCAG include the following health risk reduction strategies in the Final PEIR as guidance for future sensitive land use projects that will be sited in close proximity to freeways or other sources of air pollution. These strategies were included in the South Coast AQMD staff’s comment letter on the NOP for the Proposed Project³¹.

27

- Consider high efficiency or enhanced filtration units, such as Minimum Efficiency Reporting Value (MERV) 13 or better for sensitive land use projects that are located within 500 feet of freeways and other sources of air pollution. Enhanced filtration units are capable of reducing exposures. Installation of enhanced filtration units can be verified during occupancy inspection prior to the issuance of an occupancy permit.

²⁸ Draft PEIR. Page 3.3-76.

²⁹ South Coast AQMD. “Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis.” Accessed at: <http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis>.

³⁰ South Coast AQMD has developed the CEQA significance threshold of 10 in one million for cancer risk. When South Coast AQMD acts as SCAG, South Coast AQMD staff conducts a HRA, compares the maximum cancer risk to the threshold of 10 in one million to determine the level of significance for health risk impacts, and identifies mitigation measures if the risk is found to be significant.

³¹South Coast AQMD staff. Accessed at: <http://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2019/february/ALL190123-01.pdf>.

- Enhanced filtration systems have limitations. In a study that South Coast AQMD conducted to investigate filters³², a cost burden is expected to be within the range of \$120 to \$240 per year to replace each filter. The initial start-up cost could substantially increase if an HVAC system needs to be installed. In addition, because the filters would not have any effectiveness unless the HVAC system is running, there may be increased energy costs to the residents. It is typically assumed that the filters operate 100 percent of the time while residents are indoors, and the environmental analysis does not generally account for the times when the residents have their windows or doors open or are in common space areas of the project. Moreover, these filters have no ability to filter out any toxic gases from vehicle exhaust. Therefore, the presumed effectiveness and feasibility of any filtration units should be carefully evaluated in more detail and disclosed to prospective residents prior to assuming that they will sufficiently alleviate health risk exposures to toxic air emissions.
- Because of the limitations, South Coast AQMD staff recommends additional details regarding the ongoing, regular monitoring, inspection, and maintenance of filters be provided. To facilitate a good faith effort at full disclosure and provide useful information to future sensitive receptors who will live and/or work in proximity to freeways or other sources of air pollution, the following information should be included, at a minimum, as guidance to future sensitive land use projects in the subsequent, project-level environmental analyses:
 - a) Disclose potential health impacts to prospective sensitive receptors from living in close proximity to freeways or other sources of air pollution and the reduced effectiveness of air filtration systems when windows are open and/or when residents are outdoors (e.g., in the common usable open space areas);
 - b) Identify the responsible implementing and enforcement agency to ensure that enhanced filtration units are installed on-site before a permit of occupancy is issued;
 - c) Identify the responsible implementing and enforcement agency to ensure that enhanced filtration units are inspected and maintained regularly;
 - d) Disclose the potential increase in energy costs for running the HVAC system to prospective residents;
 - e) Provide information to residents on where MERV filters can be purchased;
 - f) Provide recommended schedules (e.g., every year or every six months) for replacing the enhanced filtration units;

³² This study evaluated filters rated MERV 13 or better. Accessed at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/aqmdpilotstudyfinalreport.pdf>. Also see 2012 Peer Review Journal article by South Coast AQMD: <http://d7.iqair.com/sites/default/files/pdf/Polidori-et-al-2012.pdf>.

- g) Identify the responsible entity such as future residents themselves, Homeowner’s Association (HOA), or property management for ensuring enhanced filtration units are replaced on time, if appropriate and feasible (if residents should be responsible for the periodic and regular purchase and replacement of the enhanced filtration units, the individual project’s lead agency should include this information in the disclosure form);
- h) Identify, provide, and disclose ongoing cost-sharing strategies, if any, for replacing the enhanced filtration units;
- i) Set criteria for assessing progress in installing and replacing the enhanced filtration units; and
- j) Develop a process for evaluating the effectiveness of the enhanced filtration units.

27

Conclusion

Pursuant to California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(b), South Coast AQMD staff requests that SCAG provide South Coast AQMD staff with written responses to all comments contained herein prior to the certification of the Final PEIR. Issues raised in the comments should be addressed in detail giving reasons why specific comments and suggestions are not accepted. There should be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice (CEQA Guidelines Section 15088(c)). Conclusory statements do not facilitate the purpose and goal of CEQA on public disclosure and are not meaningful, informative, or useful to decision makers and to the public who are interested in the Proposed Project. Further, when SCAG makes the finding that the recommended revisions to existing air quality mitigation measures and additional new air quality mitigation measures are not feasible, SCAG should describe the specific reasons supported by substantial evidence for rejecting them in the Final PEIR (CEQA Guidelines Section 15091).

REG-3

**VENTURA COUNTY
AIR POLLUTION CONTROL DISTRICT**
Memorandum

TO: Southern California Association of Governments (SCAG)
DATE: January 23, 2020
FROM: Nicole Collazo, Planning Division
SUBJECT: Public Comment for Draft Programmatic Environmental Impact Report (DPEIR)
for the Connect SoCal 2020-2045 RTP/SCS Project (RMA 19-001-1)

The Ventura County Air Pollution Control District (APCD) staff has reviewed the DPEIR for the project referenced above in the areas of Air Quality and Greenhouse Gases for Ventura County. The project is a long-range regional transportation plan that provides a blueprint for the region to achieve coordinated regional land use strategies and transportation investments. The project location extends the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The project Lead Agency for preparation of the DPEIR is SCAG.

1

GENERAL COMMENTS

In accordance with State CEQA Statute Section 21091, APCD submits this memo as commenting agency to the Lead Agency for the project referenced above.

Air Quality

Item 1- Page 3.3-19. It should be clarified that emissions presented in Table 3.3-5 are *motor vehicle emissions*, not stationary or grand total county emission estimates.

2

Item 2- Page 3.3-46. Per the latest CEQA Guidelines Update, item b of the Appendix G Environmental Checklist Form is no longer recommended (Violate any air quality standard or contribute substantially to an existing or projected air quality violation?).

3

Item 3- Page 3.3-56. The statement “The SCCAB and portions are the SSAB are also in nonattainment for PM2.5.” is incorrect. The SCCAB (Ventura Portion) is in attainment for PM2.5, as shown in Table 3.3-4.

4

Greenhouse Gases

Item 1- Page 3.8-49. Under the Ventura County section, a brief summary should be included regarding the County of Ventura’s proposed Climate Action Plan. More information can be found [here](#).

5

Item 2- Table 3.8-4. The County of Ventura is currently developing a Climate Action Plan (CAP) that is being integrated into its General Plan Update 2020-2040. It also contains General Plan Implementation Measures for GHG-reductions and General Plan Policies related to climate change. The County’s CAP has not been adopted yet. A DEIR was publicly released on January 13, 2020. More information can be found [here](#). The table has a CAP as adopted(A). The General Plan Update contains General Plan Implementation Measures for GHG-reductions and General Plan Policies related to climate change, as listed in Table 3.8-4.

6

Item 3- Page 3.8-67. We’d like to note that an even larger fire, the Thomas Fire, occurred in December 2017, burning approximately 281,893 acres and damaging/destroying 1,343 structures.

7

Thank you for the opportunity to comment on the DPEIR. Should you have any questions, you may reach me at 805-645-1426 or via email at nicole@vcapcd.org.

8

SUB-1

January 23, 2020

Mr. Kome Ajise
Executive Director
Southern California Association of Governments
900 Wilshire, Suite 1700
Los Angeles, California 90017

Subject: Orange County Council of Governments Comments for Connect SoCal 2020 RTP/SCS and PEIR

Transmitted via email

Dear Mr. Ajise:

On behalf of the Orange County Council of Governments (OCCOG), I would like to thank you for the opportunity to comment on the Southern California Association of Governments (SCAG) draft 2020 - 2045 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) (a.k.a. Connect SoCal) and the associated Program Environmental Impact Report (PEIR). The draft 2020 RTP/SCS and PEIR is a monumental effort and the OCCOG recognizes that the documents are critical to the region's ability to receive federal funding for transportation projects, improve mobility, support sustainable development, operate and maintain the transportation system, and meet the region's greenhouse gas emission reduction targets and other air conformity standards.

As we have in past RTP/SCS cycles, the OCCOG Technical Advisory Committee (OCCOG TAC) comprised of agency planning staff convened an ad hoc committee dedicated to the review of the draft 2020 RTP/SCS and PEIR. The ad hoc committee includes representation from the OCCOG; the cities of Anaheim, Irvine, San Clemente, and Yorba Linda; the County of Orange; the Orange County Transportation Authority; the Transportation Corridor Agencies; and the Center for Demographic Research at California State University Fullerton. This committee met four times during the public comment period, and has collectively spent over one hundred hours reviewing the draft Plan and documents, and preparing comments that incorporated additional feedback provided by Orange County jurisdictions and agencies.

1

SUB-1

The OCCOG TAC review and analysis was discussed by the OCCOG Board at the January 23, 2020 Board of Directors meeting and serves as the basis for OCCOG’s comments.

The following general comments and recommendations are offered by OCCOG on the draft 2020 Connect SoCal Plan and PEIR and all associated appendices. In addition to these policy-level comments, we have more detailed technical comments provided in the matrix that follows as Attachment 1. OCCOG requests that the letter and attachments be included in the public record as our collective comments on the draft 2020 Connect SoCal Plan, PEIR, and associated documents.

1

Policy-Level Comments

1. *Concurrence with the Comments from the Orange County Transportation Authority, Transportation Corridor Agencies, and Center for Demographic Research*

The OCCOG concurs with the comments identified by OCTA in its letter. OCTA has identified policy and technical issues related to the draft 2020 RTP/SCS and PEIR that are of concern to Orange County. These are focused on the regional strategies that go above and beyond the projects submitted by the county transportation commissions (CTCs). Further, we support the technical comments presented by the Transportation Corridor Agencies and the Center for Demographic Research in their letters.

2

2. *High-Quality Transit Corridors (HQTCS) and High-Quality Transit Areas (HQTAs)*

The alignment of SCAG’s Regional Housing Needs Assessment (RHNA) and RTP/SCS documents are required by Government Code Section 65080(b)(2)(B) and Section 65584.04(m). The proposed methodology SCAG submitted to the Department of Housing and Community Development (HCD) indicates that the HQTAs identified in the RTP/SCS using the 2045 planning year are to be used for RHNA purposes of evaluating “transit access.” OCCOG is concerned that the HQTAs as mapped in the draft RTP/SCS are inconsistent with SCAG’s definition for HQTAs. The draft RTP/SCS defines HQTAs as “generally a walkable transit village or corridor, consistent with the adopted RTP/SCS, and is within one half-mile of a well-served transit stop or a transit corridor with 15-minute or less service frequency during peak commute hours.” The draft RTP/SCS further notes that SCAG based the definition on language in SB 375 which defines Major Transit Stops and High-Quality Transit Corridors (HQTCS). HQTCS are “corridor[s] with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.” The definition for HQTCS does not account for walkability.

3

SUB-1

OCCOG recommends revising the identification of HQTAs to reflect the nuance with certain HQTCs that fail to meet the “walkable corridor” characterization. Namely, HQTC segments operating on freeways are clearly not walkable and should be treated similar to rail transit service (i.e. as a Major Transit Stop).

Recommendations: Correct the mapping of HQTAs to remove freeway-running HQTCs segments and treat applicable stops as Major Transit Stops for those segments operating on a freeway. To the extent practicable, align the definition of HQTAs used in the RTP/SCS and RHNA with the definition used for funding purposes by the Strategic Growth Council in disseminating cap and trade funding to ensure that the SCAG region is able to compete for available funds related to transit-oriented housing.

3

3. Process Concerns

Effective Use of the Technical Working Group OCCOG appreciates the opportunity to participate in ongoing advisory groups that inform the work of SCAG staff as it relates to mandated work products, including the RTP/SCS and PEIR, as well as the Regional Housing Needs Assessment (RHNA). We have repeatedly suggested that SCAG staff review the constitution of and reliance on the Technical Working Group (TWG) comprised of planning staff from SCAG member agencies and experts across the region. OCCOG strongly believes this is an underutilized resource for SCAG and that a stronger partnering and collaborative approach with the TWG would render a much-needed technical peer review for SCAG prior to public release of documents, strengthening the ultimate work products and providing a value-added opportunity for expertise to be offered to SCAG from partner agencies.

Subject Matter Working Groups In the 2020 RTP/SCS process, SCAG created a number of new issue-specific working groups with expanded memberships to reach a greater spectrum of stakeholders. We applaud this proactive step to ensure that more voices are included in the preparation of the Plan, but we are concerned that the manner in which these additional working groups were constituted. Their lack of interaction with the long-standing TWG does not allow for member jurisdictions to be adequately engaged on issues across the spectrum and led to silos of information. Additionally, from a practical standpoint, working group meetings were held only in downtown Los Angeles and often included activities with breakout groups, which limited the ability of remote participants to effectively contribute or hear what is being discussed.

4

Timeline Does Not Allow For Adequate Revision In addition to the structure of working groups, we emphatically recommend the timeline for development of the RTP/SCS be revised in the 2024

SUB-1

cycle to allow for a more robust review process that would ensure that comments being provided as part of the public comment period have the opportunity to be fully considered by SCAG staff and the policy committees, and stakeholders and jurisdictions have the opportunity to ensure that comments have been addressed prior to asking the Regional Council to adopt the final plan.

Do Not Cut off Regional Council Discussion Finally, OCCOG is concerned that the Regional Council agenda at the March 6, 2020 meeting when the Connect SoCal Plan is to be considered for approval is extremely crowded. It is our understanding that the agenda will also include a controversial item regarding the RHNA, as well as the RTP/SCS and PEIR; both topics require considered debate and are likely to generate discussion among policy makers. Given the manner the November 7, 2019 Regional Council meeting was conducted, with discussion being cut off to accommodate certain Regional Council members who had travel plans, we strongly recommend that SCAG prepare Regional Council members for a lengthy meeting that will allow for a full and robust policy discussion that does not cut off debate or comment.

4

Recommendations: Use the TWG as an actual working group to provide review and counsel to SCAG staff in direct support of the work of SCAG policy committees or even to the policy committees directly. Have liaisons from each subject-matter working group report out at the TWG so TWG members are aware of all ongoing issues and avoid information silos. Begin the RTP/SCS process earlier in the 2024 cycle and release drafts 6 months earlier to ensure that there is adequate time after the initial draft is released for SCAG to fully respond to and incorporate comments, especially as relates to the need for data corrections. Inform Regional Council members ahead of time that the agenda is lengthy and prepare them to allocate additional time should discussion exceed the normally-allotted 2 hours for a meeting.

4. Growth Forecast

OCCOG greatly appreciates the close coordination between SCAG and CDR on behalf of Orange County jurisdictions to ensure the 2020 RTP/SCS growth forecast accurately reflects development agreements; entitlements; current construction and recent construction; open space; and general plan densities.

5

On December 11, 2019, CDR provided SCAG the technical corrections to the draft 2020 RTP/SCS growth forecast dataset on behalf of Orange County jurisdictions so the final RTP/SCS growth forecast would accurately reflect entitlements; development agreements; projects recently completed or under construction; open space; and general plan densities.

SUB-1

CDR requested a copy of the final draft growth forecast dataset to confirm that all the technical corrections had been included in the final RTP/SCS growth forecast, but was informed on January 14, 2020 that SCAG would not provide a copy of the final draft growth forecast dataset to CDR for review until mid-February 2020. To simplify matters, it is strongly recommended that SCAG utilize the 2018 Orange County Projections (OCP-2018) dataset provided to SCAG during its Bottom-Up Local Input and Envisioning Process to ensure that general plan capacities are not exceeded and all open space and entitlements are properly reflected.

5

We oppose any alternative in the PEIR that does not utilize local input or, at the very least, use the jurisdictional totals provided through the local input process. Any alternative that does not properly reflect all development agreements, open space protections, and recent or ongoing construction should not be utilized as the preferred alternative. We further note that the failure to rely on accurate jurisdictional-level data divorces it from the methodology proposed in the RHNA as required by Government Code Section 65080(b)(2)(B) and Section 65584.04(m) and we believe this must be remedied in the final Connect SoCal Plan.

6

Recommendations: OCCOG cannot yet support the adoption of the Connect SoCal 2020 RTP/SCS growth forecast at the jurisdictional level until we have been assured that the dataset has been corrected. OCCOG does not support the intensified land use scenario as presented in the Connect SoCal Plan, and recommends aligning the RHNA with the RTP/SCS as required by Government Code Section 65080(b)(2)(B) and Section 65584.04(m).

5. *Remain Neutral on Technology*

Throughout the documents, there are specific examples of technology identified. It is not SCAG’s purview to pick winners and losers in technology; the marketplace will determine dominant technologies. Therefore, it should be noted that these are only examples and that future technologies should not be ignored or excluded from meeting the goals of the RTP/SCS. This will allow the document, including mitigation measures, to be more inclusive of and responsive to changing technological advances.

7

Recommendation: The RTP/SCS and PEIR documents should emphasize SCAG’s desire to facilitate and support innovation, but avoid naming specific technologies or providers (e.g., “TNCs” not “Uber and Lyft” or “zero emissions” instead of “electrification”).

SUB-1

6. *Maintain Unbiased, Objective Tone*

Language throughout the draft Connect SoCal Plan and PEIR and the associated appendices has a tendency to be leading and dramatic in its emphasis of certain key issues, such as active transportation, public health, and land use policy. While these issues are important, using opinion-based and emotionally-charged language is inappropriate in this context.

8

Recommendation: SCAG should remove, wherever applicable, opinion and biased descriptive language that does not reflect the fact-based, data-driven nature of this critical document in favor of a more unbiased, objective tone that embraces the diversity of the region. Examples of overly emphatic language are outlined in Attachment 1.

7. *“Can and Should”*

As indicated in the PEIR, state law provides that it is appropriate to indicate in mitigation measures that they “can and should” be implemented where the authority to implement the measures rest with agencies other than SCAG. The language conveys to local agencies an affirmative obligation to address each mitigation measure, irrespective of whether such agencies deem the measures applicable to a particular project or duplicative of their own or other governmental agencies’ regulatory measures. OCCOG recognizes SCAG’s use of the words “can and should” are derived from California Environmental Quality Act (CEQA), at Public Resources Code sections 21081 and 2155.2(b)(5)(B)(ii) and CEQA Guidelines, including section 15091(a)(2). Nevertheless, given the express limitation of SB 375 upon respective local agencies’ land use authority, OCCOG deems inappropriate any language seemingly imposing affirmative obligations contrary to SB 375 inappropriate. As such, the use of the language “can and should” for mitigation measures addressed to local agencies is overreaching.

9

Recommendation: Change language in all project level mitigation measures to read “~~can and should~~ consider where applicable and feasible.” This change will clarify that the project level mitigation measures are a menu of options.

8. *Duplicative/Existing Regulations*

It is noted that many of the mitigation measures are duplicative of existing regulation or processes (e.g., CEQA review requirements). Under CEQA, it is intended that measures be identified that will mitigate impacts of the project. Mitigation measures should address only those actions that need to be undertaken in addition to existing regulation in order to mitigate the impact. Therefore, mitigation measures that simply restate existing regulation are not valid mitigation for purposes of CEQA. Further, it is possible for regulations to change

10

SUB-1

over time. Because of this, restatement of the regulation in the mitigation measures could result in future conflict between the stated mitigation and regulation. It has become common practice to state that existing regulation will be implemented. When this is done, it is common practice when compliance is used as a mitigation measure to simply state that the responsible entity will simply comply with the regulation. If mitigation measures that restate existing regulation are not removed, then it is requested that the wording of the measures be restated to simply read that compliance with all applicable laws and regulations will be undertaken. Language that could be used is: “Local jurisdictions, agencies, and project sponsors shall comply, as applicable, with existing federal, state, and local laws and regulations.” Similar language is included in some mitigation measures.

10

9. Cities vs. Jurisdiction

Throughout the 2020 RTP/SCS, PEIR, and associated appendices, there are references to “cities”. Since the SCAG region also includes counties, it is recommended that references to “city” or “cities” are changed to “jurisdiction” or “jurisdictions” where appropriate.

11

Recommendation: Change references to “city” or “cities” to “jurisdiction” or “jurisdictions” where appropriate.

10. Spell out Acronyms Prior to Using Abbreviations

There are many different abbreviations used throughout the documents. To avoid confusion and help persons unfamiliar with technical jargon, spelling out the acronyms prior to using them for the first time is common; however, this is often missing in the Connect SoCal documents.

12

Recommendation: Spell out the words in an acronym first before using it. Include a glossary for common acronyms and jargon definitions in the appendices for each technical report.

11. Provide Sources for All Graphics and Tables

When a report of such complexity as the Connect SoCal Plan is produced, it is common for tables, maps, and other graphics to be used or referred to in a manner that could divorce them from the context in which they are presented. For instance, someone may come upon a chart that explains a topic they are researching and could download the image separate and apart from the technical explanation accompanying it in the electronic version of the document. Without source information embedded in the graphic, information can be spread without proper attribution. We understand that it may “look cleaner” to not include a source, date, and citation for data but best practices for technical reports include adding sources to all graphics.

13

SUB-1

Recommendation: Make it a SCAG style guide policy to include the source and date of all data used in tables, charts, maps, infographics etc., included in technical reports.

13

12. Fees and Taxes

Several mitigation measures indicate that local jurisdictions or other entities should implement new fees or propose taxes to pay for a variety of programs or for acquisition of land for preservation. Increases to fees or taxes are issues that could require voter approval and, therefore, it should not be assumed that they will be approved.

Recommendations: a) Reword measures to indicate that a new or increased fee, new tax, or other increase is only an option as a way to implement the mitigation. b) Clarify whether it was assumed that these additional fees were considered feasible and if the new fees that are suggested were considered in the financial plan or economic analysis of the RTP.

14

Conclusion

The OCCOG recognizes the immense efforts SCAG undertook to prepare the Connect SoCal 2020 RTP/SCS and PEIR documents. The Plan is the culmination of a multi-year effort focused on incredibly complex technical work and has important and far-reaching policy impacts for our region. It is precisely because of this importance and complexity that we reiterate our concern about the timing of the release of the documents. Our desire is that the preparation of RTP/SCS documents in future cycles will take into account the need to accommodate adequate review, discussion and revision time for all of the documents. The timeline adopted in the past two cycles makes it challenging to have credible discussion regarding possible changes, because the timeline does not allow for recirculation or full discussion of requested changes. While OCCOG is appreciative of the extended public comment period, there remains concern that only a few weeks remain for SCAG to prepare responses to comments and amend the documents to ensure that the Regional Council may consider the certification of the PEIR and the approval of the draft RTP/SCS by the April 2020 deadline. With that, we look forward to working with SCAG collaboratively to achieve the schedule.

15

We appreciate your consideration of all the comments provided in this letter and its attachments and look forward to your responses. It is a shared goal to have a RTP/SCS adopted that is credible and defensible on all levels. If you have any questions, please do

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
1	General Comment	All maps All documents	All maps in all reports/documents need to be branded with 2020 RTP/SCS/Connect SoCal along with the specific report it is within. Maps are often pulled out as singular items and the maps need to be standalone documents.
2	General Comment	All All documents	Connect SoCal is often referred to as “the Plan”. Capitalize “Plan” consistently throughout all documents.

SUB-1

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
3	General Comment	All All documents	Review use of "cities". Word "jurisdictions" should often be used to include counties and incorporated cities, not just incorporated cities.
4	General Comments	All All documents	Consider adding "Note: Numbers may not sum to total due to rounding" to applicable tables and graphics.
5	General	RTP	Clearly define what the development pattern is for the SCS.
6	General Comment	All maps growth forecast data	Add: <u>"Note: The forecasted land use development patterns shown are based on Transportation Analysis Zone (TAZ) level data utilized to conduct required modeling analyses. Data at the TAZ level or at a geography smaller than the jurisdictional level are advisory only and non-binding, because SCAG sub-jurisdictional forecasts are not to be adopted as part of the 2020 RTP/SCS. The advisory sub-jurisdictional data shall not be required for purposes of qualifying for future grant funding or other incentives or for determining a proposed project's consistency with the 2020 RTP/SCS for any impact analysis required pursuant to the California Environmental Quality Act (CEQA)."</u>
7	General Comment	All documents	<p>SCAG staff should provide regular updates to its Transportation Committee and Regional Council regarding the key implementation factors of new transportation user fees, including but not limited to:</p> <ul style="list-style-type: none"> • Technology and associated privacy issues, • Cost of implementation and administrative methods for fee collection/revenue allocation, • Equity concerns and exemptions/credits, as applicable, • Rate structures and associated impacts including evaluation of flat rates, differential pricing by type of vehicle including size and weight, time-of-day, and potentially emissions, including GHG emissions, and • Economic assessment. <p>SCAG staff should also evaluate the impacts of the new transportation user fees on existing local transportation funding mechanisms, including local option sales tax measures, express lanes and toll facilities, and consider how best to integrate the various transportation funding mechanisms. Additionally, any new user fees should include return-to-source criteria to ensure equitable distribution of funds.</p>

16

SUB-1

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
8	General Comment	All documents	SCAG staff should provide regular updates to its Transportation Committee and Regional Council regarding both the CHSR Project and the Metrolink SCORE Program. Additionally, SCAG staff should assist Metrolink and the CTCs in detailing implementation steps for the SCORE Program, including securing new revenue sources to support operations at the levels assumed in the plan.
9	General Comment	All documents	The 2020-2045 RTP/SCS should recognize that the OCTA Board has not approved conversion from HOV to tolled express lane for SR-55, SR-73, I-605, or north of I-605 on I-405 as depicted in the proposed regional express lanes network. Furthermore, the 2020-2045 RTP/SCS should clearly recognize that the proposed regional express lane network is subject to further study to evaluate right-of-way impacts, community issues, and overall feasibility.
10	General Comment	All documents	The 2020-2045 RTP/SCS should clearly state that the regional strategies suggest improvements beyond the projects submitted by OCTA, and that the implementation of the strategies is subject to availability of new revenue sources and the necessary project development and review processes by the implementing agencies.
11	General Comment	All documents	Maps & other graphics- fonts need to be embedded in PDF to print properly.
12	General Comment	All documents	All tables, charts, graphics need to have sources and the document title
13	General Comment	All documents	The RTP/SCS focuses on housing costs and homelessness throughout the document. While this topic is regionally significant, it is not a requirement of SB 375. The focus of SB 375 is to reduce greenhouse gas emissions from light duty passenger vehicles through coordinated transportation and land use planning. While a co-benefit of this effort may be an increased housing supply, it should not be a focus of the plan. Additionally, addressing homelessness is not a requirement of SB 375 and should not be part of the narrative.
14	General Comment	All documents	The growth forecast should be adopted at no lower than the jurisdictional level

16

SUB-1

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
15	General comment	All documents	In multiple documents, there is a discussion of variable speed limits, but little information on the ability for them to be enforced. The documents refer to a program in Seattle where variable signs are installed that lower speed limits in advance of congested areas, accidents, bad weather, or other situations where speeds would be reduced. It is unclear if such a program would be enforceable in California at this time, since speed limits are generally set using the 85% rule. At least the technical studies should highlight what or if there are any legislative actions that are needed to implement this concept.
16	Define	In RTP main document	Add the following to the glossary; use definitions from PEIR Households Absolute constraints Single-family Multi-family Constrained/strategic Unconstrained plan
17	Clarification	p. 61	What was the performance of the 2016 RTP? (A summary of the 2016 RTP/SCS Progress provided in the SCS Technical Report (p8) should be provided in the Main document). Where are we as a region and what still needs to be done in order to meet the region’s 2020 goal? There was no initial summary at the beginning of the report, which would have been helpful.
18	Clarification	p. 2, column 2, paragraph 1	“...but also by bringing housing closer to and jobs <u>closer together</u> , making commutes shorter and making it easier to get around without a car.”
19	Correction	p.4, paragraph 3; All documents PEIR ES-4, P2.0-10 PLAN p96, p113	Ensure revenue totals are consistent throughout all documents Expected revenues not consistently reflected in the Plan and PEIR. \$633.9 billion cf. \$638.6 billion

SUB-1

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
27	Clarification	p. 11, column 1, paragraph 3	<p>“This effort culminated in a comprehensive update to the capital list of projects, which numbers in the thousands. SCAG worked collaboratively with key stakeholders to identify additional regional projects that are intended to address challenges that are regional in nature.”</p> <p>Requested edits:</p> <p>“SCAG worked closely with each of the six county transportation commissions throughout 2018 to update the list of <u>regionally significant major local</u> transportation projects that was established in Connect SoCal’s predecessor, the 2016 RTP/SCS. Each county transportation commission in turn worked with their partner transportation agencies (including <u>applicable</u> transit providers, rail operators, marine port and airport authorities and Caltrans District offices) to finalize a list of county-priority projects to submit to SCAG. This effort culminated in a comprehensive update to the capital list of <u>programs and</u> projects, which numbers in the thousands. SCAG worked collaboratively with key stakeholders to identify additional regional projects <u>initiatives</u> that <u>go beyond county-level commitments and</u> are intended to address challenges that are <u>uniquely</u> regional in nature.”</p>
28	Correction	p.11, column 1, paragraph 4; 5 th line	Replace “New Mobility” with “Mobility Innovations”
29	Define	p. 11, column 1, paragraph 4	<p>“...SCAG’s planning process, and helped develop a vision for the future that promotes regional goals and sustainability while respecting local control.”</p> <p>Define ‘respecting local control’.</p>
30	Clarification	p. 11, column 2, paragraph 2	<p>“SCAG’s 18 CBO partners represented constituents from...”</p> <p>In the document, list the CBOs. Explain how these were chosen and when the workshops were held. If this is listed in the Public Participation & Consultation Technical Report- state this as where to refer to.</p>

16

SUB-1

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
31		p. 11, column 2, paragraph 3	“Feedback received through our CBO partners was used to identify areas where the plan could be refined to meaningfully reflect the priorities and concerns of these traditionally underserved groups, particularly because they <u>have historically been</u> are disproportionately burdened by the negative outcomes associated with existing and changing land use patterns and transportation policies.”
32	Clarification	p. 12, column 1, paragraph 3	“SCAG used <u>considered</u> input gathered through the CBO engagement and public workshops...”
33	Correction	p. 13; column 2	Economic & <u>Job Creation Analysis</u> Jobs Forecast
34	Clarification	p. 19, column 1, paragraph 2	<p>“In the years ahead, the region may face significant challenges from technology disruption by reducing opportunities for many regional workers who will not be able to close the skills gap to adequately compete for future jobs in that sphere. This has spurred increasingly popular policy discussions of universal basic income (UBI) as a potential solution to offset the negative impacts of job losses due to technology. Since employment is becoming less necessary for gains in overall economic productivity, one UBI model might involve redistributing the revenues from higher taxes on businesses utilizing these new platforms to area residents to ensure a minimum living standard without impacting the incentive to work.”</p> <p>Delete as UBI is not under purview of SCAG or RTP.</p>
35	Clarification	p. 19; column 1; paragraph 3	Note that sales tax measures fund not only future transportation infrastructure but also help to maintain the existing transportation system.

16

SUB-1

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
36	Clarification	p. 21, column 2, paragraph 1	<p>While the There has been an acceleration in new units since the Great Recession <u>that</u> has been characterized by a higher share of multi-family units, there is concern that this trend may reverse absent policy intervention, as Millennials seek affordable ownership opportunities which that are scarcer in the urban core and in the multi-family market. For example, 51% of all new housing units issued in California for 2018 were for single-family dwellings, making 2018 the first year since 2011 that single-family housing construction outpaced multi-family home production..."</p> <p>Maintain objective and unbiased tone. Please clarify whether the topic is the number of units that were permitted or the number of housing units that were constructed.</p>
37	Clarification	p. 23, column 1, paragraph 2	<p>"Between 2008 and 2016, less than six percent of household growth and less than five percent of employment growth occurred in open space areas."</p> <p>Clarify if development occurred in open space or on underutilized, undeveloped, or vacant land.</p>
38	Transportation System	p. 29, third bullet	<p>"Non-Hispanic Whites disproportionately use automobiles and bicycling modes..."</p> <p>Referring to Table 2.2, 38.9% compared with 36.2%, and 37.6% compared to 37.5% does not seem disproportional.</p> <p>Perhaps the sentence should say "Non-Hispanic Whites and Hispanics disproportionately use automobiles and bicycling modes..."</p>
39	Clarification	p. 32, column 1, paragraph 3	<p>...environmental litigation, community resistance to all kinds of housing medium and high density projects, and lack of sufficient local funding mechanisms."</p> <p>Resistance is not limited to only higher-density housing projects.</p>
40	Clarification	p. 32, column 2; paragraph 2	Add source for the economic benefits of new housing construction.

16

SUB-1

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
41	Clarification	p. 33, graphic	"...environmental litigation, community resistance to <u>all kinds of housing medium and high density</u> projects, and lack of sufficient local funding mechanisms and lack of sufficient <u>state, federal, and</u> local funding mechanisms."
42	Clarification	p.36	<p>Under "Farm Land Lost and At Risk", SCAG states that 78 percent of Orange County land utilized for farming has been lost since 1984. It should be noted that not all land used for farming was permanent farmland and was not necessarily designated in the zoning code or general plan for farming. Many of these areas are zoned for a different use and land owners farm the land for income until the development applications are approved and construction permits are issued. Additionally, farming was one of the few permitted uses allowed in areas designated flight hazard zones. For example, a great deal of the City of Irvine privately-owned land surrounding the former Marine Air Station El Toro was utilized for farming because no other uses were permitted. Once El Toro was closed, the land was rezoned to permit residential, but continued to be used as farmland for many years.</p> <p>Add note to table and section that "not all land used for farming was permanent farmland and was not necessarily designated in the zoning code or general plan for farming."</p>
43	Clarification	p. 39, graphic	<p>"If a person lives in housing adjacent to a freeway, they may be more likely to develop asthma."</p> <p>What about high capacity arterials like HQTAs or railines? Why are these not included?</p>
44	Clarification	p. 41, column 1, paragraph 2	Provide reference to Congestion Management Technical Report.
45	Clarification	p. 46, column 2, paragraph 2	"This plan is not designed to dictate local actions and policies, but rather to lay out a path to achieving regional goals <u>set by the Regional Council.</u> "
46		p. 58 column 1, paragraph 2	RAMP- How would this work? Would there be any endowment funds required? Who can/cannot participate?
47	Clarification	p. 48, column 2, paragraph 3	"...Connect SoCal can reach the <u>regional</u> target of reducing greenhouse gases..."

16

SUB-1

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
48	Clarification	p. 49, column 1, bullet 2	“Focus on a <u>regional</u> jobs/housing balance to reduce commute times and distances and ...”
49	Sustainability Communities Strategies	p. 49, column 2, fifth bullet	“Support statewide legislation that reduces barriers to new construction...” Considering coupling this with or replacing this with “Increase statewide funding to construct affordable housing”
50	Clarification	p. 50, column 1, paragraph 1	“Although center-focused placemaking can be applied in a wide range of settings, priority must be placed, however, on urban and suburban infill, in existing/planned service areas, and within the planning boundary outside of an agency’s legal boundary, known as “Spheres of Influence,” where applicable and feasible.”
51	Clarification	p. 50, column 2, paragraph 4	“Employment growth and residential growth are prioritized in Job Centers in order to leverage existing density and infrastructure. <u>However, it is recognized that infrastructure capacity, services, and other amenities may need to be evaluated to assess the potential for increasing density to determine if the existing infrastructure, services, and amenities would need to be expanded to accommodate additional growth.</u> ”
52	Green Region	p. 55, column 1, first sentence	“... in areas subject to future two-foot sea level rise.” Cite the source used. Indicate where map is showing sea level rise and HQTAs.
53	Clarification	p. 56, paragraph 1	“The Regional Housing Supportive Infrastructure strategy will help make it quicker for <u>developers</u> local jurisdictions to produce critically-needed housing.” Local jurisdictions don’t build housing.
54	Clarification	p. 59; column 1; paragraph 1; last sentence	It would be appropriate to include investment in regionally significant local streets and roads here too.

16

SUB-1

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
55	Correction	p. 59; column 2; paragraph 3	"The Plan plan includes \$68 billion towards preservation, operation and resiliency needs of the state highway system, and \$47.5 \$20.88 billion towards preservation, operation and resiliency needs of the <u>regionally significant</u> local <u>streets and</u> roads.
56		p. 60, column 2, paragraph 3 p. 62	Go Zones- specify that Go Zones should be up to jurisdictions and local CTCs to establish. Not opposed to Go Zones in concept.
57	Clarification	General Comment, p.61, 102	"A mileage-based system." For all references to a mileage-based user fee, specify that this is intended by SCAG to replace the gas tax, not be an additional fee.
58	Clarification	p. 64, column 1, paragraph 1	"Connect SoCal commit identified \$7.3 billion through 2045 to implement TDM strategies throughout the region."
59	Clarification	p.64, column 1, paragraph 3	Revised to clarify that TSM is more than ITS.
60	Active Transportation	p. 71, column 1, paragraph 3, last sentence	Communities are excited about changing our streets. We need support in the form of funding to do so.
61	Core Vision Complete Streets	p. 71, column 2, paragraph 4	"Planning for 2045...grant funds for regionally significant projects." Planning for 2045, especially for the Core Vision of Complete Streets, should include funding for non-motorized projects, such as widened sidewalks and bike lanes to close gaps in the pedestrian and bicycle regional networks.
62	Correction	p. 73; column 2; paragraph 2	"auxiliary lanes, general purpose lanes, carpool lanes, toll lanes and Express/HOT" Toll lanes are not mentioned on either table or exhibit referenced.

		3.14-16, footnote 23 3.14-22, paragraph 4	<p>“Generally, most jurisdictions have started planning for this increase in density in urban areas and the Plan builds on local input (and is not intended to result in re-designation of areas where such re- designation is not approved by the local agency). However, there remains the potential for the Plan’s strategies to influence population growth in areas where local general plans have not yet been updated to reflect such growth. Therefore, implementation of the Plan would have the potential to induce unplanned growth in some areas of the region resulting in a significant impact, requiring mitigation measures.”</p> <p>In this context, does ‘allocation’ refer to the jurisdictional number calculated through the disaggregation of the regional total to the jurisdiction or the geographic distribution and calculations of the RHNA methodology that were used to disaggregate the regional total?</p> <p>Does a jurisdiction have to site and zone for housing consistent with the Plan?</p> <p>If the update to the housing element includes a RHNA allocation that is reflective of both existing and projected housing need, how can the allocation of regional housing needs be consistent with the RTP/SCS if the jurisdiction’s RHNA number is significantly different than its growth forecast total?</p> <p>Jurisdictions are required to zone for the amount of housing units prescribed to them through the RHNA process. A large portion of the 6th cycle allocation is due to existing need, which comes from pent-up demand from existing overcrowding and cost burdenness. By zoning for the RHNA allocations and developers building those units, those units would become occupied (households) because new housing would be available at required income ranges and would therefore be attainable. Furthermore, it is reasonable that these housing units will be occupied, creating ‘households’, throughout the SCAG region. Since these new housing units, which would ultimately become households that coincide with a healthy market vacancy rate prescribed by the state, were distributed and not constrained to jurisdictional-level forecasts, the RHNA</p>

#	TOPIC	PAGE REFERENCE	RTP NARRATIVE, COMMENT & RECOMMENDATION
			however, HCD has chosen to ignore Government Code Section 65584.01(a), which requires that if the COG’s growth forecasts are within 1.5% of the DOF growth forecasts, then the COG’s forecasts shall be used for RHNA purposes. Instead HCD has chosen to use the DOF growth forecasts.
44	Clarification	3.11-33 (paragraph 2), Last Sentence	<p>“The RHNA does not necessarily encourage or promote growth...” This sentence is false. Government Code Section 65584(a)(2) states, “It is the intent of the Legislature that cities, counties, and cities and counties should undertake all necessary actions to encourage, promote, and facilitate the development of housing to accommodate the entire regional housing need, and reasonable actions should be taken by local and regional governments to ensure that future housing production meets, at a minimum, the regional housing need established for planning purposes.” Furthermore, one of the objectives of RHNA is “promoting infill development...the encouragement of efficient development patterns...” (see Government Code Section 65584(d)(2).</p> <p>In fact, the housing growth (both from projected and existing need) should occur based on the RHNA allocation plan.</p>
45	Clarification	3.11-33 (paragraph 4)	Government Code Section 65584.01(C) and (H) define overcrowding and cost-burdened households. It is important to note that the law allows for these rates to be based on “comparable housing markets...as determined by the COG.” Although SCAG has identified different rates, HCD has ignored the law that allows SCAG to determine these rates based on comparable housing markets.
46	Clarification	3.11-33 (last paragraph, last sentence)	<p>“Per SB 375, the projected needs portion of the 6th Cycle RHNA will be consistent with the Connect SoCal for the comparable period.”</p> <p>Question – Will the existing needs portion of the 6th Cycle RHNA be consistent with the Connect SoCal for the comparable period? Since the RHNA is supposed to address both existing and projected housing need, what growth pattern is assumed in Connect SoCal to address the existing need?</p>

7	Correction	p. 65; Table 10; Total	Check the math or include note that it does not sum to the total due to rounding.
8	Clarification	p. 67; column 1; Actions for technology and micro-mobility; 1st bullet	Why only Caltrans?
9	Correction	p. 68; column 1; Strategic Plan; 1st paragraph	Suggested edit: Connect SoCal contains approximately \$22.5 billion (in nominal dollars) in investments in active transportation between 2020 and 2045. However, this represents only a portion of the need, based upon reasonably available funding.
10	Clarification	p. 68; column 1; Strategic Plan; 3rd paragraph; 1st sentence	Clarify if this is in addition to the \$22.5 billion included in the constrained plan.
11	Clarification	p. 68; column 2; Table 11 walking and bicycling mode share	Verify figures for both Baseline and Plan as they do not appear to be consistent with the main book, Public Health Technical Report, and Performance Measures Technical Report.
12	Correction	p. 69; column 1; Strategic Plan; 1st paragraph; last sentence	Suggest revising this statement so that it is clear that the Plan is financially constrained.

66

Table 4. AVIATION AND AIRPORT GROUND ACCESS TECHNICAL REPORT COMMENTS

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	General Comment	Entire Section	The narrative goes back and forth between Connect SoCal and RTP/SCS. It is okay to reference both in the opening statements of the section, but one should be used uniformly throughout the document to avoid confusion.

SUB-1

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
2	General Comment	Entire Section	The narrative interchangeably references John Wayne Airport as 1) John Wayne Airport, 2) JWA, and 3) Santa Ana throughout the document. While the FAA designation for the airport is SNA, all references to the airport as Santa Ana should be removed. Furthermore, JWA is not the FAA designation for the airport, so it too should be removed. When referencing the airport and for consistency throughout the document it should be referred to as John Wayne Airport.
3	General Comment	Entire Section	There should be acknowledgement of the FAA airport designations at the beginning of the section, so that stakeholders understand the FAA designation is not always consistent with the name of the airport. For example: John Wayne Airport is not JWA, but is SNA.
4	Correction	7	Ontario International Airport has a FAA designation of ONT not LAX
5	Correction	p. 8; left column; Ontario International Airport (LAX); 2 nd paragraph; last sentence	Missing period after "7 MAP" and missing sentences after "As for air cargo, Ontario"...
6	General Comment/Clarification	Entire Section	The base year identified for all aviation data is 2017, while the base year identified for much, if not all of Connect SoCal is 2016. Provide clarification as to why the base year is different for this section.
7	Correction	10	Aer Lingus, Aeroflot, Aeromexico, Aeromexico Connect, Air Canada, Air Canada (duplicate), Air Canada Rouge, and Air China do not have destinations listed. This appears to be a copy and paste error. The chart should be updated to be consistent with the remainder of the table.
8	Correction	10	Air Canada is duplicated in the table.
9	Correction	23	Change the date to 2045 in the title. Connect SoCal is 2020-2045 not 2020-2040.
10	Correction	23	Under the title "SCAG REGION AIR CARGO FORECASTS" correct the date to 2045. Connect SoCal covers 2020-2045 not 2020-2040.

Table 8. EMERGING TECHNOLOGY TECHNICAL REPORT COMMENTS

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
1	General Comment	Entire Section	The narrative focuses in on electrification. Emerging Technologies may not necessarily be integrated into the current market, therefore, to the extent possible, discussions should be technology neutral.
2	General Comment	Entire Section	The section seems to repeat itself quite often. The section could be consolidated into a more streamlined section.
3	General Comment/Citation of Source	7	The narrative includes the following statement: "Additionally, robust user surveys show that within urban centers, carshare users will eventually sell a household vehicle, or forego a planned vehicle purchase, and instead adjust their daily trips using transit and active transportation." Citation should be included for the "user surveys" referenced, how many people in the survey, is this a Southern California survey? Additional details are needed.
4	General Comment	7	Under the Alternative Fuel Vehicles section. Following the use of the Emergency Public Safety Public Shutdown (PSPS) in the autumn of 2019, there is an increase focus on how electric vehicles will be charged if there is no electricity. Generators were needed throughout Northern California to provide power to charge vehicles. With the potential for PSPS events to increase, should there be less of a focus on electrification and more on technology neutral Alternative Fuel Vehicles?

66

SUB-1

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
5	Clarification	p. 8; column 2; Ridehailing/transportation network companies (TNCs)	It may be appropriate to address the implications of AB 5 here.
6	General Comment	8	How will Assembly Bill 5 impact Transportation Network Companies (TNCS) such as Uber and Lyft? Some note or consideration should be given to the significant impacts AB 5 will have on the gig worker sector.
7	General Comment	11	The Public Health/Safety paragraph focuses on electrification of the fleet only. Other technologies should be included in this section. Don't hydrogen fueled vehicles yield the same public health impacts as electric vehicles. Why isn't this section technology neutral if there are identical or very similar outcomes.
8	Reword Title	12	"Decline in Collisions and Deaths from Connected and Automated Features". Is there adequate data to support this statement? There have been a number of incidents (resulting in death) that have been attributed to the Tesla automated driving system. Additionally, we do not yet know the impact of connected vehicles or fully automated vehicles. While speeds may decrease, there is an increase in cyber threats and cyber terrorism. This is a very misleading title, if it is not removed, it should, at a minimum, be reworded to state "Potential Decline in Collisions and Deaths..."
9	General Comment/Correction	14	Vehicle Electrification. Almost all focus is on vehicle electrification. There should be equal space given to the other types of emerging alternative fuel technology. With the potential increased risk of PSPS (referenced in a previous comment), people may consider an alternative fuel technology different than electrification.
10	General Comment	15	Under "Existing Conditions: Alternative Fuel Vehicles" – again, this discussion is very focused on electric vehicles. There should be data regarding CNG, H2, and other technology. The constant focus on electric vehicles and electrification is leading.
11	General Comment	22	Focus on Vehicle Electrification is not technology neutral.

66

7	Clarification	p. 21; column 2; Historical demographic trends; 2nd paragraph; last sentence	Explain why the travel demand model predicts a future that is inconsistent with the trend.
8	Clarification	p. 23; Table 7; Total population	Verify values as they appear to be inconsistent with the Demographics and Growth Forecast Technical Report.
9	Clarification	p. 24; column 1; Demographic trends in EJ areas in the SCAG region; 1st paragraph	Verify 68.6 percent figure with Demographics and Growth Forecast values, which indicate that White, non-Hispanic accounted for 41.7 percent of the regional population in 2016.

SUB-1

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
10	Clarification	p. 26; column 1; Demographic trends in SB 535 Disadvantaged Communities in the SCAG region; last paragraph	Verify values for median age and percent of the seniors as they appear to be inconsistent with the Demographics and Growth Forecast Technical Report.
11	Clarification	p. 30; column 1; Expected future trends in EJ geographies; 2nd paragraph; last sentence	Explain why the travel demand model assumes a decrease in poverty.
12	Clarification	p. 30; column 1; Expected future trends in EJ geographies; 3rd paragraph; 1st sentence	Explain why the travel demand model predicts a future that is inconsistent with the trend.
13	Clarification	Table 13	Add a column with the difference between High Wage and Low Wage Commute Distance
14	Clarification	Page 39, Column 2, Paragraph 1	<p>“SCAG used the regional median household income—the midpoint of an income distribution in the SCAG region—as Area Median Income (AMI) limit and assumed that a housing unit is affordable if a household whose income is at or below 80% of the AMI can live there without spending more than 30% of their income on rental units.”</p> <p>How was the regional median household income calculated? Why is AMI referenced if regional median was used? This really skews high wages and low wages between the region. For example, high wages in San Bernardino could be considered low wages in Orange County. While this may help social equity at the regional level, it is misleading at the County level.</p>

SUB-1

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
15	Clarification	Page 39, Column 2, Paragraph 1, Last Sentence	<p>“As is the case in job-to-worker ratio analysis, SCAG used a 2.5-mile buffer from the centroids of the census tracts and counted jobs and housing within the buffer distance to estimate the jobs-housing ratio and the low-wage jobs-housing fit at the neighborhood level.”</p> <p>This calculation at the census tract level seems like it would skew the results for census tracts that are primarily residential. For example, refer to Exhibit 12 to see that residential areas with little to no commercial nearby demonstrate that the ratio of low-wage jobs to affordable rental units is extremely high. In many areas, if more housing is built, it will result in a greater imbalance between jobs and housing.</p>
16	Clarification	Page 39, Column 2, Paragraph 3	EXHIBIT 9 - EXHIBIT 12
17	Clarification	p. 45; column 1; Results; 2nd paragraph; 1st sentence	Clarify end of sentence—“...future Technical Report.”
18	Correction	Page 46, Column 2, Paragraph 3	“They found that neighborhood <u>s</u> with higher public and private investment experienced more gentrification. “
19	Clarification	Page 49, Paragraphs 3-5	<p>Who is “he” referenced in the analysis?</p> <p>Replace “he” with name of researcher/s.</p>
20	Correction	Exhibit 13, p. 54	Remove I5 BRT line from map
21	Define	Exhibit 14, p. 55	<p>Define ‘communities of concern’ on the map.</p> <p>Some of these communities are brand new (e.g., Aliso Viejo, Rancho Santa Margarita) or were quickly developed over several decades and thus, have experienced significant change, but are far from being considered gentrified communities.</p>
22	Clarification	p. 73; column 2; Results; 2nd paragraph; 4th sentence	Why the San Gabriel National Monument? For example, the Santa Monica Mountains National Recreation Area is accessible by regular bus service.

SUB-1

#	TOPIC	PAGE REFERENCE	NARRATIVE, COMMENT & RECOMMENDATION
23	Clarification	p. 74; column 2; Accessibility to the San Gabriel National Monument	Why the San Gabriel National Monument? The Santa Monica Mountains National Recreation Area is accessible by regular bus service. Every state park in Orange County is accessible by transit plus a three-mile walking threshold.
24	Clarification	p. 92-93; Exhibits 21 and 22	An EJ area overlay would be useful.
25	Clarification	p. 95; column 1; Case study 1 – Advanced research on the built environment and collisions	Suggest enhancing the linkage to EJ.
26	Correction	Page 95, Column 2, Paragraph 3, Last Sentence	“Therefore, the collisions not only between automobile and bicycle but also between automobile <u>automobiles</u> do not stand out at the intersections with bicycle lane.”
27	Clarification	p. 99; Exhibit 24	An EJ area overlay would be useful.
28	Clarification	p. 101; Exhibit 25	An EJ area overlay would be useful.
29	Clarification	p. 103; Exhibit 26	An EJ area overlay would be useful.
30	Correction	p. 114; column 2; Trends and dynamics of aviation noise in the SCAG region and beyond; 1 st paragraph	Replace “SCAG Aviation Technical Chapter” with “Aviation and Airport Ground Access Technical Report”
31	Clarification	p. 116; column 1; Roadway noise impacts; 1 st paragraph	Verify value for centerline miles as it appears to be inconsistent with main book and Highways and Arterials Technical Report.
32	Clarification	p. 120; Exhibit 27	Why are low volume, lower speed State Highways be included here, such as SR-39 and SR-74?
33	Clarification	p. 126-129; Exhibits 28-31	An EJ area overlay would be useful. Can resolution be improved?
34	Clarification	p. 134-135; Exhibits 32-33	An EJ area overlay would be useful.

Draft Connect SoCal Plan Comments
Attn: Connect SoCal Team
Southern California Association of Governments
900 Wilshire Blvd., Ste. 1700
Los Angeles, CA 90017

Dear Connect SoCal Team:

The Los Angeles Metropolitan Transportation Authority (Metro) appreciates the opportunity to review and comment on the draft Connect SoCal plan.

The Connect SoCal plan aligns closely with many Metro plans and policies, including Metro's Vision 2028 Plan and 2020 Long Range Transportation Plan (LRTP). Collectively, our plans share many of the stated goals of Connect SoCal to improve mobility, accessibility, safety and resiliency of our transportation system while reducing greenhouse gas emissions (GHG) and supporting healthy equitable communities.

1

As the largest provider of public transportation in the Southern California Association of Governments (SCAG) region, Metro recognizes the critical role we play as a partner in achieving the ambitious GHG and vehicle miles travelled (VMT) reduction targets identified in the Connect SoCal plan. Metro is fully committed to supporting SCAG in reaching these targets through the investment and deployment of mobility solutions.

Cities, through their public engagement processes, land use authority and management of their street network, similarly will be critical to achieving the targets set in the Connect SoCal plan. To this end, Metro recommends that SCAG consider a more robust plan to support cities with SB 743 implementation. As you are aware July 1, 2020 is the statewide implementation date for public agencies to adopt VMT as a metric for identifying and mitigating transportation impacts within CEQA. To date, very few cities in Los Angeles County have adopted the required changes. SCAG should consider providing technical assistance to cities directly, or at the subregional level, regarding the assessment of VMT, the development of thresholds of significance and mitigation measures. A regional approach to SB 743 implementation would not only provide consistency but may also support the further development of a quantifiable set of mitigation measures over time that reliably reduce VMT.

2

Thank you again for the opportunity to comment. I look forward to our continued collaboration in advancing sustainable mobility strategies throughout the region.

3

Sincerely,

Kalieh Honish
Executive Officer, Long Range Planning
Metro Countywide Planning & Development

20	2.0 Project Description	Figures following 2.0-42	Update figures to reflect comments submitted on RTP/SCS and Technical Reports, including but not limited to Figure 2.0-5, Figure 2.0-8, Figure 2.0-11, and Figure 2.0-18.

January 24, 2020

Mr. Kome Ajise
 Southern California Association of Governments
 900 Wilshire Blvd., Ste. 1700
 Los Angeles, CA 90017

Subject: Comments by San Bernardino County Transportation Authority and San Bernardino Council of Governments on the draft 2020 Regional Transportation Plan/Sustainable Communities Strategy (*Connect SoCal*) and draft Program Environmental Impact Report

Dear Mr. Ajise:

The San Bernardino County Transportation Authority (SBCTA) and San Bernardino Council of Governments (SBCOG) appreciate the opportunity to provide comments on the Southern California Association of Governments' (SCAG's) draft 2020 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and draft Program Environmental Impact Report (PEIR). Both documents have been very professionally prepared, with substantial input over the last several years from County Transportation Commissions (CTCs), councils of governments (COGs), local jurisdictions, other transportation agencies, advocacy groups, and the public. We appreciate the working relationship we have had with SCAG to bring the 2020 RTP/SCS to this point in its development. We look forward to the Regional Council's approval of the RTP/SCS in April and receiving subsequent federal approval for air quality conformity.

1

Our comments can be classified into three general themes:

- A summary of SBCTA's sustainability activities over the last several years
- Overall perspectives on the 2020 RTP/SCS
- Specific comments on the content of the draft RTP/SCS and PEIR (Attachment 2) and a list of edits to the San Bernardino County portion of the RTP/SCS Project List (Attachment 3)

2

SBCTA AND SBCOG SUSTAINABILITY INITIATIVES

As you are aware, SCAG and SBCTA jointly executed a Sustainability MOU in 2014 titled "Collaboration between SBCTA and SCAG to Implement the 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy." Although the MOU itself has become dated at this point, it is important to recognize that SBCTA and our local partners (transit agencies and local jurisdictions) are proactively pursuing sustainability initiatives throughout San Bernardino County. These activities represent important contributions to sustainability

3

KA200124 – SS

Kome Ajise
January 24, 2020
Page 2 of 13

region-wide, and we thought it would be appropriate to highlight some of these in our comment letter on the RTP/SCS.

The San Bernardino Countywide Vision is a centerpiece of our sustainability activities. The Vision was adopted by the County of San Bernardino and SBCTA members in June 2011, well prior to the execution of the Sustainability MOU with SCAG. The Vision is very consistent with the direction of the RTP/SCS and gave San Bernardino County an important foundation for the activities that have been undertaken since that time. Extensive information is available on the Countywide Vision site at <http://cms.sbcounty.gov/cao-vision/Home.aspx>.

In brief, the following are recent and ongoing sustainability initiatives of SBCTA and SBCOG:

- Transit investments – Over \$600 million is being invested in high-capacity transit infrastructure over a 10-year period, an extraordinary investment for a county generally thought to be suburban, with just over 2 million residents.
- Joint report with SCAG: "*Customer-Focused, Technology-Enabled Multi-Modalism Action Plan*," completed in 2018 and containing 16 targeted initiatives for transit, transportation demand management (TDM), and active transportation in San Bernardino County.
- Active transportation – we have delivered or are in the process of delivering over \$50 million in State Active Transportation Program grants, together with our local partners.
- Expansion of the SBCTA rideshare/vanpool program (in progress)
- Zero-Emission Vehicle Readiness and Implementation Plan (completed 2019)
- Countywide GHG Reduction Plan and EIR (completed in 2014 and in the process of being updated to address SB 32 goals for GHG reduction)
- Regional Energy Partnership
- Partnerships on Clean Freight
- Climate Adaptation Plan and Partnership with Western Riverside COG (Plan will be complete in February)
- Healthy Communities Best Practices Toolkit
- Preparation of a Regional Conservation Investment Strategy (RCIS), pursuant to AB 2087 – Draft has been prepared, and is being refined using a Wildlife Conservation Board grant.
- SB 743 Countywide VMT Implementation Study (being completed in Spring 2020 for all the jurisdictions in the county)
- Two Comprehensive Multimodal Corridor Plans are underway, in partnership with the Riverside County Transportation Commission, Caltrans District 8, and SCAG.

Attachment 1 to this letter expands on these activities. The SBCTA Sustainability web page can be accessed at: <https://www.gosbcta.com/planning-sustainability/>.

OVERALL PERSPECTIVES ON THE 2020 RTP/SCS

Prior to the more detailed comments contained in the attachments, SBCTA has some overall perspectives for how the RTP/SCS can be used to achieve the mobility, safety, and sustainability goals of the region in the coming years. These comments relate to our own Countywide Transportation Plan; perspectives on transit, VMT, GHGs, and a multimodal transportation system; our emerging express lane network; goods movement; and airports.

SBCTA's Countywide Transportation Plan and Relationship to the 2020 RTP/SCS

SBCTA's 2015 Countywide Transportation Plan (CTP) is being updated to be consistent with the RTP/SCS. The 2015 CTP outlined a path forward for a sustainable transportation future, laying out an achievable strategy for highway and transit facilities, transit oriented development (TOD), air quality, GHG reduction, freight, airports, transportation demand management (TDM), active transportation, and funding. The CTP analyzes two future scenarios: a "baseline scenario" that assumes traditional revenue sources (generally consistent with what the RTP/SCS defines as "core revenues") and an "aggressive scenario" (generally consistent with RTP/SCS "Plan" revenues, including the innovative sources identified in the Plan). The projects and programs in the aggressive scenario of SBCTA's updated CTP are consistent with the lists in SCAG's RTP/SCS. SBCTA has provided SCAG with technical corrections to the San Bernardino County portion of the RTP/SCS project list in a separate communication so that the changes can be incorporated into the modeling for the final RTP/SCS.

4

Need for a Balanced, Multimodal Transportation System

As noted above, SBCTA is investing heavily in the transit system, TDM, and active transportation. At the same time, our citizens and businesses remain extremely concerned about living up to the commitments in our Measure I half-cent sales tax. Much of the concern centers around the congestion on freeways, interchanges, and the regional arterial system. We have prioritized interchange improvements and are proceeding to deliver those improvements, having completed eight major interchange projects in the last 10 years. We are well into delivery of 10 additional interchanges and are working with local jurisdictions on strategic ramp improvements. Interstates 10 and 15 are being addressed largely through our managed lane strategy, as described in the next section.

We appreciate SCAG's acknowledgement that "*given that critical gaps and congestion choke points still exist in the system, improvements beyond those that are operational in nature still need to be considered*" (page 73 of RTP/SCS). In other words, the RTP/SCS acknowledges that highway improvements are still necessary, even though most of the attention is being given to trip-reduction strategies, with the goal of reducing GHGs and VMT.

At the same time, it is important to acknowledge that each individual project should not be expected to reduce VMT. What is important is the impact of the overall strategy. In San Bernardino County, the RTP/SCS shows that VMT per capita is being reduced by 2% through 2045 just with the "baseline" investment and by 5% with the "Plan" investment

(see page 122). While this is well below the 15% per capita reduction goal identified by the Governor's Office of Planning and Research (OPR), it represents billions of dollars of investment in transit and trip reduction measures over that time period and appears realistic for San Bernardino County to achieve. There are two primary points: 1) each project cannot be held to a VMT reduction target, and state/regional agencies should not impose that requirement; and 2) VMT thresholds should be set at levels that are achievable within the bounds of financial capacity and the modal choices that travelers make within the context of their geographic setting.

The RTP/SCS demonstrates how difficult it is to reduce VMT even with many billions of dollars invested in alternative modes of travel. Regionally, the Plan reduces per capita VMT by 9.5% between 2016 and 2045, but the population increases by about 20%. In other words, total VMT can still be expected to increase regionally by about 10%. The VMT increase in the Inland Empire will be more in the range of 25%. The rate of population growth tends to outstrip the per capita reductions that can be achieved, so expectations of VMT reduction need to be tempered with what is realistic.

The good news is that GHGs can be reduced even if the absolute VMT increases, following the same path as the region's remarkable improvement in air quality as population and travel has dramatically increased. This means that, for mobile sources, the path to GHG reduction will largely fall on clean energy production, energy efficiency, technological innovations, and more rapid turnover of vehicle fleets. The GHG analysis in the 2040 California Transportation Plan demonstrated that vehicle and fuels technology will be the primary way in which GHG reduction goals will need to be met. VMT reduction is an appropriate goal, but technology will be the principal path to long term GHG reduction. SBCTA looks forward to partnering with SCAG, the State, and the utility industry to pursue these opportunities, consistent with the initiatives we have mentioned earlier, while also doing what we can in transit and TDM to reduce VMT. We are excited to be involved in the Governor's "Regions Rise Together" initiative, which recognizes that there are no "one-size-fits-all" solutions as far as transportation management and GHG reduction are concerned.

4

Regional Express Lane Network

As indicated in the RTP/SCS, SBCTA has two major express lane implementation initiatives: I-10 from the Los Angeles County line to Ford Street in Redlands, and I-15 from the Riverside County line, up the Cajon Pass, through Victor Valley, to just north of the Mojave River. These projects are not only multi-modal projects for passengers, with benefits for buses, vanpools, and 3+ carpools, but they will significantly improve freight mobility as well. Each project includes auxiliary lanes and will take some of the auto travel out of the general purpose lanes.

It is noteworthy that the I-10/I-15 interchange, at the heart of Inland Empire logistics activity, is designated as the 15th most critical freight bottleneck in the United States (per the American Transportation Research Institute), and the I-10 and I-15 corridors represent the major gateways from/to Southern California to/from the rest of America. The express lanes will also permit light duty (under 10,000 pounds) commercial traffic. Improvement of these corridors is a win-win for

both multimodal passengers and freight, but will need to be staged over the duration of the RTP/SCS.

One request from SBCTA is that one of the sample projects listed in the HOV section of Table 3.2 on page 77 of the RTP/SCS be swapped out with another from the project list. Please replace the I-210 project (Add one HOV lane in each direction from I-215 to I-10) with an additional express lane project (I-10 Contract 2A – add two Express Lanes in each direction from I-15 to Sierra Avenue). The I-10 project has more visibility, is more short term, and more appropriate for inclusion on the sample list. It has an expected completion year of 2029 and cost of \$700 million. This is consistent with FTIP amendment 19-13. No changes to the master project list are required.

Goods Movement

SBCTA appreciates SCAG's analysis of freight bottlenecks, documented in the Goods Movement appendix of the draft RTP/SCS. As you know, San Bernardino County is both benefitted by the logistics industry and at the same time heavily impacted by freight. Three of our freight bottlenecks appear on Exhibit 7: I-10 east of I-15, I-15 south of I-10, and I-15 through the Cajon Pass. This is consistent with the notation earlier about the critical bottleneck on the ATRI "top 100" list at the I-10/I-15 interchange. However, we would request that the 15,000-20,000 AVHD bottlenecks be added to Table 7 on pages 53 and 54, given that these are more "fixable" than many of the bottlenecks to our west, which may have higher delay values but are much more constrained and costly to improve.

The San Bernardino County bottlenecks have near-term solutions in the works, and are likely to be strong candidates for freight program funding at the State and federal level. There are only a few of these "second-tier" bottlenecks in the region and could easily be added to Table 7. We would also point out that our freight bottleneck on eastbound I-10 in Yucaipa is one that did not make the delay threshold, but can be addressed at a relatively low cost (\$37 million for a truck climbing lane). We would recommend that the next RTP/SCS include the "feasibility of improvement" as a factor in the bottleneck evaluation, particularly given the competitive nature of freight program funding grants, such as those for SB 1.

As an additional note, we believe that the regional freight collaboration that has worked so well for our regional project funding through the State's Trade Corridor Improvement Fund (TCIF) program should be re-invigorated. The collaboration is in a good position to craft a program of freight projects that can be most competitive for State and federal freight program funds.

Airports

It should be noted that control over Ontario International Airport (ONT) was transferred from the Los Angeles World Airports to the Ontario International Airport Authority (OIAA) in November 2016. SBCTA and our partner agencies appreciate the regional support that has been provided by SCAG and other agencies around the region, enabling ONT to serve 5.5 million

passengers in 2019, the highest level in a decade. We look forward to continuing local and regional efforts to make ONT a truly regional asset.

The RTP/SCS shows the projected airport passenger forecasts for 2017 through 2045 in Table 3.3. The Plan shows that LAX and ONT account for 80% of the passenger growth region-wide. LAX is forecast to increase by 42 million annual passengers (MAP) to 127 MAP, or 50% higher than existing. ONT is forecast to increase by 28 MAP to 33 MAP, or about six times the existing passenger volume. The market will ultimately determine how rapidly each airport will grow. However, it would be helpful if SCAG could consider some additional analysis as a way of quantifying airport accessibility. It is suggested that graphics be produced for each of the seven major airports that show travel time contours and the population within each contour. In other words, this would answer the question of how much population is within 15 minutes of each airport, 30 minutes of each airport, 60 minutes of each airport, etc for both peak and off-peak conditions. It would be done for both existing and 2045 to see how airport accessibility might change with changing traffic conditions. Perhaps for the next RTP/SCS an airport accessibility index could be developed. This could be an additional data point for the forecasting of future passenger volumes.

4

Secondly, it would be beneficial to have SCAG compile regular monitoring data for all the airports in Southern California, perhaps on an annual basis, using the FAA Air Traffic Activity Data System (ATADS) or other appropriate data sources. This would be useful to just keep tabs on airport growth and operational characteristics region-wide. Finally, it would be useful for SCAG to maintain information on project activity at the airports, focusing on projects geared toward capacity expansion and airport efficiency improvements.

Programmatic Environmental Impact Report (PEIR)

Regarding the PEIR, we appreciate the structure of the document and the mitigation measures. The mitigation measures encourage action, but do not put requirements on the County Transportation Commissions or local jurisdictions, beyond those already required by State or federal law. It also acknowledges that project-level environmental studies will need to be conducted prior to the implementation of any specific project, which is why a lesser level of detail was provided in the PEIR.

5

We have no significant comments on the PEIR. In Attachment 2 to this letter we indicate that it is difficult to match up VMT data between the RTP/SCS and PEIR. It may have to do with vehicle classes included or excluded, but we would request that differences in VMT, GHGs, or other performance measures between the two documents be clearly explained.

SCAG also indicates that the PEIR for the RTP/SCS may be useful as a basis for streamlining CEQA clearance for certain types of projects. SBCTA looks forward to collaborating with SCAG to take advantage of this opportunity, where possible.

Kome Ajise
January 24, 2020
Page 7 of 13

Please see the attachments for additional comments. As stated earlier, SBCTA appreciates all the efforts by the SCAG Regional Council and SCAG staff to make the 2020 RTP/SCS a reflection of where the region is headed over the next 25 years. We look forward to continuing partnerships with SCAG to implement the projects and programs in the RTP/SCS.

6

Regards,

Raymond Wolfe
Executive Director

Attachment 1

SBCTA and SBCOG Sample Sustainability Initiatives

SBCTA and SBCOG have worked closely with SCAG in implementing and delivering sustainability projects in the region and have affirmed our commitment every four years when SCAG embarks on developing the RTP/SCS. In 2014, SBCTA/SBCOG and SCAG jointly executed a MOU on Sustainability planning efforts and delineated a list of activities demonstrating SBCTA/SBCOG's commitment to implementing the sustainability elements of the RTP/SCS. Although some project level specifics and programs in the MOU have changed over the years, the main goals and principles have remained and are still applicable and consistent with the latest 2020 RTP/SCS.

When it comes to San Bernardino County, the San Bernardino Countywide Vision is a centerpiece of our sustainability activities. Although the Vision was adopted by the County of San Bernardino and SBCTA/SBCOG in June, 2011, it still serves as the foundation for the all sustainability efforts in the County. Although the draft Connect SoCal (2020 RTP/SCS) provides an overview of some of these activities region wide, it is useful to provide a more specific status report on San Bernardino County's sustainability work. (https://www.gosbcta.com/wp-content/uploads/2019/09/SBCTA-Sustainability_FINAL_digital.pdf). Based on Table ES-3 Connect SoCal Goals, here are some examples of sustainability projects from SBCTA/SBCOG that align with the RTP/SCS.

Connect SoCal Goal #2 "Improve mobility, accessibility, reliability, and travel safety for people and goods."

Active Transportation Investments Countywide – Agencies are now engaged in delivering bicycle and pedestrian improvements made possible by over \$50 million in State Active Transportation Program (ATP) grants. SBCTA has recently updated its Active Transportation Plan to include a Safe Routes to School element, a Points of Interest element, and a Complete Streets element. A countywide sidewalk inventory project is underway.

Connect SoCal Goal #3 "Enhance the preservation, security, and resilience of the regional transportation system"

Climate Adaptation Partnership with Western Riverside COG – This plan has been initiated to address the potential effects of climate change in Riverside and San Bernardino counties and identify ways to work together to address the challenges. As a result, the Inland Empire has formed a Climate Collaborative consistent with SB 1072 to put policies identified in the Regional Climate Adaptation Plan.

Connect SoCal Goal #4 "Increase person and goods movement and travel choices within the transportation system."

The Redlands Passenger Rail Project – This is a 9-mile rail line between Redlands and downtown San Bernardino, to be operational in late 2021, using self-propelled trainsets. As part of this project, SBCTA will implement a zero emission passenger rail trainset, a first in North America.

Connect SoCal Goal #5 “Reduce greenhouse gas emissions and improve air quality.”

Countywide GHG Reduction Plan and EIR – This effort was completed in 2014 and is now being updated to address the State’s 2030 GHG reduction goals under SB 32. The Plan includes the State’s first and only certified PEIR for countywide GHGs and has facilitated adoption of local Climate Action Plans (CAPs).

Connect SoCal Goal #6 “Support healthy and equitable communities.”

Healthy Communities Best Practices Toolkit – The San Bernardino County Department of Public Health created a Strategic Plan for the implementation of Healthy Communities policies. The toolkit, a collaboration between SBCOG and the County, will contain sample policies, resolutions, processes, organizational structure, and lessons learned from agencies that have implemented health-related policies.

Connect SoCal Goal #8 “Leverage new transportation technologies and data-driven solutions that result in more efficient travel.”

Partnerships on Clean Freight – Using a federal DOE grant and state CEC grant, SBCTA partnered with Ryder to place over 200 natural gas fueled trucks into its leasing fleet in Southern California as well as a maintenance facility and two fueling facilities. We are currently working with the BYD, BNSF railroad, and Daylight Transportation to pilot battery electric drayage trucks at Intermodal Yards in San Bernardino and Los Angeles and a distribution facility in Fontana.

Connect SoCal Goal #10 “Promote conservation of natural and agricultural lands and restoration of critical habitats”

Habitat Conservation – San Bernardino County and SBCOG are collaborating on an effort to create a Regional Conservation Investment Strategy (RCIS) through the process established by the California Department of Fish and Wildlife under AB 2087.

Aside from the specific activities referenced in the MOU, it should be noted that SBCTA completed its Countywide Transportation Plan (CTP) in 2015 and is being updated to be consistent with the 2020 RTP/SCS. The CTP is built on a foundation of economic and environmental sustainability. It recognizes that mobility and smart land development are needed to sustain the economic growth and competitiveness necessary for survival within the global economy. This economic growth is needed, in turn, to fund the array of statewide and regional sustainability commitments. San Bernardino County must invest in all modes of transportation, including highways, to support its businesses and growing population.

Please visit SBCTA’s Sustainability page on our website at <https://www.gosbcta.com/planning-sustainability/?category=sustainability>, including our Sustainability Fact Sheet.

Attachment 2

Additional Comments on the Text of the RTP/SCS (Connect SoCal) Main RTP/SCS Report

- Page 18 - Figure 2.2 needs more explanation within the graphic itself. The Y-axis is not labeled. Are these thousands of jobs regionally? May be better presented as percentages of jobs subject to automation.
- Page 23, second paragraph under Transportation System – The paragraph references Exhibit 2.3, Existing Arterial System. The text refers to express lanes, while the graphic refers to Expressway/Parkway. Needs to be clarified. Also, what criteria were used for inclusion as an arterial? Was this the FHWA designation?
- Page 27, Exhibit 2.4 – Suggest that I-215 from SR-91 to I-15 be included in the map. Also, there are two intermodal facility dots shown in San Bernardino. Not clear what the second one is.
- Page 30 – Interesting graphic on mode of access to airports. Define “on-call.” Is that where TNCs are included? Please clarify.
- Page 31 – Grey text is hard to read in the electronic version. Needs more contrast.
- Page 37 – Graphic should say annually, for number of injuries and fatalities.
- Page 59, Under Progress Since 2016 – Refers to “Three roadway improvement/rehabilitation projects, including bridge improvement have already been programmed.” There have to be many more projects than that around the region. Referencing only three projects is very underwhelming. It would seem that a number of the “Progress Since 2016” sections could be improved.
- Page 61 – You may want to caveat the mileage-based user fee discussion, to be clear that no specific plans have been made to implement such a system at this time, and that implementation would need to occur on a statewide basis.
- Page 66 – Please re-orient the list of transit projects for San Bernardino from shorter term to longer term and please omit the Foothill/San Bernardino BRT from the list. That project is too long term. So the list would be in this order: Redlands Passenger Rail, West Valley Connector Phase 1, Gold Line Extension to Montclair, and Passenger Rail Service from San Bernardino Metrolink Line to Ontario Airport.
- Page 77 – I-15 Express Lane segment 5 – take out reference to High Desert Corridor and say “to north of Mojave River.” For long range projects like this, it would be adequate to round the costs off to the nearest million.
- Page 102, Figure 4.7 – If it is possible to add dash patterns to similar-color lines, that would be helpful in distinguishing the operators from one another.
- Page 103, Table 4.3 – Title should state that the revenue forecast covers both capital and operating/maintenance costs. The numbers would be very large for only capital costs, so clarifying that O&M costs are included would reduce the number of questions.
- Page 122 and throughout Table 5.1 – It is important to clearly distinguish when statistics include light duty vehicles only, versus all vehicles. For example, the GHG per capita targets for SB 375 purposes relate to light duty vehicles only. On page 122, the basis of the VMT data is unclear. It is clarified as light duty in Table 5.1, but should also be stated on page 122 and on Figure 5.1 as well. Same with daily minutes of delay. Is that person delay or vehicle delay, and which vehicle sectors are included? The definition of VMT is also critical to distinguish for SB 743 purposes, to avoid confusion. We did not

see where total VMT statistics are presented. Truck delay by facility type is presented, but we did not see truck VMT within the main body of the RTP/SCS or in the Goods Movement appendix. Also, we could not match the VMT data in the RTP/SCS with the VMT data in the PEIR. Perhaps the differences are because of the inclusion or exclusion of vehicle types. Please review these sections to make sure the references are always clearly explained.

9

Goods movement appendix

- Page 50 – Please add more truck volume data points in the Inland Empire. Volumes in the I.E. are not well represented, given the role of the IE in goods movement.
- Page 51 – See comments within the text of the letter on the bottleneck relief strategy. The likelihood and cost of fixing the bottlenecks should be factored into the bottleneck relief strategy, not just the sheer magnitude of delay. Some bottlenecks have massive delays, but there are practical and cost limitations to relieving that congestion.
- Page 61 – SBCTA supports the language in the first bullet regarding working with the federal government on a low NOx engine standard for heavy-duty trucks. We signed onto the ultra low-NOx petition several years ago, along with SCAQMD and CARB. The standards should be developed at the national level, given the amount of travel through San Bernardino County by out-of-state trucks. Having a California-only standard could disadvantage our businesses further and will not be as effective. California and our region should strive for a level playing field as part of our air quality strategy.
- Page 94 – The South Archibald grade separation is planned, not complete.

10

Mr. Kome Ajise
Executive Director
Southern California Association of Governments
900 Wilshire Blvd., Ste. 1700
Los Angeles, CA 90017

RE: Comments on the Draft Connect SoCal Plan 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy and associated Draft Programmatic Environmental Impact Report

Dear Mr. Ajise:

The San Joaquin Hills Transportation Agency and the Foothill/Eastern Transportation Corridor Agency (“TCA”) appreciates the opportunity to review and provide comments on the Draft Connect SoCal Plan 2020-2045 Regional Transportation Plan (“RTP”)/Sustainable Communities Strategy (“SCS”) and associated Draft Programmatic Environmental Impact Report (“PEIR”). TCA commends the Southern California Association of Governments (SCAG) staff and consultants for the tremendous amount of work and effort in putting these documents together. TCA also recognizes and supports the timely adoption of the RTP/SCS to enable the Southern California region to proceed with the planning and implementation of regionally significant transportation projects. Further, TCA recognizes that the SCS is particularly important for the region to meet its state-mandated greenhouse gas (GHG) emissions reduction targets for 2020 and 2035.

TCA supports the comments submitted by the Orange County Council of Governments (OCCOG) on behalf of Orange County jurisdictions, the Center for Demographic Research, the Orange County Transportation Authority, and other Orange County jurisdictions.

In addition, TCA submits the following comments to clarify the RTP/SCS Project List Technical Report and offer recommended clarification to the documents text.

DRAFT CONNECT SOCIAL PLAN

Transportation Network and Funding the Transportation System

The TCA are two joint-powers agencies formed in 1986 to plan, finance, construct and operate State Routes 73, 133, 241 and 261 (The Toll Roads), which constitute 20 percent of Orange County’s major thoroughfares (see attached Toll Road System Map). The Toll Roads were originally planned as freeways; however, due to a lack of state funding they had to be built as tolled roads. To finance the roads, toll revenue bonds were sold as the major funding source [private funds] and development impact fees have been assessed on new construction under Section 66484.3 of the California Government Code. Consistent with

the goals of AB 32 and SB 375, the Toll Road network helps to reduce GHG emissions that would otherwise be emitted by idling passenger cars and trucks on freeways and major arterials, by providing free-flow congestion relief. While these roads are a significant part of the major highway system in Orange County and the region and are, indeed, included in the core revenues from local sources (Highway Tolls), Figure 4.10, *Core Revenues, Local Sources, in Nominal Dollars* (page 105), Table 4.5 *Summary of Revenues* (page 108), Table 4.6.1 *FY2045 RTP/SCS Revenues, in Nominal Dollars, Billions* (page 112), they are not included in the discussion regarding transportation system (page 23), transportation demand management (page 64), transportation system management (page 64), highway and arterial network (page 73), regional express lane network (page 74) or paying our way forward (page 97). Nowhere in the document is the private sector funding contribution assumed for the plan described, although toll road widenings, expansions, and new tolled facilities that are privately funded are included in the plan and in the total cost of the plan. Focus in the Draft Connect SoCal Plan as well as the Draft PEIR is only on toll lanes and express/high occupancy toll lanes. Accurately describing the extent of private funding for highways is an important public disclosure, and an important element of the financial plan that relieves the burden on limited federal, state and local transportation funding.

2

Recommended Clarification

TCA requests that the language in the Draft Connect SoCal Plan and associated PEIR be expanded to appropriately describe the existing and planned inter-operable priced transportation network in the region, including Express Lanes, HOT lanes, and Toll Roads, specifically acknowledging the following points:

3

- Priced lanes provide flexibility and options as part of the congestion relief toolbox of measures designed to help meet sustainability and emission reduction goals related to SB 375 and other state and federal mandates.
- Priced facilities are an especially important tool for providing intra-county, inter-county and interregional capacity.
- The existing priced transportation network serves the locations where major employment and housing growth are projected to occur.
- Toll roads and express/HOT lanes charge users a fee for travel, but typically offer less congested traffic lanes than nearby freeways and roadways. Reduced congestion provides improved and more efficient mobility with fewer air pollutants and GHG emissions caused by congestion.
- The publicly owned TCA-operated Toll Road network in Orange County is designed to interrelate with transit service. The Toll Roads can accommodate Bus Rapid Transit and express bus service, and Toll Road medians are sized and reserved to provide the flexibility for future transit, if appropriate.
- Priced facilities such as the Orange County Toll Roads are privately funded. This ensures that these facilities can relieve congestion and associated air pollution and GHG emissions on parallel freeways and major arterials without further stressing limited state, federal and local transportation funding resources. In addition, user fees provide an economic incentive for cost-sharing that promotes ridesharing, which is beneficial to reduced criteria pollutants and GHG emissions reductions.
- The discussion should include that express lanes, HOT lanes and toll roads generate user fees that pay for construction and operation of their facilities.

4

5

6

7

8

9

Page 73, Highways and Arterials Network

The Connect SoCal Plan should include toll roads in the description of projects included in this category. Orange County Toll Roads are not categorized as express or HOT lanes, but collect tolls as a means of insuring low-emission, free-flow capacity and funding the construction and operation of the facility. TCA-operated Toll roads integrate with express lane and HOT lane facilities via the common FasTrak technology that allows inter-operability and convenience for drivers.

Recommended Clarification

- Revise the text in the last sentence on page 73 to read, “Projects include interchange improvements, auxiliary lanes, general purpose lanes, carpool lanes, toll roads, toll lanes, and Express/HOT lanes. The complete list of projects can be found in the Project List Technical..”
- Add the SR 241/91 Express Lanes (HOT) Connector project (FTIP ID ORA111207/RTP ID 2T01135) to Exhibit 3.2 *Major Highway Projects*, Table 3.2 *Sample Highway Projects*, and Exhibit 3.3 *Planned Regional Express Lane Network*.
- The text under this section should discuss that all priced facilities in the SCAG region ensure inter-operability by using a common technology, FasTrak, to collect user fees.
- The discussion should include that express lanes, HOT lanes and toll roads generate user fees that pay for construction and operation of their facilities.
- The text should establish the congestion reducing goal of priced transportation, and the associated criteria pollutants and GHG emissions benefits of providing free flow capacity that avoids emissions generated by idling. In addition, user fees provide an economic incentive for cost-sharing that promotes ridesharing which is beneficial to reduced criteria and GHG emissions reductions.

10

PROJECT LIST TECHNICAL REPORT

Page 66, Table 1: FTIP Projects, Project 10254

County	System	FTIP ID	RTP ID	Route #	Description	Project Cost (\$1,000's)
ORANGE	STATE HIGHWAY	10254	10254	73	SAN JOAQUIN HILLS TRANSPORTATION CORRIDOR (SJHTC – SR 73). 15 MI TOLL RD BETWEEN 1-5 IN SAN JUAN CAPISTRANO & RTE 73 IN IRVINE, CONSISTENT WITH SCAG/TCA MOU 4/5/01. EXISTING 3 M/F EA DIR. 1 ADDITIONAL M/F EA DIR, PLUS CLIMBING & AUX LANES BY 2020 2022 .	\$351,188

Recommended Clarification

- In Table 1, we request that the completion date for Project 10254 be clarified as 2022, consistent with the discussions between TCA, OCTA and SCAG.

Page 298, Table 3: Strategic Projects, RTP ID S2160011

County	System	RTP ID	Route #	Route Name	From	TO	Description	Lead Agency
ORANGE	STATE HIGHWAY	S2160011	73	SR-73/GL ENWOOD			INTERCHANGE IMPROVEMENT (PHASE 2 & 3)	TCA

Recommended Clarification

TCA’s Project 10254 description (Route 73/ San Joaquin Hills Transportation Corridor) is correctly listed in Table 1 *FTIP Projects*; however, Table 3 *Strategic Projects* also lists specific components of this project (the SR 73/ Glenwood Interchange Improvement (Phase 2 & 3)) as a separate TCA project with a unique RTP ID number (S2160011). This reference and project should be removed as it is part of the parent Project 10254.

Page 67, Table 1: FTIP Projects, Project ORA050, ORA051 and ORA011207

County	System	FTIP ID	RTP ID	Route #	Description	Project Cost (\$1,000’s)
ORANGE	STATE HIGHWAY	ORA050	ORA050	241	EASTERN TRANSPORTATION CORRIDOR (ETC-SR 241/261/133) 26.4 MI TOLL ROAD CONNECTS SR 91 TO I-5 VIA SR 261 AND SR 133, CONSISTENT WITH \$631,902 SCAG/TCA MOU 4/05/01. EXISTING 2 M/F EA DIR. 2 ADDITIONAL M/F IN EA DIR, PLUS CLIMBING AND AUX LANES BY 2020 <u>2022</u> .	\$631,902
ORANGE	STATE HIGHWAY	ORA051	ORA051	241	FOOTHILL TRANSPORTATION CORRIDOR-NORTH (FTC-N - SR 241). 12.7 MI TOLL ROAD BETWEEN OSO PKWY AND ETC, CONSISTENT WITH SCAG/TCA MOU \$269,045 4/05/01. EXISTING 2 M/F IN EA DIR. 2 ADDITIONAL M/F, PLS CLIMBING & A UX LANES BY 2020 <u>2022</u> .	\$269,045
ORANGE	STATE HIGHWAY	ORA111207	2T01135	241	241/91 EXPRESS LANES (HOT) CONNECTOR: NB SR-241 TO EB SR-91, WB SR-91 TO SB SR-241, PER SCAG/TCA MOU 4/05/01. PAED PHASE.	\$33,728

Recommended Clarification

- In Table 1, we request that the completion date for Projects ORA050, ORA051, and ORA111207 be clarified as 2022, consistent with the discussions between TCA, OCTA and SCAG.

Page 297, Table 3: Strategic Projects, RTP ID SORA052

County	System	RTP ID	Route #	Route Name	From	TO	Description	Lead Agency
ORANGE	LOCAL STATE HIGHWAY	SOR A052	241	SR 241	Oso Pkwy	I-5	FOOTHILL TRANSPORTATION CORRIDOR-SOUTH — OSO PKWY TO I-5 (SANDIEGO).	TCA

Recommended Clarification

- In Table 3, we request that Project ORA052 be classified as a “State Highway” system consistent with the classification of the TCA Toll Road network.

Overall, TCA’s project descriptions in Table 1 *FTIP Projects*, for projects ORA050, ORA051, ORA111207, 10254 and Table 3 *Strategic Projects*, for project ORA052 are correctly listed, as of the current FTIP. However, for ORA050, ORA051 and 10254 TCA recently submitted to OCTA a revision to these projects showing that TCA has met its original TCM commitments for the TCA Corridors. The revised projects highlighting the TCA strategic projects have been submitted to SCAG for review.

TRANSPORTATION FINANCE TECHNICAL REPORT

Page 2, Financial Plan, Introduction

The draft document states that “Our region has successfully implemented toll systems in the past with the Transportation Corridor Agencies’ network of privately financed toll roads and express lanes along interstate 10, interstate 110 and State Route 91, including the most recent extension into Riverside County.” However, the statement needs to clarify the financial planning importance of privately funded toll facilities.

Recommended Clarification

Priced transportation facilities also provide the opportunity for financial innovation. The Orange County toll roads (SR 73, SR 133, SR 241, and SR 261) utilize private funds. They provide congestion relief and associated air pollution and GHG emissions reduction without further stressing limited federal, state, and local transportation funding.

Page 29, Highway Tolls

Recommended Clarification

Under Highway Tolls Description we request the following revisions:
 “TCA consists of two separate government entities—the San Joaquin Hills Transportation Corridor **Agency Agencies** (SJHTCA), which oversees the San Joaquin Hills (State Route 73) Toll Road, and the Foothill/Eastern Transportation Corridor **Agency Agencies** (F/ETCA), which oversees the Foothill (State Route 241) and Eastern (State Route 241, State Route 261, and State Route 133) Toll Roads.”

TRANSPORTATION CONFORMITY TECHNICAL REPORT

Page 8, Highway Networks

The discussion on the coding of the region's freeway system specifically mentions express lanes, toll lanes and HOT lanes, but not toll facilities such as existing Toll Roads SR 73, SR 241, SR 133 and SR 261 in Orange County.

Recommended Clarification

- Revise text under this section to include toll roads, "Include detailed coding of the region's freeway system (mixed-flow lane, auxiliary lane, HOV lane, HOT lane, toll lane, and truck lane, toll roads, etc.) as well as Express ways arterials, major and minor collectors.

Page 20, Toll Roads

The discussion on Toll Roads states that, "There were approximately 325 lane miles of toll roads in 2016, increasing to about 1,855 toll/HOT lanes in 2045. This includes a regional Express Lane network (TABLE 8) that would build upon the success of the 91 Express Lanes and Transportation Corridor Agencies (TCA) Toll Roads in Orange County and two demonstration projects in Los Angeles County." However, none of the TCA operated Toll Roads are included in Table 8.

Recommended Clarification

- Table 8 should be retitled appropriately to include "Express Lane, HOT Lane and Toll Road Networks." This change should also be made in the main RTP/SCS document.
- TCA's facilities should be added to Table 8 as tolled facilities and the effect of the toll charges on these facilities should be incorporated into the highway assignment procedure.

TCA thanks you in anticipation of your written responses to these comments. We look forward to the amendments in the final 2020-2045 RTP/SCS and associated Draft PEIR to incorporate the recommended changes. Should you have any questions or require any clarification regarding these comments, please feel free to contact Ms. Valarie McFall, Chief Environmental Planning Officer, at 949.754.3475 or via email at vmcfall@thetollroads.com.

Sincerely,

Michael A. Kraman
Chief Executive Officer

COUNTY OF LOS ANGELES
DEPARTMENT OF PARKS AND RECREATION

LOC-1

"Parks Make Life Better!"

John Wicker, Director

Norma E. Garcia, Chief Deputy Director

January 16, 2020

Mr. Roland Ok
SCAG Main Office
900 Wilshire Boulevard, 16th Floor
Los Angeles, CA 90017

Dear Mr. Ok:

**DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT
2020-2045 REGIONAL TRANSPORTATION PLAN/
SUSTAINABLE COMMUNITIES STRATEGY (CONNECT SOCIAL PLAN)**

Thank you for the opportunity to review and comment on the Draft Program Environmental Impact Report (PEIR) for the Connect SoCal Plan. The Los Angeles County Department of Parks and Recreation (DPR) has reviewed the PEIR and offers the following comments and suggested edits:

1

General Comments:

Los Angeles Countywide Parks and Recreation Needs Assessment (2016)

The PEIR should include a discussion of the Los Angeles Countywide Parks and Recreation Needs Assessment, and incorporate relevant data and recommendations from the final report. Adopted by the Board of Supervisors on July 5, 2016, the Countywide Parks Needs Assessment was a historic and significant undertaking to engage all communities within Los Angeles County in a collaborative process to gather data and input for future decision-making on parks and recreation. The primary goal of the Parks Needs Assessment was to quantify the magnitude of need for parks and recreational facilities, and determine the potential costs of meeting that need. This goal has been accomplished, as evidenced by the final report which uses a transparent, best-practices approach to evaluate park and recreation needs, and is the product of an engagement process that involved the public, cities, unincorporated communities, community-based organizations, and other stakeholders. Please access the Parks Needs Assessment at this link: <http://lacountyparkneeds.org/>

2

Transit to Parks Strategic Plan (2019)

The PEIR should include a discussion of Metro's Transit to Parks Strategic Plan and incorporate relevant data and recommendations from the Plan. The Strategic Plan presents a systematic vision for increasing access to parks and open space countywide.

3

Mr. Roland Ok
 January 16, 2020
 Page 2

The goal is to find targeted, holistic ways to increase access to parks and open spaces, especially for communities of need. These communities, especially those that are not within walking distance or without convenient public transit to a park, are the focus of the Plan. Expanding access is a key priority for the region, as demonstrated in the Los Angeles Countywide Parks Needs Assessment, which highlights the lack of park and open space access in communities across the county, particularly for lower income, disadvantaged residents. Please access the Transit to Parks Strategic Plan at this link: <https://www.metro.net/projects/transit-parks/>

3

3.16 Parks and Recreation, page 3.16-9

Please revise the last sentence as follows: "~~The Los Angeles County General Plan has established a standard of 4 acres of local parkland per 1,000 residents in the unincorporated areas and 6 acres of regional parkland per 1,000 residents of the total population in Los Angeles County. According to the General Plan (2015), the County has a substantial deficit in local parkland, providing approximately 0.6 acres of local parkland per 1,000 unincorporated residents but 7.02 acres of regional parkland per 1,000 residents (total), which is above the regional standard. According to the Los Angeles County Parks Needs Assessment (2016), there are 3.3 acres of local parkland per 1,000 residents, which is less than the 4.0 acres per 1,000 goal in the Los Angeles County General Plan. There are 86.2 acres of regional open space and natural areas per 1,000 people, which highly exceeds the goal of 6 acres of regional parkland per 1,000 in the Los Angeles County General Plan.~~"

4

3.16 Parks and Recreation, page 3.16-10

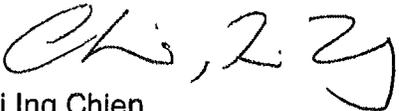

Please correct the number as follows: "Los Angeles County has ~~177~~ 181 County parks and 24 state parks..."

5

Thank you for your consideration of our comments. If you have any questions, please contact me at (626) 588-5317 or by email at jchien@parks.lacounty.gov.

6

Sincerely,

Jui Ing Chien
 Park Planner

Memorandum

County of Ventura • Resource Management Agency • Planning Division
800 S. Victoria Avenue, Ventura, CA 93009-1740 • (805) 654-2478 • ventura.org/rma/planning

DATE: January 22, 2020
TO: Southern California Association of Governments
FROM: Abigail Convery, Ventura County Planning Division
SUBJECT: Draft Program Environment Impact Report (PEIR) for Connect SoCal (2020-2045 Regional Transportation Plan/Sustainable Communities Strategy). RMA 19-001-1.

I have reviewed the Southern California Association of Governments (SCAG) Draft Program Environmental Impact Report (PEIR) for Connect SoCal 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RMA 19-001-1), which covers areas in unincorporated Ventura County.

1

Biological Resource Analysis

1. Ventura County Locally Important Species and Communities

The biological resource assessment associated with the Draft EIR did not include language which would address impacts on the County’s Locally Important Species or communities, nor were they considered “special status species.” The potential to occur and potential impacts to Ventura County Locally Important Species must be evaluated and mapped. For a complete listing of Locally Important Species, please see the following link: <https://vcrma.org/ceqa-implementation-and-initial-study-assessment-guidelines> .

2

Impacts to Locally Important Communities (e.g., oak woodlands and California black walnut woodland) should be evaluated in the EIR. The Ventura County General Plan defines a Locally Important Community as “a plant or animal community that is considered by qualified biologists to be a quality example characteristic of or unique to the County or region.” The EIR should evaluate direct and indirect (i.e., dust, diminished water supply, etc.) impacts to Locally Important Communities.

2. Ventura County Initial Study Assessment Guidelines

Project level mitigation measures identified in the draft EIR did not clarify whether projects occurring in the County would be evaluated in accordance with Ventura County’s adopted CEQA environmental thresholds of significance. Projects that occur within the unincorporated County should be assessed using the County’s CEQA thresholds of significance which are set forth in the Ventura County Initial Study

3

Assessment Guidelines (April 26, 2011), available online at:
http://www.ventura.org/rma/planning/pdf/ceqa/current_ISAG.pdf

The Draft EIR should include or reference information and protocols required pursuant to the "Ventura County Planning Division Standards for Initial Study Biological Assessments" (October 9, 2012), which is available online at:
<http://www.ventura.org/rma/planning/conservation/bio-report-procedure.html>

3

3. Ventura County General Plan

The Draft EIR should analyze the proposed project with respect to its consistency with the Ventura County General Plan Goals, Policies and Programs (2011) environmental goals and policies for biological resources. Several policies in the General Plan support the protection of, and require an evaluation and mitigation of significant impacts to, biological resources for streams and wetlands, such as:

- A 100-foot setback is required from these resources for all discretionary development (Policy 1.5.2-4);
- Discretionary projects must evaluate biological impacts within 300 feet of waters and wetlands (Policy 1.5.2- 3); and
- Unavoidable significant impacts to wetlands or streams cannot be found acceptable with the adoption of a Statement of Overriding Considerations.

4

4. Comments on Mitigation Measures Proposed

The biological mitigation measures proposed for the Draft PEIR were very thorough. Planning Division staff has a few minor comments as follows:

- **PPM BIO 1 (b).** Where avoidance is determined to be infeasible, the project level mitigation measures define various compensatory mitigation approaches that could be used by a project. For projects occurring within Ventura County, such replacement mitigation should occur as close as possible to the impact site and within the County when possible.
- **PPM BIO 1 (d).** Temporary access roads and staging areas are stated to not be located in non-native habitat. Such facilities and infrastructure should not be located in native habitat.
- **PPM BIO 4 (e).** The County requires a buffer zone of 300 feet around occupied bird nests afforded protection pursuant to the Migratory Bird Treaty Act.
- **PPM BIO 5 (m).** To mitigate or improve the connectivity of wildlife habitats within the project area, the proposed mitigation measure discusses the potential to install wildlife crossings. The PEIR should also consider project areas that have existing infrastructure that may be retrofitted for wildlife crossings for the purpose of mitigation.

5

Thank you for the opportunity to comment on the Draft PEIR. If you have questions regarding the information set forth in this memo, please contact Abigail Convery at 805-654-2489 or via email at Abigail.Convery@ventura.org.

6

 900 Wilshire Blvd, Suite 1700
 Los Angeles, California 90017

**Subject: Draft Program Environmental Impact Report for Connect SoCal (2020-2045
 Regional Transportation Plan/Sustainable Communities Strategy)**

Dear Mr. Ok:

Thank you for the opportunity to provide input and comments on the Draft Program Environmental Impact Report for Connect SoCal (2020-2045 Regional Transportation Plan/Sustainable Communities Strategy). The Long Range Section of the Ventura County Planning Division reviewed the Draft Program EIR for the proposed project and provides the following response:

1. **Saticoy Area Plan.** In September 2015, the Ventura County Board of Supervisors adopted a comprehensive update to the Saticoy Area Plan. The Saticoy community is defined as a "severely economically disadvantaged community" and the Saticoy Area Plan has a 20-year time horizon that extends from 2015 to 2035. The Mobility Element within the Saticoy Area Plan identifies implementation program MOB-P2 which prioritizes the widening/re-stripping of SR 118 from Vineyard Avenue to Darling Road.

On January 28, 2016, and February 22, 2019, the Long Range Planning Section submitted comment letters to SCAG in response to Draft RTP/SCS and environmental documents. These letters provided detailed background emphasizing the need for regional cooperation for the construction of these improvements. As such, we respectfully request that the re-stripping and any other critical intersection improvements in the Saticoy area be included in the RTP/SCS or FTIP Projects list as necessary, to make this a priority project.

2. **El Rio/Del Norte Area Plan.** The improvements and project scope identified in the environmental document cover an area of unincorporated Ventura County known as El Rio/Del Norte Area Plan. In the Land Use Section of the area plan, policies have been adopted for land use compatibility. Specifically, the following policies have a potential to be impacted:

7

- a. Policy 3.2.2(4) states "Discretionary, non-agricultural land uses adjacent to Agricultural designated land shall be required to establish appropriate buffers as determined by the Agricultural Department."
- b. Goal 4.1.1 Transportation/Circulation:
 1. Ensure adequate circulation and transportation system to serve the needs of the existing and future residents of the El Rio/Del Norte area.
 2. Plan for safe pedestrian and bicycle pathways throughout the El Rio/Del Norte area;
 3. Encourage the expansion of bus service to serve the El Rio/Del Norte area.

The Draft Program EIR discusses significant and unavoidable impacts in the Land Use section. **Impact LU-2** "Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect," results in a significant and unavoidable impact.

At the project level, Long Range Planning staff concurs with **PMM LU-2**, "When an inconsistency with the adopted general plan policy or land use regulation (adopted for the purpose of avoiding or mitigating an impact) is identified modify the transportation or land use project to eliminate the conflict; or, determine if the environmental, social, economic, and engineering benefits of the project warrant an amendment to the general plan or land use regulation."

3. **Solid Waste.** Table 3.19.1-1 Solid Waste Tonnage within the SCAG Region (2018) identifies both San Bernardino County and Ventura County as having a total tonnage of 1,908,462 for 2018. The linked source of CalRecycle Landfill Tonnage Reports shows Ventura County as having a total tonnage of 1,904,702 for 2018. Although the Total Tonnage figure of 19,550,712 (for the SCAG Region) captures the correct solid waste tonnage figure, the section should be reviewed to ensure accurate citation of solid waste data is used throughout the document.
4. **Wastewater and Storm Drainage Facilities.** The County of Ventura has adopted a Habitat Connectivity and Wildlife Corridor Ordinance and identifies bridges and culverts as wildlife crossing structures (section 8109-4.8.3.4 of the Ventura County Non-Coastal Zoning Ordinance). As such, planning staff concurs with the project level mitigation measure of **PMM USWW-1** "...During the design and CEQA review of individual future projects, implementing agencies and project sponsors shall determine whether sufficient wastewater capacity exists for the proposed projects. There CEQA determinations must ensure that the proposed development can be served by its existing or planned treatment capacity. If adequate capacity does not exist, project sponsors shall coordinate with the relevant service provider to ensure that adequate public services and utilities could accommodate the increased demand, and if not, infrastructure improvements for the appropriate public service or utility

shall be identified in each project's CEQA documentation. The relevant public service provider or utility shall be responsible for undertaking project level-review as necessary to provide CEQA clearance for new facilities."

9

If the project results in new or retrofitted infrastructure improvements, the Ventura County Planning Division shall be consulted to ensure the improvements are consistent with the County's zoning ordinance and the adopted Habitat Connectivity and Wildlife Corridor standards. Early consultation with the Planning Division during the project level design phase is encouraged. This request is intended to help streamline the project and prevent revisions to plans or new mitigation measures necessary to comply with the Habitat Connectivity and Wildlife Corridor regulatory standards.

Subject: Notice of Preparation of a Program Environmental Impact Report (PEIR) for Connect SoCal (2020-2045 Regional Transportation Plan/Sustainable Communities Strategy)(RTS/SCS)

Dear Mr. Ok:

Thank you for the opportunity to provide input and comments on the Notice of Preparation of a PEIR for Connect SoCal (2020-2045 Regional Transportation Plan/Sustainable Communities Strategy). The Long Range Planning Section of the Ventura County Planning Division reviewed the Notice of Preparation for the proposed project and provides the following response:

1. **Saticoy Area Plan.** In September 2015, the Ventura County Board of Supervisors adopted a comprehensive update to the Saticoy Area Plan. The Saticoy community is defined as a "severely economically disadvantaged community" and the Saticoy Area Plan has a 20-year time horizon that extends from 2015 to 2035. The Mobility Element within the Saticoy Area Plan identifies implementation program MOB-P2 which prioritizes the re-striping of SR 118 from Vineyard Avenue to Darling Road.

On January 28, 2016, the Long Range Planning Section submitted a comment letter to Southern California Association of Governments (SCAG) in response to Draft 2016 RTP/SCS and PEIR. This letter provided detailed background emphasizing the need for regional cooperation for the construction of these improvements. As such, we respectfully request that the re-striping and any other critical intersection improvements in the Saticoy area be included in the RTP/SCS or FTIP Projects list as necessary, to make this a priority project.

2. **Bottom-up Local Growth and Land Use Input Process.** On October 1, 2018 and December 14, 2018, the Ventura County Planning Division provided detailed and comprehensive data and analysis in response to the request for local input. We request that this input be considered as part of the preparation of the environmental document.
3. **Population Growth and Housing Projections.** As part of the scoping for the environmental analysis in the PEIR, we request special consideration be given to protection of farmland and

800 South Victoria Avenue, L# 1740, Ventura, CA 93009 (805) 654-2481 Fax (805) 654-2509

that contaminated sites such as Santa Susana Field Laboratory (SSFL) be excluded from consideration of potential housing sites.

Thank you again for the opportunity to comment. Should you have any questions about the contents of this letter, please contact me at 805-654-3327 or via email at linda.blackburn@ventura.org

Sincerely,

Linda Blackburn, Senior Planner
Long Range Planning Section
Ventura County Planning Division

DATE: January 28, 2016

TO: Laura Hocking, RMA/Planning Technician

FROM: Kari Finley, Senior Planner

SUBJECT: Environmental Document Review, RMA Ref. #15-024
2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS)

We would like to thank the Southern California Association of Governments (SCAG) for the opportunity to review the Draft 2016 RTP/SCS and Program EIR. This memo provides comments on the Draft 2016 RTP/SCS from the Ventura County Planning Division for consideration by SCAG.

In September 2015, the Ventura County Board of Supervisors adopted a comprehensive update to the Saticoy Area Plan. The Saticoy community is defined as a "severely economically disadvantaged community". The Saticoy Area Plan has a 20-year time horizon that extends from 2015 to 2035. Within the Saticoy Area Plan, project objectives are called "guiding principles" that must be used when evaluating future Area Plan amendments. The four guiding principles developed for the Saticoy Area Plan update 1) sustainable development that supports a healthy community, 2) economic revitalization, 3) improved housing opportunities and, 4) improved infrastructure systems. The Area Plan update was primarily funded through a combination of Compass Blueprint Program Grant and the Strategic Growth Council Sustainable Communities Planning Grant Program. Significant planning efforts were focused on reducing vehicle miles travelled.

One of the unavoidable, significant impacts that was identified in the Saticoy Area Plan Program EIR, includes traffic impacts on State Route 118 (SR118) in the Saticoy Community. One potential mitigation measure that was identified includes the widening/re-striping of SR118 in the Saticoy community (e.g., generally between Vineyard Avenue to Darling Road). Although the Board of Supervisors adopted a statement of overriding considerations for this impact, the following implementation program (highlight added) was included in the Area Plan to help mitigate the impact in the future:

No.	Program Description	Responsibility	Priority	Timeframe
MOBILITY ELEMENT				
MOB-P2	Reclassify Portion of SR 118: To mitigate significant project and cumulative traffic impacts on SR 118 between Vineyard Avenue and Darling Road, the County should review and process a General Plan Amendment that would reclassify that segment of SR 118 from 4 to 6 lanes on the Regional Road Network. The road reclassification should be incorporated into the next General Plan Update, tentatively scheduled for completion in 2020. Finally, the County shall work with VCTC and Caltrans to reprioritize the re-striping of SR 118 from Vineyard Avenue to Darling Road on the Ventura County Congestion Management Plan and the Caltrans list of projects. Although the re-striping project is currently listed in the Congestion Management Plan, the prioritization and timing for construction should be modified to occur within the 20-year horizon of the Saticoy Area Plan.	PWA/ Transportation; RMA/Planning; VCTC; Caltrans; City of Ventura	A	0-5 years

As indicated in the adopted Saticoy Area Plan program, it is critical for implementation of the recently adopted Saticoy Area Plan and future development in the Saticoy community that the re-striping project be included as a prioritized project in the 2016 RTP/SCS (FTIP Projects). The Saticoy Area Plan guiding principles are consistent with the RTP/SCS overarching strategy that calls for “more compact communities in existing urban areas”. The Saticoy Area Plan includes a land use plan with more compact development and improved mobility in an existing urban area. Peak-hour traffic impacts are already significant in this area and will impede future revitalization of this disadvantaged community if improvements to SR118 are not constructed.

As such, we respectfully request that the re-striping and any other critical intersection improvements in the Saticoy area be included in the RTP/SCS or FTIP Projects list as necessary, to make this a priority project. If you have any questions concerning these comments, you may contact Kari Finley at kari.finley@ventura.org or 805/654-3327.

WATERSHED PROTECTION
WATERSHED PLANNING AND PERMITS DIVISION
800 South Victoria Avenue, Ventura, California 93009
Sergio Vargas, Deputy Director – (805) 650-4077

M E M O R A N D U M

DATE: December 6, 2019
TO: Anthony Ciuffetelli, RMA Planner
County of Ventura
FROM: Sergio Vargas, Deputy Director *S.V.*
SUBJECT: RMA19-001 NOP of PEIR 2020-2045
Watershed Protection District Project Number: WC2019-0008

Pursuant to your request dated November 18, 2019, this office has reviewed the submitted materials and provides the following comments.

PROJECT LOCATION:

The SCAG region consists of six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura), and 191 cities (Figure 1, *SCAG Region*). To the north of the SCAG region are the counties of Kern and Inyo; to the east is State of Nevada and State of Arizona; to the south is the county of San Diego; and to the northwest is the Pacific Ocean. The SCAG region also consists of 15 sub-regional entities that serve as partners in the regional planning process

PROJECT DESCRIPTION:

Pursuant to federal and state planning requirements, SCAG updates and adopts a long-range regional transportation plan every four years. SCAG's last Plan was adopted in 2016 and an updated Plan is required to be adopted by April 2020.

Connect SoCal will outline the region's goals and policies for meeting current and future mobility needs, provide a foundation for transportation decisions by local, regional and state officials that are ultimately aimed at achieving a coordinated and balanced transportation system. Connect SoCal will also identify the region's transportation needs and issues, recommended actions, programs, and a list of projects to address the needs consistent with adopted regional policies and goals, and document the financial resources needed to implement Connect SoCal. It is important to note that SCAG does not implement individual projects in the RTP, as they will be implemented by local and state jurisdictions, and other agencies.

COMMENTS:

For each specific project considered, the environmental impacts for three areas of concern must be considered.

Impacts to Watershed Protection District Facilities and Jurisdictional Channels:

Each project analyzed under the proposed program must consider the impacts to facilities owned or under the jurisdiction of the Ventura County Watershed Protection District. Any projects in, on, over, under, or across a District jurisdictional channel or within District right-of-way would require a permit from the Ventura County Watershed Protection District consistent with District policy and Ordinance WP-2.

2

In planning future projects from a programmatic standpoint. The environmental documents should include a requirement that each project under the program must consider current and future flows for any projects that cross redline channels or other major waterways.

Hydraulic Hazards FEMA:

Each project analyzed under the proposed program must consider if the project is located in a special flood hazard area (SFHA) shown on either the effective or preliminary flood hazard mapping as prepared by the Federal Emergency Management Agency (FEMA). Project considered within the SFHA must obtain a permit from the Ventura County Public Works Agency and meet project specific requirements to mitigate impacts from flooding.

3

Costal Hazards and Sea Level Rise:

If a project is proposed in a Coastal Zone costal hazards and the impacts sea level rise must to be considered consistent with the California Coastal Commission and the Ventura County General Plan Policies.

4

END OF TEXT

If you have any questions, please feel free to contact Nathaniel Summerville by email at Nathaniel.Summerville@ventura.org or by phone at (805) 477-1967.

Los Angeles, CA 90017

Dear Connect SoCal Team:

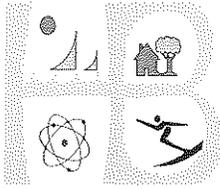

The City of Costa Mesa appreciates the time and effort undertaken by the Southern California Association of Governments (SCAG) staff in its efforts to develop a RTP/SCS of our large and diverse metropolitan planning area. The City of Costa Mesa remains committed to doing its fair share in addressing regional issues and appreciate the comment and review period provided by SCAG for the Connect SoCal Plan and its associated PEIR.

The City would like to express its support of recommendations and comments submitted by the Orange County Council of Governments, Orange County Transportation Authority, and Center for Demographic Research. We strongly recommend that all comments and concerns from these bodies be implemented into the Connect SoCal Plan and the associated PEIR.

Sincerely,

Draft Connect SoCal PEIR Comments

Attn: Roland Ok

Southern California Association of Governments

900 Wilshire Blvd., Ste. 1700

Los Angeles, CA 90017

Submitted via email to: 2020PEIR@scag.ca.gov

RE: CITY OF HUNTINGTON BEACH DRAFT CONNECT SOCIAL AND PEIR COMMENT LETTER

Dear Mr. Ok,

Thank you for the opportunity to submit comments on the Draft Connect SoCal plan and Program EIR. The City of Huntington Beach appreciates SCAG’s public outreach efforts for this process and offers the following comments and concerns for your consideration.

1

High Quality Transit Areas (HQTAs)

HQTAs are defined as “corridors that have at least a fifteen minute headway (time in between the next scheduled service) during peak hours bus service.” According to RTP/SCS maps, all of Beach Boulevard within the City of Huntington Beach is defined as a HQTA. However, based on the October 13, 2019 Orange County Transportation Authority (OCTA) Bus Schedule¹, there are no bus stops on Beach Boulevard within the City of Huntington Beach with headway times of 15 minutes or less. Route 29 services Beach Boulevard from the City of La Habra to PCH in Huntington Beach. The shortest headway time during peak hours for bus service is on the Route 29 stop at PCH/1st Street (not a stop on Beach Boulevard) traveling southbound with an average headway time of 18.23 minutes during the PM peak hours. Most stops have an average peak hour headway time of approximately 19-25 minutes. Some stops, such as the Beach Boulevard/Talbert Avenue stop, have peak hour headway times of 40-49 minutes. One stop (Beach Boulevard/Atlanta Avenue) did not list any stop times as part of any route for this stop. It must also be noted that OCTA eliminated Route 211 in October 2019, which serviced Huntington Beach to Irvine (a major Orange County job center) due to low ridership.

2

¹ OCTA Bus Book <http://www.octa.net/ebusbook/CompleteBusBook.pdf>

Further, OCTA's 2018 Long Range Transportation Plan (LRTP)² includes Figure 4.1 – *Local, Community, and Bravo! Final Route Recommendations*. This figure recommends that Route 29 receive a reduction in frequency of service. This will add further delay to the 19-25 minute average peak hour headway service times on Beach Boulevard.

2

The Connect SoCal Plan and PEIR must utilize practical application of HQTAs as they operate and are planned for in order to implement the statute objectives of the RTP/SCS, including promoting an improved intraregional relationship between jobs and housing. The City of Huntington Beach recommends revising the HQTAs throughout Connect SoCal and the PEIR to accurately reflect available data regarding actual bus service and planned bus service on Beach Boulevard. Based on SCAG's definition of a HQTA, the entire length of Beach Boulevard in Huntington Beach does not qualify as a HQTA and must be adjusted accordingly.

The Connect SoCal Plan and PEIR also include other transportation related errors in Orange County, as identified by comments made by OCTA. The City of Huntington Beach expresses support for OCTA's comments as they pertain to errors and inconsistencies between the existing and planned Orange County transportation network and the RTP/SCS and PEIR. For example, the OCTA Board has not approved conversion from HOV to tolled express lane for SR-55, SR-73, I-605, or north of I-605 on I-405 as depicted in the proposed regional express lanes network. The potential regional express lane network is currently subject to further study to evaluate right-of-way impacts, community issues, and overall feasibility. Additionally, Connect SoCal regional strategies rely on improvements beyond the projects submitted by OCTA, and implementation of the strategies is subject to availability of new revenue sources, necessary project development, and review processes by the implementing agencies.

3

RHNA Growth Exceeds General Plan Growth

Section 3.14 – Population and Housing of the Connect SoCal PEIR includes four guiding principles related to Growth Forecasts approved by SCAG's Regional Council on August 1, 2019:

Principle #1: The draft plan forecast for Connect SoCal shall be adopted by the Regional Council at the jurisdictional level, thus directly reflecting the employment, population and household growth projections derived from local input and previously reviewed and approved by SCAG's local jurisdictions. The draft plan growth forecast maintains these projected jurisdictional growth totals, **meaning further growth is not reallocated from one local jurisdiction to another.**

4

Principle #2: The draft plan forecast at the Transportation Analysis Zone (TAZ) level is **controlled to be within the density ranges of local general plans or input received from local jurisdictional** in this most recent round of review.

² OCTA Long Range Transportation Plan, Figure 4.1 <http://www.octa.net/pdf/OCTALRTP111618FINAL.pdf>

Principle #3: For the purpose of determining consistency for California Environmental Quality Act (CEQA) streamlining, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the Plan.

Principle #4: TAZ level data or any data at a geography smaller than the jurisdiction is included in the draft plan forecast only to conduct the required modeling analytical work and is therefore, only advisory and non-binding as SCAG's sub-jurisdictional forecasts are not formally adopted as part of the Plan.

The SCAG RHNA methodology is inconsistent with Principle #1 and #2. The currently proposed draft 6th Cycle RHNA methodology reallocates "residual" existing need across jurisdictions within the same county. The reallocation is assigned to jurisdictions based on transit accessibility (50%) and job accessibility (50%), and excludes Disadvantaged Community jurisdictions which have over 50% of their populations in very low resource areas using California Tax Credit Allocation Committee (TCAC)/HCD Opportunity Indices.

4

Further, the cumulative impacts of the reallocation, projected need, and existing need result in a total RHNA that exceeds 1.0368 times planned household growth from the SCAG region³. While 1.0368 is the overall exceeded household growth in the region, each jurisdiction may be given a RHNA allocation that exceeds their General Plan growth even further as a result of the reallocated "residual" existing need calculation.

The PEIR also states that although the existing housing need portion of the 6th cycle RHNA is not included in the SCS growth forecast, the existing need portion will be allocated in a manner to support the goals of Connect SoCal through the RHNA process. The PEIR does not provide any meaningful analysis or supporting evidence to demonstrate how this will be accomplished. The currently proposed draft 6th Cycle RHNA methodology which includes reallocated "residual" need and growth exceeding SCAG local jurisdiction General Plan forecasts is not consistent with the goals of Connect SoCal, including the following:

Goal 2: Improve mobility, accessibility, reliability, and travel safety for people and goods

Goal 4. Increase person and goods movement and travel choices within the transportation system

Goal 9: Encourage development of diverse housing types in areas that are supported by multiple transportation options.

The City of Huntington Beach is unable to accommodate any reallocated growth due to a lack of transportation options, which is not consistent with Connect SoCal Goals 2, 4, or 9. As a result, the SCAG RHNA methodology is wholly inconsistent with Connect SoCal and the PEIR must address this information.

³ SCAG 6th Cycle RHNA Draft Allocation Methodology November 7, 2019
<http://www.scag.ca.gov/programs/Documents/RHNA/RHNA-Draft-Methodology.pdf>

Support for Comments and Recommendations Submitted by Other Groups

The City of Huntington Beach expresses support for comments made by OCTA as they pertain to errors and inconsistencies between the existing and planned Orange County transportation network and the RTP/SCS and PEIR, as noted above. The City also expresses support for comments made by the Center for Demographic Research (CDR) and the Orange County Council of Governments (OCCOG). The City would like to highlight the following comments from CDR and OCCOG that are of the highest level of concern:

1. SCAG must utilize the 2018 Orange County Projections (OCP-2018) dataset provided to SCAG during its Bottom-Up Local Input and Envisioning Process to ensure that general plan capacities are not exceeded and all open space and entitlements are properly reflected for the RTP/SCS and PEIR.
2. CDR PEIR comments #33, #35, and #54 to add the following text: "SB 375 requires the determination to be based upon population projections by the Department of Finance and regional population forecasts used in preparing the regional transportation plan. If the total regional population forecasted and used in the regional transportation plan is within a range of 1.5 percent of the regional population forecast completed by the Department of Finance for the same planning period, then the population forecast developed by the regional agency and used in the regional transportation plan shall be the basis for the determination. If the difference is greater than 1.5 percent, then the two agencies shall meet to discuss variances in methodology and seek agreement on a population projection for the region to use as the basis for the RHNA determination. If no agreement is reached, then the basis for the RHNA determination shall be the regional population projection created by the Department of Finance. Though SCAG's total regional population projections from the regional transportation plan were within 1.5 percent of the Department of Finance projections, HCD rejected the use of SCAG's population projections."
3. CDR RTP/SCS and OCCOG comments which revise text to maintain an objective/unbiased tone, delete sensationalized language, and include meaningful evidence to support generalized claims about the SCAG region.
4. OCCOG comments to revise the definition of a HQTAs used in the RTP/SCS and RHNA to be consistent with the definition of a HQTAs in SB 375 and the Strategic Growth Council. This is necessary to ensure the SCAG region is able to compete for available funds related to transit-oriented housing.
5. OCCOG comments opposing any alternative in the PEIR that does not utilize local input, including the intensified land use alternative. The RHNA must be consistent with the RTP/SCS as required by Government Code Section 65080(b)(2)(B) and Section 65584.04(m).
6. OCCOG PEIR comments regarding the usage of "can and should" in mitigation measures. Revise all mitigation measures to be "considered where applicable and feasible" to clarify that these mitigation measures are a menu of options and not

5

6

7

8

9

10

requirements. Further, any mitigation measure that includes a new fee or tax to be adopted at the jurisdictional level must be revised to clarify that it is an option for implementation and not a requirement. Also clarify whether the assumed revenue from the suggested new fees were included in the financial plan or economic analysis of the RTP/SCS.

10

Conclusion

Thank you for the opportunity to comment on the Draft Connect SoCal plan and Program EIR. The City of Huntington Beach appreciates SCAG's commitment to a fair and transparent process and will continue to be an active participant during the RTP/SCS update and 6th cycle RHNA process.

11

Draft Connect SoCal Plan Comments
 ATTN: Connect So Cal Team
 Southern California Association of Governments
 900 Wilshire Blvd., Suite 1700
 Los Angeles, CA 90017

RE: PUBLIC REVIEW AND COMMENT ON THE DRAFT CONNECT SOCIAL PLAN (2020-2045 REGIONAL TRANSPORTATION PLAN/SUSTAINABLE COMMUNITIES STRATEGY) AND PROGRAM ENVIRONMENTAL IMPACT REPORT.

Connect So Cal Team,

Thank you for providing the City of Indio's Planning Division the opportunity to review and comment on the draft Connect SoCal plan (also known as the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy or RTP/SCS). After reviewing the information provided, comments pertaining to the draft Connect SoCal document and draft Program Environmental Impact Report the following updates and comments are being provided for consideration:

1

I. General Plan Update

In response to Table 3.8-4 *California Jurisdiction Addressing Climate Change in the SCAG Region (2019)* on the Draft Program EIR we would like to provide and update for the three items that were (IP) In Progress (1) GHG Reduction Plan, (2) Climate Action Plan, and (3) General Plan Policy. On September 18, 2019 the City Council approved the City of Indio 2040 General Plan Update (Resolution No. 10107) and Climate Action Plan (Resolution No. 10108). The General Plan addresses the mandatory elements required by state law that are Land Use, Housing, Circulation (Mobility), Conservation, Noise, Open Space and Environmental Justice. It also includes optional elements of Community Facilities and Infrastructure, Health and Equity (inclusive of Environmental Justice), Economic Development and Implementation. The Climate Action Plan establishes the City's goals for addressing and implementing measures consisting of policies, programs, and/or plans to achieve emissions reductions that would meet or exceed the established GHG reduction targets. The three items on the table mentioned

2

COMMUNITY DEVELOPMENT DEPARTMENT
 100 Civic Center Mall • Indio, CA 92201
 (760) 391-4120 • Fax (760) 391-4027

above can be updated to (A) Adopted with the addition of the General Plan Implementation Measures.

Below are current City projects aimed to reduce GHG emissions, encourage active transportation, and integrate shared mobility.

2

II. Multi Modal Hub Feasibility Study

The City applied to Caltrans for a Sustainable Planning Grant. The grant analyzed and evaluated fifteen (15) sites for a future Multi-Modal Hub site in the City of Indio. Furthermore, in collaboration with RCTC and Caltrans the feasibility study identified the selected site for use for passenger rail services. The passenger rail route is being planned as Special Events Train to operate between Los Angeles Union Station and Indio. The Special Events Train will serve the Coachella Valley Music and Arts Festival and Stagecoach Festival. The feasibility study looks at existing and proposed transportation system to provide multi-modal services such as park-and-ride, transit connections, bikeshare. The study includes site development, management and operations, maintenance, costs and funding. The Multi Modal Hub Feasibility Study is planned to be completed and adopted by February 2020.

3

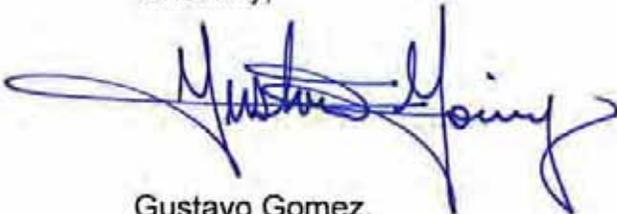

III. Complete Streets Plan

The City of Indio 2040 General Plan's Mobility elements outlines the goals and objectives for the Complete Streets Master Plan. The purpose of the Complete Streets Plan is to enhance connectivity across all travel modes. Although the City of Indio has over 20 miles of existing bikeways and various miles of existing sidewalks, there are still critical connectivity gaps for both bicyclists and pedestrians. As part of this project, transit, bicycle, and pedestrian connectivity improvements identified in the Mobility Element are being reviewed in the Complete Streets Plan to identify remaining connectivity gaps and identify projects to address these gaps. The Complete Streets Master Plan is expected to be completed by early 2020.

4

Thank you for your consideration of these comments. Should you have any questions please feel free to contact me at (760) 391-4064.

Sincerely,

Gustavo Gomez,
Assistant Planner

January 24, 2020

Mr. Kome Ajise
Executive Director
Southern California Association of Governments
900 Wilshire Boulevard, Suite 1700
Los Angeles, California 90017
ConnectSoCal@scag.ca.gov

Subject: Comments on Connect SoCal, the Draft 2020 Regional Transportation Plan/Sustainable Communities Strategy and Draft Program Environmental Impact Report

Dear Mr. Ajise:

The City of Irvine appreciates the opportunity to review and provide comments on Connect SoCal, the Draft 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (2020 RTP/SCS) and the Draft Program Environmental Impact Report (PEIR). The draft 2020 RTP/SCS and PEIR is a significant effort and the City of Irvine recognizes that the documents are critical to the region's ability to receive federal funding for transportation projects, improve mobility, support sustainable development, operate and maintain the transportation system, and meet the region's greenhouse gas emission reduction targets and other air conformity standards.

The following general comments and recommendations are offered by the City of Irvine on the 2020 RTP/SCS, associated appendices, and PEIR. In support of this letter, please find attached more specific detailed comments from the City of Irvine that are consistent with the comments provided by the Orange County Council of Governments (OCCOG) and the Center for Demographic Research (CDR) at California State University Fullerton. The City of Irvine requests that this letter and all of its attachments be included in the public record as our collective comments on the 2020 RTP/SCS, PEIR, all associated appendices and documents, and online inventory of maps.

1. The City of Irvine concurs with the Orange County Council of Governments (OCCOG) and the Center for Demographic Research (CDR) at California State University Fullerton

1

2

The City of Irvine concurs with the comments SCAG will receive from the OCCOG and the CDR. The City requests that SCAG respond to all of the comments detailed in the OCCOG and CDR letters and to act upon any changes advocated by OCCOG, of which the City is a member agency.

2

2. 2020 RTP/SCS Growth Forecast

The City of Irvine greatly appreciates the close coordination between SCAG and CDR on behalf of the City of Irvine to ensure the 2020 RTP/SCS growth forecast accurately reflects development agreements; entitlements; projects recently completed or under construction; open space; and general plan densities.

Additionally, the City of Irvine supports a growth forecast that is adopted at a geographic level no lower than the jurisdictional level. The City of Irvine provided SCAG with a detailed and accurate land use dataset and growth forecast during its eighteen (18) month Bottom-Up Local Input and Envisioning Process and through the submission of the 2018 Orange County Projections (OCP-2018) dataset.

3

On December 11, 2019, CDR provided SCAG with the technical corrections to the draft 2020 RTP/SCS growth forecast dataset on behalf of the City of Irvine and all other Orange County jurisdictions. The technical corrections ensure the final 2020 RTP/SCS growth forecast accurately reflects entitlements; development agreements; projects recently completed or under construction; open space; and general plan densities. On January 8, 2020, CDR requested, on behalf of the City of Irvine and all other Orange County jurisdictions, a copy of the final draft growth forecast dataset to confirm that all the technical corrections have been included in the final 2020 RTP/SCS growth forecast. On January 14, 2020, CDR was informed that SCAG would not provide a copy of the final draft growth forecast to CDR for review until mid-February 2020.

It is strongly recommended that SCAG utilize the 2018 Orange County Projections (OCP-2018) dataset provided to SCAG during its Bottom-Up Local Input and Envisioning Process to ensure that general plan capacities are not exceeded and all open space, development agreements, and entitlements are properly reflected.

The City of Irvine opposes any alternative in the PEIR that does not utilize local input, or at the very least, the jurisdictional totals provided through the local input process should be used. Any alternative that does not properly reflect all development agreements, open space protections, and recent or ongoing construction should not be utilized as the preferred alternative. We further note the failure to rely on accurate jurisdictional-level data divorces the 2020 RTP/SCS from the methodology proposed in the RHNA as required by

4

Government Code Section 65080 (b)(2)(B) and Section 65584.04(m) and we believe this must be remedied in the final 2020 RTP/SCS.

4

3. High Quality Transit Area (HQTA)

The alignment of SCAG's Regional Housing Needs Assessment (RHNA) and RTP/SCS documents is required by Government Code Section 65080 (b)(2)(B) and Section 65584.04(m). The proposed methodology SCAG submitted to the Department of Housing and Community Development (HCD) indicates that the HQTAs identified in the RTP/SCS using the 2045 planning year are to be used for RHNA purposes of evaluating "transit access." The City of Irvine has expressed concern throughout the RHNA methodology development process with the utilization of the Interstate 5 Bus Rapid Transit (BRT) corridor. The HCD approved RHNA methodology identifies three station stops within the City of Irvine, however, the Interstate 5 BRT project and the three station stops have not been approved or vetted by the City and are not certain. The City of Irvine requests that the station stops within the City of Irvine or potential references to them be removed from the RTP/SCS.

5

4. Remain Neutral on Technology

Throughout the documents, there are specific examples of technology identified. It is not SCAG's purview to pick winners and losers in technology; the marketplace will determine dominant technologies. Therefore, it should be noted that these are only examples and that future technologies should not be ignored or excluded from meeting the goals of the RTP/SCS. This will allow the document, including mitigation measures, to be more inclusive and responsive to changing technological advances.

6

5. Maintain Unbiased, Objective Tone

Language throughout the draft 2020 RTP/SCS, the PEIR, and the associated appendices has a tendency to be leading and dramatic in its emphasis of certain key issues, such as active transportation, public health, and land use policy. While these issues are important, using opinion-based and emotionally-charged language is inappropriate in this context.

7

SCAG should remove, wherever applicable, opinion and biased descriptive language that does not reflect the fact-based, data-driven nature of this critical document in favor of a more unbiased, objective tone that embraces the diversity of the region. Examples of overly emphatic language are outlined in Enclosure 1.

6. “Can and Should”

As indicated in the PEIR, state law provides that it is appropriate to indicate in mitigation measures that they “can and should” be implemented where the authority to implement the measure rests with agencies other than SCAG. The language conveys to local agencies an affirmative obligation to address each mitigation measure, irrespective of whether such agencies deem the measures applicable to a particular project or duplicative of their own or other governmental agencies’ regulatory measures. The City of Irvine recognizes SCAG’s use of the words “can and should” are derived from California Environmental Quality Act (CEQA), at Public Resources Code sections 21081 and 2155.2(b)(5)(ii) and CEQA Guidelines, including section 15091(a)(2). Nevertheless, given the express limitation of Senate Bill 375 (SB 375) upon respective local agencies’ land use authority, the City of Irvine deems any language seemingly imposing affirmative obligations contrary to SB 375 inappropriate. As such, the use of the language “can and should” for mitigation measures addressed to local agencies is overreaching.

The City of Irvine recommends SCAG change all language in all project level mitigation measures to read “~~can and should~~ consider where applicable and feasible.” This change will clarify that the project level mitigation measures are a menu of options.

7. Duplicative/Existing Regulations

It is noted that many of the mitigation measures are duplicative of existing regulation or processes (e.g., CEQA review requirements). Under CEQA, it is intended that measures be identified that will mitigate impacts of the project. Existing regulations are already assumed to be abided by in the evaluation of the impact, and the significance of the impact should be looked at after all existing regulation is applied. Mitigation measures should address those actions that need to be undertaken in addition to existing regulation in order to mitigate the impact. Therefore, mitigation measures that simply restate existing regulation are not valid mitigation for purposes of CEQA. Further, it is possible for regulations to change over time. Because of this, restatement of the regulation in the mitigation measures could result in future conflict between the stated mitigation and regulation. It has become common practice to state that existing regulation will be implemented. When this is done, it is common practice, when compliance is used as a mitigation measure, to simply state that the responsible entity will simply comply with the regulation. If mitigation measures that restate existing regulation are not removed, then it is requested that the wording of the measures be restated to simply read that compliance with all applicable laws and regulations will be undertaken. Language that could be used is “Local jurisdictions, agencies, and project sponsors shall comply, as applicable, with

existing federal, state, and local laws and regulations. Similar language is included in some mitigation measures.

9

8. Cities vs. Jurisdiction

Throughout the 2020 RTP/SCS, PEIR, and associated appendices, there are references to “cities”. Since the SCAG region also includes counties, it is recommended that references to “city” or “cities” are changed to “jurisdiction” or “jurisdictions” where appropriate.

10

9. Spell out Acronyms Prior to Using Abbreviations

There are many different abbreviations used throughout the documents. To avoid confusion and help persons unfamiliar with technical jargon, spelling out the acronyms prior to using them for the first time is common; however, this is often missing in the 2020 RTP/SCS documents.

11

10. Provide Sources for All Graphics and Tables

When a report of such complexity as the 2020 RTP/SCS is produced, it is common for tables, maps, and other graphics to be used or referred to in a manner that could divorce them from the context in which they are presented. For instance, someone may come upon a chart that explains a topic they are reaching and could download the image separate and apart from the technical explanation accompanying it in the electronic version of the document. Without source information embedded in the graphic, information can be spread without proper attribution. The City of Irvine understands that it may “look cleaner” to not include a source, date, and citation for data but best practices for technical reports include adding sources to all graphics.

12

11. Fees and Taxes

Several mitigation measures indicate that local jurisdictions or other entities should implement new fees or propose taxes to pay for a variety of programs or for acquisition of land for preservation. Increases to fees or taxes are issues that could require voter approval and, therefore, it should not be assumed that they will be approved.

13

The City of Irvine recommends that SCAG reword measures to indicate that a new or increased fee, new tax, or other increase is only an option as a way to implement the mitigation. SCAG should also clarify whether it was assumed that these additional fees were considered feasible and if the new fees that are suggested were considered in the financial plan or economic analysis of the RTP.

The City of Irvine appreciates your consideration of all comments provided in this letter and enclosure and looks forward to your responses. It is a shared goal to have a Regional Transportation Plan and Sustainable Communities Strategy adopted by the April 2020 deadline that represents the best in regional planning developed collaboratively with local jurisdictions and stakeholders in a manner that is credible and defensible on all levels. If you have any questions, please do not hesitate to call me.

14

Sincerely,

Pete Carmichael
Director of Community Development

Re: Draft Connect So Cal Program Environmental Impact Report Comments

Dear Mr. Ok,

Thank you for the opportunity to review the "Draft Connect So Cal Program Environmental Impact Report". As you are aware, the California Environmental Quality Act allows potentially affected agencies to comment on proposed projects that may cause significant environmental impacts to their community. Given the nature of the project, the following are our concerns and comments:

DOWNLOADS

Draft Connect SoCal Plan- No comments.
Chapter 0: Making Connections- No comments.
Chapter 1: About the Plan- No comments.
Chapter 2: SoCal Today- No comments.
Chapter 3: A Path to Greater Access, Mobility and Sustainability- No comments.
Chapter 4: Paying our Way Forward- No comments.
Chapter 5: Measuring our Progress- No comments.
Chapter 6: Looking Ahead- No comments.
Glossary: No comments.

Re: City of Laguna Hills Comments for Connect SoCal; 2020 RTP/SCS and PEIR

Dear Mr. Komise:

The City of Laguna Hills appreciates SCAG's efforts to address complex regional issues and to collaboratively plan with local jurisdictions. The City of Laguna Hills respectfully provides the comments below concerning SCAG's 2020 RTP/SCS known as Connect SoCal (the Plan).

Local Input

The City supports the use of data provided to SCAG on behalf of the City by Cal State Fullerton's Center for Demographic Research (CDR) via OCP-2018. At this time the City understands that CDR has not yet been given the opportunity to review the final RTP/SCS growth forecast. The City does not support any intensification of the City's land uses in the proposed RTP/SCS beyond the local input provided in OCP-2018.

Interstate 5 (I-5) High Quality Transit Area (HQTA) Proposal – South Orange County

The City is perplexed by the Plan's proposal to designate I-5 in south Orange County as a High Quality Transit Area. The Plan refers to HQTAs as corridor-focused growth areas within one half mile of an existing or planned fixed guideway transit stop or a bus transit corridor where buses pick up passengers at a frequency of every 15 minutes (or less) during peak commuting hours. No such transit access currently exists anywhere in south Orange County, and based on the City's understanding of the Orange County Transportation Authority's (OCTA) operations, no such transit access is contemplated. Without the appropriate supporting transit, an HQTA designation for I-5 is not justified.

Nearly 360,000 motorists travel the I-5 daily in South Orange County, and volumes are expected to grow 25 percent by 2045 (OCTA, 2019). Increasing higher intensity housing uses along the I-5 will merely add congestion without reducing per capita VMT since limited transit alternatives

for commuting to job centers exist for South County residents. While OCTA and CalTrans are working to implement various widening projects to improve capacity of the I-5, there are no plans associated with CalTrans or OCTA projects to add any infrastructure typically associated with an HQTAs. In addition, a substantial portion of the land area adjacent to I-5 in south Orange County is constrained by steep slopes, flood control improvements, rail infrastructure, water and sewer infrastructure, and open space. There may be pockets of areas that exist along the I-5 that could arguably transition to higher intensity land uses under the Plan (such as near existing Transit Priority Areas), but these pocket growth areas do not justify the designation of the entire I-5 corridor as an HQTAs. Therefore, the City requests that the HQTAs designation be revised on the I-5 corridor to extend no further south than El Toro Road. The City believes revising the HQTAs in this manner is appropriate given a variety of land use and planning factors that exist in the area. These factors lend themselves to supporting a transition to higher intensity land uses contemplated by the Plan in the City of Laguna Hills.

Sincerely,

David Chantarangsu
Community Development Director
City of Laguna Hills

Candice Vander Hyde – City of Lancaster, Management Analyst

To Whom It May Concern.

After reviewing the projects listed in the Connect SoCal PEIR document, the City of Lancaster would like to submit to you that there are two of our projects missing from the project listing. The following are the TIP IDs and Titles for the missing projects:

- LA9918789: 10th Street West and Avenue J Improvements
- LATP16S001: 10th Street West Road Diet & Bikeway Improvements

CITY OF LOS ANGELES
INTER-DEPARTMENTAL MEMORANDUM

Date: January 16, 2020

To: Honorable City Council
c/o City Clerk, Room 395
Attention: Honorable Mike Bonin, Chair, Transportation Committee

From: *for* Seleta J. Reynolds, General Manager *[Signature]*
Department of Transportation

Subject: **Draft Connect SoCal (2020 Regional Transportation Plan / Sustainable Communities Strategy)**

SUMMARY

This report recommends that the City Council authorize the Los Angeles Department of Transportation (LADOT) to submit comments on behalf of the City of Los Angeles (City) to the Southern California Association of Governments (SCAG) on the draft Connect SoCal Plan (2020 Regional Transportation Plan/Sustainable Communities Strategy).

RECOMMENDATION

1. APPROVE the comments provided in this report to be submitted on behalf of the City in response to the draft SCAG Connect SoCal Plan.
2. DIRECT LADOT to transmit comments to SCAG that are substantially consistent with those contained in this report.
3. DIRECT LADOT to work with SCAG to incorporate the comments into the Final Connect SoCal Plan and related Programmatic Environmental Impact Report (Program EIR).

1

BACKGROUND

Every four years, the Southern California Association of Governments prepares a Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) for the six-county region. The draft 2020 RTP/SCS, Connect SoCal, includes planned transportation projects and demographic projections through 2045. Connect SoCal presents a strategy for investing \$638 billion into the region's transportation network over the next 25 years and a Sustainable Communities Strategy (SCS) for the six-county region.

Required by SB 375, the SCS focuses on reducing greenhouse gas (GHG) emissions from vehicles and light trucks by integrating land use and transportation planning, expanding transit, implementing transportation demand management, and leveraging new transportation technologies to reduce vehicle trips. The California Air Resources Board (CARB) set a regional GHG emissions reduction target for the SCAG region. The target addressed by the draft Connect SoCal Plan is to reduce GHG emissions eight percent below 2005 per capita emission levels by 2020, and 19 percent below 2005 per capita emissions levels by 2035. In addition to the regional target, CARB indicates a 25 percent GHG reduction is needed

2

by 2035 in order to meet the State's climate action goals. While SCAG anticipates the implementation of Connect SoCal will achieve both the 2020 and 2035 GHG reduction targets, the plan's Program Environmental Impact Report (Program EIR) indicates that Connect SoCal is not forecasted to achieve the reductions that CARB has determined necessary to meet the State's climate action goals. Connect SoCal's inability to meet the statewide reduction target may inhibit cities from relying on the plan. While it may be infeasible to consider a scenario that meets the more aggressive statewide target, SCAG should continue to partner with state and local agencies to pursue innovative solutions that reduce regional vehicle miles traveled (VMT) and resulting greenhouse gas emissions. These strategies may need to reach beyond traditional land use policies involving growth forecasting, and additionally consider market solutions like roadway pricing, broad scale fleet electrification, electric charging infrastructure, and new transportation technology partnerships that fundamentally alter the incentives for drive-alone trips.

2

SCAG could further support lowering regional VMT by leading a regional VMT reducing credit system, or 'VMT exchanges' similar to cap and trade markets. VMT exchanges could enable more sustainable outcomes throughout the six-county region by collecting off-set credits to reinvest in sub-regionally managed programs, like subsidizing transit passes for students. Metro has already demonstrated that such programs can lower the demand to drive alone. These investments could also potentially reverse the national trend of falling transit ridership. We are supportive of innovative strategies in the SCAG mitigation measures listed on page 3.17-62 to 3.17-64 of the Program EIR, and offer to be an active partner in these efforts.

SCAG recently conducted a series of workshops across the region, including in-depth graphic and narrative presentation materials. The City appreciates the outreach effort, both to the City and across the region.

3

Following the release of the draft Connect SoCal Plan on November 7, 2019, LADOT reviewed the draft plan and compiled the proposed comments to SCAG. The discussion included in this memo represents comments and concerns related to LADOT's goals and strategies.

DISCUSSION OF POLICY CONCERNS AND COMMENTS

Policy and Planning Framework

Since the adoption of the 2016 RTP/SCS, the City of Los Angeles adopted several plans and policies that further the legislative framework that informs the Connect SoCal. We are pleased to see SCAG acknowledge the City's Mobility Plan 2035 as a substantial advancement since the adoption of the 2016-2040 RTP/SCS. The Mobility Plan 2035 fundamentally shifted the City's priorities by adopting goals that include designing for safety first, building a world class infrastructure with a 'complete streets' planning framework, access for all Angelenos, more collaboration and informed choices, and a clean environment and health community. These goals align with the goals of SB 375 to reduce greenhouse gas emissions that are a bi-product of travel, especially drive-alone trips.

4

Since the adoption of the Mobility Plan 2035, the City continues to put the plan into action with meaningful results. In advancing the safety first goal, LADOT released the *Vision Zero Action Plan*¹ which aims to eliminate traffic-related deaths by 2025.

¹ [Vision Zero Action Plan](#), January 2017.

LADOT's Strategic Plan *Great Streets for Los Angeles*² released in January 2018 describes the department's vision to provide access to safe and affordable transportation choices that treat everyone with dignity and support vibrant inclusive communities. This Strategic Plan includes actionable strategies that advance the department's priorities through 2020.

Transportation technologies have changed rapidly within the past five years. LADOT released a transportation technology strategy titled, *Urban Mobility in a Digital Age*³ in August 2016, which focuses on building a solid data foundation, leveraging technology and design for a better customer experience, creating partnerships for more complementary shared services and prepare for an automated future. In November 2019, LADOT released the Technology Action Plan that outlines the visions defined in the *Urban Mobility in a Digital Age*. This action plan provides guidance for LADOT to clearly communicate physical and virtual platforms that maximize equity and livability.

Lastly, Mayor Eric Garcetti released *LA's Green New Deal*⁴ in April 2019, which sets aggressive goals for the City's sustainable future, tackles the climate emergency with accelerated targets to reduce greenhouse gas emissions, strengthens our economy and middle class, and sets the City on course to be carbon neutral by 2050.

We would like to underscore the strong commitments the City has made to advance innovative and sustainable transportation strategies that have the potential to transform the historical reliance on the personal automobile. In the creation of the Final Connect SoCal Plan, we invite SCAG to draw from the vast array of transformative strategies that can increase the share of sustainable trips, especially those that scale at the regional level.

4

Transportation System Project List

The RTP includes an extensive project list. As stated in the Project List appendix, the list is divided into three primary sections, as follows: 1) The Federal Transportation Improvement Program (FTIP), which forms the foundation of the RTP project investment strategy and represents the first six years of already committed funding; 2) the Financially Constrained list of projects not included in the FTIP but which have "reasonably available" funding; and 3) Strategic Plan projects representing an unconstrained list of potential projects that the region would pursue given additional funding and commitment.

LADOT closely reviewed the three Transportation Project lists. The City's requested revisions are categorized under the three RTP project list categories:

- *FTIP*: A small number of projects that were removed in a recent FTIP amendment remain on this draft list. This list should be updated to reflect the most recent FTIP amendment;
- *Financially-Constrained RTP*: SCAG should work with the City to ensure all eligible projects and programs are captured in the final list. There are some projects that have identified funding, under construction or being implemented that are omitted that should be included; and

² [Great Streets for Los Angeles](#), January 2018.

³ [Urban Mobility in a Digital Age](#), August 2016.

⁴ [L.A.'s Green New Deal](#), April 2019.

- *Strategic Projects:* Some projects on this list were identified from adopted Community Plans and include projects related to decreasing automobile delay and improving the outdated Level of Service (LOS) metric. The City is re-evaluating whether these projects are compatible with the policy goals of SB 743. Several Community Plans are anticipated to be updated over the next few years and City staff may work with SCAG to ensure this projects on this list are compatible with current City policy goals.

Following the review of the Transportation Conformity Analysis Technical Report, Table 63 should reflect any changes made to the FTIP Project List included in the Project List Technical Report.

LADOT recently initiated the Mobility Investment Program (MIP), which represents the department's data-driven effort to capture and plan for mobility investments that advance the City's values and vision for transportation. The MIP institutes project-delivery best practices to identify funding opportunities early in project development, enhance project engagement and evaluation protocols, pursue formalized interagency collaboration, and establish short- and long-term capital improvement plans. As a comprehensive, map-based inventory of both funded and unfunded projects, LADOT will utilize the MIP to develop short-term (five year) and long-term (20 year) plans to serve as the Department's infrastructure playbook that will prioritize the City's mobility investments. In coordination with the RTP project lists, the MIP will be cross-referenced to ensure the projects within the City are included on the appropriate RTP project lists and reflect a similar level of priority and implementation timeframe identified by the City.

4

We suggest that the SCAG staff responsible for compiling the Transportation System Project List meet with LADOT Planning and Policy staff prior to adoption of the Final Connect SoCal Plan to ensure project information is up to date. Should the RTP Project Lists be updated to address any of the comments mentioned above, LADOT requests SCAG closely coordinate with City staff on the revisions.

SB 743 Implementation

In 2013, the State of California signed SB 743 into law, which requires a shift in the way cities measure environmental impacts. State guidelines require all cities to update their transportation impact analysis metrics from level of service (LOS) to vehicle miles traveled (VMT) before July 1, 2020. In July 2019, the City of Los Angeles adopted new CEQA Transportation thresholds, accompanied by updated Transportation Assessment Guidelines, to comply with SB 743.

The City acknowledges SCAG's efforts noted in the Connect SoCal plan to support and assist in the implementation of SB 743 throughout the region. One notable effort was the assistance provided through the Sustainability Planning Grants, of which several jurisdictions took advantage of including the City of Los Angeles. LADOT encourages SCAG to continue taking a leadership role in providing technical assistance to cities beyond the State's deadline to comply.

5

SCAG's in-house data and transportation modeling expertise could be leveraged to provide hands-on assistance to the jurisdictions within the SCAG region that may not have the staff resources or funding to appropriately respond to the State mandate. SCAG's leadership could narrow the gap in staff capacity and available funding by developing sub-regional sketch planning tools and recommending uniform

thresholds to be considered for each sub-area Council of Governments (COG). SCAG should continue to help develop VMT exchanges by providing more technical capacity and regional forums with a goal to better serve areas of the region with fewer mitigation options. Continued research on these topics will allow for more efficient implementation of SB 743 across jurisdictional lines in order to achieve the intended outcomes of the legislation: promote reductions in greenhouse gas emissions, develop multimodal transportation networks, and diversify land uses.

5

Emerging Transportation Technology

Transportation technology has evolved rapidly over the last five years. Micro-mobility and on-demand transportation services, including Transportation Network Companies (TNCs) and dockless devices have dramatically changed how people travel within the City of Los Angeles and the SCAG region. The draft Connect SoCal plan's Emerging Technology Technical Report initiates a discussion on how these technologies impact travel behavior regionwide.

Connect SoCal alludes to the possibility of emerging technologies disrupting the transportation system and increasing VMT. We encourage SCAG to take a more proactive approach to integrating new transportation technologies in a way that promotes sustainable travel choices and meets the region's greenhouse gas emission reduction goals. LADOT's strategy for regulating, monitoring, and evaluating emerging transportation technologies is outlined in *Urban Mobility in a Digital Age*. The groundwork by which LADOT will implement this plan and regulate emerging technologies can be found in LADOT's Technology Action Plan (TAP).⁵ LADOT recommends SCAG provide guidance in Connect SoCal to help cities throughout the region effectively manage new innovations operating in public spaces and neighborhoods.

6

Cities host a suite of operational and regulatory services that include moving people to safety during emergencies, sometimes shutting down streets, providing safe passage to those wishing to gather and demonstrate, and managing and pricing the curb to regulate parking and deliveries. New technology enabled modes require technological tools to enforce regulations, streamline customer service, and empower private companies to provide service equitably and responsibly. SCAG should consider both the needs and the opportunities of government agencies within their jurisdiction to leverage the technological advancement that brings both challenges and opportunities. In September 2019, LADOT deployed the Mobility Data Specification (MDS) to regulate dockless mobility. We urge SCAG to consider advancing the role of MDS and other digital regulatory tools to better plan for evolution in the transportation technology landscape.

Lastly, public transit use has declined over the past few years both throughout the SCAG region and nationwide. As the regional Metropolitan Planning Organization, SCAG plays a unique leadership role in policies and programs that support public transit use and sustainable transportation modes.

Transportation Model Review

As SCAG updates and makes changes to the transportation model, LADOT urges SCAG to work closely with City staff to ensure those changes are consistent with existing datasets and forecasts. LADOT uses SCAG's transportation model as the foundation for the City's transportation model. Transparency in the

⁵ [Technology Action Plan](#), November 2019.

development of the model, baseline model assumptions, and framework are valued and critical components of the update process.

6

Conclusion

The draft Connect SoCal Plan and Program EIR provide a long-range vision that aims to balance future regional mobility and housing needs with economic, environmental, and public health goals. The plan represents a six-county effort to meet both State and Federal requirements and GHG reduction targets. If approved, the comments in this report will be submitted to SCAG by LADOT on behalf of the City of Los Angeles.

7

FINANCIAL IMPACT

This report contains comments regarding proposed policies and projects included in the draft Connect SoCal Plan (2020 RTP/SCS) and related Program EIR. The comments to be transmitted to SCAG will not impact the City's General Fund.

January 22, 2020

Mr. Kome Ajise
Executive Director
Southern California Association of Governments
900 Wilshire Boulevard, Suite 1700
Los Angeles, California 90017

Dear Mr. Ajise:

Subject: City of Mission Viejo Comments: Draft Connect SoCal and Draft Connect SoCal Program Environmental Impact Report

The City of Mission Viejo respectfully submits comments on the Southern California Association of Government (SCAG) draft 2020 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and its associated Draft Program Environmental Impact Report (EIR), also known as Connect SoCal and the Connect SoCal Program EIR.

The comments provided below identify broader policy inquiries that surfaced as we reviewed the Connect SoCal documents. SCAG's responses to these inquiries will further assist in our understanding of the achievement of SB 375 greenhouse gas emissions reductions on the Connect SoCal Plan and its EIR alternatives, in addition to a clearer understanding of the application of Connect SoCal policies and EIR mitigation measures on local government projects.

1

The City of Mission Viejo comments are as follows:

Greenhouse Gas Emissions Reductions:

1) Connect SoCal Program EIR; Section 4; Alternatives:

2

Discussion: One of the primary objectives of Connect SoCal is to achieve SB 375 greenhouse gas emissions reduction targets for Year 2020 and Year 2035. The Connect SoCal Plan and the Program EIR identify that the Proposed Plan exactly meet the Year 2020 and Year 2035 GHG emissions reduction targets for cars and light-duty trucks of a per capita 8% and 19% reduction, respectively (PEIR: Table 3.8-10: SB 375 Analysis, page 3.8-74).

Mr. Kome Ajise

City of Mission Viejo Comments: Draft Connect SoCal & Draft Connect SoCal Program EIR

January 20, 2020

Page 2 of 4

The Draft Program EIR Alternatives section further outlines three alternatives for analysis: the No Project Alternative, Existing Plans-Local Input Alternative, and Intensified Land Use Alternative. As discussed below, the City of Mission Viejo recommends that the Program EIR be revised to include a quantification and consistent discussion on the amount of GHG emissions reduction that would be achieved for each EIR alternative.

This request is of particular importance, since Connect SoCal is based upon a land use distribution that differs from the Local Input received from SCAG jurisdictions. While the total numbers of population, households and employment are consistent at the jurisdiction level with the input provided by local jurisdictions on their future growth estimates, the proposed Connect SoCal plan internally shifts, within jurisdictions, future growth proximate to Priority Growth Areas such as high quality transit areas, resulting in a land use distribution that differs from the Local Input distribution, to reduce Vehicle Miles Traveled (VMT) and reduce greenhouse gas emissions.

Recommendations: Given that the distribution of land uses is different between the proposed Connect SoCal Plan, the Local Input Alternative, and the Intensified Land Use Alternative, the PEIR should clearly identify and consistently discuss in the narrative of each EIR Alternative, how much per capita GHG emissions reduction would be achieved for both Year 2020 and Year 2035, for all the EIR Alternatives, as follows:

- a) Table 4.0-1: Comparison of Connect SoCal and Alternatives (pages 4.0-7 –4.0-9) should be revised to include an “element” that addresses the amount of SB 375 GHG emissions reduction that would be achieved for Year 2020 and Year 2035 for the Connect SoCal Plan and each of the EIR Alternatives.
 - b) The narrative in the Alternatives section should be revised to consistently identify and reference how much GHG emissions reduction is achieved, for both Year 2020 and Year 2035, for each of the discussed Alternatives.
- 2) Connect SoCal Program EIR: Section 4: Alternatives: Alternative 3: Intensified Land Use Alternative:

Discussion: The Draft EIR discussion for the Intensified Land Alternative (pages 4.0-40 and 4.0-41) states that the transportation-related GHG emissions generated by this Alternative is projected to be less than the Connect SoCal Plan, because it generates less VMT. The Draft EIR further states that the Intensified Land Use Alternative is projected to achieve the 2020 target of 8% per capita reduction, and would exceed the 19% reduction for Year 2035 (actual amount is not specified; see Comment #1 above).

The draft EIR then proceeds to conclude that “Since meeting the regional reduction goals from cars and light-duty trucks would not be sufficient to meet the state’s overall GHG reduction goals, this alternative would conflict with AB 32 and SB 32. The Plan would have the same impact as this alternative.”

Mr. Kome Ajise

City of Mission Viejo Comments: Draft Connect SoCal & Draft Connect SoCal Program EIR

January 20, 2020

Page 3 of 4

Recommendation: Please re-review the paragraph cited above. Its conclusion (that the Intensified Land Use Alternative and the Connect SoCal Plan GHG emissions reduction capabilities are not sufficient to meet the targets) seems contradictory and perhaps incorrect, based on the data cited.

3

Vehicle Miles Traveled:

3) Connect SoCal Program EIR: Section 3:8 Greenhouse Gases: SB 743 and VMT Guidance

Discussion: The Draft Program EIR includes detailed discussion on the statewide and regional emphasis to reduce VMT as a mechanism to tackle greenhouse gas emissions reductions goals established under AB 32, SB 32 and the California Air Resources Board's Scoping Plan. However, the Draft EIR further states that "even if all MPOs meet their regional SB 375 GHG targets, the state would not be able to meet the statewide GHG reduction goals of AB 32, SB 32 and the Scoping Plan." (page 3.8-80).

4

Recommendation: Please clarify if there is any discussion in the draft Connect SoCal Plan, the Draft SoCal EIR or any of the technical appendices of said documents, that either identifies, recommends, or infers the attainment of a specific VMT reduction policy, target or performance measure for the SCAG region, or that may be imposed upon local governments.

Draft EIR Mitigation Measures:

4) Draft Connect SoCal EIR Mitigation Measures: Table ES-5: Summary of Project Impacts, Mitigation Measures and Residual Impacts

Discussion: The Draft Program EIR discusses two tiers of mitigation measures: mitigation measures that would be applied to SCAG, and mitigation measures that would be applied to local jurisdictions and other lead agencies responsible for project-specific environmental review documents for specific projects. The project level mitigation measures are currently structured with a reference of "can and should", as follows:

"In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project *can and should* consider mitigation measures to reduce substantial adverse effects". (emphasis added).

5

Recommendation: The Draft EIR (page ES-16) states that the project level mitigation measure approach of "can and should" provides detail on possible mitigation measures that can be considered by Lead Agencies as they conduct environmental assessments of specific projects. The Draft EIR further recognizes that flexibility should be maintained in the application of mitigation approaches, given the variety and scope of projects proposed in the 6-county SCAG region. The Draft EIR further identifies narrative that the application of the "can and should" approach, "be considered by lead agencies in

Mr. Kome Ajise

City of Mission Viejo Comments: Draft Connect SoCal & Draft Connect SoCal Program EIR

January 20, 2020

Page 4 of 4

project-specific environmental review documents *as appropriate and feasible.*" (emphasis added).

The City of Mission Viejo fully supports flexibility in the application of the project-level mitigation measures, and recommends that each of the project-level mitigation measures listed in the Draft Connect SoCal Program EIR be revised to also include the reference "as appropriate and feasible," as follows:

"In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should, as appropriate and feasible, consider mitigation measures to reduce substantial adverse effects

The City of Mission Viejo appreciates the opportunity to provide comment on the broader policy issues raised herein, and also expresses support of the comments and recommendations on the Draft 2020 RTP/SCS and PEIR by the Orange County Council of Governments, the Orange County Transportation Authority, the Center for Demographic Research, and other Orange County agencies whose comments support Connect SoCal with its use of the Orange County's growth forecast – the 2018 Orange County Projections.

Should you have any questions on this transmittal, please do not hesitate to contact either Elaine Lister at elister@cityofmissionviejo.org, or Mark Chagnon at mchagnon@cityofmissionviejo.org.

With appreciation,

DENNIS WILBERG
City Manager

Claudia Manrique – City of Moreno Valley – Associate Planner

Connect SoCal Team:

The City of Moreno Valley appreciates the opportunity to submit comments on Southern California Association of Governments' (SCAG) Draft Connect SoCal Plan (also known as the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy or RTP/SCS). It is important that the Connect SoCal Plan is equitable, achievable, and results in sustainable development.

The City of Moreno Valley has reviewed the draft Connect SoCal Plan and related technical studies. Based on our review, the City of Moreno Valley has the following comments:

1. I-215 from I-10 to I-15 should be included as an existing major Goods Movement corridor.
2. SR60 through the Badlands to I-10 should be included as part of the Primary Highway Freight System.
3. Plan does not reflect current Riverside County Transportation Commission (RCTC) study / strategy for Metrolink and Express Bus expansion.
4. Arterial Network included is not complete for City of Moreno Valley.
5. The Planned Regional Express Lane Network should be updated to reflect recent Riverside County Transportation Commission (RCTC) decisions.
6. Active Transportation discussion should include the importance of consistent standards and maintenance for regional trail systems.
7. Bicycle Network is not complete for the City of Moreno Valley.
8. There is a need to compare the Draft Connect SoCal Plan with the proposed 6th Cycle RHNA for compatibility.

Re: City of South Pasadena Draft Connect SoCal Plan Comments

Dear Mr. Ajise,

The City of South Pasadena (City) appreciates the opportunity to review and comment on the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (Connect SoCal) and associated Programmatic Environmental Impact Report (PEIR).

In October 2019, Governor Newsom signed Assembly Bill 29 (Holden) and Senate Bill 7 (Portantino) to remove the State Route 710 (SR-710) freeway stubs located north of Interstate 10 and south of Interstate 210 from the State Highway Code. In addition, AB 29 and SB 7 declared that “any other freeway or tunnel alternative to close the Interstate 710 North Gap shall no longer be deemed as feasible alternatives for consideration in any environmental review process for the Interstate 710 North Gap Closure project...”

Furthermore, the Los Angeles County Metropolitan Transportation Authority (Metro) and California Department of Transportation (Caltrans) decision to adopt the Transportation System Management/Transportation Demand Management Alternative for the SR-710 North Project further emphasizes the fact that the SR-710 Freeway Alternative is dead. The City is pleased to see that the description for Federal Transportation Improvement Program (FTIP) project LA710NB and RTP project 1M0101 has been updated to include the TSM/TDM Alternative in the RTP project list. The City recognizes that S1120082 was included in the Strategic Plan to reflect additional projects that have been proposed as SR-710 Mobility Improvement Projects.

However, the City is concerned by the inclusion of FTIP/RTP project 18790 (please refer to the below table). The project is described as an “Alternative Analysis, Engineering and Environmental Studies to close 710 freeway gap...” As described, this project is contrary to the Metro and Caltrans decision to move forward with the TSM/TDM Alternative and recent state legislation deeming any freeway alternative for the SR-710 North Project as infeasible.

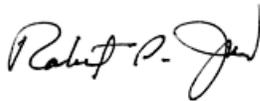

<u>FTIP ID</u>	<u>RTP ID</u>	<u>Description</u>	<u>Project Cost (\$1,000's)</u>
LA710NB	1M0101	SR RT. 710 North - Transportation System Management (TSM) & Transportation Demand Management (TDM) as identified in the EIR/EIS	\$111,000
18790	18790	Route 710: Study to perform Alternative Analysis, Engineering and Environmental Studies to close 710 freeway gap (EA# 18790, PPNO# 2215)	\$70,454
	S1120082	SR-710 Transportation Improvement Options	Strategic Plan

1

To ensure consistency with state legislation and the Metro and Caltrans decision to move forward with the TSM/TDM Alternative the City requests that project 18790 be removed from the RTP project list.

If you have any questions or comments, please feel free to contact Margaret Lin, Manager of Long Range Planning and Economic Development, at mclin@southpasadenaca.gov or (626) 403-7236.

Sincerely,

Robert S. Joe
South Pasadena Mayor

RE: Southern California Association of Governments Connect SoCal – Draft Program
Environmental Impact Report (SCH# 2019011061)

Dear Mr. Ok:

Thank you for the opportunity to provide input on the Draft Connect SoCal Program EIR.

The City of West Hollywood is supportive of the Southern California Association of Governments' (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) vision to promote sustainable development in the region.

To that end, the City of West Hollywood encourages SCAG to actively support our ongoing work with Metro and the City of Los Angeles to accelerate delivery of the Northern Extension of the Crenshaw/LAX transit line through some of the densest and most congested parts of the region including Mid City Los Angeles, West Hollywood, and Hollywood. The Northern Extension project will transform regional mobility by forming a new north-south regional connector enabling tens of thousands of transit riders to avoid the need to travel downtown to transfer by linking five existing Metro Rail lines from the South Bay to the San Fernando Valley. This level of connectivity and access to opportunity will benefit several underserved communities; link countless major employment, entertainment, medical, and cultural centers; and generate ridership in excess of 90,000 daily riders—higher than any light rail line in the Country.

Because of these and other project benefits, the Northern Extension project will help the region achieve the RTP's stated goals of reducing greenhouse gas emissions and vehicle miles travelled while locating employment and density near transit.

CITY OF
WEST HOLLYWOOD

In addition, the City of West Hollywood has revisions to the Draft Technical Report Project List:

- FTIP ID LAF9623 – This project is Phase I in a multiphase design district program including several other projects that should also be included. See enclosed Attachment 1 for a revised list of projects to be included in the final RTP/SCS.
- FTIP ID LA0G1052 – Remove this project as Metro has selected and is constructing an alignment along Wilshire Boulevard.
- Attachment 1 includes a revised list of additional projects to be included in the Final RTP/SCS to reflect our upcoming transportation investments.

If you have any questions, please contact Bob Cheung, Senior Transportation Planner, Long Range Planning Division at (323) 848-6346 or at bcheung@weho.org.

Sincerely,

JOHN LEONARD
Community and Legislative Affairs Manager
City of West Hollywood

CITY OF YORBA LINDA

4845 CASA LOMA AVENUE • YORBA LINDA • CALIFORNIA 92686

January 21, 2020

Kome Ajise
 Executive Director
 Southern California Association of Governments
 900 Wilshire Boulevard, Suite 1700
 Los Angeles, California 90017

Subject: Comments on Draft Connect SoCal Plan and PEIR

Dear Mr. Ajise:

The City of Yorba Linda appreciates the opportunity to review and provide feedback on the draft Connect SoCal Plan and its accompanying Program Environmental Impact Report (PEIR). We especially appreciate the opportunity SCAG provided through the Bottom-Up Local Input and Envisioning Process during 2017-2018. We recognize the significant amount of time, effort, and coordination it takes to put together a plan of this magnitude. Our primary concern with the Connect SoCal Plan is its inconsistency with the draft Regional Housing Needs Assessment (RHNA).

Specifically, the City offers the following public comments on Connect SoCal and its PEIR. We recognize that some of our comments are directly related to the draft RHNA methodology; however, we believe that these comments are relevant to Connect SoCal since SB 375 requires that SCAG "identify areas within the region sufficient to house an eight-year projection of the regional housing need for the region pursuant to Section 65584." We also recognize that although neither Connect SoCal nor the RHNA have been adopted, as proposed these two plans will be inconsistent with one another. This is significant because Government Code 65584.04(m) requires that RHNA "allocate housing units within the region consistent with the development pattern included in the sustainable communities strategy."

- 1) The growth and need forecasted in RHNA is dramatically inconsistent with the draft Connect SoCal growth forecast. Section 3.14.1.1 of the draft PEIR defines *household* as "all the people who occupy a housing unit." This definition includes related and unrelated persons sharing a housing unit, including individuals living in overcrowded conditions. Table 14 of the Demographics and Growth Forecast Technical Report identifies a projected household growth for the City of Yorba Linda of 900 households between 2016 and 2045 (or 31 households per year). However, the draft RHNA projects the need for an additional 2,322 housing units between 2021 and 2029 (290 housing units per year). If RHNA is supposed to be consistent with the development pattern of Connect SoCal and SCAG only

1

2

projects an additional approximately 250 households (31 units x 8 years) over the eight-year RHNA period for the City of Yorba Linda, why would RHNA project the need for 2,322 housing units over the same eight-year period? Even if it is assumed that all 900 projected households from Connect SoCal would happen by 2029, why would RHNA project the need for 2,322 housing units?

Furthermore, according to the 2019 Department of Finance Population and Housing Estimates, the City of Yorba Linda has 861 vacant housing units (3.6% vacancy rate). The City could easily accommodate the projected household growth of 250 households over the eight-year RHNA period through its existing vacant housing units and still have over 600 vacant housing units available without constructing any additional housing units. In other words, the proposed RHNA would essentially require the City to construct an additional 2,322 housing units plus utilize its 861 vacant housing units (a total of 3,183 housing units) to accommodate a projected population growth of 1,644 people and a projected household growth of 250 for the eight-year RHNA period. This is in direct conflict with Government Code Section 65080(b)(2)(B) and Government Code Section 65584.04(m) that require that Connect SoCal and RHNA be consistent with one another. Ironically, it is actually the SCAG staff recommended RHNA methodology from November 7, 2019, that much more closely aligns with the growth forecast and development pattern found within the Connect SoCal Plan.

- 2) It is also important to point out that Section 3.14.1.2 (Existing Population, Housing, and Employment) of the draft PEIR identifies four guiding principles that were not properly updated to reflect the latest draft from the October 17, 2019 Technical Working Group (TWG). The first principle should state, "The preferred scenario will be adopted at the jurisdictional level, and directly reflects the population, household and employment growth projections that have been reviewed and refined with feedback from local jurisdictions through SCAG's Bottom-Up Local Input and Envisioning Process. The preferred scenario maintains these locally informed projected jurisdictional growth totals, meaning future growth is not reallocated from one local jurisdiction."

The draft RHNA differs from the Connect SoCal growth forecast. As proposed, the projected household growth from Connect SoCal will be redistributed from one jurisdiction to another through the RHNA methodology, which conflicts with SCAG's guiding principle of not reallocating growth from one jurisdiction to another.

- 3) Sections 3.11.2.2 and 3.14.2.2 of the PEIR are incorrect in the explanation of RHNA. Pages 3.11-33 and 3.14-14 both state, "***The RHNA does not necessarily encourage or promote growth***, but rather allows communities to anticipate growth and address existing need, so that they can grow in ways that enhance quality of life, improve access to jobs, transportation and housing, and not adversely impact the environment." Government Code Section 65584(a)(2) states, "It is the intent of the Legislature that cities, counties, and cities and

counties should undertake all necessary actions to **encourage, promote, and facilitate the development of housing** to accommodate the entire regional housing need, and reasonable actions should be taken by local and regional governments to ensure that future housing production meets, at a minimum, the regional housing need established for planning purposes." Furthermore, one of the five objectives of RHNA is "promoting infill development...the encouragement of efficient development patterns..." (see Government Code Section 65584(d)(2).

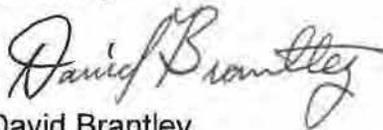

- 4) Pages 3.11-33 and 34 and page 3.11-15 of the PEIR state, "Per SB 375, the **projected need's portion** of the 6th Cycle RHNA will be consistent with the Connect SoCal for the comparable period." SB 375 requires that the RHNA, which includes both existing and projected housing need, be consistent with the Connect SoCal for the comparable period (see Government Code Section 65584.04(m)). RHNA should "allocate housing units within the region consistent with the development pattern included in the sustainable communities strategy." Please revise the explanation to state that the RHNA (including existing and projected need) will be consistent with the Connect SoCal.
- 5) Page 3.14-16 of the draft PEIR states, "The SCS must accommodate the **projected need portion** of the 6th Cycle RHNA." This statement is misleading in that Government Code 65080 states that the SCS must "identify areas within the region sufficient to house an eight-year projection of the regional housing need [existing **and** projected need] for the region." The PEIR also states, "While the existing housing need portion of the 6th cycle RHNA is not included in the SCS growth forecast, the existing need portion will be allocated in a manner to support the goals of Connect SoCal through the RHNA process." While the development pattern for the projected need portion of the RHNA (approximately 505,000 housing units) is clearly outlined in the PEIR and Connect SoCal Plan, the development pattern for the remaining approximately 835,000 housing units for "existing need" (approximately 62% of the total housing need) is not addressed in any specificity in the PEIR. For the City of Yorba Linda, it is completely unreasonable to assume that 2,322 new housing units are necessary to accommodate approximately 250 households through the upcoming RHNA cycle, or even to accommodate 900 households through 2045.
- 6) If the PEIR is supposed to evaluate the 'overall impacts of transportation projects and land use strategies described in the Plan' and to evaluate reasonable alternatives, the RHNA methodology is a reasonable alternative because each jurisdiction is going to have to zone for that amount of housing. The RHNA does not adhere to the jurisdictional totals set forth in the RTP/SCS growth forecast. The Intensified Land use Alternative may redistribute growth across jurisdictional boundaries, but it did not evaluate changes that were made due to disadvantaged communities and further household growth changes, and therefore population changes, due to a redistribution of the 'Residual' in the RHNA calculations. Therefore, wouldn't the draft RHNA methodology need to be evaluated as a reasonable alternative within the PEIR?

Draft Connect SoCal Plan and PEIR Comment Letter
January 21, 2020

- 7) Exhibit 1 of the Sustainable Communities Strategy Technical Report is described as "the growth vision and the forecasted regional development pattern." This exhibit is confusing and needs a better explanation. For example, do darker shades of blue represent higher priority growth areas?
- 8) Page 48 of the draft Connect SoCal Plan describes "absolute constraint areas" but the term is not defined within the glossary. Please include a definition for this term.
- 9) Several exhibits throughout the Plan and Technical Reports show the I-5 corridor between Anaheim and Mission Viejo as a High Quality Transit Area (HQTA); however, that corridor does not currently have any HQTA. Furthermore, the proposed Bus Rapid Transit (BRT) has not even had specific stop locations identified or evaluated by Orange County Transportation Authority (OCTA). Therefore, referring to the entire corridor as a HQTA is not appropriate. Please remove this from all exhibits.
- 10) The City also supports the comments made by the Orange County Council of Governments and Cal State Fullerton's Center for Demographic Research.

The City recognizes and appreciates the time and effort provided by everyone on this important and complex issue and for your consideration of these items. As far as we understand, this will be considered by the Regional Council on March 5, 2020. We also understand that at this same meeting the Regional Council will be discussing the RHNA methodology and RHNA appeals procedures. It is absolutely imperative that there is sufficient time for the Regional Council to discuss any questions or concerns with the Plan and its PEIR as well as the RHNA methodology and appeals. In order to avoid another rushed meeting agenda where Regional Council members are denied the opportunity to ask questions and provide comment, we strongly encourage SCAG to either reschedule the RHNA discussion to another date or extend the length of the meeting. Please let me know if you need any additional clarification or have any questions by contacting me at (714) 961-7130 or dbrantley@yorbalingca.gov.

Sincerely,

David Brantley
Community Development Director

Su: Draft Connect SoCal PEIR
 Re: Public Comments

The Coalition For A Safe Environment et al co-signature organizations respectfully submit these Public Comments on behalf of our members, organization affiliations and the public regarding the Draft Connect SoCal PEIR.

When reviewing the Draft Connect SoCal PEIR we discovered that the document was 3,005 pages in length. We also discovered that it was impossible to read, assess, discuss, seek expert opinion and comment on this 3,005 page document in 45 days.

1

We respectfully request a 30 extension for the public comment period. We will advise our elected officials of this request for an extension.

We did note that throughout the document there was a failure to identify, acknowledge and address the unique and disproportional impacts to Environmental Justice Communities and Disadvantaged Communities. As you are aware, there are now numerous Federal, State, Regional, County and City laws, executive orders, public policies, rules, regulations, ordinances and programs that address the subject of Environmental Justice Communities and Disadvantaged Communities that have legal mandates to comply.

2

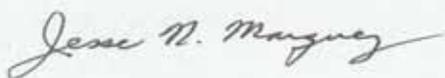

We request that a new section be added to the Draft PEIR that addresses the subject of Environmental Justice and Disadvantaged Communities.

Our public comment consists of a red mark-up of the original document with our requested changes, additional information and noted areas of required information. We have attached our public comments by Draft Connect SoCal PEIR Chapters to this public comment letter.

- 3.3 AIR QUALITY
- 3.11 LAND USE AND PLANNING

For additional information, Jesse N. Marquez is our principal contact person for these submitted public comments.

Respectfully Submitted,

Jesse N. Marquez

3.3 AIR QUALITY

This section of the Program Environmental Impact Report (PEIR) describes air quality within the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect air quality, and analyzes the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”).

The U.S. EPA, California Air Resources Board and the South Coast Air Quality Management District describe air quality, environmental impacts and public health impacts from air quality based on three major categories of emissions:

- Criteria Air Pollutants
- Toxic Air Pollutants aka Hazardous Air Pollutants aka Toxic Air Contaminants
- Green House Gases

(Note: OEHHA is a health agency that uses the term Toxic Air Contaminants)

4

In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.3.1 DEFINITIONS

Air Dispersion: Air dispersion is defined as how air pollutants travel through ambient air. Toxic Air Contaminants/Mobile Source Air Toxics (TACs/MSATs) impact those located closest to the emission sources more than those located further away. A California law passed in 2003 (Public Resources Code Section 21151.8) prohibits the siting of a school within 500 feet of a freeway unless “the school district determines, through analysis based on appropriate air dispersion modeling, that the air quality at the proposed site is such that neither short-term nor long-term exposure poses significant health risks to pupils.” The U.S. EPA has issued a number of regulations that will dramatically decrease MSATs through cleaner fuels and cleaner engines.

Concentrations: The amount of pollutant material per volumetric unit of air, measured in parts per million (ppm) or micrograms per cubic meter ($\mu\text{g}/\text{m}^3$). The following discussion identifies the pollutants included in this analysis.

Criteria Air Pollutants: Criteria air pollutants are defined as pollutants for which the federal and State governments have established ambient air quality standards for outdoor concentrations. The federal and State standards have been set at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort.

exhaust, which includes DPM is $5 \mu\text{g}/\text{m}^3$. This value is similar to the National Ambient Air Quality Standard established for fine particulate matter, which is $15 \mu\text{g}/\text{m}^3$.¹⁷

Cumulative Impacts

Emissions: The quantity of pollutants released into the air, measured in pounds per day (ppd) or tons per day (tpd).

GHG Greenhouse Gases – Components of the atmosphere that contribute to the greenhouse effect. The principal greenhouse gases that enter the atmosphere because of human activities are carbon dioxide, methane, nitrous oxide, and fluorinated gases.

Toxic Air Pollutants

Visibility: With the exception of Lake County, which is designated in attainment, all of the air districts in California are currently designated as unclassified with respect to the California Ambient Air Quality Standards (CAAQS) for visibility reducing particles. (A pollutant is designated unclassified if the data are incomplete and do not support a designation of attainment or nonattainment.)

Since deterioration of visibility is one of the most obvious manifestations of air pollution and plays a major role in the public's perception of air quality, the state of California has adopted a standard for visibility or visual range. Until 1989, the standard was based on visibility estimates made by human observers. The standard was changed to require measurement of visual range using instruments that measure light scattering and absorption by suspended particles. The visibility standard is based on the distance that atmospheric conditions allow a person to see at a given time and location. Visibility reduction from air pollution is often due to the presence of sulfur and nitrogen oxides, as well as particulate matter. Visibility degradation occurs when visibility reducing particles are produced in sufficient amounts such that the extinction coefficient is greater than 0.23 inverse kilometers (to reduce the visual range to less than 10 miles) at relative humidity less than 70 percent, 8-hour average (from 10:00 a.m. to 6:00 p.m.) according to the state standard.

3.3.2 ENVIRONMENTAL SETTING

The SCAG region encompasses a population exceeding 19 million persons in an area of more than 38,000 square miles within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura.

Air quality in the four air basins in the SCAG region—South Coast Air Basin (SCAB), Mojave Desert Air Basin (MDAB), Salton Sea Air Basin (SSAB), and South Central Coast Air Basin (SCCAB) (Ventura

commercial areas. The MATES V study proposes to study air toxics for a one-year period at ten fixed sites beginning in January 2019.⁷³

You referenced the average cancer risk stated in the MATES IV Study but failed to reference Environmental Justice Communities whose cancer risk is 2x and 3x greater than the average and have not declined. We want to see a Table of the Highest Cancer Risk EJ Communities in the SCAB region. The SCAQMD intentionally manipulated the MATES V Study (a fact that is verifiable) and did not include Wilmington one of the highest Cancer Risk EJ Communities so as not to skew the data to the worse.

6

AB 32 Global Warming Solutions Act of 2006 - AB 32 requires California to reduce its GHG emissions to 1990 levels by 2020 - a reduction of approximately 15 percent below emissions expected under a "business as usual" scenario. Pursuant to AB 32, ARB must adopt regulations to achieve the maximum technologically feasible and cost-effective GHG emission reductions. The full implementation of AB 32 will help mitigate risks associated with climate change, while improving energy efficiency, expanding the use of renewable energy resources, cleaner transportation, and reducing waste. Reductions in GHG emissions will come from virtually all sectors of the economy and will be accomplished from a combination of policies, planning, direct regulations, market approaches, incentives and voluntary efforts. These efforts target GHG emission reductions from cars and trucks, electricity production, fuels, and other sources

7

This Draft PEIR is in non-compliance with AB 32 because SCAG rubber-stamps and approves all projects and it does not require transportation and infrastructure projects to comply.

AB 617 Nonvehicular air pollution: criteria air pollutants and toxic air contaminants - This bill would require the state board, by October 1, 2018, to prepare and update, at least once every 5 years, a statewide strategy to reduce emissions of toxic air contaminants and criteria pollutants in communities affected by a high cumulative exposure burden. The bill would require the state board to select locations around the state for the preparation of community emissions reduction programs, and to provide grants to community-based organizations for technical assistance and to support community participation in the programs. The bill would require an air district containing a selected location, within one year of the state board's selection, to adopt a community emissions reduction program. By increasing the duties of air districts, this bill would impose a state-mandated local program. This bill would require a district that is in nonattainment for one or more air pollutants to adopt an expedited schedule for the implementation of best available retrofit control technology, as specified. The bill would require the schedule to apply to each industrial source that, as of January 1, 2017, was subject to a specified market-based compliance mechanism and give highest priority to those permitted units that have not modified emissions-related permit conditions for the greatest period of time. The bill would require an air district containing a selected location, within one year of the state board's selection, to adopt a community emissions reduction program. By increasing the duties of air districts, this bill would impose a state-mandated local program.

8

This Draft PEIR is in non-compliance with AB 617 because SCAG rubber-stamps and approves all projects and it does not require transportation and infrastructure projects to comply. The Draft PEIR does not require community emission reductions from stationary and mobile sources in projects. 10 AB 617 Pilot Project Communities have already completed and submitted their Community Emissions Reduction Plans in conjunction with their local AQMD.

SB 44 requires CARB to create a comprehensive plan for reducing greenhouse gas emissions from medium- and heavy-duty vehicles.

SB 210 – The bill requires the California Air Resources Board (CARB) to develop and implement a Heavy-Duty Inspection and Maintenance Program for non-gasoline, heavy-duty trucks—the first ‘smog check’ program of its kind in the nation. The bill would remove levels of oxides, nitrogen and particulate matter from the air equivalent to removing 375,000 trucks from California roads by 2031. A “smog check” for trucks would also help prevent thousands of cases of asthma and respiratory diseases that disproportionately impact economically disadvantaged neighborhoods near major highways and freight hubs.

SB 375 Sustainable Communities and Climate Protection Act of 2008 - The bill requires the regional transportation plan for regions of the state with a metropolitan planning organization to adopt a sustainable communities strategy, as part of its regional transportation plan, as specified, designed to achieve certain goals for the reduction of greenhouse gas emissions from automobiles and light trucks in a region. The Bill focuses on incentivizing regional and local planning and building in ways that bring people and destinations closer together, with low-carbon, alternative and convenient ways to get around. It requires regional metropolitan planning organizations in California to develop Sustainable Communities Strategies (SCS), or long-range plans, which align transportation, housing, and land use decisions toward achieving GHG emissions reduction targets set by the California Air Resources Board (CARB).

This Draft PEIR is in non-compliance with AB 375 because SCAG rubber-stamps and approves all projects and it does not require transportation, infrastructure, housing and land use projects to comply.

9

Senate Bill 656 (Chapter 738, Statutes of 2003)

In 2003, the Legislature enacted Senate Bill (SB) 656 (Chapter 738, Statutes of 2003), codified as Health and Safety Code Section 39614, to reduce public exposure to PM10 and PM2.5. SB 656 required ARB, in consultation with local air pollution control and air quality management districts (air districts), to develop and adopt, by January 1, 2005, a list of the most readily available, feasible, and cost-effective control measures that could be employed by ARB and the air districts to reduce PM10 and PM2.5 (collectively referred to as PM).⁷⁴

The legislation established a process for achieving near-term reductions in PM throughout California ahead of federally required deadlines for PM2.5, and provided new direction on PM reductions in those areas not subject to federal requirements for PM. Measures adopted as part of SB 656 complement and support those required for federal PM2.5 attainment plans, as well as for State ozone plans. This ensures continuing focus on PM reduction and progress towards attaining California’s more health protective standards. This list of air district control measures was adopted by the ARB on November 18, 2004. ARB also developed a list of State PM control measures for mobile and stationary sources, including measures planned for adoption as part of ARB’s Diesel Risk Reduction Plan. The lists are at the following web site: <http://www.arb.ca.gov/pm/pmmeasures/pmmeasures.htm>.

California Air Resources Board Mobile Source Programs

Emission Reduction Plan for Ports and Goods Movement

Our County - Los Angeles Countywide Sustainability Plan - OurCounty is organized around 12 cross-cutting goals that describe our shared vision for a sustainable Los Angeles County.

Goal 1: Resilient and healthy community environments where residents thrive in place The County will protect low-income communities and communities of color from pollution, reduce health and economic inequities, and support more resilient and inclusive communities.

Goal 2: Buildings and infrastructure that support human health and resilience The buildings and infrastructure of both yesterday and tomorrow will utilize more efficient technologies and practices that reduce resource use, improve health, and increase resilience.

Goal 3: Equitable and sustainable land use and development without displacement With policy tools such as anti-displacement measures, existing community members can remain in and strengthen their neighborhoods and networks while accepting new residents through more compact, mixed-use development.

Goal 4: A prosperous LA County that provides opportunities for all residents and businesses and supports the transition to a green economy We will support the growth of green economy sectors through our procurement practices, land use authority, and various economic and workforce development incentives.

Goal 5: Thriving ecosystems, habitats, and biodiversity The region's ecosystems, habitats, and biodiversity are under stress from urbanization and climate change. Careful planning will ensure that our ecosystems, including urban habitats, thrive even as our region becomes increasingly urbanized.

Goal 6: Accessible parks, beaches, recreational waters, public lands, and public spaces that create opportunities for respite, recreation, ecological discovery, and cultural activities The County will help make parks and public lands more accessible and inclusive and will manage them carefully so that all residents may enjoy their benefits.

Goal 7: A fossil fuel-free LA County By supporting an efficient transition to a zero emission energy and transportation system, the County will be a leader in taking action to address the climate crisis. **EXAMPLE TARGET: BY 2050, ACHIEVE CARBON NEUTRALITY**

Goal 8: A convenient, safe, clean, and affordable transportation system that enhances mobility while reducing car dependency By developing programs that focus on reducing the number of miles people travel in private vehicles, the County will help people choose alternatives to single-occupancy vehicles. These programs will expand residents' mobility, including those residents whose limited automobile access translates to stifled economic opportunity.

Goal 9: Sustainable production and consumption of resources The County will effectively manage our waste, water, energy, and material resources by improving our ability to promote integrative and collaborative solutions at the local and regional scale.

Goal 10: A sustainable and just food system that enhances access to affordable, local, and healthy food The County of Los Angeles will leverage its capital assets, public services, and regulatory authority to improve access to healthy food within County boundaries while optimizing its purchasing power and business services to make food production more sustainable.

Goal 11: Inclusive, transparent, and accountable governance that facilitates participation in sustainability efforts, especially by disempowered communities The County will act to create a more inclusive and accountable governance structure, in order to build stronger communities and better-informed policy and programs.

Goal 12: A commitment to realize OurCounty sustainability goals through creative, equitable, and coordinated funding and partnerships The County will seek to strengthen partnerships, establish new funding techniques, and leverage its own purchasing power to advance the goals of OurCounty.

This Draft PEIR is in non-compliance with Our County - Los Angeles Countywide Sustainability Plan because SCAG rubber-stamps and approves all projects and it does not require compliance to the 12 Goals.

3.3.4 ENVIRONMENTAL IMPACTS

in order to estimate emissions from mobile sources and includes County-specific data, such as fleet mix in order to estimate criteria air pollutants. See **Appendix 3.3, Health Risk Assessment Technical Report**, for more detail.

In *California Building Industry Association (CBIA) vs. Bay Area Air Quality Management District (BAAQMD)*, the California Supreme Court ruled that agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents unless the proposed project risks exacerbating those environmental hazards or conditions that already exist.¹²²

Therefore, emissions from the existing transportation network, including freeways, are generally not considered impacts under CEQA unless the project exacerbates the existing environmental conditions.¹²³ Since Connect SoCal includes transportation projects, including freeway improvements, that could occur within 500 feet of sensitive receptors (thereby exacerbating an existing condition), this section analyses the risk posed from existing freeways on sensitive receptors.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in **Chapter 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

However, SCAG can:

- Review and submit written public comments on projects.
- Identify areas of non-compliance with CEQA requirements.
- Not include projects on its state and federal funding list.
- Recommend mitigation measures.
- File motions to intervene on projects not in compliance with CEQA, RTP and the public interests.

(Example: The Port of Los Angeles BNSF Southern California Gateway Intermodal Project EIR that was approved by the Port of Los Angeles Board of Harbor Commissioners and the City of Los Angeles did not comply with CEQA and five class action lawsuits were filed with the State Attorney General filing a Motion to Intervene on behalf of the Plaintiffs. The City of Long Beach, Long Beach Unified School District and the South Coast AQMD were co-plaintiffs with non-profit environmental justice organizations and public interest groups. The Port and City of LA were found guilty and the project stopped.)

Connect SoCal would result in a less than significant impact to air quality related to the potential to conflict with or obstruct implementation of the adopted SIPs/AQMPs/Attainment Plans in the SCAG region because the projected long-term emissions are in alignment with the local SIPs/AQMPs as demonstrated in the transportation conformity analysis, found in the Conformity Technical Report for the Plan.¹²⁴ The emissions resulting from the Plan are within the applicable emissions budgets as stated in the SIPs/AQMPs for each nonattainment or maintenance area for all milestone, attainment, and planning horizon years.

Significant Impact.

The Connect SoCal PIER will result in significant impact to air quality because SCAG automatically and programmatically approves all projects and lists projects for state and federal funding that do not comply with all federal, state, regional, county, local laws, rules, regulations, plans and programs. SCAG has a legal mandate to support compliance.

SCAG and the Connect SoCal PIER does not have the resources and capacity to evaluate all projects for compliance with all federal, state, regional, county, local laws, rules, regulations, plans and programs. SCAG has a legal mandate to support compliance.

SCAG and the Connect SoCal PIER have no criteria and metrics to evaluate project compliance with air quality and greenhouse gas reduction requirements in laws, rules, regulations, plans and programs. SCAG and the Connect SoCal PIER cannot rely on the California Air Resources Board and the Air Quality Management District SIP's for compliance. SCAG has a legal mandate to support compliance.

The last California and South Coast AQMD SIP's were rejected by the U.S. EPA for non-compliance. SCAG and the Connect SoCal PIER does not the resources and capacity to evaluate all projects or proposed SIP's for compliance with all federal and state SIP requirements. SCAG has a legal mandate to support compliance.

SCAG and the Connect SoCal PIER has the authority and mandate to identify and recommend mitigation for project EIR/EIS/EA's etc. that claim that they are "Significant and Unavoidable".

Example I: Zero Emission Electric Buses are currently available for all public transportation needs.

Example II: Zero Emission Electric Trains are currently available for all public transportation needs.

Example III: Zero Emission Heavy Duty and Light Duty Freight On-Road and Off-Road Trucks are currently available for all Short Hauls of less than 100 miles.

Example IV: Zero Emission Construction Equipment is currently available for 90% of all categories.

Example V: Zero Emission Electric Power is currently available for all lighting categories.

Example VI: Zero Emission VOC Paints are currently available.

Example VII: Emissions Capture & Treatment Technologies are available for all Freight Ship categories. AMECS-Advanced Maritime Emissions Control System, a CARB Certified Technology.

As described in the Regulatory Framework, when a region is in nonattainment for any of the six criteria air pollutants relative to the NAAQs, the federal CAA requires states to develop SIPs to achieve the federal standard. The AQMPs are required as part of the SIP. Within the SCAG region, the 8-hour federal ozone standard is designated as nonattainment for all six counties. San Bernardino, Riverside, Orange, Los Angeles, and Imperial Counties are all designated as nonattainment for PM_{2.5}. Additionally, San Bernardino, Riverside, and Imperial Counties are designated as nonattainment for PM₁₀. As a result, all the SIPs in the SCAG region focus on reducing ozone emissions and may also focus on particulate matter pollution. The following air quality plans are applicable to Connect SoCal: 2016 SCAQMD Air Quality Management Plan (AQMP), AVAQMD Federal 75 ppb Ozone Attainment Plan (2017), MDAQMD Federal 75 ppb Ozone Attainment Plan (2017), 2016 Ventura County Air Quality Management Plan, and Imperial County 2018 Annual PM_{2.5} State Implementation Plan.

The goals of the air quality management plans and attainment plans are to establish a strategy for achieving the standards by a set date by listing all feasible control measures, including transportation control measures. These control measures help advance the attainment date and are financially, economically, and socially feasible. As standards become more stringent over time, achieving the standards becomes a moving target that the air quality districts, and air-related plans must continue to chase. At this current snapshot of time (2019), the Plan would not conflict with the existing air-related plans since it will align with feasible Transportation Control Measures (TCMs). SCAG coordinates with air districts in the region to ensure that air quality management plans (and air pollution control plans) are consistent and comprehensively address air pollution from all sources (as appropriate) in the SCAG region. For example, the 2016 SCAQMD AQMP was developed in alignment with the 2016 RTP/SCS, incorporating the latest scientific, technological, and regulatory information and planning assumptions as of January 17, 2017.¹²⁵

¹²⁴ Southern California Association of Governments. 2019. *Transportation Conformity Analysis Draft Technical Report*.

¹²⁵ SCAQMD. 2015. *2016 AQMP Updates Coordination with SCAG & CARB*. Available online at: http://www.aqmd.gov/docs/default-source/Agendas/STMPR-Advisory-Group/stmpr_073015_5.pdf, accessed October 29, 2019.

As the scientific methods for the study of air pollution health effects have progressed over the past decades, adverse effects have been shown to occur at lower levels of exposure. For some pollutants, no clear thresholds for effects have been demonstrated. The new findings have, in turn, led to the revision and lowering of National Ambient Air Quality Standards (NAAQS) which, in the judgment of the Administrator of the U.S. EPA, are necessary to protect public health. Chapter 8 of the draft 2016 AQMP provides an overview of the extensive, multi-year, public process involved in setting federal air quality standards. Assessments of the scientific evidence from health studies is an important part of the process, and has helped inform revisions to the federal air pollution standards. Figures [included in the AQMP] are meant to convey some of the historical context to recent revisions to the NAAQS for ozone and for particulate matter, with regard to key developments in the understanding of the health effects of these pollutants.

Mitigation Measures

SCAG Mitigation Measures

SMM-AQ-1: SCAG shall develop the Southern California Disadvantaged Communities Planning Initiative which would provide funds to selected applicants to develop a low-cost, high- impact model which leverages SCAG's staff, data, and outreach resources to deliver context-sensitive plans in high-need, low-resourced active transportation infrastructure and frameworks. As part of the initiative, the model will be operationalized through the development of plans in six communities and refined to provide a sustainable resource for SCAG staff partner with local agencies to develop local active transportation plans.

SMM-AQ-2: SCAG shall continue its commitment to analyze public health outcomes as part of Connect SoCal. As part of the public health analysis for the Plan, SCAG shall continue to analyze the Plan's impacts on air quality through its Public Health Working group and continue to support policy change at the city and country level through education programs.

SMM-AQ-3: SCAG shall continue to conduct air quality-related technical analyses on the region, specifically in vulnerable areas that are typically environmental justice areas. For example, SCAG staff conducted technical analysis of emissions impacts on populations within 500 feet of freeways and highly travelled corridors in the Connect SoCal Environmental Justice Appendix. SCAG staff shall also continue to work with districts and relevant stakeholders to be informed of any updates new and/or changes to air quality issue areas through various forums like the Environmental Justice Working Group.

SMM-AQ-4: SCAG shall develop and fund a Zero Emissions Technology Clearing House which will identify all currently available Zero Emissions Technologies.

- SMM-AQ-5:** SCAG shall develop and fund an Emissions Capture and Treatment Technology (ECT) Clearing House which will identify all currently available ECT Technologies for unique industries.
- SMM-AQ-6:** SCAG can request a project include a Health Impact Assessment to determine the current public health status and to establish a Public Health Baseline to assure that proposed Mitigation Measures and other proposed polices and measures do in fact improve public health. Health Risk Assessments (HRA's) only tell you how many people might die due to a project.

Project Level Mitigation Measures

PMM-AQ-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Minimize land disturbance.
- b) Suspend grading and earth moving when wind gusts exceed 25 miles per hour unless the soil is wet enough to prevent dust plumes.
- c) Cover trucks when hauling dirt.
- d) Stabilize the surface of dirt piles if not removed immediately.
- e) Limit vehicular paths on unpaved surfaces and stabilize any temporary roads.
- f) Minimize unnecessary vehicular and machinery activities.
- g) Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway.
- h) Revegetate disturbed land, including vehicular paths created during construction to avoid future off-road vehicular activities.
- i) On Caltrans projects, Caltrans Standard Specifications 10-Dust Control, 17-Watering, and 18-Dust Palliative shall be incorporated into project specifications.
- j) Require contractors to assemble a comprehensive inventory list (i.e., make, model, engine year, horsepower, emission rates) of all heavy-duty off-road (portable and mobile) equipment (50 horsepower and greater) that could be used an aggregate of 40 or more hours for the construction project. Prepare a plan for approval by the applicable air district demonstrating achievement of the applicable percent reduction

the differences in sensitivity to carcinogens during early life exposure. OEHHA recommends a default ASF of 10 for the age range between the third trimester of pregnancy through two years, and an ASF of three for ages two through 15 years.

As a conservative measure to characterize maximum potential exposures of sensitive receptors to carcinogenic risks, residential exposures are assumed to begin in the third trimester and exposures of children at schools is anticipated to begin at the lowest educational grade level. The OEHHA guidance provides recommended DBR values that are specific to the age of the receptor and the type of activity in which the receptor would be engaged during exposure, which are evaluated on a case-by-case basis. Air districts in the SCAG region (including SCAQMD) have not adopted guidelines to implement the 2015 OEHHA HRA guidelines for construction and indicated it is currently considering how to implement the guidelines. Only one air district -- the San Joaquin Valley Air Pollution Control District -- appears to have adopted guidelines to implement the 2015 OEHHA HRA guidelines. BAAQMD is undergoing a process to implement guidelines as well.

The specific size and location of future construction activity within the SCAG region is not known, (Not True SCAG maintains a list of 100's of proposed projects with descriptions within its jurisdiction) and therefore many variables related to characterizing potential exposures to air toxics during construction activities could not be determined, such as proximity to the emissions sources and duration of exposure. Connect SoCal's Project List (See **Appendix 2.0**) includes transportation projects through 2045, however a construction health risk analysis would be speculative given the lack of a construction location and construction activities. However, it is reasonable to assume that some level of construction activity would occur adjacent to sensitive receptors (e.g., residences and schools). The significant construction emissions identified above, could result in adverse health effects to sensitive receptors. As such, it is likely that intense construction activities (e.g., from development projects that involve a high volume of haul trucks) would exceed the health risk significance thresholds due to equipment and truck exhaust emissions. This is considered a significant impact related to substantial pollutant concentrations during construction activities.

14

On-Road Mobile-Source Emissions

Mobile source (heavy-duty truck) diesel emissions, specifically DPM, are the primary source of health concern in most urban areas in the SCAG region. Mobile DPM emissions in the SCAG region are anticipated to decrease as compared to existing conditions. Additionally, from 2019 to 2031, passenger and light daily truck PM_{2.5} is expected to remain constant, while heavy-duty PM_{2.5} emissions

3.11 LAND USE AND PLANNING

This section of the Program Environmental Impact Report (PEIR) describes the existing land use characteristics within the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect land use and planning, and analyzes the potential impacts of the Connect SoCal Plan (“Connect SoCal”; “Plan”). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

In 2019 the Tishman Environment and Design Center published a report titled. “Local Policies For Environmental Justice: A National Scan.” The report provides a comprehensive look at recent efforts in 23 cities, three counties and two utilities across the United States to address environmental injustices through innovative reforms of zoning, land use, and other local policies.

15

The Draft PEIR fails to reference the California Air Resources Board - AIR QUALITY AND LAND USE HANDBOOK: A COMMUNITY HEALTH PERSPECTIVE, April 2005.

16

The Draft PEIR fails to reference the South Coast AQMD - Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning,” May 6, 2005.

17

We request that SCAG reference relevant information and incorporate mitigation measures that address project impacts in these three documents.

18

3.11.1 ENVIRONMENTAL SETTING

3.11.1.1 Definitions

Agricultural Lands Land designated for farming; specifically the production of crops and rearing of animals to provide food and other products.

Air Quality Management Plans: The Air Quality Management Plan (AQMP) is a plan prepared by local air districts and is a regional blueprint for achieving air quality standards and healthful air.

Buffer Zone:

Carbon Sequestration The ability for natural elements such as forests, soils and oceans to store carbon instead of releasing it into the atmosphere, preventing GHG Emissions.

Clean Up Green Up Supplemental Use District – Los Angeles Municipal Code Ordinance to reduce cumulative health impacts resulting from incompatible land uses, establish a citywide Conditional Use for asphalt manufacturing and

19

refinery facilities, and increase the notification requirement for projects within a surface mining district within Boyle Heights, Pacoima/Sun Valley, and Wilmington.

19

Complete Communities Suburban communities that provide a mix of land uses in strategic growth areas, wherein most daily needs can be met within a short distance of home. Complete communities provide residents with the opportunity to support their local area and run daily errands by walking or bicycling rather than traveling by automobile.

Cumulative Impact:

Disadvantaged Community:

Environmental Justice Community:

20

Established Community: Refers to a place where there are existing populations of people that have been living in that place for some period of time. The term is used in Appendix G of the *CEQA Guidelines* under the land use thresholds of significance

Farmland: §21060.1(a) of CEQA (Public Resources Code §§21000-21177) delineates the consideration of agricultural land to include “prime farmland, farmland of statewide importance, or unique farmland, as defined by the United States Department of Agriculture (USDA) land inventory and monitoring criteria,

*Mitigation Measures*SCAG Mitigation Measures

SMM LU-1: SCAG shall coordinate with local County Transportation Commissions, Caltrans and other implementing agencies when siting new facilities or expanding existing facilities in, adjacent or near residential areas to facilitate minimizing future impacts of transportation, warehousing, air pollution emission facility projects on established communities, through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts to promote best planning practices.

SMM LU-2: SCAG shall coordinate with local cities and their planning, transportation and environment departments and commissions when siting new facilities or expanding existing facilities in, adjacent or near residential areas to facilitate minimizing future impacts of transportation, warehousing, air pollution emission facility projects on established communities, through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts to promote best planning practices.

21

Project Level Mitigation Measures

PMM LU-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects that physically divide a community, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Facilitate good design for land use projects that build upon and improve existing circulation patterns
- b) Encourage implementing agencies to orient transportation projects to minimize impacts on existing communities by:
 - Selecting alignments within or adjacent to existing public rights of way.
 - Design sections above or below-grade to maintain viable vehicular, cycling, and pedestrian connections between portions of communities where existing connections are disrupted by the transportation project.
 - Wherever feasible incorporate direct crossings, overcrossings, or under crossings at regular intervals for multiple modes of travel (e.g., pedestrians, bicyclists, vehicles).

Subject: Comments SCAG Connect SoCal Plan + PEIR

Attached, find public/independent comments for the SCAG Connect SoCal Plan and the Program Environmental Impact Report, due by January 24, 2020, 5 p.m. Please put this data on the public record also.

Dear Sirs,

Thank you for the opportunity to provide comments and technical information pertaining to the City of Diamond Bar, conservation/open space element, general plan 2040 input.

Please be advised, at present, we see no biological elements, natural open space nor special status species present on your map for the City of Diamond Bar, and the SEA 15 area to the south, including Tonner Canyon and the Puente Chino Hills Wildlife Corridor.

Attached is a comments letter along with scientific biological reports on existing conditions in these areas. Please update your information as per this input.

Thank you.

Draft Connect SoCal Plan Comments
Attn: Connect SoCal Team
Southern California Association of Governments
900 Wilshire Blvd., Ste. 1700
Los Angeles, CA 90017

RE: Comments for PEIR, Natural & Farmlands Conservation

Dear Connect SoCal Team:

Thank you for the opportunity to comment on the Southern California Association of Governments 2020 Regional Transportation Plan and Sustainable Community Strategy, collectively called *Connect SoCal*.

The Diamond Bar – Pomona Valley Sierra Club Task Force, Angeles Chapter, has worked since 2018, to recognize, conserve and restore wildlife habitats, corridors and natural resources in the City of Diamond Bar and surrounding areas. We wholeheartedly believe in first, “doing no harm” to existing natural lands conditions, whilst prioritizing “natural climate solutions” through the conservation and restoration of local green belts, watersheds, residential landscapes, parks and open spaces. Our task force is proud to participate in the growing SCAG plan coalition in 2020.

The Diamond Bar – Pomona Valley Sierra Club Task Force, Angeles Chapter, is a community service/public benefit non-profit group, serving Los Angeles County, and the cities of Diamond Bar, Pomona, Walnut, Rowland Heights, La Verne, Claremont, San Dimas, Glendora and Chino Hills. Our mission is to educate, advocate environmental literacy and ecological integrity at the local level in conserving wildlife habitats, natural landscapes, watersheds, wetlands, California Native residential gardens, public parkland and natural open spaces.

We have had important successes since our inception, including the official mapping of rare and endangered species (California Gnatcatcher, Cactus Wren, Golden Eagle) in the City of Diamond bar, and creating a conservation element report: City of Diamond Bar Biological Resources Report by Hamilton Biological, which informs the city’s 2040 General Plan update.

We offer the following comments on the Natural and Farmland policy, goals, and next steps.

Natural Communities Map Correctives

At reviewing the PEIR and Natural & Farmlands habitat, special status species and wildlife movement maps, we noticed your data does not include the latest, updated biological information for the City of Diamond Bar, SEA 15 and the surrounding natural land areas.

We request that your drafts be corrected and updated by referring to the attached biological report and map, “City of Diamond Bar Biological Resources” report and “City of Diamond Bar, Natural Communities” map, dated February 25, 2020. These documents are referred to in the city’s recently adopted General Plan 2040 and are on record with the California Dept. Fish Wildlife Region 5 and the United States Fish and Wildlife Service.

Most notable updates should include the special status species “California Gnatcatcher,” which maps an old, established populations distributed throughout the city due to its quality coastal scrub habitats.

3

Prioritizing Natural Climate Solutions

We are pleased to see conservation of our natural and agricultural lands as one of the 10 main policies of Connect SoCal. Land preservation not only reduces greenhouse gas (GHG) emissions, but also sequesters carbon. Any investment in habitat restoration improves this sequestration potential as well. Natural lands (*green infrastructure*) are a proven “natural climate solution” and key to preserving quality of life and authentic community sustainability. We believe including land conservation is a step in the right direction. SCAG has demonstrated that Metropolitan Planning Organizations can play a vital, thoughtful, and science-based role in mitigating impacts to our natural environment from transportation, infrastructure, and other development projects. By incorporating natural and farmlands protection strategies into your policy document, we believe the many benefits of this broad-based conservation approach will be realized sooner than expected. Thank you for your leadership.

4

Mechanisms for Saving Natural Open Spaces – Wildlife Habitats

Our organization supports the idea that as new growth occurs it should be focused in existing city-centers and near transit. When developments are built in the city center, it relieves pressure from the fringe. However, the Plan fails to outline precisely how (or with what conservation mechanism) these fringe lands (or any lands) will actually be

protected. Relieving pressure by focusing development elsewhere, does not automatically conserve or protect natural lands. A growing alliance of numerous organizations, including ours, focus work on protecting important habitat lands. Much time, energy, money, strategy, and political will are combined to create a successful conservation transaction that leads to permanently-conserved lands. Further, just because local agencies may be contributing to the conservation arena, in no way should you discount the roles of the conservation non-profit community. In short, SCAG must identify the actual mechanism, process or plan on how the greenfields and agricultural lands will be protected.

The Benefits of Conservation

Many of the benefits of open space and parkland have been outlined in the Plan and Natural Lands Appendix. In addition, there are many economic benefits of open space. These are realized through increased property values, ecosystem services, support of local businesses through park visitor purchases, and a reduction in the urban heat island effect. Further, conservation of natural lands has many on-the-ground co-benefits like access to recreational opportunities, preservation of important habitats and species, protection of cultural and archeological sites, increased job opportunities, protection of threatened/endangered species, and environmental education experiences. Our natural lands also filter water, clean the air, and provide homes for wildlife. Natural lands preservation also protects our watersheds, rivers, and water sources. Voters consistently support measures that benefit their local water resources.

Wildlife corridors are getting more and more attention these days. Ensuring survival of the top predator and the suite of species in the ecosystem means our natural lands must also maintain ecological functions, be sustainable over the long term, and include plans for long-term stewardship. The issue is that many housing and transportation projects eliminate the wildlife movement corridors and fragment the landscapes into smaller, less viable pieces of land. Natural landscapes are neglected due to regarding landscapes from only “aesthetic uses” attitude. Realizing the big picture by ensuring open spaces are connected to one another is essential for species survival and building authentic, sustainability. Wildlife corridors allow landscapes to maintain ecological functions, allow places for regeneration after natural disasters such as drought, fire, flood or landslide, and improve the resiliency in the face of climate extremes impacts. The Plan would be stronger if it supported the enhancement of and/or protection of documented wildlife corridors *prior to commencing* impactful projects.

Coastal & Riparian Assets

Many non-profits are working to ensure additional bays, estuaries, wetlands, bluffs, and beaches are preserved forever. Additionally, one way our coasts are connected to inland areas are through our watersheds, rivers and streams. These riparian areas serve as recreational trail corridors, water recharge and infiltration locations, and serve as places our wildlife use for watering sources. However, transportation and land use generated urban runoff are still problems. Our beaches and coastline are inundated with pollution. Litter, debris, and pollutants should be decreased prior to reaching the coast. Ensuring everyone has a positive experience on the sand and in the surf should be our goal, but we need to address Southern California's trash problem.

The Benefits of Habitat Restoration

California is one of 36 biodiversity hotspots on earth! This means, the unique ecosystem diversity of our state is rare and one of the most threatened by human activities. The health of California ecosystems affects the globe for good or ill, as well as local communities.

One key way to improve the environment is through restoration projects. These can be on land, in riparian areas, and even in the ocean. Restoration provides benefits by adding native plants, removing the non-native plants and their seedbank, as well as increasing carbon storage, and providing improved habitats for our wildlife. Our environment benefits from these improvements, as do our watersheds, our air, and our communities. Having improved habitats means that our water is cleaner, our soils won't erode as easily, it creates jobs for local residents, and our unique biodiversity is maintained. Further, the many endemic and threatened/endangered plants and animals benefit from these restoration projects as well. Thank you for including restoration as a key component in the natural lands and agricultural policy.

Thank you for reviewing our comments and we look forward to working with SCAG on the implementation of this Plan, especially as it relates to the conservation policy and Natural and Farmlands Appendix. Should you need to contact me, I am available at your convenience. In addition, we request to be included on any notifications (electronic or otherwise) about this policy's creation and implementation, please send information to

Sincerely,

Robin Smith

RIPARIAN SCRUB AND WOODLANDS

Natural Open Space Areas: 1, 4, 5, 6, 7, 8, 10, 12, 13, Diamond Bar Golf Course, Sphere of Influence

HUMAN-ALTERED HABITATS

Developed areas, such as turf/landscaped parks and the Diamond Bar Golf Course, generally do not support Natural Communities, but these areas may nevertheless play important ecological roles. For example, the golf course includes large number of ornamental trees that comprise a non-native woodland that supports a wide variety of resident and migratory native birds, presumably including nesting raptors, and the man-made lake provides habitat for migratory and resident waterfowl.

Details of these natural communities are stated page 9-12 in the Biological Resources report.

Dear 2020 Connect SoCal Team,
2020

Friday January 24,

Re: Comments on the 2020 Draft Connect SoCal Plan and Draft Connect SoCal PEIR

While I appreciate that conservation is one of the top ten goals, I am concerned that I do not see what will happen to make it so that we do not end up with a bunch of urban islands of habitat which will eventually lead to the weakening and death of most wildlife within. There needs to be connectivity over and under all your roads, Expressways Freeways and Boulevards which impede the movement of wildlife. These forms of connectivity must be able to help all forms of wildlife that need to use it to move freely from one area of habitat to another.

Below my name is a Press-Enterprise article concerning a two month old court ruling about a housing tract blocking Mountain Lions important movements— please read to the very bottom of it. I found it sad that the Western Riverside County Multi-Species Conservation Plan did not provide the leadership needed to protect this important Mountain Lion crossing and therefore the environmental community did. **"No funding for any 15 Freeway crossings has been raised so far."** (Press-Enterprise article found below) The words "Connect SoCal" must not only apply to people but to the wildlife which cannot speak for themselves. It therefore must be part of this plan to not only set aside sufficient funds for connectivity over and under new and improved projects, but must also have the all the necessary funds to go back and retroactively build new freeway/rail crossings to provide important linkages for the many different impacted species. City and County jurisdictions cannot be allowed to impede this much needed connectivity. I look forward to the final plan showing how "Connect SoCal" applies to the free movement of all forms of wildlife throughout southern California.

In the Moreno Valley area it is important to have connectivity—especially for the Fish and Wildlife 20,000 acres San Jacinto Wildlife Area (SJWA). This very special area are in two 10,000 acre units separated by a couple of miles as well as SR-79 and Gilman Springs Road. There are many sensitive, threatened and endangered species using these two SJWA units and they need to travel between them. There are no crossings over or under Gilman Springs Road and SR-79 doesn't have what is necessary for safe crossing of all these special species. As

mentioned above the words, Connect SoCal must mean wildlife in addition to people. The plan also needs sufficient money to go back and make right the missing connections/connectivity/linkages for all forms of wildlife from previous already built/approved projects. The Ramona Expressway is on the southern border of the SJWA and will probably use some of these funds and other sales tax money to expand its number of lanes. Again more crossings need to be planned so we do not make the world class SJWA an urban island. The Connect SoCal plans need to provide for the future viability of the SJWA and similar wildlife areas/open space to allow for sufficient linkages. A passenger rail system along the Ramona Expressway could easily happen with Connect SoCal help. SR-60 and the I-215 through Moreno Valley doesn't have any under or over-crossings for wildlife. Will Connect SoCal continue to propose building more and more roadways without fully considering wildlife? The plan needs to build on what other organizations have already produced in showing what linkages must be maintained, but go further for the well being of our planet as well as the enjoyment of future generations.

To meet our greenhouse gas (GHG) and air quality as well as Climate Change goals we must reduce vehicle miles traveled. We cannot just rely on electric vehicles, but they are important. Where in this plan is it providing charging stations for both cars and semi-trucks in enough sufficiency to help meet these goals? Where in the plan does it acknowledge induced traffic? Please include the cartoon below this paragraph which depicts what happens in most cases when more asphalt and cement are added to existing lanes = you build it they will come. It is accepted by most state leaders that you cannot build yourself out of congestion with more car/truck lanes.

The first consideration for additional lanes needs to be for public transportation. At least three times as much money needs to be put into this area as in adding vehicle lanes. If you ever go down the road of providing separate lanes for semi-trucks, then the only trucks that may be allowed to use them must be electric or zero emission.

In the area I live, the I-215 and SR-60 interchange or merging of the two freeways is at ultimate design buildout. Even though this is the case we continue to read that there will be efforts to raise the sales tax to widen SR-60 leading to this pinch point and the same is true of the I-215. This area is a beyond challenging most mornings heading west and woe be to all when there is even a minor accident.

If and when the 40 million sq foot World Logistic Center (WLC) is built, then its more than 14,000 daily diesel truck trips and its other 50,000 vehicle trips will make

Moreno Valley area a nightmare. They/you cannot build enough of anything to make it work and reduce its impacts on GHG and our non-attainment air quality as well as reducing impacts to Climate Change or as some say Climate Disruption.

Attached is a newspaper article and two amicus briefs filed January 10, 2020. The first is from the California Attorney General's office and California Air Resources Board expressing concerns over the WLC's impacts. The second is from CEQA and climate experts - Ken Alex, Dallas Burtraw, Ann E. Carlson, Fran Pavley, and Michael Wara. These two "friend of the court" briefs come from those who must implement AB 32 and one of its principal authors as well as the head of Office of Planning and Research (OPR) for many years. All three attachments are to be incorporated into my comments.

Projects like the WLC show the importance of rail for both people and goods.

SCAG knows the infrastructure is not there for the WLC and will never be available to accommodate its impact. As mentioned above the SR-60 and I-215 point of merging is already built to its ultimate design — what will happen if and when the WLC is built a few miles east of there?

I appreciate this opportunity to make some comments on this plan. As mentioned above please print out the three attachments as part of my comments for future documents as well as the article on Mountain Lions. Please continue to inform me of all future documents and meetings by using this email address and the P.O. Box found below.

Sincerely,

George Hague

WILDLIFE LAWSUIT

LEGAL WIN FOR MOUNTAIN LIONS

Judge tentatively rules that environmental report on Temecula housing development doesn't answer questions about the big cats

By Martin Wisckol

mwisckol@scng.com @MartinWisckol on Twitter

Mountain lion attacks, like the 2004 Orange County mauling that marked California's most recent cougar-on-human fatality, underscore the ferocity the big cats can unleash on people.

But the danger humans pose to the lions of the Santa Ana Mountains is much broader — extinction.

That possibility unfolded in a man-versus-animal courtroom skirmish Friday, the result of a lawsuit brought by environmental groups hoping to block — or at least condense — the planned 1,750-home Altair development west of the 15 Freeway in Temecula.

Just before the hearing, Riverside Superior Court Judge Daniel A. Ottolia made his leanings clear when he issued a written tentative ruling. In it, he agreed with mountain lion advocates' claim that the environmental impact report filed by the developer failed to adequately address impacts on the area's lions

1

Lions

FROM PAGE 1

as well as on the rare western pond turtle and endangered San Diego ambrosia.

Lawyers for the city and the developer, Ambient Communities, spent much of the next hour defending the report. They have until Dec. 31 to present written arguments in hope that Ottolia will reverse course.

The stakes could be high. Although the 270-acre project would not be the sole cause of extinction for the Santa Ana Mountain cats, it could contribute to it, according to suit.

"This project could be the final nail in the coffin for the Santa Ana Mountains lions," said Center for Biological Diversity attorney J.P. Rose afterward, adding that he was "encouraged" by the tentative ruling. Rose's group is joined in the suit by the Sierra Club, the Mountain Lion Foundation and the Cougar Connection.

Mountain lions are regularly photographed by trail cameras in the area of the proposed development and the project is adjacent to an existing underpass that could allow the animals to travel to and from the much larger Eastern Peninsular ranges east of the freeway.

Largely hemmed in by development and freeways, Santa Ana Mountains cats face the threat of being unable to reproduce because of inbreeding and a lack of genetic diversity. A study earlier this year determined that they could become extinct in the area in the next few decades and that better access to the Eastern Peninsular ranges would greatly improve their odds.

City downplays impacts

While a handful of lions have been documented making it over or under the freeway in the area, the subdivision would make such trips less likely, according to environmentalists and mountain lion experts.

"The Santa Ana Mountain lions are the most at risk of local extinction of any lion population in California, and possibly the United States," the environmental groups said in a court brief. The brief added that the project's environmental report "fails to inform the public and decision-makers of the Project's severe and permanent impact on the Santa Ana mountain lion population."

The brief also notes criticisms that the California Department of Fish and Wildlife and the U.S. Fish and Wildlife Services filed over the environmental report.

The city of Temecula, which approved the project and the environmental report in December 2017, is the principal defendant in the case. It was joined by the developer in a response brief saying the environmental report met regulatory requirements and "the Project's impacts on mountain lions could be reduced to less than significant" provided the proposed 450,000-square-foot "civic" building at the southern end was reduced to the 20,000-square-foot nature center.

Concerns about the western pond turtle and San Diego ambrosia also were dismissed by the defendants, with the city's brief saying the impact on them would also be "less than significant."

The city brief noted that mitigation for environmental damage includes an estimated \$23 million for conservation efforts over the next hundred years. It also says that the project's footprint has been significantly reduced by rerouting a planned four-lane road known as the Western Bypass.

"From the very outset, Ambient sought to realign the Western Bypass to lessen impacts on the hillside escarpment, wildlife movement and conservation areas," the city's brief says.

Attorney Ginetta Giovinco, representing the city, held out hope for the project's current configuration despite the judge's tentative ruling.

"We certainly don't consider the case over," she said after Friday's hearing. "(Ottolia) will take another look at our position in light of our objections."

Wildlife underpass 'critical'

While the lawsuit calls for city approval of the project to be invalidated, it notes that environmentalists have said they would be satisfied if the project were further

condensed and any building slated for the southern end is moved out of that area. On the 270-acre project site, 186 acres would actually be developed with buildings and roads. Environmentalists propose

reducing the developed area by 22%, to 145 acres.

"If the tentative ruling becomes final, it will require the city and developer to go back to the drawing board and revise the footprint," Rose said.

The smaller configuration would allow the lions more space to migrate along the hillside overlooking proposed development and, perhaps more importantly, it would create a larger buffer for the freeway underpass where Temecula Creek trickles into the Santa Margarita River.

The underpass is potentially a prime crossing area for mountain lions, although it is unknown if they have ever used it. Winston Vickers, a UC Davis veterinarian who researches mountain lions in the area, documented seven male lions crossing the freeway from 2001 to 2016, but six of those trips were verified by genetic analysis and it's not known exactly where they crossed. The sole lion tracked crossing the freeway while wearing a GPS collar made the trip at the Gopher Canyon Road underpass nearly 20 miles to the south.

At least four more lions were killed from 2013 to 2018 trying to cross on the freeway itself.

But Vickers' cameras have caught lions approaching the Santa Margarita River underpass. He said a variety of factors currently deter the animals from continuing through to the other side, including homeless people living in the tunnel, other foot traffic, dense brush, and noise and light from the freeway.

The underpass "is critical to mountain lion movement between the Santa Ana Mountains and the Palomar Mountains east of Interstate 15," according to Vickers and fellow mountain lion expert Kathy Zeller in a letter critical of the environmental report.

A Cal Poly Pomona report detailed possible wildlife crossings — a project initiated by Vickers — and produced a \$570,000 plan for improving the river underpass to make it more attractive to mountain lions.

The environmentalists' lawsuit says human activity around the underpass is likely to increase with a nearby subdivision and new trails, further deterring lions. The city counters that the project developer would make its own improvements so the tunnel is more inviting to lions, including the erection of barriers to discourage foot traffic.

Other possible crossings

The Cal Poly study also produced a pair of potential crossings 2 miles to the south of the Santa Margarita River underpass that could connect the lions' 600-square-mile habitat in the Santa Ana Mountains with the vaster Eastern Peninsular ranges, which extend into Mexico. A single adult male needs about 150 square miles of habitat, with females needing far less, according to the National Park Service. This year's extinction

study estimated there were five adult males and 11 adult females in the Santa Ana Mountains.

An overpass in the southern area 2 miles south of the river was tagged at \$17.6 million while a lionfriendly culvert upgrade in that same area was priced at \$9 million to \$10 million. **No funding for any 15 Freeway crossings has been raised so far.**

A wildlife bridge in the general area proposed by the study has been endorsed by the city.

"A wildlife overpass for the I-15 ... is the most logical and effective means to restore mountain lion movement," according to a city court brief.

Vickers said a crossing in that southern area would not be affected by the Altair development but didn't want to give up on the Santa Margarita River underpass.

"You want to keep an existing crossing, especially when you don't know if or when the crossing to south will be built," Vickers told the Southern California News Group before the hearing. "I'm confident we can get the lions to cross at the existing underpass if we diminish human presence there."

That's consistent with what Vickers told the Southern California News Group in a 2018 report.

"We know they want to cross," he said. "Sometimes they'll come and sit near the freeway and watch it all day."

"This project could be the final nail in the coffin for the Santa Ana Mountains lions."

RE: Draft Connect SoCal RTP/SCS Plan and Program EIR

Dear Team Members:

We write to followup on the comments we made during the Scoping Plan, as a civil rights organization focused on promoting minority home ownership and opposing government “redlining” actions that result in residential segregation and disparate harms to California’s minority communities.

We are deeply distressed that the draft Connect SoCal RTP/SCS Plan is even more forcefully aimed at ending minority home ownership opportunities in California’s most populous region, especially since the majority of the region’s residents are minorities – and especially since homeownership has long been recognized as the most successful pathway to the middle class and the intergenerational wealth accumulation that helps fund income interruptions from injuries or job losses, college expenses for kids, and other unplanned expenses for all family members. Senate Bill 375 expressly requires SCAG to develop and periodically update these regional plans to meet the region’s actual (not aspirational based on some “end capitalism” or “massively redistribute wealth” advocacy vision) housing and transportation needs. SB 375 also requires that these regional plans accommodate for continued economic growth (which we believe requires preserving upward mobility for California’s hard working minorities, as well as young people), and actually advance California’s climate leadership – not simply induce Californians to leave to other states to find housing they can afford to buy, allowing California to falsely claim a GHG reduction credit for reducing its population and in-state economic activities.

We are fully supportive of the SB 375 goals – but we oppose making minorities the collateral damage in California’s war on climate change. We oppose the RTP/SCS as an unlawful agency action to promote *de jure* residential racial segregation while exacerbating the adverse environmental, commuter health, and family welfare harms caused by intentionally increasing roadway gridlock. We further conclude that the Program EIR for the RTP/SCS is false, as well as wholly unlawful, for failing to acknowledge that the catastrophic physical, social, and civil rights consequences of the SoCal Connect plan’s high density infill rental housing, someone-else-should-ride-the-bus agenda, including further increases in homeless and poverty with attendant significant adverse health, safety, and environmental impacts. We support an “all of the above” strategy for solving the housing crisis, which brings a clear-eyed

1

2

3

recognition of what the region's families can actually afford to buy (and rent), and which matches the region's overwhelming transportation mode automobile choice with transportation plan solutions that actually work for people – not agencies, not staff, and not the legion of consultants who profit from taxpayer-funded planning that has not, and does not, work in the real world. SCAG's prior SB 375 plans did not reduce VMT: VMT increases with population and employment. SCAG's prior SB 375 plans were implemented when both the homelessness and housing crisis got much worse, not better. Professor Einstein said the definition of "insanity" is doing the same thing over and over again while expecting a different outcome. The SoCal Connect Plan is indeed insane: it provides neither housing nor transportation solutions that match the needs of the region, especially the needs of the region's minorities and young people.

3

We further support a rationale and transparent consideration of all regional greenhouse gas reduction strategies, not simply the fiction that Vehicle Mile Travelled (VMT) reductions for California families will actually meaningfully reduce global GHG. The fact is that SB 375's GHG reduction mandate was unlawfully converted into an unlawful VMT reduction mandate by the California Air Resources Board in an unlawful underground regulation "guidance" document that is no less than a bureaucratic putsch to end-run the Legislature's repeated refusal to mandate regressive (and ultimately racist) VMT reductions. By aiding and abetting CARB in this unlawful and racially discriminatory anti-housing and anti-transportation plan, SCAG joins CARB in violating the civil rights of the region's minority population while making zero – or negative – progress in reducing global GHG.

In fact, SB 375 did not authorize any agency, including SCAG, to make homeownership unattainable, worsen the homelessness crisis, and increase housing costs and make transportation more costly and less efficient for hard working minorities and young people. In adopting SB 375 the Legislature considered, and expressly rejected, requiring the reduction in Vehicle Miles Travelled (VMT) as a climate legal imperative in California. Later legislation to require VMT reductions have likewise failed, which is not surprising given the inherently regressive consequences of increasing commute durations and costs for the very people priced out of more proximate housing, the overwhelming ongoing dependence of Californians on cars and falling transit utilization, and the far more equitable and effective climate change strategies and mandates that have been adopted by the Legislature.

4

While CARB and its allies routinely assert that transportation is the largest GHG emission sector left in California, they omit the fact that the cars needed by people to get to and from work and attend to medical appointments, family care, and other routine family needs, are both increasingly cleaner – with more electric car mandates underway – and account for only a fraction of the plane, train, shipping, and heavy duty truck transportation sector GHG. They also routinely omit the fact that California already has a very low per capita VMT relative to other states outside the historic East Coast, that passenger car smog emissions have dropped by more than 99% through the methodical and transparent regulatory implementation of the Clean Air Act, that VMT has of course actually substantially increased – with the highest increase by far coming from Latino workers and families. They also ignore the fact that coastal Southern California already has the highest population densities in the United States.

We implore SCAG to resist the lure of redlining by elitist anti-car and anti-homeownership planners, and avoid violating civil rights, air quality, transportation, and housing laws to appease the takeover of land use decisionmaking by CARB to worsen California's homelessness, housing and poverty crises.

4

Residential re-segregation in Southern California is already well underway based on the housing crisis, which has caused a shortage of housing supply and skyrocketing housing costs in the region, and which has in turn resulted in relentless increase in the homeless population, and caused California to have the nation's highest poverty rate – and by far the highest poor population count based on US Census Bureau data. In even more accurate poverty data compiled by United Way of California, even when state public assistance is taken into account (e.g., assistance with rent, childcare, food and medical care), nearly 40% of Californians – disproportionately minorities, children, and seniors – cannot meet routine monthly living expenses. Struggling to Stay Afloat: The Real Cost Measure in California 2019, <https://www.unitedwaysca.org/realcost>. “Redlining” to exacerbate redlining remains endemic in California's government agencies through tools like the California Environmental Quality Act (CEQA): the most common target of CEQA lawsuits are housing, and within the SCAG region 14,000 housing units were challenged in just a three year study period. Virtually all (99%) of the challenged housing was in urbanized areas not greenfields, most (70%) was within one-half mile of the 2016 SB 375's priority transit areas, and most (78%) were in the region's whiter, wealthier and healthier communities rather than in the designated minority “environmental justice” neighborhoods suffering from higher poverty and unemployment rates, and lower educational and health outcomes, for residents. California Environmental Quality Act Lawsuits and California's Housing Crisis, Hastings Law School Environmental Law Journal, Fall 2018 https://repository.uchastings.edu/hastings_environmental_law_journal/vol24/iss1/3/

5

The 200 has filed three civil rights lawsuits against state agencies that have weaponized CEQA as an anti-housing, anti-transportation redlining litigation cudgel to be deployed against housing that hard working minority families can afford to buy. The first lawsuit targeted CARB's four measures in the CARB scoping plan, including the unlawful VMT reduction mandate rejected by the Legislature; in unsuccessfully attempting to dismiss that lawsuit, CARB's attorneys argued that it was lawful for CARB to engage in racially discriminatory housing practices because housing was not a protected class. The second lawsuit sought disclosure under the Public Records Act of documents deemed by CARB and its allied agencies such as the Office of Planning and Research (OPR) to be “too controversial” for public release; attorneys for the state have employed a variety of litigation tactics to delay that lawsuit by nearly two years. The most recent lawsuit challenged the anti-housing 2018 expansions of CEQA regulations, and is attached hereto as a separate comment to this letter because SCAG's draft SoCal Connect Plan – like its unlegislated and unlawful CARB and OPR predecessors – is a violation of the state and federal constitutional due process and equal protection provisions, violates state and federal fair housing act laws, and violates air quality and transportation and land use laws, by distorting approved housing and transportation plans that have already been approved by voters, elected officials, and environmental and transportation agencies, to intentionally increase traffic congestion and intentionally curtail or even eliminate market rate housing that is actually affordable for purchase by the majority-minority median income workers in the SCAG region. Each paragraph in the attached Complaint is a separate comment, and

6

provides factual and legal evidence demonstrating that the draft SoCal Connect Plan is as unlawful as the discriminatory anti-housing regulatory expansion of CEQA.

6

The Program EIR for the plan is likewise unlawful under CEQA. The plan ignores the environmental consequences of its economically infeasible (to the vast majority of the region's residents, including especially minorities) high cost, high density infill-only housing plan, which will cause more homelessness, poverty, out-migration, and supercommutes. The San Francisco Bay Area, which has pursued this failed high density infill-only strategy for a decade, now draws workers from 21 counties – an explosion of “supercommuters” forced to live ever-greater distances away from the woke advocates who decided that global climate change required the wholesale adoption of bikes and scooters instead of cars, and 500 square foot one-bedroom apartments costing \$4000 per month. Even in the Bay Area, which has median incomes well in excess of Los Angeles, this fictional “housing plan” has left thousands of approved high rise apartments unbuilt because they are financially infeasible, and has created gridlock conditions so bad that even commuters in counties adjacent to San Francisco have earned “supercommuter” status by spending more than 90 minutes per day on the road.

7

The Program EIR's deficiencies span every single environmental impact section based on the document's willful omission of any analysis of the mismatch of the plan's housing and transportation “solutions” with the urgent housing and transportation needs of the community. If the plan called for a housing solution consisting of \$1 million mansions, it's racist and exclusionary character would be obvious. In fact the plan does something much worse, by calling for \$1 million small condos (or equally costly rental apartments), because high density and even medium density housing costs 3-7 times more to build than two story homes, duplexes and townhomes. If the plan called for a transportation solution that banned driving every Friday, those who must be physically present – on time – at their job to remain employed and be paid would be grossly harmed, while those in the “keyboard economy” of college graduates working on agency plans and studies could happily remain in their pajamas clacking away on their computers at home. In fact the plan does just that, with a VMT reduction mandate from CARB that is the equivalent of eliminating a weekday of driving. (Although called GHG reduction in the plan, but counted as a GHG reduction by CARB only if it derives from VMT reductions per CARB's unlawful underground regulatory “guidance” to SCAG and other MPOs). Construction workers, nurses, teachers, emergency responders, and the hundreds of other job categories that require physical presence on jobsites can't do their work wearing jammies in their kitchen – and these workers, and the region's economy, need a transportation system that actually works.

8

Also included in this comment letter, as a separate comment for which responses are required, is the 200's lawsuit against the four anti-housing measures in the CARB scoping plan, which includes in detail the adverse physical consequences to the environment of these measures – inclusive of the VMT reduction mandate, and imposition of higher costs and litigation obstacles to housing. These are the same impacts ignored in the Program EIR for the draft SoCal Connect Plan.

9

The Program EIR is also fatally flawed in failing to acknowledge, and assess the impacts of, accommodating the 1.34 million new homes assigned to the region in the latest Regional Housing Needs Assessment (RHNA) cycle, or SCAG's preliminary allocation of new housing

10

obligations among the counties and cities of the region which constitutes the best available information about the future location of this planned growth, or the SCAG Board’s endorsement of requiring most of the new housing units – 1 million – to be built in Orange and Los Angeles county. The 200 takes no position on whether this is an accurate housing number, or whether SCAG’s initial distribution of these units is appropriate or final. CEQA, however, requires that this additional housing be assessed as part of the cumulative impact analysis under every CEQA threshold of significance used in the Program EIR, and otherwise required by CEQA.

10

The Program EIR also violates CEQA by failing to identify, and implement, all feasible mitigation measures for each of the dozens of significant unavoidable impacts identified as consequences of SoCal Connect Plan implementation. CEQA requires the full and complete assessment even of feasible mitigation measures that are outside the jurisdiction and control of SCAG itself to implement or enforce, and includes the lead agency’s (SCAG’s) obligation to identify such measures as being within the jurisdiction and control of specified other agencies which SCAG believes can and should implement such measures. SCAG cannot escape CEQA compliance because it is politically difficult, technically complex, or requires an assessment of the reasonably foreseeable consequences of failing to provide housing solutions that the region’s people can afford or transportation solutions that the region’s people actually need.

11

The 200 implores SCAG, which has done tremendous analysis and work for decades, to apply its own knowledge to develop an alternative regional land use and transportation plan that actually does provide housing that is affordable for purchase by median income families, and transportation solutions that do ease congestion and reduce gridlock. Part of this solution is undoubtedly some high density housing in the wealthiest neighborhoods where \$1m condos and \$4000 rents are in fact affordable. Virtually none of the solution for median and above-median income families can be paid for by taxpayers, given the overwhelming needs and extraordinarily high cost of providing housing for the homeless, special needs populations, and the lowest income families. Practical solutions for solving the housing and transportation crisis will reduce GHG by preventing the need for people to move to high GHG states to find housing they can afford, and clean car and other transportation sector legal mandates will reduce GHG just as smog was reduced from a combination of emerging technologies and actual rulemaking rather than underground regulations.

12

The preparation and analysis of an alternate housing and transportation plan that actually complies with SB 375’s mandate to accommodate the housing, transportation, and economic expansion of the region will require recirculation of the Program EIR. An honest and legally adequate assessment of the draft SoCal Connect plan’s adverse environmental, health and safety consequences – and the legally adequate identification and assessment of feasible mitigation measures in and outside SCAG’s jurisdictional reach – will also require recirculation of the Program EIR. Finally, the legally required cumulative impact assessment of accommodating the RHNA housing allocation for the region – all of which is to occur within the earlier years of the planning horizon used in the SoCal Connect plan, will likewise require revision and recirculation of the Program EIR.

13

It is immoral, and unlawful, for any public agency in California to worsen the homelessness and housing crisis. It is immoral, and unlawful, for any public agency in

14

California to discriminate against minority families, or worsen poverty for the 40% of Californians who cannot meet their monthly expenses. SCAG has no history of such immoral and unlawful conduct, and – when handed a racially discriminatory and unlegislated mandate by a state agency like CARB – should resist the lure of joining in the long line of California agencies that engaged in intentionally discriminatory redlining practices. The 200 has two videos – the history of redlining, and CEQA as redlining – on its website at <https://www.thetwohundred.org/>. The 200 urges SCAG staff and leaders to reconsider the plan, and substantially revise the Program EIR.

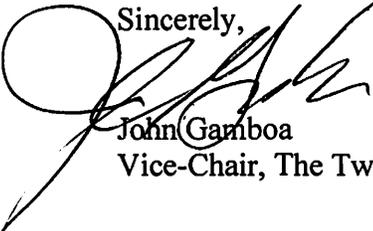

14

Finally, we understand that SCAG staff is concerned that delaying approval of the unlawful SoCal Connect Plan and Program EIR pending completion of a lawful and effective housing and transportation plan for the region could cause the United States Environmental Protection Agency (EPA) to determine that the region is in nonconformance with Clean Air Act mandates. Members of The 200 have a long history, and very high success rate, in persuading both federal and state agencies – with and without lawsuits – to stop engaging in racially discriminatory practices. Given California’s willingness to sue the current federal administration on environmental matters, and the emergency nature of the California homelessness and housing crisis, we would be pleased to assist SCAG in advocating for the necessity of a one year extension for the conformity determination. There is also precedent for this one year extension in San Diego. Unsubstantiated hypothetical fears of a delayed conformity determination to force approval of an infeasible and discriminatory housing and transportation plan is, bluntly, elevating bureaucratic bean counting over the actual needs of actual people.

15

Please do not hesitate to contact us if you have any questions, would like any further information, or would like to discuss a consensual path forward. Some of our members have been civil rights leaders for more than 50 years, and had hoped that civil rights laws had finally addressed the decades of de jure racial discrimination by public agencies. We commend to your collective attention The Color of Law, by Richard Rothstein, which describes in detail the scores of residential housing discrimination practices inflicted on minorities by state and local agencies in California. Mr. Rothstein calls this the “forgotten” history of redlining in America. We have not forgotten, and stand ready to litigate – as a last resort – to prevent the recurrence of redlining under the bureaucracy’s new favorite label of climate change. We can reduce GHG emissions; we cannot deprive minorities of attainable homeownership and effective transportation solutions.

16

Sincerely,

 John Gamboa

Draft Connect SoCal PEIR Comments
Attn: Roland Ok
Southern California Association of Governments
900 Wilshire Blvd., Ste. 1700
Los Angeles, CA 90017
Submitted via email: 2020PEIR@scag.ca.gov

Thank you for the opportunity to comment on the draft regional transportation plan whose many goals will guide transportation and land use policy and program for the coming years in the SCAG region through 2045. As stated in the opening chapter of the draft, the regional plan seeks to chart “a path toward a more mobile, sustainable and prosperous region by making key connections: between transportation networks, between planning strategies and between the people whose collaboration can make plans a reality.” While fulfilling this vision, it is important to note that the plan must do much more than merely coordinate transportation projects, reduce greenhouse gas emissions, meet federal Clean Air Act requirements, promote the preservation of natural and agricultural lands, promote measures that improve the public’s health, ensure the maintenance of roadways and transit infrastructure, provide needed support for good’s movement, promote the more effective use of our limited resource, usher in new technologies related to transport and transportation – all while supporting healthy and equitable communities and restoring endangered and fouled habitats (for all species as well as our human brothers and sisters). In short, this plan and future regional planning must usher in a form of policy evolution – a culture shift that must be sensitively and carefully advanced understanding the many factors involved.

Although laws can be passed and policies can be adopted, none will fully succeed without careful attention played to the human factors involved and to the careful design of transitions. As it pertains to the shift away from the Southern California car culture, SCAG and all its member governments are likely painfully aware of the need to build bridges between “what is” and “what must be.” What concerns me as I review proposed policies and laws, is the failure to acknowledge that the realities of the impacts of the transition cannot be ignored or be “sold” to the public by platitudes.

The public's exposure to the Connect SoCal plan through recent webinars and telephone town hall did not and could not "get into the weeds" of the plan. These overviews would not have led to an understanding of what will come to pass over time. They did not lead people to ask questions that get to the root of some of the challenges that we face in the implementation of a plan like Connected SoCal. The ability to make meaningful comment from the public's point of view, experience and background is quite limited – especially understanding that SCAG has worked with representatives of the region's member cities to seek input and incorporate those thoughts into the plan. How can we as laypersons make a contribution to this process?

We have observed and been recipients of the implementation of LA City policies that seek to support some of the same goals being sought in the Connect SoCal plan. Some of our thoughts in response to what we have seen in the rollout of those policies and the Connect SoCal plan follow:

- RE: Complete Streets
 - The emphasis on providing significant density bonuses to developments on what have traditionally been our communities' commercial corridors has resulted in the significant loss of local community serving merchants – the very backbone of retail and service providers needed in a community. Small retailers and service providers are often the first displaced tenants in the reorientation of commercial corridors into so-called mixed use development sites. However, it must be noted that the "mixed-use" developments are often nothing more than residential developments. In fact, Los Angeles' RAS mixed use development zone does not require a project to have a mixed use component. Further, many residential projects that claim to incorporate ground floor "live-work" units which are purported to be active pedestrian oriented uses are most often purely residential uses with no street orientation.
 - Creating purely residential communities with proximity to transit without providing for the community services and retail support for the growing dense population will require residents to travel distance to support their daily living needs.
 - Allowing residential development to occupy both commercial and light industrial/manufacturing zoned land (much the result of the very generous entitlement bonuses given to residential development) in the push to provide new housing will result in the need for those residents to have to travel far distances to reach their work locations. There is a clear need to identify and reserve land for job opportunity also near transit. Housing and jobs may not be coming closer together without more attention to the current realities.
 - Further: Re: Jobs and Housing balance: While we understand that the RHNA process has resulted in the placement of the bulk of new housing to be in the coastal zones of SCAG's region, we do not believe that it is a sound policy to rely on the coastal zone to absorb all new population – both because of the inherent higher cost of land in proximity to the coast (something seen worldwide), and the fact that each region as its own ecosystem has what we believe is a carrying capacity. The plan talks about the importance to preserve farmland and open space, but it does not address the need to provide for needed infrastructure such as open space in the urban areas of growing population density. Where is the

recognition of the need to develop urban open space, to develop greenbelts, to regulate the proximity of housing adjacent to transit corridors and noxious uses? Los Angeles City, with which we are most familiar, has land zoned for density to accommodate projected population growth. However, developers do not wish to build in all the areas where land would accommodate new growth. Yet, we are pressed to rezone neighborhoods often creating what many view to be a future unlivable city. With sewer and water mains bursting, with streets crumbling, how much added development can our urban areas absorb? The assumption that the urban areas are able to support large density increases is open to serious questioning. Many would challenge the statement made on page 12 of the project summary: "... by focusing new residential and commercial development in higher density areas already equipped with the requisite urban infrastructure."

What is the strategy to develop population centers with both jobs AND housing where land costs will result in affordable workforce housing and where these newer communities will not endanger agricultural producing land or sensitive habitats? What kinds of incentives can be developed to foster the establishment of job centers in these new population areas? These sub-regional job centers can be built with compact land uses that incorporate open space protections as well as urban open space. These are opportunities to build model communities in a more dense format than former single family home communities.

1

- Regarding housing and the high cost of housing:
We all agree that there is an affordable housing crisis and that there are no simple fixes. This "crisis" has been brewing for decades while real estate speculation, the mortgage crisis fiasco, foreign investment in CA property (with many properties left empty and no taxes assessed on them to encourage occupancy) and a growing short-term rental market that removed residential units from the housing market took hold. While Connect SoCal is a transportation program, it is important that these factors be noted and addressed for no current measures have addressed any of these contributors that have helped to bring us to where we are today and have placed added pressures on our housing supply.
- RE: The shift from automobiles to a more transit-oriented transportation realm.
 - This is an evolutionary process best accomplished by halting the demonization of drivers or the creation of an "us vs. them" battle. Innovative programs to incentivize transit use (when possible/realistic) and reduce vehicle use that are not punitive are needed.
 - Road maintenance and improvements must be supported by augmented fees levied on electric vehicles as well as those raised through gas tax funds. Policies that allow for annual fees on electric vehicles are important to reflect the use of the roads by these vehicles which currently may not be paying their fair share. However, we foresee potential backlash in the adoption of both a gas tax for road maintenance and a

use tax based on miles travelled. Should it not be one or the other? Whatever funding mechanism is adopted should build in an established adjustment for inflation without the need for further legislative action. Is it fair to seek both a mileage-based user fee AND a local road charge program?

- The possible investment of private equity firms in the construction and/or operation of transit will come at a future cost. We are concerned that decisions made are done with clear understanding of the cost to future users and how that compares with public financing options. Those discussions should be held in the open in a transparent manner.
- The placement of bike and bus only lanes that results in the intentional “traffic calming” on streets often comes with unintended consequences for nearby streets. Our streets have traditionally been characterized by their ability to carry different volumes of traffic. Our community supports streets designated to provide safe passage for bicyclists. However, we also believe that certain streets should be designated to move vehicles and not bicycle traffic. We are extremely concerned that the intentional slowing of traffic on arterials will result in the transfer of vehicles from the arterials to our local community streets – streets where we believe it is safest for pedestrians and bicycle riding. The adoption of “bus only” lanes will present some of the same challenges.
- Transit use: There are those who can easily access transit and there are those that cannot do so. Each of those groups has an additional subset—those who use transit and those who do not. It is likely unrealistic to expect that all can and will use transit. In some families, some family members will use transit and others will not/cannot do so. We must recognize that Los Angeles is a city that is separated by a mountain range – a mountain range separating valley and city areas. While METRO has current plans to connect the two areas by fixed public transit, we are not there yet. And yet, there are plans to levy user fees to riders who enter the Westside via “GO ZONES” – also known as tolling areas. So long as there are significant gaps in our transportation network, GO ZONES or local toll areas will be viewed as schemes devised to raise funds to help support transit development/maintenance. The proposed Westside GO ZONE now being discussed does not address the impacts on those who cannot adjust work shifts, of those who must access needed medical care within a GO ZONE area. This will strike those affected as yet another tax that is being levied to make up for otherwise unsound funding mechanisms for our transit/transportation infrastructure.
- The Westside has long waited to receive fixed public transit. The EXPO line exceeded ridership estimates from the minute it opened and yet frequency of trains has been reduced. The “Subway to the Sea” will not reach the sea and will end at the VA removing a major transit connection along a major travel corridor. The lower population levels in hillsides and substandard streets there will likely make it unlikely that transit can be justified to serve hillside residents (although microtransit may be helpful there). Why is the Westside being identified as the target of a tolling program? Why isn’t the downtown area, where major investments in transit, including the Downtown Connector) have been made and where

the Gold Line, Subway, Union Station, Metrolink all meet? Promises that low income drivers will somehow be subsidized if entering the area does not address the many issues presented by tolling in local communities.

- It is up to the transit providers to present an attractive and efficient option for prospective riders. It is an unfortunate fact that currently some of our transit options are not viewed by riders as realistic options. The reasons for this are many: Poor access to stations, lack of parking where transit options to reach transit are not available, unrealistically long travel times, perceived unsafe conditions (particularly for women traveling along after dark), filthy conditions, unreliable service.
- First mile/ Last mile: Many transit riders and prospective transit riders cannot avail themselves to use scooters or bicycles and may not be able to reach transit on foot. The needs of those individuals need to be recognized and addressed. This is perhaps a growing challenge as the Baby Boomer generation ages. Data has demonstrated that Lyft/Uber-style ride providers are often major contributors to street congestion. Further, the safety of passengers in Uber/Lyft vehicles is becoming a growing issue suggesting that if our transit networks are to rely on these forms of transit then more regulation may be required.
- It is important for planners to recognize that vehicles will not disappear from our environment and that removing parking spaces in residential developments in the thought that this will stop people from driving is wishful and illusory thinking. Providing parking is necessary because not all members of a family will be able to use transit given their work responsibilities and the vast geographic area this region represents. Further, some jobs are shift jobs with irregular hours that do not conform to transit availability. Space provided for parking in buildings should be designed so that it can be repurposed in the future should need for that use be reduced. LA permits developments under the TOC/Transit Oriented Community Guidelines that provide ½ space of parking per unit – regardless of the number of bedrooms in those units. Some projects provide no/zero units assuming that those who live near transit will not own or have a need to park a loaned vehicle. Is this realistic? We think not. At the very least we suggest that data be gathered from all new projects that can help to document how many bicycle and automobile spaces have been provided, how many are in use, whether there are waiting lists seeking access to a parking space. We also suggest (and continue to do so) that projects permitted with bonus densities granted as a result of proximity to transit be required to provide new residents and employees FREE transit passes for an initial period of time, followed by discount pass provision upon proof of regular transit use. Those buildings have benefited from significant “upzoning” and development rights at no cost. They should be part of the process in supporting the use of transit whenever possible. Citizens should not need to have to suggest such a policy. It should be expected, particularly since more and more developments are being built “by right” with little opportunity for community members to participate in making suggestions for improvement.

We are grateful that SCAG has made strong efforts to seek public participation in this effort. It is extremely troubling to us that measures to incentivize housing development have resulted in

the streamlining of the entitlement process that removes our input from the process. Even worse is proposed STATE legislation such as SB 50 that seeks to implement zoning from a statewide perspective – voiding local community plans and local planning efforts. We look to SCAG to be an advocate in challenging the disempowerment and silencing of the voices of local communities in the planning the future of our communities.

1

Thank you for your consideration.

Re: Comments to the Draft Program Environmental Impact Report (PEIR) (SCH#2019011061) in accordance with the California Environmental Quality Act (CEQA) for Connect SoCal (2020-2045 Regional Transportation Plan/Sustainable Communities Strategy).

Dear Mr. Ok:

Since 1995, ARSAC has advocated for the increased utilization of unconstrained underserved or unserved outlying regional airports such as Ontario and Palmdale to meet Southern California's airport capacity needs instead of expanding LAX.

ARSAC supports a safe, secure, modern and convenient LAX. LAX, the dominant So Cal airport, is limited in operational land and is in a very congested airspace. In 2016, ARSAC negotiated a second legal settlement to extend the 153 gate cap by four additional years through December 31, 2024. The gate cap is based upon Aircraft Design Group III sized aircraft comprised of the narrow body mainline aircraft such as the Airbus A320 and Boeing 737 series commercial airplanes. LAX is currently the largest public works project in Los Angeles County.

1

ARSAC is disappointed with the PEIR:

1. The outreach for public comment appears to very limited.
2. The time for public comment is too short. The PEIR was released in December when most people are paying attention to the holidays and not public policy. SCAG should extend the comment period an additional 45 days and provide lots of publicity to encourage public comment.
3. The content of the PEIR appears to be thinner in scope than in the past, especially the Aviation Element. Instead of doing the RTP right, it appears as "RTP Lite."

2

The draft document repeatedly states its lack of authority to mandate actions. SCAG can be a much stronger contributor to the economic and environmental development of this region by providing increased guidance for transportation priorities. It provides extensive housing priorities and goals and to increase mass transportation to reduce vehicle miles travelled. It appears to favor "active transportation" such as bikes and scooters but fails to project how will be used to generate meaningful data resulting in congestion improvement.

3

ARSAC strongly agrees with the five decade old principle that our airport system must provide a regional accommodation to travelers and cargo. Mass transit train stations and buses must be

4

ARSAC Alliance for a Regional Solution to Airport Congestion
7929 Breen Ave., Los Angeles, CA 90045

310 641-4199 WWW.RegionalSolution.org info@regionalsolution.org

built to support our airport system. Much of the RTP discusses “livable communities” in which single vehicle traffic is discouraged for densified communities. The call for active mobility choices with inadequate parking may serve local communities, but this will not work well for travelers who generally have luggage. Bike centric projects may increase active transportation alternatives but it also reduces vehicle capacity and slows down vehicle traffic resulting in increased GHG.

Traffic around LAX is legendary. Despite all of the major changes proposed we expect that “Every day will be like Thanksgiving gridlock” if the increased projection of 127 Million Annual Passengers (MAP) occurs. No documentation is provided anywhere in the RTP to validate that this 35% increase from current gridlock can be accommodated within or around LAX.

ARSAC strongly encourages data collection and analysis activity to highlight the sources of passengers and to encourage airlines to offer flights at airports most convenient to travelers.

SCAG congestion analyses and “transportation analysis zones” around airports must be detailed enough to identify potential action for improvements not only at end of the planning period of 2045, but also incrementally to match changes within airport areas. When will this data be used? If it is only for 2045, then it will be too late.

In this RTP, SCAG seems to have backed away from 5 decades of advocacy for regional accommodation of commercial aviation needs. The wording, “Regionalization” in reference to Aviation is absent from the draft despite its critical importance to ensuring optimum access and emergency back up for both natural and man-made disasters.

The definition of regionalization has been crafted by ARSAC and the cities of Inglewood and Culver City in 2011 which SCAG should consider adopting:

“Regionalization is the proactive redistribution of a portion of Southern California’s aviation demand to unconstrained airports in the Southern California region other than LAX, in order to achieve a more equitable and proportional allocation of airport growth and aircraft operations among the airports, reduce congestion, increase safety, and minimize vehicle miles traveled, with consequent benefits to both the environment and the economy.”

ARSAC was part of the coalition to “SetONTario Free” whereby Ontario International Airport (ONT) ownership and management returned to local control. ONT has been dramatically increasing domestic service and adding new long-haul international service such as Taipei, Republic of China. ONT is a great example of airport regionalization in Southern California.

ARSAC Alliance for a Regional Solution to Airport Congestion
7929 Breen Ave., Los Angeles, CA 90045

310 641-4199 WWW.RegionalSolution.org info@regionalsolution.org

We agree with the RTP statement: “SCAG has and will continue to play a role in terms of aviation systems research, planning, and analysis, as well as encouraging collaboration and communication amongst the region’s aviation stakeholders.”

As the federally recognized Metropolitan Planning Organization (MPO) for Southern California and its ability to prioritize ground transportation dollars, SCAG must do more to help underutilized regional airports become more attractive for airline service by providing easy access by road, rail (Metrorail, Metrolink, Amtrak, High Speed Rail such as Brightline/Virgin Trains) and other mass transit.

Part of Southern California’s freeway congestion problems stems from leakage of passengers from one airport catchment area (natural marketing area) to other airports causing millions of extra vehicle miles traveled. All of Palmdale Regional Airport’s possible passengers are forced to drive to Hollywood-Burbank (BUR), Ontario International (ONT) or Los Angeles International (LAX) to catch a flight. LAX has 70% of the region’s flights including 95% of the international flights. While it is not possible to accommodate all leakage from one catchment area to another, without airline service at places such as PMD freeway congestion will continue to increase. SCAG must work with airports in the region to have ground access projects prioritized. SCAG must re-commit itself to making airport regionalization a reality.

4

In the RTP, some airports having commercial jet service are designated “Reliever Airports”.

Were these “Reliever Airports” included in calculations such as Air Quality, Green House Gas Emissions, Noise, etc.???

Additional information that should be included in the RTP about “reliever airports”:

1. March Inland Port (RIV). As of 2018, Amazon Air has 6 cargo flights per day.

Reference: https://en.wikipedia.org/wiki/March_Air_Reserve_Base

2. Palmdale Regional Airport (PMD). PMD has charter Boeing 737 flights to support US Defense projects such as the B-21 bomber program. The City of Palmdale is in the planning process to build a new passenger terminal on the northwest corner of Air Force Plant 42 (southeast corner of Sierra Highway and Avenue M). This location is adjacent to the Metrolink Antelope Valley Line and would be perfect for a train station stop to make PMD an intermodal and multimodal facility. Virgin Trains USA could also make this a station.

Reference 1: https://en.wikipedia.org/wiki/Palmdale_Regional_Airport

Reference 2: <https://cityofpalmdale.org/DocumentCenter/View/5858/Palmdale-Regional-Airport-Facts-and-Figures-PDF?bidId=>

Reference 3: https://www.avpress.com/news/palmdale-explores-return-of-service-to-airport/article_c0ffc290-bbf9-11e9-8a1a-7fd9889b4667.html

ARSAC Alliance for a Regional Solution to Airport Congestion
7929 Breen Ave., Los Angeles, CA 90045

310 641-4199 WWW.RegionalSolution.org info@regionalsolution.org

3. San Bernardino International Airport (SBD). SBD has a new passenger terminal with Federal Inspection Service (FIS) facilities. SBD has commercial aircraft Maintenance, Repair and Overhaul (MRO) facilities. FedEx and UPS have cargo flights from SBD to 9 US cities. Reference: https://en.wikipedia.org/wiki/San_Bernardino_International_Airport

4. Southern California Logistics Airport (VCV). SCLA is a major aircraft storage, maintenance, overhaul and testing facility. Boeing Capital Corporation, a subsidiary of The Boeing Company, stores aircraft here for future leases and sales. GE Aircraft Engines does flight testing of engines here including the new GE9X engine powering the new Boeing 777X. Airtanker 910, which has a McDonnell Douglas DC-10, uses VCV for fighting forest fires in California. Reference: https://en.wikipedia.org/wiki/Southern_California_Logistics_Airport

4

Main document comments and questions.

1. RTP Page 1.03: “The region is home to the two largest container ports in the Western Hemisphere (Los Angeles and Long Beach), and the world’s fifth busiest airport system (Los Angeles World Airports).”

The statement above needs to be updated. According to Airport Council Internationals, Los Angeles International Airport (LAX) is the world’s fourth busiest airport as of 2018. Los Angeles World Airports operates LAX. LAX is on track to becoming the world’s third busiest airport according to first half 2019 figures. Reference: https://en.wikipedia.org/wiki/List_of_busiest_airports_by_passenger_traffic

2. RTP Appendix 3.13. This document leaves out the noise contours for airports classified as “Reliever Airports.”

Palmdale (PMD), March Inland (RIV), San Bernardino International (SBD) and Southern California Logistics Airport (VCV) all have jet air traffic that impacts airport neighbors with noise, pollution and vibration issues. Are these reliever airports included in the air quality, greenhouse gas emission, noise and other analyses? If not, then the RTP could be inadequate in disclosing and analyzing these important issues.

5

Aviation and Airport Ground Access Technical Report comments and questions

1. Overall. SCAG must recommit to an active policy of “regionalization”, a policy that SCAG embraced for the past five decades. Why does SCAG no longer mention regionalization in the RTP? How can we get SCAG to implement regionalization?

6

ARSAC Alliance for a Regional Solution to Airport Congestion
7929 Breen Ave., Los Angeles, CA 90045

310 641-4199 WWW.RegionalSolution.org info@regionalsolution.org

2. Executive Summary, page 2. “Only a small percentage of air passengers used transit to travel to and from the region’s airports.”

SCAG must work with airports in the region to identify and prioritize projects that will encourage passengers to use public and mass transit to airports. Hollywood-Burbank Airport (BUR) is a good local model of being an intermodal and multimodal facility. LAX is working on the Landside Access Modernization Program (LAMP) to improve mass transit connectivity. Plans to extend the Metro Gold Line and Metrolink to and from Ontario International (ONT) need to be prioritized.

3. Executive Summary, page 2. “The majority of air passengers in the region are traveling to and from Los Angeles International Airport.” Again, SCAG needs an active regionalization program to help redirect passengers who are leaking from other SCAG airports. This will help to reduce pressure on LAX to expand in the future and to reduce traffic congestion on freeways and local streets around LAX.
4. Executive Summary, page 2. “The growth in air passenger demand globally can be explained in part due to the health of the economy and an ongoing trend of decreasing airfare.”

The statement is correct, but leaves out important components of growing international air service: Open Skies Agreements between the United States and other countries which removed restrictions on city pairs and aircraft types and the use of new fuel efficient long range aircraft such as the Airbus A350XWB and the Boeing 787 Dreamliner that have made flying between smaller size markets profitable.

5. Exhibit 1, SCAG Region Airports, Page 4.

Why is Palmdale Regional Airport listed as “Palmdale Air Terminal” on the map?

6. Table 1, Commercial Air Carriers (and Destinations) Operating in the SCAG Region Airports, Pages 10 and 13
 - a. The list appears to be LAX-centric. Why was the list not broken out by individual SCAG airports with airlines and destinations?
 - b. The destinations are missing for Aer Lingus (Dublin), Aeroflot (Moscow), Aeromexico (Mexico City, etc.), Aeromexico Connect, Air Canada (Vancouver, Calgary, Edmonton, Toronto, Montreal), Air Canada Rouge and Air China (Beijing). Where did the information about “O&M Existing Service” and “Bridges, pavement” come from?
 - c. Why were these airlines not listed? Air Italy (Milan)? Boutique Air (Merced)? Finnair (Helsinki)?
 - d. Why are Air Canada and Volaris listed twice?

ARSAC Alliance for a Regional Solution to Airport Congestion
7929 Breen Ave., Los Angeles, CA 90045

310 641-4199 WWW.RegionalSolution.org info@regionalsolution.org

- e. Norwegian Air Shuttle has reduced its destinations from LAX
 - f. Scandinavian Airlines just switched its destination from Stockholm to Copenhagen
 - g. Thomas Cook Airlines, WOW Air and XL Airways France have ceased operations.
7. Table 2, SCAG Region Cargo Airlines and Destinations, Pages 14 and 15
 - a. The list appears to be LAX-centric. Why was the list not broken out by individual SCAG airports with airlines and destinations?
 - b. Does this list account for Amazon's Prime Air operation at March Inland Port (RIV)?
 8. MPO's have no authority over Airport Development, Pages 18 and 19. Please refer to our comments above concerning active regionalization.
 9. Where are air passengers coming from and how are they getting to the airport?, Pages 24 to 26. Again, SCAG has an opportunity and a responsibility to work with airports in facilitating projects to create and enhance mass transit projects to airports to encourage more air passengers to use transit options other than single occupancy vehicles or Transportation Networking providers.
 10. Air Cargo traffic to the SCAG region airports, Page 26. Why did SCAG only include the top 5 cargo airports in the SCAG modeling program for truck trips? Other airports such as San Bernardino (FedEx and UPS) and March Inland Port (Amazon Prime Air) produce truck trips. It is anticipated that these 2 airports will likely see increases in cargo service from these cargo carriers and this will impact roadways with more truck traffic.
 11. Strategies, Page 31. Again, SCAG must be more pro-active in working with SCAG region airports on ground access to make these airports more intermodal and multimodal.
 12. Table 12, SCAG Region Airport Forecast for 2020-2045 RTP/SCS, Page 33. What documentation and justification has LAWA provided for the projected 127 Million Annual Passengers in the 2045 horizon year?
 13. General Aviation Forecast, Page 34. Does the forecast include the possible closure of Santa Monica Airport (SMO)? Does the forecast include membership flying services such as SurfAir and FLOAT?
 14. New Airport Ground Access and Modernization Projects, Pages 34 to 36. ARSAC appreciates that the 2028 Olympic Games are mentioned, but again, it appears that there is lack of urgency in this RTP to have airport access projects completed before the Olympic games making the airports in the SCAG region, "Olympics ready." ARSAC supports efforts to bring Metrolink and Metrorail to Ontario International Airport (ONT).
 15. Supersonic aircraft missing from RTP. Supersonic passenger aircraft are expected to debut during the 2020-2045 timeframe of the RTP. These include the Boom Technology Overture and Aerion AS2 supersonic business jet. Boom has 10 options each from Japan Airlines and Virgin Atlantic, both of whom serve LAX.
Reference 1: https://en.wikipedia.org/wiki/Boom_Technology

ARSAC Alliance for a Regional Solution to Airport Congestion
7929 Breen Ave., Los Angeles, CA 90045

310 641-4199 WWW.RegionalSolution.org info@regionalsolution.org

Reference 2: <https://en.wikipedia.org/wiki/Aerion>

16. Drones also missing from RTP. Drones are being deployed for law enforcement and commercial purposes such as filming and package delivery.
17. Helicopters also missing from RTP. Helicopters are used law enforcement, fire fighting, medical, news coverage and private transportation. Helicopters negatively affect residents when they fly low.
18. VTOL. New services such as Uber Elevate are on the horizon. This service will require new landing pads to enable its usage. The safety of manned and unnamed VTOL needs to be examined. From Wikipedia: "UberAIR / UberElevate will provide short flights using VTOL aircraft. Demonstration flights are projected to start in 2020 in Dallas and Los Angeles. Commercial operations are projected to begin in 2023.[48] Although technically feasible, the program is expected to encounter safety and regulatory obstacles.[49]"

Reference: https://en.wikipedia.org/wiki/Uber#Riding_with_Uber

Passenger Rail Technical Report comments and questions

1. Table 1, Private Transportation Providers, Page 18. Destinations are missing for Tres Estrellas de Oro and TUFESA.
2. Los Angeles to Las Vegas, Page 27. Was XpressWest and its successor Virgin Trains USA approved for a Palmdale to Victorville segment? Why is this not mentioned about a Virgin Trains station in Palmdale?
3. Airport Ground Access, Page 33. Were the City of Palmdale's plans for a new airport terminal on the northwest corner of Air Force Plant 42 (southeast corner of Sierra Highway and Avenue M) considered in this RTP?

ARSAC will continue to work with SCAG to improve our regional economic and environmental conditions. We encourage SCAG to increase its outreach and to foster discussion and action within each of the Counties and Cities of our region.

Sincerely,

Denny

SUBJECT: "Connect SoCal" DEIR Comments

On behalf of BizFed, a grassroots alliance of more than 190 business organizations representing 400,000 employers with over 3.5 million employees in Los Angeles County, we want to thank SCAG for the great work in presenting this plan to many diverse stakeholders in Southern California.

We see great things in the plan that we strongly support, such as increasing housing production, leveraging investments from enhanced infrastructure financing districts (EIFD), supporting 5G Smart Cities, and supporting increased public transit and Metrolink service. However, we heed caution to the calls for imposing vehicle miles travelled (VMT) reduction targets and the fees attached to them as a strategy for greenhouse gas (GHG) reduction. This strategy and its fees have negative impacts on disadvantaged communities. We view this as counterproductive to BizFed's anti-poverty goal of lifting one million persons in Los Angeles County out of poverty over this decade.

California ranks at the top in the United States for poverty and homelessness – both of which are attributable directly to the housing supply shortage, high housing prices that are nearly three times above the national average, and longer commutes where working families are "driving until they qualify" for housing that they can rent or buy.

The call for user based vehicle mileage travel fees - in Chapter 5 of the Environmental Justice section of the plan - will hurt the very people who are most disadvantaged. These workers are paying more as they travel farther to work at a good paying job and afford a place to live, thereby spending more of their income on basic necessities such as transportation and shelter.

BizFed recognizes the call for increased public transit service and multi-family transit-oriented housing production as a strategy to mitigate those concerns. We believe the implementation of these goals will be hampered by CEQA lawsuit abuses. Since 2013, over 70% of these CEQA lawsuits are targeted at stopping infill, multi-family, and transit-oriented housing. According to CARB, these are housing types are needed to invest and support our environmental goals.

In 2012 and 2016, SCAG's two prior RTP/SCS met the required GHG reduction targets. The RTP/SCS were the result of local input on land use planning, full respect for voter-approved funded transportation infrastructure projects as required by longstanding laws for efficient transportation and goods movement solutions.

These voter approved transportation projects are mostly funded from sales taxes which can be volatile to outside triggers such as the recession of 2008-10, resulting in a decrease of sales tax receipts. If these assumptions on VMT reductions, in the RTP/SCS, are to be delivered, we may see dramatic reductions in goods movement infrastructure and sales tax receipts, which are critical to the state's economy. The last time a significant reduction in VMTs occurred was during the recession of 2008-2010. However, with the current trends in e-commerce as well as alternative transportation mobility options such as Uber and Lyft, we have seen VMT's increase.

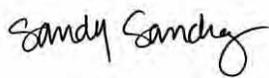

BizFed believes there is an opportunity to include in this plan strategies that will help deliver our housing and mobility goals. We want to partner with SCAG in making these goals a reality. We believe that policy tools such as; the return of community redevelopment agencies, leveraging tax increment financing to invest in affordable housing projects, and CEQA reforms against lawsuit abuses for transportation infrastructure projects and housing developments of all kinds both urban and rural, are essential to the conversation that will successfully implement this bold, economically and environmentally sustainable vision SCAG has laid out in the plan.

1

We appreciate SCAG's steadfast efforts to assure that SB 375 can be implemented, complying with its statutory protections for a healthy economy and growing population.

BizFed will help SCAG with the above solutions to truly connect all Southern Californians.

Sincerely,

Sandy Sanchez

Re: Draft Program Environmental Impact Report for Connect SoCal 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (State Clearing House Number 2019011061)

Dear Mr. Ok:

These comments are submitted on behalf of the Center for Biological Diversity (the “Center”) regarding the Draft Program Environmental Impact Report (“DEIR”) for Connect SoCal 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (“RTP/SCS”). The Center has reviewed the DEIR and RTP/SCS and provides these comments for consideration by the Southern California Association of Governments (SCAG).

The Center is encouraged to see several conservation facets of the RTP/SCS, including SCAG’s attention to preserve, enhance, and restore regional wildlife connectivity (RTP/SCS at 50), avoid growth in wetlands, wildlife corridors, biodiverse areas, wildfire prone areas and floodplains (RTP/SCS at 55), encourage housing and commercial development near public transit and urban areas (RTP/SCS at 48) and incorporate greenbelts into planning initiatives (RTP/SCS at 55). The Center respectfully submits these comments to help achieve SCAG’s aspirations of a “healthier, safer, more resilient and economically vibrant region” by facilitating a comprehensive approach to growth that addresses human transportation and development needs, the needs of wildlife and habitats that are fragmented by transportation infrastructure and development, and how we can make human and natural communities more resilient to climate change.

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over 1.7 million members and online activists throughout California and the United States. The Center and its members have worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in Southern California.

I. The Connect SoCal Goals Should Include Maintaining and Enhancing Wildlife Movement and Habitat Connectivity

The Center is encouraged to see the inclusion of Goal #10, “Promote conservation of natural and agricultural lands and restoration of critical habitats” (DEIR at ES-7); however, integrating wildlife connectivity is critical to overall ecosystem health and biodiversity. Doing so would also improve chances of attaining other goals, including supporting healthy and equitable communities, reducing greenhouse gas emissions and improving air quality, and adapting to climate change. Preserving and restoring habitat connectivity would help ensure invaluable ecosystem services that benefit human communities, including but not limited to water purification, erosion control, groundwater recharge, resilience to extreme weather events (e.g., severe storms and flooding), carbon sequestration, and crop pollination.

As mentioned in the Center’s Notice of Preparation comment letter, roads and traffic create barriers that lead to habitat loss and fragmentation, which harms wildlife and people. As barriers to wildlife movement and the cause of injuries and mortalities due to wildlife vehicle collisions, roads and traffic can affect an animal’s behavior, movement patterns, reproductive success, and physiological state, which can lead to significant impacts on individual wildlife, populations, communities, landscapes, and ecosystem function (Mitsch and Wilson 1996; Trombulak and Frissell 2000; van der Ree et al. 2011; Haddad et al. 2015; Marsh and Jaeger 2015; Ceia-Hasse et al. 2018). For example, habitat fragmentation from roads and traffic has been shown to cause mortalities and harmful genetic isolation in mountain lions in southern California (Riley et al. 2006, 2014, Vickers et al. 2015), increase local extinction risk in amphibians and reptiles (Cushman 2006; Brehme et al. 2018), cause high levels of avoidance behavior and mortality in birds and insects (Benítez-López et al. 2010; Loss et al. 2014; Kantola et al. 2019), and alter pollinator behavior and degrade habitats (Trombulak and Frissell 2000; Goverde et al. 2002; Aguilar et al. 2008). Habitat fragmentation also severely impacts plant communities. An 18-year study found that reconnected landscapes had nearly 14% more plant species compared to fragmented habitats, and that number is likely to continue to rise as time passes (Damschen et al. 2019). The authors conclude that efforts to preserve and enhance connectivity will pay off over the long-term and “[conservation] plans that focus solely on habitat area, will leave unrealized the substantial, complementary, and persistent gains in biodiversity attributable specifically to landscape connectivity,” (Damschen et al. 2019).

The Center recommends the goal be edited as follows:

Goal #10: “Promote conservation of natural and agricultural lands **and habitat connectivity** and restoration of critical habitats **and wildlife movement corridors.**”

II. The Connect SoCal Guiding Principles Should Include Maintaining and Enhancing Wildlife Movement and Habitat Connectivity to Protect Wildlife and Improve Public Safety

Wildlife vehicle collisions pose a major public safety and economic threat, as well as a threat to the region’s wildlife and biodiversity. During 2015 to 2018 more than 26,000 incidents involving vehicles and wildlife were reported to the California Highway Patrol, which included

2

3

reports of animals standing next to, in, or running across lanes, collisions with large animals, or swerving to avoid collisions and resulting in a crash (Shilling et al. 2019). State reports and car insurance companies estimate that that 7,000 to 23,000 wildlife vehicle collisions (with large mammals) have occurred annually on California roads (Shilling et al. 2017; Shilling et al. 2018; Shilling et al. 2019; State Farm Insurance Company 2016, 2018). These crashes result in human loss of life, injuries, emotional trauma, and property damages that can add up to an estimated \$300-600 million per year and over \$1 billion from 2015-2018, based on reported wildlife vehicle collisions. And it is important to note that collisions with large animals often go unreported as much as 5- to 10-fold (Donaldson and Lafon 2008; Olson et al. 2014; Donaldson 2017) Thus, avoiding and minimizing impacts of transportation projects and development on wildlife movement and habitat connectivity would help preserve biodiversity and ecosystem health while protecting human health and safety.

The Guiding Principles should reflect the need to adequately address wildlife movement and habitat connectivity issues to minimize wildlife vehicle collisions. Outside of California many states, including Arizona, Colorado, Florida, Montana, Nevada, Oregon, New Mexico, Utah, Washington, and Wyoming, have been proactively addressing wildlife connectivity issues and realizing the benefits of wildlife crossing infrastructure. For example, Arizona, Colorado, and Wyoming have seen 80-96% reductions in wildlife vehicle collisions while gradually increasing the level of wildlife permeability over time (it appears that some species take more time than others to adapt to crossings) on sections of highways where they have implemented wildlife crossing infrastructure, such as underpasses, culverts, overpasses, wildlife fencing, and escape ramps (Dodd et al. 2012; Sawyer et al. 2012; Kintsch et al. 2018). Utah just completed the state's largest wildlife overpass at Parleys Canyon for moose, elk, and deer. Washington State is about to complete its largest wildlife overpass on I-90, which is anticipated to provide habitat connectivity for a wide variety of species between the North and South Cascade Mountains. The overpass cost \$6.2 million as part of a larger \$900 million expansion project that will include multiple wildlife crossings along a 15-mile stretch of highway. Savings from less hospital bills, damage costs, and road closures from fewer wildlife vehicle collisions will make up those costs in a few years (Valdes 2018). State transportation departments are actively pursuing these types of projects because of the benefits for wildlife connectivity, public safety, and the economy. California needs to follow suit and more actively invest in preserving habitat connectivity where there are no roads while also enhancing or restoring connectivity where roads or other transportation infrastructure already exist.

The Draft Plan recognizes two important ecological components about southern California. First, it recognizes the incomparable biological diversity of California, due primarily to its flora:

“The region’s desert, mountain and coastal habitats have some of the highest concentrations of native plant and animal species on the planet. Southern California is part of the California Floristic Province, one of the planet’s top twenty-five biodiversity hotspots.” (RTP/SCS at 23)

Secondly, it recognizes the significant contribution to greenhouse gas sequestration that plants, exposed soils and open space provide:

“In addition to their respective roles in biodiversity and food production, both natural areas and farmlands help reduce the impacts of climate change by capturing greenhouse gases in the soil, plants, and trees instead of allowing them to concentrate in the atmosphere.” (RTP/SCS at 36)

In addition, southern California native plants are adapted to our unique “Mediterranean” climate and persist in our relatively arid conditions where rainfall primarily occurs on the winter. For all of these reasons, the Draft Plan needs to adopt the commitment to the preferential use of native plants as part of the final 2020-2045 Regional Transportation/Sustainable Communities Plan.

Much literature is available on the use of native plants on roadsides. The Federal Highway Administration produced a Managers Guide to Roadside Revegetation Using Native Plants (FHA-DOT 2007), which notes:

“Native plants are a foundation of ecological health and function. Revegetating roadsides with native plants is a key practice for managing environmental impacts and improving conditions for healthy ecosystems. The ability to establish native plant communities on roadsides is central to determining whether the transportation corridor will be a healthy environment or a damaged one.”

The Guide continues to tout the benefits of using native plants along transportation corridors as follows:

“Native plants along roadsides offer ecological, economic, safety, and aesthetic advantages. Ecologically, healthy native plant communities often are the best long-term defense against invasive and noxious weeds. Economically, maintenance costs for managing problematic vegetation are reduced, as are the concerns that sometimes result when weeds from roadsides invade neighboring lands or when pollution from herbicides occurs.”

From the perspective of safety, the FHA states:

“The establishment of native plant communities supports transportation safety goals in a number of ways. One of the most important is by improving the function of roadside engineering. Appropriate vegetation can enhance visibility and support design features to help drivers recover if their vehicles leave the pavement. When native plant materials are incorporated into road design, they can improve long-term slope stability while softening visual experiences.”

Native roadside vegetation helps to identify local place, reduces the cost of roadside maintenance, and requires little to no pesticides (Quarles 2003). Tinsley et al (2007) found that native revegetation grass and forb seed mixes outperformed non-native seed mixes in establishing cover on roadsides and concluded that “suites of early- and late-successional native species can provide a highly effective mix for revegetation projects”. In order to assure successful planting with native plant species, care must be taken when planning native roadside

plantings. Plant selection must consider soil type and compaction from engineered slopes, harsh microclimates directly adjacent to roads, invasive species, and pollution from vehicle emissions. Haan et al. (2012) found that “soil characteristics largely determined plant survival” but other considerations were also important considerations. Karim and Mallik (2007) found that “floristic zonation along roadsides is a function of roadside microtopography, substrate type and environmental gradients created by the road building process” and that certain native plant species were more successful in certain zones. Therefore, careful selection of native species is crucial to successfully vegetating transportation corridors. Fortunately, California’s diverse native flora provides the diversity to meet the roadside zones. Several drought tolerant native species lists, tailored to local conditions are readily available for the South Bay of Los Angeles County¹ and coastal southern California².

Because of the ongoing pollinator crisis, the Draft Plan also needs to adopt the commitment to use best management practices for pollinators as part of the final 2020-2045 Regional Transportation/Sustainable Communities Plan. The Federal Highways Administration (FHA-DOT 2015) provides guidelines for best management practices that will benefit pollinators and includes a focus on using native plants. Wildlife connectivity typically focuses on large animals that require safe passage through and beyond their home territories and because of that scale, automatically protects a suite of more localized plants and animals. Here, linear roadside corridors are obviously inappropriate for large mammals, but can still be important and indeed crucial to plants and small animals, including invertebrates. Therefore, these types of linear features should not be overlooked for their potential ecological benefits.

While some of the SCAG transportation goals include roads and road improvements in urbanized areas, these areas provide great opportunities to transition plantings to native plants that are drought tolerant, sequester carbon, provide linear habitat for local fauna and identify a sense of place based on southern California’s iconic flora. For these reasons and those listed above, the Draft Plan would benefit from the incorporation of a commitment to the preferential use of native plants as part of the final 2020-2045 Regional Transportation/Sustainable Communities Plan.

Therefore, the Center recommends Connect SoCal Guiding Principles to be edited as follows:

Guiding Principle #2: Place high priority for transportation funding in the region on projects and programs that improve **human** mobility, accessibility, reliability and safety, and **wildlife connectivity that is based on native southern California flora**. ~~that preserve the existing transportation system~~

Guiding Principle #5: Encourage transportation investments that will result in improved air quality and public health **and safety**, and reduced greenhouse gas emissions

¹ See <https://bestofthesouthbay.com/10-drought-tolerant-california-native-plants/>

² See <https://www.scpr.org/news/2015/05/13/51644/go-native-a-list-of-drought-friendly-california-pl/>

III. The Projects on the Transportation System Project List Undercut the SCAG's Stated Land Use Strategies and Sustainability Goals

The Center is encouraged to see that SCAG's land use strategies include prioritizing infill and redevelopment; facilitating multimodal transportation for various purposes (*i.e.*, work, education, other destinations); urban greening; and avoiding growth in wetlands, wildlife corridors, biodiverse areas, wildfire prone areas, and floodplains. However, the Transportation Project List contains over 300 pages of projects in Appendix 2.0, many of which include the widening and extension of freeways, which will result in increased greenhouse gas ("GHG") emissions and fragment landscapes and wildlife connectivity while promoting sprawl development, some of which is located in high fire hazard severity zones.

As the Center noted in its NOP comments to SCAG last year, scientific studies and state agency reports from the California Air Resources Board ("CARB") have shown the state will not achieve the necessary GHG emissions reductions to meet its mandates for 2030 and 2050 without significant changes to how communities and transportation systems are planned, funded and built. Significant reductions in GHG emissions is the only pathway to limiting the impacts of climate crisis, which are already being felt by people and wildlife throughout the state. Those reductions will not be achieved by small half measures of simply encouraging more zero-emission vehicles or hoping local agencies will change their land use decision-making in the future. Instead agencies at all levels—state, regional and local—must take head on the interconnected relationship between the climate crisis and land use, housing, workforce growth and transportation investments. Fundamental changes in land use planning for the future by local and regional land use agencies and hard questions about existing transportation plans must occur.

4

For example, the Transportation Project List earmarks an astounding \$600,000,000 for the 138 Northwest Corridor Improvement Project to support leapfrog sprawl development like Tejon Ranch Company's proposed Centennial city. Centennial would be located 60 miles away from a major work center (*i.e.*, downtown Los Angeles) so the Project's anticipated 57,000 residents will be forced to drive long distances to reach jobs, schools, and supplies for decades during Project build-out. Centennial alone would generate 75,000 new vehicle trips per day, with an average trip length of 45 miles. The development will also pave over pristine native grasslands rich with endemic and rare species in a mountain lion movement corridor important for statewide genetic connectivity and an area designated as having very high fire hazard severity.

In addition to the 138 Northwest Corridor Improvement Project, there are many projects that involve paving over dirt roads, which could lead to increased traffic that would result in increased greenhouse gas emissions from increasing VMT and significant impact on small animal species since roads with heavy traffic may deter movement from a wide range of small animals (Brehme et al. 2013; Brehme et al. 2018). Transportation projects should focus more on public transit infrastructure and less on widening already large freeways and paving dirt roads, both of which facilitate the use of more cars and increase vehicle miles traveled, commute times, air pollution, and greenhouse gas emissions.

The Transportation Project List allocates many millions of dollars on I-15 expansion projects even while the I-15 continues to be a major barrier to mountain lion and wildlife

movement, and critical wildlife crossings along the I-15 remain unfunded. Instead of further degrading habitat connectivity by expending hundreds of millions of dollars on multi-lane highways in remote areas that will fill up with GHG emitting vehicles, SCAG should prioritize funding for more public transit and adequate wildlife crossings on existing highways. For instance, critical wildlife crossings such as the Liberty Canyon Wildlife Crossing are not yet fully funded. In fact, in the 300-page project list, there is only a *single* listed proposal for a wildlife crossing.

As it stands, the RTP/SCS contains laudable goals regarding sustainable development, reducing VMT, and increasing wildlife connectivity. However, many of the projects on the Transportation Project List will undercut these goals by increasing VMT and exacerbating existing connectivity problems. If SCAG is serious about addressing this region-wide issue, it should work to reallocate funding away from particularly damaging projects and instead allocate funding towards public transit and wildlife connectivity projects.

IV. SCAG Should Aim for Higher Per Capita VMT Reductions

The Center is encouraged by SCAG's goals and guiding principles that focus on supporting more development supported by existing public transit. (RTP/SCS at 8.) However, the Center believes SCAG can and should do more to reduce daily vehicles miles traveled. Increases in VMT negatively impact communities by leading to more vehicle crashes, poorer air quality, increases in chronic diseases associated with reduced physical activity, and worse mental health. Also, as noted above, the natural environment is impacted as higher VMT leads to more collisions with wildlife and fragments habitat. Therefore, any additional step SCAG takes to reduce VMT will have co-benefits of better air quality, decreased chronic disease, decreased wildlife-vehicle collisions, and less habitat fragmentation.

As currently drafted, the RTP/SCS boasts of a 4.1% reduction in VMT per capita from a 2045 baseline and a 9.5% reduction from the base year of 2016. (RTP/SCS at 5, 122.) However, these reductions are far less than reductions in VMT detailed in the December 2018 Technical Advisory issued by the Governor's Office of Planning and Research ("OPR VMT Report"). The OPR VMT Report concluded, "achieving 15 percent lower per capita (residential) or per employee (office) VMT than existing development is both generally achievable and is supported by evidence that connects this level of reduction to the State's emissions goals." (OPR VMT Report at 12.) OPR emphasized that land use decisions to reduce GHG emissions associated with the transportation sector are crucial to meet the state's GHG reductions goals. (*Id.* at 3.) The OPR VMT Report further noted that because California cannot meet its climate goals without curbing single-occupancy vehicle activity, land use patterns and transportation options will need to change to support reductions in VMT. (*Id.* at 10.) Historically regional SCS and RTPs have lead increases in VMT rather than decreasing them as SB 375 intended. While SCAG's RTP/SCS has taken a small step in the right direction, it is not enough, and more fundamental changes are needed. The Center urges SCAG to utilize the RTP/SCS process to set the region on the path reducing its VMT at the level necessary to address the climate crisis and meet the state's GHG reduction goals.

V. The DEIR Fails to Adequately Assess or Mitigate Impacts to Mountain Lions (*Puma concolor*) and Regional Wildlife Connectivity Throughout the SCAG Region

The Center is encouraged to see SCAG acknowledge the importance of wildlife corridors and habitat connectivity by including the preservation, enhancement, and restoration of regional wildlife connectivity (RTP/SCS at 50), avoiding growth in wetlands, wildlife corridors, biodiverse areas, wildfire prone areas and floodplains (RTP/SCS at 55), and drawing attention to greenbelts (RTP/SCS at 55). Mountain lions are a key indicator species of wildlife connectivity. As the last remaining wide-ranging top predator in the region, the ability to move through large swaths of interconnected habitat is vital for genetic connectivity and their long-term survival. In addition, impacts to mountain lions in the SCAG region could have severe ecological consequences; loss of the keystone species would have ripple effects on other plant and animal species, potentially leading to a decrease in biodiversity and diminished overall ecosystem function. Without mountain lions, increased deer populations can overgraze vegetation and cause stream banks to erode (Ripple and Beschta 2006; Ripple and Beschta 2008). Many scavengers, including foxes, raptors, and numerous insects, would lose a reliable food source (Ruth and Elbroch 2014; Barry et al. 2019). Fish, birds, amphibians, reptiles, rare native plants, and butterflies would diminish if this apex predator were lost (Ripple and Beschta 2006; Ripple and Beschta 2008; Ripple et al. 2014).

In light of recent studies regarding imperiled mountain lion populations in Southern California, the DEIR fails to disclose or describe the RTP/SCS's severe impacts on mountain lion populations throughout the SCAG region. CEQA requires a "mandatory finding of significance" if there is substantial evidence in the record that the Project *may* cause a "wildlife population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; substantially reduce the number or restrict the range of an endangered, rare or threatened species" (CEQA Guidelines § 15065(a)(1).) This means that a project is deemed to have a significant impact on the environment as a matter of law if it reduces the habitat of a species, or reduces the number or range of an endangered, rare, or threatened species.³ (See *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 792 fn. 12 [citing *Defend the Bay v. City of Irvine* (2004) 119 Cal.App.4th 1261, 1273–1274].)

There is ample scientific evidence that indicates mountain lion populations in Southern California are imperiled and that human activities and land use planning that does not integrate adequate habitat connectivity can have adverse impacts on mountain lions. Continued habitat loss and fragmentation has led to 10 genetically isolated populations within California. Several populations in Southern California are facing an extinction vortex due to high levels of inbreeding, low genetic diversity, and high human-caused mortality rates from car strikes on roads, depredation kills, rodenticide poisoning, poaching, disease, and increased human-caused wildfires (Ernest et al. 2003; Ernest et al. 2014; Riley et al. 2014; Vickers et al. 2015; Benson et al. 2016; Gustafson et al. 2018; Benson et al. 2019). This is detailed in the Center's petition to

³ On June 25, 2019, the Center and Mountain Lion Foundation submitted a petition pursuant to 14 Cal. Code Regs. § 670.1 to the California Fish and Game Commission requesting the Commission list the Santa Ana mountain lion population and other populations as "endangered" or "threatened" under the California Endangered Species Act.

the California Fish and Game Commission to protect Southern California and Central Coast mountain lions under the California Endangered Species Act (Yap et al. 2019).

Mountain lions in the Santa Monica Mountains and Santa Ana Mountains were found to have dangerously low genetic diversity and effective population size, and they are likely to become extinct within 50 years if gene flow with other mountain lion populations is not improved (Benson et al. 2016; Gustafson et al. 2018; Benson et al. 2019). Due to extreme isolation caused by roads and development, the Santa Monica and Santa Ana mountains populations exhibit high levels of inbreeding, and, with the exception of the endangered Florida panther, have the lowest genetic diversity observed for the species globally (Ernest et al. 2014; Riley et al. 2014; Gustafson et al. 2018; Benson et al. 2019). In addition, Gustafson et al. (2018) found that the nearby mountain lion population in the San Gabriel/San Bernardino Mountains also has low genetic diversity and effective population size, which indicates that they too have a high risk of extinction. The long-term survival of these mountain lions, along with those in the Tehachapi and Sierra Pelona mountains, are vital for statewide genetic connectivity (Gustafson et al. 2018). Improved connectivity among the mountain lion populations within the SCAG Region and beyond is essential for the long-term survival of Southern California mountain lion populations (Gustafson et al. 2017; Gustafson et al. 2018; Benson et al. 2019).

Growth and development in identified “major highway projects” (RTP/SCS at Exhibit 3.2), “transit priority areas” (RTP/SCS at Exhibit 3.7), “priority growth area - high quality transit areas” (RTP/SCS at Exhibit 3.8), and “livable corridors” (RTP/SCS at 3.10) could have severe impacts on Southern California’s already-imperiled mountain lion populations. Such development without addressing wildlife connectivity issues and integrating effective wildlife crossings and corridors could lead to the extirpation of multiple mountain lion populations in the SCAG region. The RTP/SCS should encourage the involvement of wildlife connectivity experts from CDFW and other agencies, organizations, academic institutions, communities, and local groups starting at the initial planning stage of development and transportation projects so that habitat connectivity can be strategically integrated into project design and appropriately considered in the project budget. The RTP/SCS should require highway projects to include adequate wildlife crossing infrastructure in order to reduce impacts to mountain lions and other species.

Project planning should consider the impacts of climate change on wildlife movement and habitat connectivity in the design and implementation of projects and any mitigation. Climate change is increasing stress on species and ecosystems, causing changes in distribution, phenology, physiology, vital rates, genetics, ecosystem structure and processes, and increasing species extinction risk (Warren et al. 2011). A 2016 analysis found that climate-related local extinctions are already widespread and have occurred in hundreds of species, including almost half of the 976 species surveyed (Wiens 2016). A separate study estimated that nearly half of terrestrial non-flying threatened mammals and nearly one-quarter of threatened birds may have already been negatively impacted by climate change in at least part of their distribution (Pacifi et al. 2017). A 2016 meta-analysis reported that climate change is already impacting 82 percent of key ecological processes that form the foundation of healthy ecosystems and on which humans depend for basic needs (Scheffers et al. 2016). Genes are changing, species' physiology and physical features such as body size are changing, species are moving to try to keep pace with

suitable climate space, species are shifting their timing of breeding and migration, and entire ecosystems are under stress (Parmesan and Yohe 2003; Root et al. 2003; Parmesan 2006; Chen et al. 2011; Maclean and Wilson 2011; Warren et al. 2011; Cahill et al. 2012).

6

VI. Conclusion

Thank you for the opportunity to submit comments on the DEIR and RTP/SCS for Connect SoCal. We look forward to working with SCAG to foster land use policy and growth patterns that promote wildlife movement and habitat connectivity, facilitate public health and safety, and move towards the State’s climate change goals. Please do not hesitate to contact the Center with any questions at the number or email listed below.

SUBJECT: DRAFT 2020 RTP/SCS “CONNNECT SOCIAL” PEIR COMMENTS

Dear Mr. Ok:

The Center for Demographic Research has reviewed the Draft 2020 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS, “Connect SoCal”) PEIR. We recognize and appreciate the work SCAG staff has done to produce these reports and work with local agencies during the development process and for the continued cooperation and reception of initial feedback and draft comments discussion.

1

We also want to extend our thanks for the close coordination between SCAG and the Center for Demographic Research (CDR) at California State University, Fullerton on behalf of Orange County jurisdictions to ensure that the 2020 RTP/SCS and PEIR preferred alternative’s growth forecast accurately reflects all entitlements, development agreements, projects recently completed, and projects under construction.

The CDR would like to express support of comments and recommendations on the Draft 2020 RTP/SCS PEIR by the Orange County Council of Governments, the Orange County Transportation Authority, and other Orange County agencies whose comments support Connect SoCal with its use of the Orange County’s growth forecast, the 2018 Orange County Projections. We thank you for the opportunity and ask for your consideration and response to the following comments detailed comments in Table 1 below. If you have any questions, please do not hesitate to contact me at ddiep@fullerton.edu or 657-278-4596.

2

Sincerely,

Deborah S. Diep
Director, Center for Demographic Research

#	TOPIC	PAGE	RTP NARRATIVE, COMMENT & RECOMMENDATION
---	-------	------	---

#	TOPIC	PAGE	RTP NARRATIVE, COMMENT & RECOMMENDATION	
1	Define	Glossary, all pages	The PEIR only includes a glossary of acronyms. Please define the following terms and add to the glossary: Orientation timing, p. 1.0-13 Development centers Livable corridors p. 3.11-43 Neighborhood mobility areas p. 3.11-43 Urban infill p. 3.11-45 Compact/walkable (communities) p. 3.11-45 Destinations, p. 3.14-21 Mobility options, p. 3.14-21 Large-lot single-family, p. 3.14-23 Small-lot single-family, p. 3.14-23 ROW, p. 3.14-25	3
2	General Comment	All tables and figures	All tables and figures should cite original source data and not reference previous SCAG RTP documents.	4
3	General Comment	All data, tables and figures	All references to data that is interpolated, e.g., interpolating 2019 estimates from 2016-2020 or 2016-2045 growth increments, should be annotated as such. Each column/row in tables, as applicable, should be annotated to indicate if data was interpolated.	5
4	Clarification	ES-8, paragraph 2	“The region’s transportation network comprises more than 9,000 miles of public transit, 5,000 miles of bikeways, 135,578 lane miles of roadways, and 94 miles of express lanes.” Please clarify if ‘lane miles’ include highways and freeways.	6
5	Clarification	ES-9, paragraph 2	“There are many contributors to the overall housing shortfall, such as <u>state regulations</u> , zoning, costs and fees that prevent projects from... Additionally, population and employment growth in metropolitan areas in California has slowed in recent years, <u>in part</u> , because wages cannot compensate for the high cost of housing.”	7
6	Clarification	ES-9, paragraph 3	“Since the Plan <u>envisions</u> foresees regional growth with transportation system improvements, it identifies strategies to ...”	8
7	Clarification	ES-10, bullet 3	“Establish a mileage-based user fee <u>to replace the gas tax and to</u> generate a funding source for aging infrastructure and construction of other travel options”	9
8	Clarification	Table ES-5 p. 2.0-26	“PMM BIO-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to threatened and endangered species, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	10
9	Clarification	Table ES-5 p. 2.0-27	“PMM BIO-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to riparian habitats and other sensitive natural communities, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	11
10	Clarification	Table ES-5 p. 2.0-29	“PMM BIO-3: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to wetlands, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	12

#	TOPIC	PAGE	RTP NARRATIVE, COMMENT & RECOMMENDATION	
11	Clarification	Table ES-5 p. 2.0-30	“PMM BIO-4: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to wildlife movement, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	13
12	Clarification	Table ES-5 p. 2.0-32	“PMM BIO-5: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce conflicts with local policies and ordinances protecting biological resources, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	14
13	Clarification	Table ES-5 p. 2.0-33	“PMM BIO-6: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects on HCPs and NCCPs, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	15
14	Clarification	Table ES-5 p. 2.0-34	“PMM CULT-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to historical resources, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	16
15	Clarification	Table ES-5 p. 2.0-36	“PMM CULT-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to human remains, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	17
16	Clarification	Table ES-5 p. 2.0-37	“PMM-GEO-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to historical resources, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	18
17	Clarification	Table ES-5 p. 2.0-39	“PMM-GEO-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to paleontological resources, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	19
18	Clarification	Table ES-5 p. 2.0-39	“PMM-GHG-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to greenhouse gas emissions, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	20
19	Clarification	Table ES-5 p. 2.0-57	“PMM-NOISE-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	21

#	TOPIC	PAGE	RTP NARRATIVE, COMMENT & RECOMMENDATION	
20	Clarification	Table ES-5 p. 2.0-64	“PMM-TRA-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to transportation-related impacts, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	22
21	Clarification	Table ES-5 p. 2.0-66	“PMM TCR-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects on tribal cultural resources, <u>where applicable and feasible</u> . Such measures may include the following or other comparable measures identified by the Lead Agency:”	23
22	Clarification	1.0-4, paragraph 3	“... Responsible for regional policy direction and review, standing committees at SCAG include the Executive/Administration Committee, the Transportation Committee, the Community, Economic & Human Development Committee, the Energy & Environmental Committee, and Legislative/Communication & Membership Committee. In addition to the standing committees, there are various subcommittees, technical advisory committees, working groups, and task forces that report to the standing committees...” All these subcommittees do not report directly to the policy/standing committees. Please clarify the hierarchy of which committees/groups report to whom, e.g., working groups to staff, RHNA subcommittee to CEHD, etc., by listing all the committees and who they report to.	24
23	Clarification	1.0-12, paragraph 2	“...For purposes of the PEIR, 2019 data has been estimated based on an interpolation of 2016 to 2045 projections. Available data that differs from this generalized explanation and used to determine existing conditions is specified in each resource section in Section 3.0 of this document.” All references to data that is interpolated, e.g., interpolating 2019 estimates from 2016-2020 or 2016-2045 growth increments, should be annotated as such. Please provide more information in the document, appendix or separate memo regarding how data was interpolated if various methods and sources were used.	25
24	Define	1.0-13, paragraph 3	“...However, because locations, densities, orientation timing, and...” Define ‘orientation timing’	26
25	Clarification	1.0-13, paragraph 3	“Intensified Land Use Alternative ... This alternative analyzes more aggressive densities and land use patterns than included in the Accelerated Tomorrow Scenario... It also includes a greater progressive job-housing distribution optimized for TODs and infill in HQTAs.” Explain ‘Accelerated Tomorrow Scenario’ and ‘greater progressive job-housing distribution’.	27
26	Clarification	3.11-3, paragraph 5	“Regional Housing Needs Assessment (RHNA): Regional Housing Needs Assessment — <u>Legislatively-mandated state program that quantifies</u> Quantifies the need for housing within each jurisdiction of the SCAG region based on population growth projections. Jurisdictions <u>Communities</u> then address this need through the process of <u>updating</u> completing the housing elements of their General Plans.”	28
27	Correction	3.11-5, paragraph 4	“...El Centro Naval Air Facility, Fort Irwin, <u>Joint Forces Training Base- Los Alamitos</u> , Los Angeles Air Force Base...”	29
28	Clarification	3.11-11, paragraph 4	“...In addition to the standing committees, there are various subcommittees, technical advisory committees, working groups, and task forces that report to the standing committees...” All these subcommittees do not report directly to the policy/standing committees. Please clarify the hierarchy of which committees/groups report to whom, e.g., working groups to staff, RHNA subcommittee to CEHD, etc., by listing all the committees and who they report to.	30

#	TOPIC	PAGE	RTP NARRATIVE, COMMENT & RECOMMENDATION	
29	Clarification	3.11-12, paragraph 1	<p>“City and county general plans must be consistent with each other.” This statement is not accurate. Delete.</p>	31
30	Clarification	3.11-15, paragraph 5	<p><u>“Multi-Family Residential (Attached units)</u> The term ‘multi-family units’ is used to describe those housing units that <u>Multi-family units</u> are attached residences. This includes apartments, condominiums, and townhouses, <u>even if townhomes are typically categorized as single-family units.</u> SCAG refers to housing in the RTP & PEIR as single-family and multi-family, while in practice, SCAG classifies units into two categories: single-family detached and all other units, which is generically referred to as ‘multi-family’.</p>	32
31	Clarification	3.11-20, paragraph 2	<p>“...In yet other instances, lands may be designated or zoned as open space <u>or as agriculture</u> but still allow for development of a single-family home.”</p>	33
32	Clarification	3.11-22, paragraph 2	<p>“Each local jurisdictional authority (city or county) with lands within the coastal zone is required to develop...” Include how far inland is considered to be in the coastal zone.</p>	34
33	Clarification	3.11-32, paragraph 1	<p>“Regional Housing Needs Assessment ...The California Department of Housing and Community Development (HCD), in consultation with each council of governments, determines each region’s existing and projected housing need.³⁵ HCD must meet and consult with each council of governments, including SCAG, regarding the assumptions and methodology to be used by HCD to determine the region’s housing need.³⁶ HCD’s determination is based on population projected produced by the Department of Finance and regional population forecasts used in preparing regional transportation plans.³⁷ <u>SB 375 requires the determination to be based upon population projections by the Department of Finance and regional population forecasts used in preparing the regional transportation plan. If the total regional population forecasted and used in the regional transportation plan is within a range of 1.5 percent of the regional population forecast completed by the Department of Finance for the same planning period, then the population forecast developed by the regional agency and used in the regional transportation plan shall be the basis for the determination. If the difference is greater than 1.5 percent, then the two agencies shall meet to discuss variances in methodology and seek agreement on a population projection for the region to use as the basis for the RHNA determination. If no agreement is reached, then the basis for the RHNA determination shall be the regional population projection created by the Department of Finance. Though SCAG’s total regional population projections from the regional transportation plan were within 1.5 percent of the Department of Finance projections, HCD rejected the use of SCAG’s population projections.”</u></p>	35
34	Clarification	3.11-32, paragraph 4	<p>“The purpose of the housing element is to identify the community’s housing needs, <u>as determined by the RHNA process,</u> state the community’s goals and objectives with regard to housing production, rehabilitation, and conservation to meet those needs.”</p>	36
35	Clarification	3.11-33, paragraph 3	<p>“...If the total regional population forecasted and used in the regional transportation plan is within a range of three 1.5 percent of the regional population forecast completed by the Department of Finance for the same planning period, then the population forecast developed by the regional agency and used in the regional transportation plan shall be the basis for the determination...If no agreement is reached, then the basis for the RHNA determination shall be the regional population projection created by the Department of Finance. <u>Though SCAG’s total regional population projections from the regional transportation plan were within 1.5 percent of the Department of Finance projections, HCD rejected the use of SCAG’s population projections.”</u></p>	37

#	TOPIC	PAGE	RTP NARRATIVE, COMMENT & RECOMMENDATION	
36	Clarification	p. 3.11-43, paragraph 2	“...Land use strategies included in the Plan aim to <u>redistribute focus</u> most of the new housing and job growth into high-quality transit areas (HQTAs), with 60 percent of new homes and 73 percent of new jobs being located in these Priority Growth Areas (PGAs), which include existing main streets, downtowns, and commercial corridors. Land use strategies also seek to <u>concentrate focus</u> growth in other PGAs, such as...”	38
37	Clarification	p. 3.11-45, paragraph 2	“In addition, it is possible that many general plans do not include similar regional policies as they are focused on land uses within the local jurisdiction.” What are the regional policies referred to?	39
38	Clarification	p. 3.11-45, paragraph 2	“For example, while the Plan includes strategies for compact development and higher densities as a means to accommodate increased population in an efficient manner, many jurisdictions are planning for smaller individual numbers and may assume <u>smaller lower</u> densities.” What are ‘smaller individual numbers’?	40
39	Clarification	p. 3.11-45, paragraph 2	“It is possible that local general plans have not been updated to reflect the land use assumptions within the Plan, <u>because jurisdictions do not have to change their general plans to be consistent with the SCS despite SCAG’s outreach and bottom up planning process for the reasons stated above.</u> As a result, there exists the potential for <u>SCAG’s projected land use pattern to conflict with</u> a local general plan <u>to conflict with SCAG’s projected land use pattern.</u> ”	41
40	Clarification	p. 3.11-45, paragraph 4	“As previously discussed, there are areas subject to general plans that would be impacted by transportation projects.” Are there areas not subject to general plans?	42
41	Clarification	3.14-1, paragraph 4	“Household: A household consists of all the people who occupy a housing unit. A household includes the related family members and all the unrelated people, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated people sharing a housing unit, such as partners or roomers, is also counted as a household. <u>There is no more than one household per housing unit.</u> ”	43
42	Clarification	3.14-1, paragraph 6	“Housing: As used in this analysis, housing is data available from the U.S. Census for the SCAG region for the period of 2000 through 2035. Housing is a general term used to describe multiple housing units.” Clarify years of data used and add DOF as a source.	44
43	Clarification	3.14-1, paragraph 7	“Housing Unit: A house, an apartment or other group of rooms, or a single room are regarded as housing units when occupied or intended for occupancy as separate living quarters. Different jurisdictions have slightly different definitions of what constitutes a housing unit.” Explain why jurisdictions may have different housing unit definitions.	45
44	Clarification	3.14-2, paragraph 3	“The six-county SCAG region encompasses 38,000 square miles in area (almost 25 million acres) and is home to approximately 19 million people as of 2019, making it the second most populous metropolitan region in the U.S. ^{1 1} American FactFinder. 2017. <i>2017 Population Estimates</i> . Latest data available for the U.S. is for 2018. Please update text and citation.	46
45	Clarification	3.14-3, Table 3.14-1	Correct source citations to U.S. Census Bureau Decennial Census 2000 and 2010. Cite original source of 2019 data as DOF or SCAG’s interpolated data as appropriate. SCAG Local Profiles contain 2018 data from DOF and 2017 from Census ACS due to the timing of publication of document and prior release of source data.	47

#	TOPIC	PAGE	RTP NARRATIVE, COMMENT & RECOMMENDATION	
46	Clarification	3.14-4, top sentence	At a fundamental level, there is simply not enough housing for everyone who wants to live in the state <u>in the type of housing unit they can afford in the jurisdiction they prefer.</u>	48
47	Clarification	3.14-4, Table 3.14-2	Correct source citations to U.S. Census Bureau Decennial Census 2010 and 2019 data as DOF or SCAG’s interpolated data as appropriate.	49
48	Clarification	3.14-4, paragraph 3 Household Income	Data reported is from 2017 ACS and for whole counties, not just the incorporated cities within each county. Update text accordingly. Correct data to 2018 American Community Survey data and cite accordingly.	50
49	Clarification	3.14-4 & 5, paragraph 4 Household Size; Table 3.14-3	Data reported is from State DOF. Cite original data source, not SCAG past documents. Update data to most recent E-5 DOF 2019 estimates for all jurisdictions, not just incorporated cities.	51
50	Clarification	3.14-6, Table 3.14-4	Verify data and cite original data source, not SCAG past documents.	52
51	Clarification	3.14-7, Tables 3.14-5 & 6	Verify data and cite original data source, not SCAG past documents. Data is likely from State EDD if for wage & salary only. If these estimates are for total employment, including both wage & salary and self-employment, state this in a table note. If 2019 data is interpolated, indicate this in notes.	53
52	Clarification	3.14-8, Table 3.14-7	Verify data and cite original data source, not SCAG past documents. Source is likely State EDD for 2000.	54
53	Clarification	3.14-8 & 9	“...the following guiding principles approved by SCAG’s Regional Council on August 1, 2019.” RC agenda did not have these as an action item. Update guiding principles to current.	55
54	Clarification	3.14-13, paragraph 3	“Regional Housing Needs Assessment ... HCD’s determination is based on population projected produced by the Department of Finance and regional population forecasts used in preparing regional transportation plans. ¹⁵ <u>SB 375 requires the determination to be based upon population projections by the Department of Finance and regional population forecasts used in preparing the regional transportation plan. If the total regional population forecasted and used in the regional transportation plan is within a range of 1.5 percent of the regional population forecast completed by the Department of Finance for the same planning period, then the population forecast developed by the regional agency and used in the regional transportation plan shall be the basis for the determination. If the difference is greater than 1.5 percent, then the two agencies shall meet to discuss variances in methodology and seek agreement on a population projection for the region to use as the basis for the RHNA determination. If no agreement is reached, then the basis for the RHNA determination shall be the regional population projection created by the Department of Finance. Though SCAG’s total regional population projections from the regional transportation plan were within 1.5 percent of the Department of Finance projections, HCD rejected the use of SCAG’s population projections.</u> ”	56
55	Clarification	3.14-20, paragraph 6	“...SCAG holds growth projection numbers constant at the <u>jurisdiction</u> , county and regional level, meaning that as the distribution of population, housing and employment changes, the total numbers remain constant.”	57
56	Clarification	3.14-23, paragraph 3	“...Specifically, improved accessibility and connectivity potentially gained from transportation investments in the Plan could facilitate population and economic growth in areas of the region that are currently not developed or <u>are underdeveloped and in areas not currently planned for the type of density the Plan proposes.</u> ”	58

#	TOPIC	PAGE	RTP NARRATIVE, COMMENT & RECOMMENDATION
57	Clarification	3.14-27, paragraph 2	“...The Plan includes land use strategies that would redistribute <u>target</u> the region’s growth in the next 25 years into HQTAs, urban areas, and more walkable, mixed-use communities. Supported by other public amenities and transit services, housing in these areas tends to cost more <u>command higher</u> premiums and may be attractive to more affluent residents and unaffordable for <u>to</u> current residents in these areas.”

Re: PEIS – Chapter 3.8 on Greenhouse Gases

Dear Mr. Ok:

Climate Resolve is pleased to submit the following comments on the Draft Connect SoCal PEIS.

Overall, there are many excellent sections within the draft. However, we wish, below, to provide both general and detailed comments to make the PEIS more contemporary and more relevant to the SCAG region.

1

Among the larger issues, we believe it insufficient and unhelpful to still use 2012 GHG emission data in 2020. We suggest that SCAG blend-in CARB data to present a more contemporary picture on emissions, specifically, the region’s sharp rise in transportation emissions.

2

Another major weakness is the sub-chapter on public health. We think it needs a lot of work, and have made suggestions below on where to find relevant data.

3

In its table of member municipalities, SCAG may wish to add an assessment of compliance with SB 379, SB 1000 and LHMPs. Climate Resolve has this data for each and every municipality within the SCAG region and would be happy to share.

4

Last, SCAG needs to state up-front the State of California’s current position on GHG reductions – namely that EO B-55-18 commits the state to carbon neutrality by 2045. The Newsom Administration is continuing the Brown Administration’s approach – and we see no reason to believe that this policy will be the operational policy of the state going forward.

5

On specific content within the chapter:

Page 3.8-1:

- Paragraph 2:
o “Nitrous Oxide NO2” change to “N2O”
• Paragraph 3:

6

- o "... atmosphere are thought to be linked" should be change to "are linked".
"Thought to be linked" sounds equivocal, as if scientists remain uncertain. The science is clear, and SCAG should state it as such.

7

Page 3.8-2:

- Change Nitrous Oxide abbreviation to "N2O"

8

Page 3.8-3:

- Change Nitrous Oxide abbreviation to "N2O"

9

Page 3.8-5:

- Paragraph 1:
 - o The caveating language about the range of climate impacts is absurd and needs to be changed. There is no serious debate on whether GHGs "have caused" or "will cause" climate change. The leading uncertainty concerns the rate of GHG emissions, not whether science can accurately predict impacts.
 - o Therefore, we suggest that SCAG remove the word "significant" in "there continues to be significant debate over the extent..."
 - o And remove the caveating language whether GHG has caused or "will cause" climate change?.
- Paragraph 2:
 - o Add "longwave" to "GHGs are any gas that absorbs **longwave** radiation in the atmosphere"
 - o We noticed a curious absence of referring to peer-reviewed climate studies that cover the SCAG region, especially Cal-Adapt, as well as the State of California Fourth Climate Change Assessment and two regional studies covering the Los Angeles Region and Inland South, see <http://climateassessment.ca.gov/> and <https://cal-adapt.org/>.

10

Page 3.8-6:

- We noticed the authors using global data on glacier loss, we suggest that SCAG also cite California specific glacier loss information from the 2018 OEHHA climate indicators report: <https://oehha.ca.gov/climate-change/document/indicators-climate-change-california>; and cite the same report for migration of species (aka refugia).
- For reference 10, on snowmelt rates, we noticed that SCAG uses an old 2006 datapoint. We suggest updating your data by citing either the California 4th Climate Change Assessment or Schwartz, Hall, et al "Significant and Inevitable End-of-Twenty-First-Century Advances in Surface Runoff Timing in California's Sierra Nevada" from 2017, <https://journals.ametsoc.org/doi/pdf/10.1175/JHM-D-16-0257.1>.

11

Page 3.8-8:

- Paragraph 1: change "from" to "by" in "this would further exacerbate hazard posed from dead trees.
- Paragraph 2: please reference the groundbreaking wildfire study by Jin, Randerson, Hall, et al as it focuses on the Southern California / SCAG Region: "Identification of two distinct fire

12

regimes in Southern California: implications for economic impact and future change," <https://iopscience.iop.org/article/10.1088/1748-9326/10/9/094005>

- Paragraph 3: in the SCAG region is the US’s leading research institution on acidification and hypoxia, the Southern California Coastal Water Research Project, located in Costa Mesa. In fact, SCCWRP’s director co-chairs the West Coast Ocean Acidification & Hypoxia Science Panel. We suggest referencing their reports: <http://westcoastoah.org/westcoastpanel/>.

12

Page 3.8-9:

- Paragraph 1: It is curious why SCAG does not cite regionally-specific studies related to flood events. The Bureau of Reclamation has produced three studies that generally cover the SCAG territory. The LA Basin Study, <https://www.usbr.gov/lc/socal/basinstudies/LABasin.html>, the Santa Ana Watershed Basin Study: <https://www.usbr.gov/lc/socal/basinstudies/OWOW.html>, and the Southeast California Regional Basin Study: <https://www.usbr.gov/lc/socal/basinstudies/SECA.html>. We suggest referencing these important locally-focused studies.

13

Page 3.8-11:

- First and preceding paragraph and Table 3.8-2: The text and table showing China’s current lead in GHG emissions is curiously both accurate and misleading. It is misleading in that a single year does not yield the full view of GHG emissions. (How to calculate GHG emissions is one of the most contentious issues at the United Nations.) We believe it is only fair to also include data and charts/graphs associated with cumulative GHG emissions. The World Resources Institute — a source used by SCAG in other sections — suggests that from 1850-2011 the United States and Western Europe have together contributed over 50% of global GHG emissions. See <https://www.wri.org/blog/2014/11/6-graphs-explain-world-s-top-10-emitters>. We see it as important to view GHG emissions both ways — describing present day data as well as cumulative emissions. Related idea, SCAG may wish to further analyze China’s GHG emissions, as well as other developing countries’ emissions, related to embedded carbon, especially those materials being produced for export to developed nations — which could be as high as 25% of all emissions; see National Academy of Sciences: <https://www.pnas.org/content/early/2010/02/23/0906974107.abstract>.

14

Page 3.8-12 and 3.8-13:

- Table 3.8-3: Please explain why SCAG is not using California Air Resources Board inventory data in the table. It would be helpful to show discrepancies between IPCC assumptions and CARB data, especially important because CARB demonstrates that California’s transportation emissions are higher than what IPCC suggests.

15

Page 3.8-14:

- Paragraph 2: It is insufficient and unhelpful to still use 2012 data in 2020. We suggest SCAG use statewide CARB data to present a more contemporary picture on emissions, specifically, the region’s sharp rise in transportation emissions.

16

Page 3.8-15:

- Has SCAG evaluated black carbon contributions to local GHG emissions? This is especially important as there has been a steep rise in port activity since 2012, which also suggests an

17

increase in diesel use along with associated black carbon emissions. Please consult with South Coast AQMD.

17

Page 3.8-16:

- The public health section is paltry and insufficient. The section needs to be greatly enhanced. SCAG may reference any number of relevant studies ranging from CALBRACE reports, <https://www.cdph.ca.gov/Programs/OHE/Pages/CalBRACE.aspx>, especially those created for individual counties: <https://www.cdph.ca.gov/Programs/OHE/Pages/ClimateHealthProfileReports.aspx>. There is also the County of Los Angeles OurCounty sustainability plan, the California 4th Climate Change Assessment, especially its CHAT tool (which can be used for determining heat impacts on human health): <https://www.cal-heat.org/>
- End of page, second to last bullet: please edit to add “no carbon” option to “low carbon” as well.

18

Page 3.8-17:

- Add to bullets: “transitioning from use of flurochlorines in industry”
- The seven strategies recommended are paltry and insufficient. There are easily hundreds of interesting relevant strategies that SCAG member cities and COGs could deploy. We strongly suggest adding at least 15 more adaptation strategies. (In our view, SCAG should also highlight social resilience or social cohesion, as a key strategy. Cool streets and parking lots should also be highlighted — as should investment in resilience hubs and enhancing emergency management communications.) A quick survey of Safeguarding California will provide additional strategies. See <http://resources.ca.gov/docs/climate/safeguarding/update2018/safeguarding-california-plan-2018-update.pdf>
- Last Paragraph: add Local Hazard Mitigation Plans (LHMPs) to “these actions take the form of climate action plans, general plan policies, **Local Hazard Mitigation Plans (LHMPs)**, GHG reduction plans, sustainability plans, and ordinances.”

19

Page 3.8-27:

- **3.8.2.3 State**
 - Add discussion on LHMPs, SB379, SB1035, and SB1000

20

Page 3.8-49:

- **Cities:** add COGs Climate Action / Climate Adaptation Plans
 - (e.g., South Bay Cities’ 2019 COG Climate Adaptation Plan http://southbaycities.org/sites/default/files/documents/FinalSubRegionalAdaptationPlan_Sep_2019.pdf)

21

Page 3.8-51:

- Table 3.8-4:
 - The City of Lakewood has not adopted a Climate Action Plan, please change.
 - Most of these links are to the municipalities’ website **and not individual plan**
 - Suggestion: Hyperlink to each plan where adopted

22

- Include separate columns for GHG reduction policies and climate change adaptation strategies in general plans, to get a better sense of how well their General Plan addresses climate change. There are columns "Adaptation or Resilience Plan", but some cities choose to detail their adaptation plans within their General Plan.
- SCAG may wish to add an assessment of compliance with SB 379, SB 1000 and LHMPs. Climate Resolve has this data for each and every municipality within the SCAG region and would be happy to share.

22

Page 3.8-63:

- For both tables, "NO2" change to "N2O"

23

If you have any questions related to our comments on the PEIS, please do not hesitate to

Sincerely,

Jonathan Parfrey
Executive Director

24

p.s. I also wish to thank Kristopher Eclarino (Climate Resolve Fellow) for his contributions to the letter.

Daniel Burruel – Keep Nuevo Rural

All opened space, conservation areas should be connected creating a corridor for wildlife. For example, the El Potrero and the San Jacinto Wildlife Area must link together without any interruption of mass development, freeways, and so on, in between these open spaces. Green belts should run straight through cities; green threads of open spaces that run directly through the city of Perris, for example, must be promoted and adopted as models of open spaced systems to help promote a healthy community/city (Clive Greenbelt in Illinois, for example). The proposed project of warehouse development should be halted and open spaces, for example, in the rural, unincorporated community of Nuevo, and south of Ramona Expressway, along the banks of the San Jacinto River, should remain a vast open space. If SCAG is truly committed to embracing and advancing healthy communities, then proposed plans, such as SP 239 (Stoneridge Commerce Center), then proposed plans like this one should be completely abandoned. Thank you.

RE: COMMENTS ON DRAFT PEIR 2020 SCAG RTP/SCS (SCH # 20199011061)

Dear Mr. Ok:

UNITE HERE Local 11 hereby provides these comments on the draft Program Environmental Impact Report (“PEIR”) for the draft 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy plan (“Plan” or “2020 RTP/SCS”), by the Southern California Association of Governments (“SCAG”) under the California Environmental Quality Act, Pub. Res. Code § 21000 *et seq.* (“CEQA”).

Local 11 represents more than 25,000 workers employed in hotels, restaurants, airports, sports arenas, and convention centers throughout Southern California and Phoenix, Arizona. Members of Local 11, including hundreds who live or work in the SCAG region, join together to fight for improved living standards and working conditions. Local 11’s members have a direct interest in seeing that the State’s environmental/planning laws are being followed and that new development and regional planning efforts do not contribute to the climate-change crisis that threatens a loveable future in Southern California for them and their children.

1

Here, one of the fundamental objectives of the 2020 RTP/SCS and PEIR is to provide *specific* strategies, policies, performance standards, and other provisions that *will* reduce greenhouse gas (“GHG”) emissions pursuant to Senate Bill 375 (“SB 375”). To this end, Local 11 provides the following questions and requests for information about the Plan’s specific GHG strategies that need to be included in a recirculated or final PEIR.

2

- A. Under the Plan, GHG per capita emissions from automobile and light-duty vehicles (“LDA”) are anticipated to drop from 23.8 lbs/day (2005) to 21.3 lbs/day in 2020, and further reduced to 18.8 lbs/day in 2035 (see PEIR, Tbl. 3.8-10). Please clarify the following:

3

- 1. How were these targets developed, what data was used, and what are the exact underlying calculations? What are the specific data and targets for each city and county within the SCAG region? 3
- 2. Are these targets for all project types or specific project types (e.g., residential, office, retail, hotel, mixed-use, etc.)? 4
- 3. Is the *capita* merely residents, residents + employees, or something else? 5
- 4. What is the trajectory of these GHG reductions over the duration of the Plan? Are there specific targets during the interim years between 2020-2035, or merely a straight-line negative compound annual growth rate? 6
- 5. Why are 2005 baseline emissions calculated based on EMFAC2007, but 2020 and 2035 levels based on EMFAC2014? 7

- B. Under the Plan, per capita Vehicles Miles Traveled (“VMT”) from LDAs and all vehicles are to be reduced from 22.09 VMT and 23.79 in 2009 (respectively) to 20.67 and 22.89 in 2045 (respectively) (see PEIR, Tbl. 3.8-11). Please clarify the following: 8
 - 1. How were these VMT targets developed, what data was used, and what were the exact calculations? What are the specific data and VMT targets for each city and county within the SCAG region? 9
 - 2. Are these VMT targets for all project types or specific project types (e.g., residential, office, retail, hotel, mixed-use, etc.)? 10
 - 3. What is the trajectory of these VMT reductions? Are there specific targets during the interim years between 2020-2035, or merely a straight-line negative compound annual growth rate? 11
 - 4. Clarify whether these VMTs are from just the residential population or also employees? 12
 - 5. What data/metrics are specific to employee trips? 13
 - 6. What are the VMT projections for the residential and employee populations, as well as the disaggregated data for the various cities and counties within the SCAG region? 13

- C. Under the Plan, various Plan goals are tied to key specific performance standards (see Plan, Performance Measures Report, Tbls. 1, 2, 4, 20). However, many of the standards are not made clear and require clarity, including: 14
 - 1. For Outcome 1(1) (id. pp. 15-16), what is the disaggregated data (e.g., what are the household/employment figures for each city and county within the SCAG region in 2016 and 2045 under both “Baseline scenario” and under the Plan scenario)? 14
 - 2. For Outcome 1(4) (id. p. 16), what is the disaggregated data (e.g., 2016 base year and Connect SoCal VMT levels for each city, and what is the interim targets between those years)?
 - 3. For Outcome 1(5) through (7) and Outcome 2 (1) through (6) (id. pp. 18-28), what is the disaggregated data (e.g., counties and cities), how were

these calculated/modeled, and how are projects able to demonstrate consistency with these performance metrics?

- 4. For all performance measures under Location Efficiency and Safety and Public Health (id. at pp. 56-58 [Tbl. 20]), what is the disaggregated data (e.g., counties and cities), how were these calculated/modeled, and how are projects able to demonstrate consistency with these performance metrics?

14

- D. Under the Plan, four measures are listed as SCAG mitigation measures (e.g., SCAG “shall continue to work with” local agencies to adopt Climate Action Plans (“CAP(s)”), “shall encourage energy efficient design” through strengthening local building codes, “shall continue working with partners” to support deployment of electric vehicle (“EV”) charging stations, “shall continue to pursue partnerships” to promote energy-efficient development) (see PEIR, p. 3.8-68). Please clarify the following:

15

- 1. What exactly do “work” or “encourage” or “working with” or “pursue” mean, and are these enforceable performance standards as CEQA requires?
- 2. What specifically is required to satisfy these vague mitigation measures?
- 3. What specific criteria can one objectively look at to determine compliance with these mitigation measures?
- 4. What specific performance-based criteria apply to these non-specific mitigation measures?
- 5. Why is there no consideration of specific actions listed (e.g., work with local agencies to develop CAPs that meet specific GHG reduction targets, or encourage local building code updates that require mandatory CalGreen Tier 1 or Tier 2 standards, or work with partners/agencies to support specific percentage of code-required parking to be EV-immediate charging, etc.)?
- 6. What other SCAG-related mitigation was considered and found infeasible?

16

17

18

19

20

21

- E. Under the Plan’s Sustainable Communities Strategy Report, Appendix 1 (i.e., SPM Place Types), no mention is given as to hotel project types. Please explain how hotels are accounted for in the Plan, also the assumptions, intensification, traffic generation, GHG generation, and other relevant data specific to hotel uses/projects.

22

Local 11 appreciates the opportunity to provide these comments to SCAG, and looks forward to a detailed response item by item with all requested supporting data. Please also provide us with all notices of CEQA actions or public hearings on the Plan/PEIR. Please send notice by e-mail to: yzeltser@unitehere11.org.

23

Sincerely, 

Charles Du
Staff Attorney, UNITE HERE Local 11

and by electronic mail to: 2020PEIR@scag.ca.gov

Re: Comments on the the Draft “Connect SoCal” (SCAG’s 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy) and the Related Draft Program Environmental Impact Report (PEIR).

Ladies and Gentlemen:

On behalf of the Southern California Leadership Council (SCLC), the Building Industry Association of Southern California (BIASC) and the other business/industry associations subscribing to this letter, we appreciate this opportunity to comment on the Draft 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (“Connect SoCal”) and its associated Program Environmental Impact Report (draft “PEIR”). Our comments set forth below relate to both the draft policy document (i.e., the draft Connect SoCal) and the related

draft PEIR because our concerns about each are inextricably related. We therefore respectfully ask SCAG to consider our comments below in the context of both SCAG's policy determinations and its compliance with the California Environmental Quality Act ("CEQA"), the discussion of which begins on page 12 hereof.

1

Our organizations, and the members and industries that they represent, have been involved with the implementation of Senate Bill 375 (2008) (hereinafter "SB 375") ever since its original introduction. As Southern California stakeholders, we were also highly attentive to and involved in the formulation and adoption by the Southern California Association of Governments ("SCAG") of its inaugural, 2012 regional transportation plan/sustainable communities strategy ("RTP/SCS") and its more recent 2016 RTP/SCS. Indeed, we have been heavily involved with SCAG's activities for the entire last decade.

The companies and individuals comprising our collective memberships care very deeply about economic development, job creation and the quality of life in Southern California. Many of our members engage in developing the housing, business properties and infrastructure (i.e. transportation, water, utilities, etc.) that are and will be needed to make the region the best possible place to live and work. Collectively, our organizations also include some of Southern California's largest private employers. With that in mind, the comments set forth below about SCAG's draft Connect SoCal and the related draft PEIR are based on our concern for the overall betterment of the SCAG region, its economy, its communities, and its citizens.

2

When we weighed in concerning SCAG's 2012 RTP/SCS, its 2016 RTP/SCS, and recently in February 2019 concerning the scoping of the PEIR Connect SoCal, our group has consistently espoused principles concerning SCAG's regional planning efforts; and we've always championed consistent policy outcomes. Even more recently, in September 2019, our coalition commented to SCAG concerning its then-proposed allocation of a preliminary sixth-cycle Regional Housing Needs Assessment (RHNA) for the SCAG region. When we did so, we recounted both the principles that we espouse and the societal and economic outcomes that we champion. We will also set them forth again below as they relate to the present context.

But before getting into such details, we will state here briefly our overall view of the draft Connect SoCal and its draft PEIR:

Insofar as the draft Connect SoCal relates to the distribution of new housing and purports to accommodate housing production, we believe that it takes large steps leading in the wrong direction. Our region is suffering from an urgent and worsening housing crisis, one which can be solved only through extraordinary increases in housing production and consequent improvements in housing affordability. Yet, if adopted as it is drafted, Connect SoCal will foreseeably combine with SCAG's most recently vetted sixth-cycle RNHA allocation to channel the majority of the region's future homebuilding overwhelmingly into already developed, densely urbanized areas. When combined, they largely aim for the near-total preclusion of other types of reasonable and appropriate community development (specifically suburban, annexed edge, greenfield and new town development). This is a dangerous policy prescription for any region that is suffering from a critical housing crisis, because it depends almost entirely on realizing – without precedent –

3

massive production of the type of new housing that both is the hardest to produce and costs the most.

We recognize that SCAG's rationale for its heavy emphasis on infill is caused by increasingly imposing state mandates to reduce per capita VMT. However, we believe SCAG, when planning our region's future, must address and confront the need to balance VMT impacts against housing impacts both wisely and realistically. We believe that, unfortunately, SCAG's most recent proposals do not strike a wise and realistic balance of the kind that is needed now. Instead, if both the draft Connect SoCal and SCAG's recently-vetted RHNA distribution methodology were to be adopted as they are now proposed, they would combine to propel our region in the wrong direction vis-à-vis housing production and affordability. Given the severity of our region's housing crisis and the urgency of this moment, when SCAG's RTP/SCS and RHNA will converge to set a new course for land use throughout Southern California well into the future, it is imperative that we pause and get it right.

3

Therefore, we respectfully urge SCAG to do what its southern brethren, the San Diego Association of Governments (SANDAG), did recently: seek and obtain permission to take an additional year in which to study and correct its overall regional planning. Our group would like to work with SCAG over the course of 2020 to fashion a much more realistic final Connect SoCal – one that will accommodate the entitlement of new housing units in such quantities, at such locations, and at such levels of affordability as will permit the housing of the SCAG region's population.

Lastly, we strongly urge SCAG to undertake preparation of an alternative planning scenario (APS) alongside a substantially revised and realistic sustainable communities strategy (SCS). As long as the California Air Resources Board (CARB) continues to impose unrealistically high targets for greenhouse gases (GHG) reductions which can be demonstrated only through radical cuts in per capita VMT, consequently worsening of our housing supply and affordability crises, SCAG should recognize and admit that such targets cannot possibly be met consistent with adopting a more realistic and appropriately accommodating SCS. The preparation of a complementary APS, therefore, one that reflects radical VMT reductions that CARB wants to see – however illusory they may ultimately prove to be, would allow SCAG to comply with its statutory requirements while simultaneously putting in place a much more realistic and beneficial RTP/SCS.

4

As the draft Connect SoCal reads now, poised for its potential final adoption if not changed substantially, it will constitute a harmful policy document vis-à-vis housing supply and affordability at a time when the housing crisis indicates the need for a major course correction in policy. Consistent with this need, SCAG should recognize, grasp, and begin to champion urgently the need for changes in our state government's planning policies. Specifically, the current policies should be corrected so that SCAG's still-pending sixth-cycle RHNA allocation and its transportation planning do not continue driving the SCAG region down the road toward unduly centripetal development and re-development, with negative ramifications for housing supply and unaffordability. Accordingly, SCAG should lead regional planning toward a more balanced mix of both urban and peripheral development.

5

DISCUSSION:

A. Our Group's Consistent Principles and Warnings Concerning SCAG's SCS Planning.

As is noted above, as our coalition has worked with SCAG's staff over the last decade, we have consistently espoused certain principles that we believe are essential to the effective and successful growth and development of the SCAG region. Last September, in connection with our comments concerning the then-proposed sixth-cycle RHNA allocation, we restated our support for sound regional planning that does all the following:

- Provides positive economic impacts and is a plan that is conducive to economic growth and job creation – Our organizations and our members are extremely aware of the economic implications of the spatial dispersion of homebuilding. When viewed at all scales (at the regional, the local, and the neighborhood levels), missteps and mistakes concerning how best to distribute land uses can profoundly impact economic vibrancy and stability. Specifically, the RTP/SCS must undergo a true economic cost/benefit analysis so that economic impacts are understood and known by SCAG Regional Council members (and stakeholders) before making a final decision on the RTP/SCS.
- Reasonably respects local governments' prerogatives – Policymakers need to respect the essential role of local government in sound land use decision-making, because local governments (much more than relatively central governments) have the best understanding of local needs, pressures, and aspirations of their growing and evolving communities. Maintaining local control of land use is essential to maintaining so-called “small d” democracy.
- Appreciates the organic nature of land use and development – Policymakers must appreciate the organic and dynamic nature of land development over time. Given this reality, land use planning must reflect continuous balancing and rebalancing of possible growth alternatives such as urban redevelopment and densification, and new town or greenfield development.
- Does not impose unrealistic, inflexible land use prescriptions on diverse jurisdictions – Our respective members constitute the businesses and individuals who know how to actually build new homes and communities. Accordingly, we see the many varying opportunities and challenges that are inherent in providing necessary housing throughout the SCAG region. Because of the widespread work that our members regularly undertake, we see the need for local governments to continue to entitle for new housing development or redevelopment on many diverse sites. Local governments must retain and exercise the necessary flexibility to take into account diverse local conditions of all types when making sound land use and entitlement decisions.
- Assures that new revenue sources are put in place to allow local governments to plan for achievable densification, while appreciating the beneficial primacy of market forces – Our

group has noted in other contexts (such as pertaining to SCAG's RTP/SCS development) that many of the desired changes in existing land uses are unlikely to occur unless there are put in place new and sufficient financial tools benefiting local government and public infrastructure. For example, in recent years, California dispensed with its erstwhile favorable urban redevelopment agency policies. Such helpful policies and tools must be restored and improved upon if local governments are required to spur positive community development and, especially, redevelopment.

- Anticipates and, where possible, overcomes legal and procedural roadblocks to housing construction – For years, our group has been calling for meaningful CEQA reform and other changes which would allow homebuilding to proceed more quickly when faced with NIMBYism and community resistance against change. In this environment, CEQA can be misused to halt progress toward housing goals. Sound regional planning, therefore, should meet all CEQA requirements and, more importantly, facilitate all related streamlining. Additionally, the state should adopt measures necessary to prevent the ongoing abuse of CEQA as a means to stop or significantly delay much needed and worthwhile housing projects.

6

Whereas the principles set forth above are stated as positive characteristics, we have also shared our continuing views about the negative effects of some of the unhelpful policy directives that have been applied in California and the SCAG region. To a large extent, we remain sorely disappointed by the fact that there remain far too many regulatory and legal impediments to homebuilding. Several persistent regulatory trends are actually working against meaningful increases in housing production, and especially production at the scale needed to alleviate our state's housing crisis.

First, there is a strong, growing and thus ever-worsening regulatory preference for fostering transit-oriented, urban infill, and increasingly dense, multi-family development and redevelopment. While we certainly support reasonable efforts to increased production of higher density housing within the urban core, this particular housing type should be deployed in reasonable relative volume, in appropriate locations, and with a clear understanding and appreciation of the heightened costs that are associated with an excessive reliance on such dense, urban-infill housing types.

7

With that in mind, we do not support an over-reliance on increased urban densification to the exclusion of more affordable, common and readily-available community types. The regulatory trend toward an over-emphasis on urban renewal and densification is particularly problematic from an affordability standpoint because the costs of building urban housing is often several times higher (on a square foot basis) than are the costs of other available and potential housing types – particularly less dense, suburban, and peripheral types of development, which are variously called relative “greenfield,” “new town,” “edge,” or “fringe” development.

Because the costs of developing and constructing dense urban housing is much higher than other types of homebuilding, fewer households can afford to buy or even to rent such new urban housing, at least not without significant government subsidies or housing assistance

programs. As a consequence, the still-growing regulatory preference for more intense urbanization, and the broad disfavoring of any and all greenfield development, are leading to sharp housing cost and price increases. These in turn exacerbate the under-supply of housing, and decrease both home ownership and regional living standards. These harmful trends should be especially alarming to those who are concerned about social equity and economic mobility – because home ownership has long provided a critical pathway for working class households to both secure housing and to accumulate family wealth and financial security.

7

As noted, the excessive regulatory preference for urban densification and redevelopment has been accompanied by complementary regulations aimed at curbing homebuilding activities of all types that do not constitute high-density, urban, “transit-oriented” or so-called “centripital” (i.e., moving toward the center) development. The best example of this is the recently-imposed requirement to apply the California Environmental Quality Act (“CEQA”) to effectively tax and disincentivize vehicle miles traveled (“VMT”) – which is a costly attack on individual mobility alone, with profound implications for millions of prospective households. At a minimum, these new CEQA requirements related to VMT add further disincentives, costs, and hurdles to greenfield and new town development.

Concerning these new VMT mandates, everyone can agree on the need for efficient, smart, safe and well-functioning regional transportation solutions. Rather than focusing excessively on reducing VMT and individual vehicular mobility, however, new housing opportunities should be promoted, considered and pursued with proper attention to all of the following:

- (i) the relative costs of construction and infrastructure,
- (ii) the public demand for different housing types and at different prices (to accommodate social equity for working households),
- (iii) the relative costs of providing different housing types in different areas (e.g., urban versus greenfield or edge), and
- (iv) the complicated relationships among housing and job locations (e.g., achieving a jobs-housing balance sometimes requires putting more housing where jobs are, even when jobs are located outside of the urban core).

8

Regrettably, the draft Connect SoCal very much perpetuates, incorporates and reflects the harmful policy push toward radical per capita VMT reductions. Again, we appreciate that SCAG feels compelled to do so in light of a state agency’s (CARB’s) mandate forcing SCAG to focus on VMT reductions as the primary means to demonstrate GHG reductions. In our view, however, the time has come for SCAG to take the lead in pushing back strongly against such state mandates, so that more realistic and ameliorative regional planning can then unfold. In doing so, SCAG should point out to state regulators that its decisions concerning the dispersion of new housing opportunities must take into account not only VMT, but also the real-life, existing, affordable, and dominant housing choices that are made by today’s regional workforce.

SCAG's ongoing failure to do so will have negative implications for social equity – especially for vulnerable communities. The lack of affordable and available housing in the Southern California region has played a role in exacerbating a number of serious problems such as homelessness, the disappearing middle class and the increasing outward migration from our region.

8

Lastly, we have seen continuing increases in the costs of entitlement and construction. New and increasing fees and exactions continue to place a disproportionately large fiscal burden on homebuilding activities. Growing mandates for project developers and homebuilders to provide rental or ownership subsidies for the less advantaged, and/or homeless housing funding, will not achieve promised levels of housing production unless such mandates are accompanied by a suite of policies that will expedite entitlement approvals, reduce construction costs, and reduce other fees and exactions. Achieving the level of homebuilding activity necessary to address the current housing crisis will require the circumspect review of and substantial relief from the fiscal and regulatory cost burdens that impede the production of new housing.

In short, unless and until SCAG realizes that our region is mired in a worsening crisis concerning both the supply and affordability of new housing opportunities, SCAG will continue to pursue and implement unwise regional planning policies at the insistence of CARB. A substantial course correction is needed; and it should begin now. SCAG needs to take the lead in creating and pursuing such a course correction. If it were to fail to do so, our region will continue to be directed indefinitely toward a bleaker future and unnecessary, worsening crises in terms of both housing supply shortages and housing unaffordability.

In light of these concerns, we must note here and express our very strong disappointment concerning the SCAG Regional Council's decision to ignore and reject entirely our September 2019 comments concerning the then-proposed sixth-cycle RHNA allocation for the SCAG region. We set forth in those comments the need for SCAG to expand the areas over which new housing can and should be built to include more vacant land (for suburban, annexed edge, greenfield and new town development). Notably, as we stated in our September comments, we were not opposed to the overall large size of the proposed sixth-cycle RHNA, we were instead concerned about the allocations and ultimately the indicated locations of more than 1.34 million new housing units envisioned within the SCAG region.

9

Specifically, our RNHA concern was and remains about where new housing units can best and most affordably be located and distributed amongst the nearly 200 local jurisdictions within the SCAG region. Housing has a higher likelihood of actually being built if the obligations to provide sufficient building sites for new housing are spread out in a more realistic, balanced and achievable manner. Because of this, we continue to urge SCAG to endeavor to allocate relatively more housing units toward the local jurisdictions that have a relatively meaningful supply of vacant land available.

Unfortunately, after we lodged our September 2019 comments concerning the RHNA allocation, SCAG chose to redirect the sixth-cycle RHNA allocation in the opposite direction from that which we advocated. Specifically, SCAG has since voted to squeeze even more of the

envisioned homesite allocations into the already urbanized, densely populated, and – importantly – least affordable relatively coastal communities. SCAG should not finalize the currently pending RHNA allocation without improvement; and SCAG most certainly should not hold the course that it is currently on for the entire sixth-cycle RHNA process (which is prescribed to last eight years).

Similarly, SCAG should be aiming now to adopt a 2020 RTP/SCS that reflects much more realistic assumptions about (i) where within the SCAG region there can be constructed nearly 1.5 million new housing units in the decade of the 2020's, and especially (ii) what will be the affordability of those units. Obviously, a substantial amount – but not all – of the needed additional housing stock can and should be provided as urban infill and through more urban densification. On the other hand, a very substantial portion of the needed additional housing stock will need to be instead in the form of so-called “new towns” and “edge” or “greenfield” development. **In short, a meaningful and significant portion of new housing units will need to be planned and built where there is now vacant land. Doing so will undoubtedly conflict with both (i) CARB's ideal of significantly reducing per capita VMT in the region to unrealistically low levels, and (ii) the Connect SoCal plan as it is now proposed.**

This is not to say that SCAG's staff and CARB should abandon their goal of planning for a sustainable region in which per capita *GHG-emissions reductions* can be realized. Moderate growth (i.e., relatively tempered growth) in per capita VMT is consistent with achieving the kinds of GHG-emissions reduction goals that climate-change scientists argue must be pursued – provided our society makes meaningful, steady improvements in our fleets and fuels over time. Steady improvements in both the efficiency of our transportation fleet and/or fuel options seem increasingly likely to unfold in the years ahead. Importantly, foreseeable improvements in our transportation fleet and fuel options will decrease the GHG-emissions reduction benefit that can be realized through any given decrease in per capita VMT – so much so that if we were to pursue enough of the former (fleet and/or fuel changes) and other technological advances, we would need none of the latter (per capita VMT reductions) to meet our GHG reduction goals.¹

B. The Draft Connect SoCal is Fundamentally Contrary to Our Group's Longstanding Principles and Goals.

¹ See K. Leotta & C. Burbank, *One Percent [Annual] VMT Growth or Less to Meet Greenhouse Gas Emissions Reduction Goals* (2009). Their study concludes that ambitious 2050 GHG emissions reduction goals can be achieved consistent with a moderated one percent annual increase in aggregate VMT – specifically if *emissions per VMT* can be decreased on average by roughly 72 percent over the 45-year projection period (2005-2050). Importantly, the combination of California's standards requiring aggressive improvements in automobile emissions and the accelerating adoption of electric vehicles, natural gas, plug-in electric hybrid and even hydrogen vehicles suggests that California is well on its way to achieving greatly reduced GHG emissions per vehicle mile traveled. This foreseeable achievement will also predictably lessen over time the marginal benefit that will flow from any marginal reduction or constriction of per capita VMT.

In light of the above-stated principles and prior consistent urgings, we now encourage SCAG's staff to re-address and substantially correct the draft Connect SoCal and the related draft PEIR. Rather than adopt these drafts as they are, SCAG should refashion and adopt a 2020-2045 RTP/SCS that will allow for a realistic degree of ongoing per capita VMT growth in and about the SCAG region. To be sure, per capita VMT growth should be *tempered* and *moderated* as much as possible. It should even potentially be decreased slightly, but only if such a result can be achieved consistent with the ability to reasonably employ, mobilize and house our region's growing and partially-homeless population.

To do so, SCAG needs to study and promote more new housing opportunities within a more relaxed span of potential locations. Such a direction is desperately needed if our SCAG region is to have any realistic hope of fairly and affordably housing its population. Local governments, in turn, must explore, condition and approve many different kinds of new housing opportunities in the most relatively sensible locations. The new kinds of housing opportunities that should be pursued and their specific siting must take into account and include the following: (1) new urban development and redevelopment opportunities at varying densities, (2) the ongoing growth and expansion of budding and still-growing communities, and (3) well-planned, entirely new communities.

To its detriment, the draft Connect SoCal does not appreciably reflect either the ongoing expansion of budding and growing communities, or the future entitlement of any new, well-planned communities. Instead, the draft Connect SoCal largely comports with the same policy direction that underpins its recent RHNA allocation decision.

Even worse, the draft Connect SoCal literally boasts of its policy aim of curtailing any and all such organic development. For example, on page 36 of the draft Connect SoCal, the text reads:

The conservation of natural area and farmlands on the edges of urban and suburban development is an integral aspect of Connect SoCal as it incentivizes infill development and the concentration of different land uses. This makes it easier to travel shorter distances which reduces greenhouse gas emissions. Many counties and cities in Southern California have excelled in their work to protect these vulnerable lands, but few plans or policies have been enacted to preserve habitat and farmlands on a regional scale. With regional population increases, conservation decisions made now can safeguard the endurance of these lands, protecting threatened wildlife and the local agricultural economy, and reducing carbon emissions, while also contributing to a high quality of life for future generations.

Similarly, the draft Connect SoCal describes all land on the edge of existing development to be regrettably "vulnerable" to development, expressly stating on page 32 of the draft Connect SoCal the following (emphasis added):

A range of local conservation plans, habitat conservation agencies and state/federal park designated areas provide protection for a significant amount of natural and farmland in

the SCAG region. However, most of these protected lands are in remote desert areas far from incorporated areas Therefore, *a substantial amount of land on the urban and suburban fringe is vulnerable to development*.

Rather than lament the fact that peripheral, vacant land is “vulnerable to” development, SCAG should instead be encouraging local jurisdictions to ascertain which such land “on the urban and suburban fringe” is the most suitable for development. In particular, SCAG should be encouraging the counties’ supervisors, who respectively govern the use of nearly all of the vacant land suitable for smart development, to identify and make available for housing products the “land on the urban and suburban fringe” which is most suitable for smart development.

Importantly, the draft Connect SoCal also boasts of the fact that new single family residential construction has been falling as a *percentage* of total new residential construction in the SCAG region, while multi-family housing (apartments and attached condominiums) have conversely been gaining in terms of its relative share of all new residential construction. For example, concerning the typology or mix of new housing units in the SCAG region between 2006 and 2016, page 20 of the draft Connect SoCal reads in part:

In meeting ... new residents’ demand for housing, the [SCAG] region also added about 400,000 units from 2006 to 2016 – 54 percent of which were multi-family units. Comparing to current conditions in 2016, 39 percent of the region’s housing units are multi-family and 61 percent are single-family units. Riverside County and Los Angeles County again took the highest shares, ... and Los Angeles County added an additional 164,000 housing units - with 90 percent representing multi-family developments, largely occurring in denser areas that are well served by transit.

While the draft Connect SoCal thus boasts that new multi-family housing units have been gaining in the *relative share* of new housing units, the change in relative share has come at the expense of total number of all new housing units (as is shown by Figure 2.4 on page 21 of the draft Connect SoCal). In fact, the data shows that overall new housing production has fallen along with – and most likely primarily due to – a corresponding decrease in single family residential construction.

It must be understood and appreciated as well that the new, relatively-increasingly multi-family housing production about which the draft Connect SoCal boasts (such as Los Angeles County’s additions of mainly “multi-family developments, largely occurring in denser areas that are well served by transit”) tends to be the most expensive type of new residential housing. Indeed, highly urban, dense, new housing is relatively and increasingly unaffordable to most renters – let alone to most would-be homebuyers. To achieve some levels of affordability on this type of housing product often requires government funding, in part or in whole, through various “affordable housing” programs. While we have consistently supported the more reasonable types and levels of these programs and recognize their benefit, we have great concern that these programs are becoming increasingly necessary in order to make this type of housing project affordable. It must be the goal of the RTP/SCS, RHNA and any good housing plan to assure that it accommodates “market rate” affordable housing, which is housing that is built and funded by

the private sector and sold or rented at market rates affordable to Southern Californians. Given the size and scope of the region's housing shortage and the tremendous affordability gap, we must maintain and increase strong private sector participation in new housing production because there is simply not enough government funding to solve this massive problem through the public sector alone. Therefore, we must be wary of plans that are heavily dependent on government subsidies to achieve housing affordability.

These facts have led our group to conclude that SCAG needs to reconsider and reverse its policy of championing almost exclusively dense infill redevelopment to the exclusion of all new town, urban edge and greenfield development. Only by reversing such an institutional policy can SCAG play its proper role in solving the housing supply and related housing affordability crises that currently grip the SCAG region and California as a whole.

10

C. The Draft PEIR is Inadequate as a CEQA Disclosure Document.

As we discussed above, there is no evidence that the policy prescriptions reflected in the draft Connect SoCal will meet either the realistically regarded housing and transportation needs of the region, or provide for sustainability as required by SB 375. We believe that the draft Connect SoCal, if it were to be adopted as proposed, would instead negatively impact many elements of the human environment throughout the SCAG region, such as by greatly worsening vehicular congestion and homelessness, certainly displacing the poor, and the like. The draft PEIR purports to discuss the environmental impacts of the draft Connect SoCal. We believe that the draft PEIR fails to do so adequately.

11

The draft Connect SoCal would implement a variety of policy choices aimed at fostering more high density infill housing. The higher density housing typologies that the draft Connect SoCal aims to foster are frequently five to seven times more expensive to build than are one and two-story detached or attached structures in less dense and relatively peripheral communities. The latter communities more typically provide home rental and ownership options at prices that are relatively attainable to the region's workforce.

Similarly, the draft Connect SoCal would reject a more diverse range of transportation options (including voter-approved and funded transportation improvements) of types that would increase transportation efficiencies in the region. Instead, the draft Connect SoCal would singularly favor bus, electric scooter, and other transit modes which are either increasingly ineffective (e.g., fixed route bus transit) or infeasible in relation to the needs of many commuters within the region's workforce (e.g., electric scooter programs, which are no help to our region's construction workers, who must carry or move tools and material to jobsites).

As a disclosure document, the draft PEIR fails to identify, analyze, impose legally-mandated, feasible mitigation measures for the reasonably foreseeable consequence of the draft Connect SoCal's proposed implementation. It fails to disclose the scale and significance of unavoidable adverse impacts for impacts that cannot be mitigated through measures enforced by SCAG. The impacts which were unlawfully omitted from the analysis provided in the draft PEIR include:

12

- The reasonably foreseeable demolition and displacement of existing uses in and near transit stations and corridors. Such demolition and displacement will cause significant localized noise and air emission impacts, significant new burdens on local infrastructure and public service, the significant or potentially significant displacement of local businesses (which will result in the absence of such businesses or greater travel distances to such local business services), and the significant or potentially significant displacement of existing residents who will most likely be forced to relocate to less costly residential locations farther away from their present workplaces, all with attendant increases in travel-related impacts such as the explosive growth of “supercommuters” with higher commute-related air emissions, health and safety hazards, traffic congestion, and noise impacts.
- The reasonably foreseeable ongoing increase in “supercommuters” – even for populations that are not physically displaced by urban, transit-oriented development. As was examined in a recent Chapman University study completed by economist John Husing, even households headed by union construction workers cannot afford a median priced home in any county that touches the ocean in Southern California.² The disconnect between the draft Connect SoCal’s high-cost, high-density, disproportionately infill housing vision assures that the pattern that Dr. Husing identified will continue and get worse.
- The draft PEIR fails to discuss the fact that there are and will remain no practical, fixed-route public transit options to serve the distantly-residing construction workers and other middle class households who need their mobility. The draft Connect SoCal’s prioritization of mass transit over roadway expansions would therefore worsen the growing tendency toward gridlocked conditions. Consequently, work force commutes will lengthen – thereby increasing air emissions and causing other adverse impacts. These are not speculative impacts: both the housing shortage and affordability crises and the performance of the SCAG region’s transportation network worsened after the first two rounds of RTP/SCS plans were adopted; and the draft Connect SoCal, especially when viewed in light of SCAG’s recent actions involving the sixth-cycle RHNA allocation, would effectively double down on the unsuccessful over-dependency and over-emphasis on fixed-route, public transit. SCAG’s own transit studies demonstrate that housing density does not result in increased transit ridership because, in the real world, jobs are widely distributed throughout the region and workers (including low income hourly wage workers) often can practically commute only by using cars.³

12

13

² John E. Husing, “Impact of California’s Housing Prices on Construction Workers,” March 3, 2019, available at: <https://www.newgeography.com/content/006254-impact-californias-housing-prices-construction-workers>

³ See, e.g., UCLA “Falling Transit Ridership: California and Southern California,” available at: <https://www.its.ucla.edu/2018/01/31/new-report-its-scholars-on-the-cause-of-californias-falling-transit-ridership/>

- There is clearly not enough public funding to bridge the massive gap between (i) the costs of constructing high-density, infill-only housing, and (ii) the lower cost of the housing that is actually needed by affordable to middle class households in the region. Relatively affordable housing is widely available outside the SCAG region. Because of California’s stringent building and efficiency codes, and its commitments to renewable energy and electric and other alternative energy vehicles and modes of transit, California’s future residents are projected to have the lowest per capita GHG footprint in the nation. By failing to solve the housing shortage and affordability crises, our society will worsens GHG emissions globally by forcing an increasing number of Californians to relocate to other regions, states or nations where housing is more affordable. Presently, the top three out-migration destinations for departing Californians are Texas, Nevada and Arizona; and they all have far higher per capita GHG emissions. The draft PEIR discusses and analyses no impacts related to such out-migration caused by the draft Connect SoCal’s foreseeable worsening of the housing supply and affordability crises.

14

The Program EIR also fails to identify all feasible mitigation measures for the scores of significant unavoidable adverse impacts it identifies. Even though SCAG cannot itself implement or enforce some potential mitigation measures, CEQA requires that the final EIR must identify feasible measures to avoid or reduce impacts and note, where applicable, that such measures can and should be implemented by other agencies. Measures such as reducing housing costs through accelerated and by-right entitlement approvals, reducing fees and other regulatory costs, and enhancing local government revenues with tax-increment financing to pay for the community infrastructure and public service improvements needed to accommodate new housing, are omitted from the PEIR. The omission must be corrected.

15

The draft PEIR does and analyze the foreseeable failure of VMT reduction policies, taking into account the region’s plummeting transit ridership and the evidence that any growing population which enjoys strong employment typically has increased or barely reduced per capita VMT; but has never significantly reduced it. The draft PEIR fails to identify and alternate GHG reduction strategies (other than VMT reduction) which could more feasibly and beneficially reduce regional GHG. Moreover, even if CARB continues to dictate that SCAG must envision and plan for large per capita VMT reductions, the draft PEIR should have analyzed and discussed the broader environmental impacts and potential mitigation of such a policy.

16

In addition, the draft PEIR also omits any discussion of the reasonably foreseeable cumulative impacts that will flow from the 2019 determination that SCAG must allocate more than 1.34 new housing units through the RHNA process for the sixth cycle of RHNA, and that SCAG has already decided to disproportionately allocate that large number of housing units to the more expensive, relatively near-coastal areas and communities. Although the localities’ respective general plans have not yet been amended to make sites available for these housing unit allocations, CEQA does not allow for the deferral of consideration of cumulative impacts analyses for reasonably foreseeable new projects and activities simply because they have not yet been fully or finally approved. The draft PEIR must be reworked to include discussion of the consequences of tripling the availability of housing unit sites and SCAG’s decision to largely

17

focus this large quantity of new potential housing units in the already dense, expensive near-coastal communities.

17

Finally, because of all of the concerns which are stated above in this comment letter, the draft Connect SoCal policy document and the related draft PEIR should each be revised to include an alternative – one that will actually result in more ameliorative housing and transportation solutions for the region.

18

The draft PEIR’s fails to adequately identify, analyze and/or discuss the mitigation of environmental impacts. It fails to identify the reasonably foreseeable consequences of the cumulative housing increase prescribed by the RHNA process. Both it and the draft Connect SoCal fail to identify and analyze an alternative that would actually result in housing and transportation solutions needed by this region. These are all flaws that can be remedied only if SCAG were to recirculate a revised draft PEIR which corrects its deficiencies. This is all the more reason for SCAG to seek and obtain a one-year extension in additional time to revise and ultimately adopt a better Connect SoCal.

19

D. Conclusion.

To summarize our conclusions:

- We believe that the draft Connect SoCal compounds the policy mistakes that were latent in SCAG’s prior two RTP/SCSs but are now recognizable in light of the housing crisis; and it is, therefore, not a sound plan for the region. Whereas a major policy course correction is needed to best address the region’s housing supply dearth and housing affordability crisis, the draft Connect SoCal would combine with SCAG presently-proceeding RHNA allocation to worsen these crises.
- SCAG should therefore request a one-year extension of time during which to entirely revisit the draft Connect SoCal, and substantively re-make it with a view toward better balancing the environmental and transportation goals of the RTP/SCS with approaches that will address more urgently and deliberately the region’s housing supply and affordability crises.
- The draft PEIR is legally infirm as it now reads, and should be redone when analyzing a substantially new, more realistic and more achievable regional plan.
- If we are correct in assuming that a resulting, newly-drafted, more realistic and more achievable regional plan will conflict with CARB’s overly-ambitious per capita VMT reduction, then we urge SCAG to prepare and adopt both a SCS and a complementary APS for presentation to CARB.

20

21

22

We have always recognized the daunting regulatory and administrative challenges that are inherent in SB 375 and the federal requirements with which SCAG must comply. We

23

recognize that it will be a major challenge for SCAG’s staff to re-evaluate all of the VMT implications of envisioning a more circumspect regional land use plan than those which underpinned SCAG’s last two RTP/SCSs and now underpin the draft Connect SoCal and its draft PEIR. It is especially challenging to do so in a way that better accommodates the large housing needs assessment that must be allocated regionally via the sixth-cycle RHNA process. We remain, however, confident in SCAG and both its Regional Council and professional staff to lead the way on smart, innovative approaches for solving our region’s most daunting problems. Likewise, given our longstanding involvement with the SB 375 process and the depth of our concerns, we look forward to continuing to work with SCAG and participating in ongoing discussions about Connect SoCal. With such collaboration in mind, we respectfully ask for your meaningful consideration of these comments.

RE: DRAFT PEIR COMMENTS FOR 2020 RTP/SCS (SCH # 20199011061)

Dear Mr. Ok:

Service Employees International Union – United Service Workers West, on behalf of its members (collectively "USWW" or "Commentor"), appreciates the opportunity to comment¹ on the referenced draft Program Environmental Impact Report ("PEIR")² for the draft 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy plan ("Plan" or "2020 RTP/SCS"),³ prepared by the Southern California Association of Governments ("SCAG") pursuant to the California Environmental Quality Act, Pub. Res. Code § 21000 *et seq.* ("CEQA").⁴

1

In short, USWW writes with regard to the Plan's air quality analysis and growth forecasts. Concerning is the absence of any modeling under newer EMFAC2017 models that may disclose additional air quality impacts. It is unclear whether the Plan's General Conformity Determination accounts for additional, updated projects that have already been credited with emission budgets under applicable air quality plans. Finally, the Plan's growth assumptions seem untethered to the SCAG region's historic growth record. USWW respectfully requests clarification on these issues in a recirculated or final PEIR.

2

I. STANDING OF COMMENTOR

USWW and its sister local unions have many thousands of members who reside and work in the SCAG region which this Plan covers. They will be directly affected by impacts under the Plan, such as traffic, air quality, GHG and noise.

This comment letter is made to exhaust remedies under administrative law principles and Pub. Res. Code § 21177 concerning the Plan, and incorporates by this reference all written and oral comments, in their entirety, submitted on the Plan or PEIR by any commenting party or agency. It is well-established that any party, as Commentor here, who participates in the administrative process can assert all factual and legal issues raised by anyone.⁵

3

⁵ See *Citizens for Open Government v. City of Lodi* (2006) 144 Cal.App.4th 865, 875.

II. SPECIFIC COMMENTS REGARDING DRAFT PLAN/PEIR

1. Use of EMFAC2014 Rather Than EMFAC2017 Is Concerning

It appears that the Plan’s air quality, health risk assessment, and GHG analysis utilizes the older EMFAC2014 modeling per the two-year grace period provided by the U.S. EPA for regional conformity analysis.⁶ Yet, the newer EMFAC2017 modeling may show more significant air quality emissions that should be translated into human health impacts in order to fulfill CEQA’s informed decision-making purposes. *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502. So too, it is unclear whether the grace period for using the old EMFAC2014 model applies to the entire 2020 RTP/SCS PEIR analysis or is limited strictly to the federally-required General Conformity Determination (“GCD”).

4

Commentor requests clarification regarding the utility of the 2020 RTP/SCS PEIR absent an EMFAC2017 modeling. For example, would future addendums to the PEIR include brand new EMFAC2017 modeling? Will future projects after the expiration of the grace period have to do *both* an EMFAC2014 modeling (to show consistency with 2020 RTP/SCS assumptions) and EMFAC2017 modeling to disclose emissions otherwise undisclosed in this PEIR? What specific mitigation measures are incorporated now to ensure future impacts disclosed pursuant to EMFAC2017 modeling are addressed?

2. Available General Conformity Determination Emission Budgets Are Not Updated

The Plan claims that air emissions associated with the 2020 RTP/SCS are within the air quality emission Budgets under applicable State Implementation Plans (“SIP(s)”) and local Air Quality Management Plans (“AQMP(s)”), and thus the Plan satisfies its federally-mandated General Conformity Determination.⁷ First, as noted above, this analysis relies on EMFAC2014 modeling under a soon-lapsing grace provision,⁸ which may very well leave impacts unanalyzed and unmitigated.

Second, the Plan compares Plan emissions against applicable emission Budgets,⁹ often finding slim to no emission Budgets remain after deducting the Plan’s emissions. It is unclear, however, whether this analysis accounts for recent projects not already included in the applicable AQMP that rely on local General Conformity Budgets. For example, a warehouse logistics project at San Bernardino International Airport just approved in December 2019 exceeded *de minimis* thresholds and required a GCD under the National Environmental Protection Act.¹⁰ There, the project relied on set-aside General Conformity Budgets tracked by South Coast Air Quality Management District (“SCAQMD”).¹¹ As indicated by SCAQMD, SCAQMD tracks projects requiring GCDs that utilize General Conformity Budgets and the Budgets “are in high demand and have a limited availability.”¹² Here, it is unclear whether the Plan’s GCD accounts for the recent projects that have already secured these highly sought after General Conformity Budgets.

5

⁶ See Plan, TR-Transportation Conformity Analysis, p. 28; PEIR, pp. 3.3-19, 3.3-50, 3.3-76, 3.8-60, 3.8-74.

⁷ See PEIR, p. 3.3-52, 3.3-69; Plan, TR-Transportation Conformity Analysis, pp. 2-4, 108.

¹² *Ibid.*

Commentor therefore requests clarification whether the Plan and PEIR account for available General Conformity Budgets. For example, do the emission Budgets in the Plan include set-aside General Conformity Budgets? Has SCAG consulted with SCAQMD and other relevant agencies about the updated status of available General Conformity Budgets that are highly sought after by project-proponents? Does SCAG, much less the public, know how much of the Budgets have already been allocated, and how much remains? All this should be provided in a recirculated or Final PEIR.

3. Growth Assumptions May Lack Substantial Evidence

The 2020 RTP/SCS anticipates a significant increase in airplane passenger volume for the SCAG region with passenger enplanements increasing from 110.17 million annual passengers ("MAP") in 2017 to 197.14 MAP in 2045 (i.e., an increase of 86.97 MAP), which amounts to a Compound Annual Growth Rate ("CAGR") of approximately 2.1 percent during those 28 years.¹³ This level of growth is out of line with the area's historic track record and more akin to the trajectory anticipated under old SCAG plans that have proven unreliable. Table 1 below shows the anticipated growth in passenger enplanement SCAG-wide under this Plan and prior SCAG plans over their respective planning periods, and historic growth from 1997 to 2017. As the below table indicates, past plans have consistently overestimated anticipated growth as compared to actual growth (i.e., 1.55 percent actual growth from 1997-2017).

TABLE 1: PRIOR ANTICIPATED GROWTH UNDER SCAG PLANS

RTP	Base		Forecast		Trend	
	Year	MAP	Year	MAP	Period	CAGR
2001	1997	81	2025	167	28	2.62%
2004	2002	77.8	2030	170	28	2.83%
2008	2007	89.53	2035	165.3	28	2.21%
2012	2009	79.1	2035	145.9	26	2.38%
2016	2013	88	2040	136.2	27	1.63%
2020	2017	110.17	2045	197.14	28	2.10%
Historic	1997	81	2017	110.17	20	1.55%

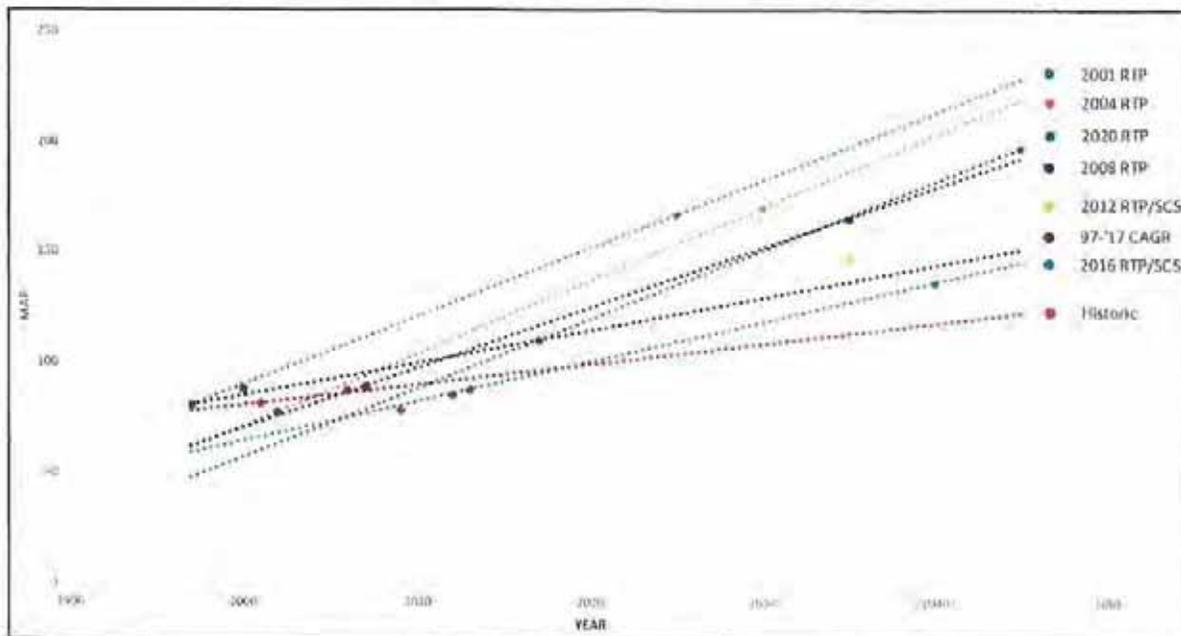

The linear trajectory of the above growth projections are reflected in Figure 1 on the following page, which shows the 2045 anticipated growth under the proposed 2020 RTP/SCS (green) is near levels anticipated under the older 2001 RTP (blue), 2004 RTP (orange), and 2008 RTP (purple); and much higher than anticipated growth under the newer 2012 RTP/SCS (yellow) and 2016 RTP/SCS (light blue). As compared to historic levels reported by SCAG between 1997 through 2017 (red),¹⁴ those older RTP forecasts overestimated passenger growth significantly. So too, those older plans overestimated growth

¹³ See Plan, p. 81; Plan, TR-Aviation & Airport Ground Access, p. 33; PEIR, APP-3.13, PDF p. 37.

¹⁴ According to SCAG-reported figures, the SCAG-wide region had 81 MAP in 1997, 88.5-88.7 MAP in 2000, 81.9 MAP in 2001, 77.8-77.9 MAP in 2002, 87.9 MAP in 2006, 89.4-89.53 MAP in 2007, 79-79.1 MAP in 2009, 85.8 MAP in 2012, 88 MAP in 2013, and 110.17 MAP in 2017. See e.g., 2020 RTP/SCS, TR-Aviation and Airport Ground Access, p. 26; 2016 RTP/SCS, Aviation Airport Ground Access Appendix, p. 1, <http://bit.ly/2tEwfxP>; 2012 RTP/SCS, PDF p. 106, <http://bit.ly/2RrJvip>; 2008 RTP, Aviation and Airport Ground Access Report, PDF p. 30, <http://bit.ly/2GllrXT>; 2004 RTP, PDF p. 144, <http://bit.ly/36rk3NY>; 2001 RTP, PDF p. 113, <http://bit.ly/3aK11aD>.

as compared to the CAGR trajectory based on the actual levels reached from 1997 and 2017 (black).¹⁵

FIGURE 1: PASSENGER FORECASTS COMPARED TO HISTORIC LEVELS

As indicated in the above figure, the trajectory of the region’s actual track record (i.e., black and red) is relatively low and much more in keeping with the trajectory under SCAG’s 2012 and 2016 RTP/SCS growth forecasts, which collectively anticipate passenger volume in 2045 in the range of 145-170 MAP. It would seem that, after 16 years of consistently lowering forecasted passenger volumes in each successive RTP, SCAG is now changing course under an apparent pro-growth plan that may not be supported by substantial evidence.

The 2020 RTP/SCS derives its 2.10 percent CAGR growth rate based on factors described only generically and is facially out of line with the region’s long-term track record that has seen only a 1.55 percent CAGR in passenger enplanement from 1997-2017. This discrepancy is due, in part, to the Plan’s emphasis on recent growth rates from narrow time periods (e.g., 2012-2017 returning to normal levels after sharp declines in the wake of the 9/11 attacks and the Great Recession), based on largely forecasted numbers that have yet to be proven accurate (e.g., 2018-2045), and from jurisdictions that are dissimilar from the SCAG region (e.g., emerging countries like Africa and Asia/Pacific).¹⁶ As a long-term planning document, the RTP/SCS must give adequate weight to the SCAG-region’s actual performance over the long-term, such as SCAG’s 1.55 percent CAGR from 1997-2017 and the 1.3 percent CAGR from 2000-2017 (i.e., from 88.5 MAP in 2000 to 110.1 MAP in 2017).¹⁷ Furthermore, given that the State and region have

¹⁵ This 1997-2017 CAGR trajectory is higher than the red trajectory because it only includes the historic levels at 1997 and 2017, excludes lower MAP levels in interim years largely attributed to the 9/11 attacks and the Great Recession. See Plan, TR-Aviation & Airport Ground Access, pp. 26, 29.

¹⁶ See Plan, TR-Aviation & Airport Ground Access, pp. 22, 28 (TbIs. 6 & 9).

¹⁷ *Ibid.*, pp. 27, 29.

experienced ten-years of continued economic growth, a softening of the economy is foreseeable, which will undoubtedly affect passenger travel. This seems to be entirely overlooked by the Plan and PEIR. As such, Commentor requests clarification regarding the adequacy of the Plan's growth projections. For example, what modeling and source data was used to derive this 2.10 CAGR? Why does the Plan/PEIR fail to specify exactly what levels were in prior years? How effective is this model compared to the region's track record?¹⁸ Why is there no consideration for the cyclical nature of the economy?

Moreover, each SCAG airport is assumed to accommodate this growth at different volumes and at different CAGRs, as reflected in Table 2 below. So too, the Plan anticipates some airports will have significant increases or decreases to their respective regional share of passenger volume.

TABLE 2

Airport	2017		2045		MAP CAGR (2017-2045)
	MAP	% of Total	MAP	% of Total	
BUR	4.74	4.3%	9.00	4.6%	2.3%
IPL	0.012	0.0%	0.30	0.2%	12.2%
LAX	84.56	76.8%	127.00	64.4%	1.5%
LGB	3.783	3.4%	5.50	2.8%	1.3%
ONT	4.552	4.1%	33.00	16.7%	7.3%
OXR	0.00	0.0%	0.30	0.2%	n/a

<i>Notes:</i>					
n/a CAGR not calculated given SCAG provides no base year values.					

6

In addition to concerns about overstated growth projections, Commentor therefore requests clarification about the timing of these purported MAP increases. For example, how does the PEIR account for and mitigate more severe local impacts that could be caused by accelerated increase in MAP at a particular airport within the first five or ten years of the planning period, instead of evenly spread out over the Plan's full 25+ year time period? Alternatively, in this circumstance how does the PEIR account for disruptions in the Plan's modeled regional share of passenger volume for each airport?

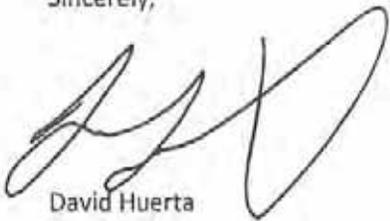

¹⁸ For example, if the current model used in the Plan was used under prior RTPs, how accurate would the model's forecasts be compared to historic passenger volumes.

III. CONCLUSION

USWW appreciates the opportunity to provide these comments to SCAG and looks forward to a meaningful response to these fundamental questions. Commentor reserves the right to supplement these comments at future hearings and proceedings for this Plan. Finally, to the extent not already on the notice list, Commentor requests all notices of CEQA actions, Plan CEQA determinations, or public hearings to be held on the Plan/PEIR under state or local law requiring local agencies to mail such notices to any person who has filed a written request for them.¹⁹ Please send notice by electronic and regular mail to: casey.coward@seiu-usww.org, 1650 Harbor Bay Parkway, Suite 200, Alameda, CA 94502.

To whom it may concern,

Thank you for the opportunity to comment on the Southern California Association of Governments (SCAG) 2020 Regional Transportation Plan (RTP) and Sustainable Community Strategy (SCS) (collectively called Connect SoCal). In 2012, with release of the prior RTP/SCS, Friends of Harbors, Beaches and Parks coordinated a cross-county regional conservation coalition focused on the inclusion of natural lands mitigation and policies within that SCAG plan. The Bolsa Chica Land Trust is now a part of this growing coalition in 2020.

The Bolsa Chica Land Trust is a 5,000 member non-profit organization established in 1992. Our mission is the acquisition, preservation and restoration of all of Bolsa Chica and the education of the public to its natural wonders and cultural significance. The Bolsa Chica Ecological Reserve, located on our Orange County coastline, is owned and managed by the State. Bolsa Chica is an international birding location visited by approximately 80,000 visitors each year. Over the course of our 27 year history, BCLT has been the catalyst for the protection of hundreds of acres of coastal wetlands and 118 acres of coastal uplands at Bolsa Chica from development.

We offer the following comments on the Natural and Farmland policy, goals, and next steps.

We are pleased to see conservation of our natural lands as one of the 10 main policies of Connect SoCal. Land preservation not only reduces greenhouse gas (GHG) emissions, but also sequesters carbon. Any investment in habitat restoration improves this sequestration potential as well. SCAG has demonstrated that Metropolitan Planning Organizations can play a vital, thoughtful, and science-based role in mitigating impacts to our natural environment from transportation, infrastructure, and other development projects. By incorporating natural and farmlands protection strategies into your policy document, we believe the many benefits of this broad-based conservation approach will be realized sooner than expected. We thank you for your leadership.

BCLT agrees that future development should be focused in existing city-centers and near transit. When developments are built in the city center, it relieves pressure from the fringe. However, the Plan fails to outline exactly how (or with what conservation mechanism) these fringe lands (or any lands) will actually be protected. Just because the pressure is relieved by focusing development elsewhere, doesn't mean the land then automatically becomes protected. Numerous organizations, ours included, focus our work on protecting important habitat lands. A lot of time, energy, money, strategy, and political will are combined to create a successful conservation transaction that lead to permanently conserved lands. Further, just because local agencies may be contributing to the conservation arena, in no way should you discount the roles of the conservation non-profit community. In short, SCAG must identify the actual mechanism, process or plan on how the greenfields and agricultural lands will be protected.

Many of the benefits of open space and parkland have been outlined in the Plan and Natural Lands Appendix. In addition, there are many economic benefits of open space. These are realized through increased property values, ecosystem services, support of local businesses through park visitor purchases, and a reduction in the urban heat island effect. Further, conservation of natural lands has many on-the-ground co-benefits like access to recreational opportunities, preservation of important habitats and species, protection of cultural and archeological sites, increased job opportunities, protection of threatened/endangered species, and environmental education experiences. Our natural lands filter water, clean the air, and provide homes for wildlife. Natural lands preservation also protects our watersheds, rivers, and water sources. Voters consistently support measures that benefit their local water and natural resources.

The Plan outlines that the region anticipates an additional 3.8 million people by 2045 providing increased pressure to our existing parkland. Existing studies document that many communities in the Southern California region already do not have enough parkland as outlined by the Quimby Act (five acres per 1000 residents). As cities grow, more parks and more park access will be needed. What is the mechanism for this? Additionally, and more importantly, these city parks are fundamentally different than habitat-focused parks. Usually city and regional parks include high intensity activities, like turfed soccer and baseball fields. The types of land acquired as mitigation or through local conservation efforts typically focus on preservation of natural habitat and less intensive uses (birding, hiking, etc.). In fact, many of these mitigation lands have limited or managed public access. Providing "more" access to either high or low intensity parks and/or habitat lands may have significant consequences for the land manager. How additional access will be provided should be addressed, as well as how additional lands will actually be acquired and preserved.

Wildlife corridors are critical components to Southern California conservation efforts. Ensuring survival of the top predator and the suite of species in the ecosystem means our natural lands must also maintain environmental functions, be sustainable over the long term, and include plans for long term stewardship. The issue is that many housing and transportation projects eliminate the wildlife movement corridors and fragment the landscapes into smaller, less viable pieces of land. Ensuring our open spaces are connected to one another is essential for species survival. Wildlife corridors allow landscapes to maintain ecological functions, allow places for regeneration after natural disasters such as fire, flood or landslide, and improve the resiliency in the face of climate change impacts. The Plan would be stronger if it supported the enhancement of and/or protection of documented wildlife corridors *prior to commencing* impactful projects.

1

Many non-profits like BCLT are working to ensure additional bays, estuaries, wetlands, bluffs, and beaches are preserved forever. Additionally, one way our coasts are connected to inland areas are through our rivers and streams. These riparian areas serve as recreational trail corridors, water recharge and infiltration locations,

and serve as places our wildlife use for watering sources. However, transportation and land use generated urban runoff are still problems. Our beaches and coastline are inundated with pollution. Litter, debris, and pollutants should be decreased prior to reaching the coast. Ensuring everyone has a positive experience on the sand and in the surf should be our goal, but we need to address Southern California's trash problem.

One key way to improve the environment is through restoration projects. These can be on land, in riparian areas, and even in the ocean. Restoration provides benefits by adding native plants, removing the non-native plants and their seedbank, as well as increasing carbon storage, and providing improved habitats for our wildlife. Our environment benefits from these improvements, as do our watersheds, our air, and our communities. Having improved habitats means that our water is cleaner, our soils won't erode as easily, it creates jobs for local residents, and our unique biodiversity is maintained. Further, the many endemic and threatened/endangered plants and animals benefit from these restoration projects as well. Thank you for including restoration as a key component in the natural lands and agricultural policy. We feel it is important to note that although restoration dollars are available through State measures, there is overwhelming competition for those dollars, particularly for Southern California where restoration projects are typically more expensive to implement. SCAG support of restoration will be an important element to achieving restored and functioning habitats.

Thank you for reviewing our comments and we look forward to working with SCAG on the implementation of this Plan, especially as it relates to the conservation policy and Natural and Farmlands Appendix. Should you need to contact me, I can be reached at (714) 846-1001. In addition, we request to be included on any notifications (electronic or otherwise) about this policy's creation and implementation, please send information to me at Kim@bclandtrust.org.

Sincerely,

Kim Kolpin
Executive Director

RE: Comments on the 2020 Draft Connect SoCal

Dear Connect SoCal Team:

Friends of Harbors, Beaches and Parks (FHBP) has been engaged with the Southern California Association of Governments (SCAG) for many years—most recently through its ongoing Natural Lands Working Group. In 2012, we formed a coalition that promoted open space policies and regional advance mitigation programs (RAMPs) at the SCAG level. These policies were ultimately adopted by SCAG leadership in the 2012 Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS). This was done a second time with the 2016 RTP/SCS. We are pleased to gain a broader, more inclusive, and geographically diverse coalition for the 2020 Plan (Connect SoCal) and though we have substantive comments below, we are supportive of the 2020 Connect SoCal Natural and Farmlands policies.

While FHBP mainly focuses its work in Orange County, we have been able to relay our experiences with the successful RAMP under the Orange County Transportation Authority's (OCTA) Renewed Measure M to other county transportation agencies in California. Measure M2's Environmental Mitigation Program has permanently protected 1,300 acres and restored nearly 350 acres throughout Orange County. This innovative program enables 13 freeway projects to collectively mitigate impacts with large landscape-level mitigation, instead of small individual project-by-project mitigation efforts. It streamlines the environmental review and permitting process, allows projects to come in under budget, builds a positive working relationship with resource and permitting agencies, allows more thoughtful science-based conservation planning to occur, and is supported by many conservation and community organizations. This, and our involvement in the creation of the Natural Lands Policy in the 2012 Orange County SCS, drew our attention and focus to the SCAG RTP/SCS and opportunities for a more regional effort there. We are grateful to be involved in the process and to have developed an excellent working relationship with SCAG leadership and staff.

Below are our comments on the SCAG Connect SoCal Plan segmented by topic and chapter.

Additions shown as *italics*

Deletions shown as ~~strikethrough~~

SoCal Connect (Plan)

Executive Summary

We support the focus of “Fit it First” and encourage local transportation agencies to stop building new roads. History has shown that building new roads or widening freeways and roads does not solve the traffic problem—it simply allows more single occupant vehicles to be on the road, which SCAG is trying to avoid to reduce greenhouse gas emissions (GHG) and vehicle miles traveled (VMT).

It is exciting to see new tools such as tax increment financing included in the plan. However, there was a missed opportunity in the Executive Summary and throughout the Plan itself. We believe that tax-increment finance districts can and should be used to fund open space conservation. Our parks and open spaces are part of the community infrastructure that our taxes support—as the cities grow, so will our need for more parkland. Further, most cities do not meet the requirements of the Quimby Act. The 1975 Quimby Act established a statewide requirement that developers set aside land, donate conservation easements, or pay fees for park improvements (called park in lieu fees). Many jurisdictions have enacted local ordinances that require the maximum number of park acres per person under the Quimby Act - or 5 acres per 1,000 residents. As more houses are built and more land is used, more parkland will be needed as well. We suggest the following modifications:

Proposed Policy Modification (Plan, Pg. 49)

Support cities in the establishment of Enhanced Infrastructure Financing Districts (EIFDs), Community Revitalization and Investment Authorities (CRIAs), or other tax increment or value capture tools to finance sustainable infrastructure, *including parks and open space*, and development projects.

Similarly, the comment about value capture tools and financing also applies to the “Support Implementation of Sustainability Policies” in the SCS (Pg. 27 & 29), as parks are part of our community infrastructure.

Proposed Modification (SCS, Pg. 27)

Support cities in the establishment of EIFDs, CRIAs, or other tax increment or value capture tools to finance sustainable infrastructure, *including parks and open space*, and development projects.

Proposed Modification (SCS, Pg. 29)

TIF is an important tool in the creation of sustainable communities, and NIFTIs specifically can fund multifamily affordable housing, transit capital projects, transit-oriented development, complete-streets capital projects, parking, *parks and open space*, and programs to reduce GHG emissions and VMT within TPAs.

Overarching Goals

We appreciate the effort to locate housing, jobs, and transit closer together and in priority growth areas, while simultaneously preserving natural resources and farmlands. It was great to see this consistent thread woven throughout the document.

When reviewing the 10 priorities of the Connect SoCal Plan, we noticed that the preservation of natural resources and farmlands actually aligns well with several other goals including:

1. Encourage regional economic prosperity and global competitiveness.
5. Reduce greenhouse gas emissions and improve air quality.
6. Support healthy and equitable communities.
7. Adapt to a changing climate and support an integrated regional development pattern and transportation network.

Often one policy can support another, and this can be accomplished with the goal of conservation.

Chapter 1: How the Plan was Developed

As the Plan was being developed, participants (FHBP included) in the planning workshops were asked to review four potential growth scenarios and strategies that go with those scenarios. Unfortunately, we found this exercise inequitable because not all growth scenarios apply to every geography in the SCAG region and therefore the strategies cannot apply equally across the region either.

For example, in a very urban area, creating an urban growth boundary or setting aside land for conservation is not feasible or realistic. However, those actions could work in areas that are still bordered by natural lands and are more suburban or rural. Different geographies need different strategies and different conservation tools. We hope that, in the next scenario development exercise in 2023, this will be considered and therefore make the exercise more realistic. Accordingly, we make the following suggestion:

Solution for Future Plan Exercises

Be cognizant of the tools provided and how they will or will not apply to each land use type. For example, tools used in an urban geography are likely not the same as those used in a rural geography.

Chapter 2: SoCal Today

We appreciate acknowledgement in the document that our habitat lands face severe development pressure and that those same lands are a valuable asset to our region, residents, and visitors. However, the document implies that construction, infill, and other “development based” activities are the only activities to generate economic growth. It is important to note that our natural lands and agricultural industry are also economic engines for the region. For every dollar invested in conserving natural lands, an estimated \$2.37 is generated through local sales, recreation purchases, gas, and snack/food purchases from outdoor enthusiasts. This is significant in its own right.

We commend cities and counties that prioritize conservation of our open spaces. Between acquisitions, policy adoption, mitigation measures, and public-private partnerships, local and regional governments have been successful at adding natural lands to the inventory. Here are a few of those examples:

- Laguna Beach residents (Orange County) taxed themselves decades ago to fund what essentially became an urban growth boundary around the city to protect their quality of life by purchasing hillsides.
- In San Bernardino County, efforts are currently underway to create a Regional Conservation Investment Strategy that closely links appropriate development locations with priority conservation areas.
- In Los Angeles County, a newly updated ordinance focuses on areas in need of more protection due to sensitive natural resources through an updated Significant Ecological Area layer.
- In Ventura County, residents passed Save Open Space and Agricultural Resources (SOAR), which includes a series of eight voter initiatives that require a majority vote of the people before agricultural land or open space can be rezoned for development.
- Both Riverside and Imperial Counties have implemented thoughtful conservation plans that aim to protect thousands upon thousands of acres as development and transportation projects advance.

While cities and counties participated in land preservation, conservation based non-profits have also contributed, delivering numerous park bonds, public and private conservation dollars, and acquisition and restoration projects that benefit our region. It is a disservice to limit acknowledgement of the conservation efforts to only municipalities. Therefore, we propose these modifications:

Proposed Modification (Plan, Pg. 36)

Many counties, *cities* and ~~cities~~ *conservation groups* in Southern California have excelled in their work to protect these vulnerable lands, but few plans or policies have been enacted to preserve habitat and farmlands on a regional scale.

Proposed Modification (N&FL Appendix, Pg. 4)

For the past several years, many of the SCAG region’s local governments, *public agencies* and ~~public agencies~~ *conservation groups* have taken action to conserve natural and farmlands through a number of policies and programs.

Chapter 3: A Path to Greater Access, Mobility & Sustainability

We hope that the Sustainable Community Strategies, specifically those listed in the Green Region, can be implemented across the Southland. The Plan’s goal is to “avoid growth in wetlands, wildlife corridors, biodiverse areas, wildfire prone areas, and flood plains” (Pg. 55). We fully support this, but remind SCAG that all of Southern California is part of the California Floristic Province—making the entire geography a “biodiverse area” that is threatened with development.

Further, many of our state and federally listed threatened and endangered species reside in our (protected and unprotected) natural areas. Decisions about what happens to the landscape (land use conversion) where these sensitive species live starts with local land use planners. Efforts are underway to list additional species on the California endangered species list, including the subspecies of mountain lion found in the Santa Ana Mountains. Without connections between open spaces, this local cougar population will face the genetic consequences of inbreeding and will

eventually the population will die out. Again, these connections between open spaces come back to land use decisions.

While we appreciate the link this plan provides between environmental mitigation and transportation planning (Pg. 58)—it is high time that all infrastructure projects provide that link. RAMPs should also be incorporated for water, electric, solar, wastewater, natural gas, and other infrastructure. All of these projects have environmental impacts. As an example, the Central Valley and Sacramento Valley RAMP Pilot Program linked both road and water projects in a RAMP. We are asking SCAG to expand the list in this section to more than just transportation projects so that the impacts of all projects are thoughtfully and comprehensively mitigated. Accordingly, we propose the following modifications:

Proposed Modification (Plan, Pg. 58)

Advance mitigation also benefits ~~transportation~~ *all* agencies with a more efficient permitting process, as well as reduced cost escalation and project delay. Regional advance mitigation planning takes this concept further and establishes inventories of anticipated impacts from ~~transportation~~ *infrastructure* projects across the region.

Chapter 6: Looking Ahead

We agree with the statement made on page 150: “Real progress can be made towards sustainable results over the next twenty-five years if cities and counties are equipped with sufficient resources and practical tools.” Unfortunately, we have found in our interactions with local cities and the County of Orange, that not only do their general plans not support this concept, but neither do the zoning codes. Further, in many instances, the planners, planning commissions, and city councils/boards of supervisors do not have a clear understanding of what “sustainable” actually means. SCAG is in a perfect position to serve as a clearinghouse for innovative policies, programs, sustainability efforts, etc., through its Toolbox Tuesday webinars or other training opportunities. As they say, “you don’t know what you don’t know.” We strongly recommend that SCAG use its regional leadership position and resources to teach, train, and educate.

Sustainable Communities Strategy (SCS)

We agree that development is occurring at the fringes of the urbanized region and in many instances these are places that (1) burn frequently, (2) lack appropriate infrastructure for houses, and (3) promote the single occupant vehicle habit. We suggest providing information to local cities and counties about how these fringe developments **add** GHG and VMT and that conservation of that land reduces those impacts. A landowner’s decision to sell their land for conservation supports private property rights and local control.

As it relates to the climate change issues raised (Pg. 3)—we appreciate your acknowledgement of these issues (extreme heat, sea level rise, wildfire frequency, and changing rainfall levels).

However, we are concerned at how the NIMBY (Not in my Backyard) and public opposition to projects was framed in the SCS. While we are aware that residents may oppose projects for any number of reasons, but finger pointing to NIMBYs as the problem isn’t helpful.

Trust in government is at an all-time low, and yet resident engagement is increasing. Any local opposition is tagged NIMBYism. And, the connotation behind the word “public” remains negative. Often times, residents’ main goal is to achieve a balanced policy solution to their concerns, and local activism on a controversial project should be seen as an opportunity for convening a public policy discussion on key issues. It appears that what decision makers perceive as frustration by the public is really a lack of tools deployed to resolve the issues. Training opportunities for decision makers exist that could help bridge this gap are offered by the Public Policy Institute of Pepperdine, as one example.

Further, every city in the SCAG region should have a goal to become a “responsive government” that pays attention to the residents, businesses, and visitors. Engaging the residents in goal setting is essential to creating a shared outcome that aligns the community, business, and city’s interests—a view *everyone* can support. A good public process includes not only results in a cost effective, timely, and goal-oriented process, but it also considers the culture and history of the topic. The latter seems to be consistently missing from the dialogue. Further, adhering to the policies set in the general plan or zoning code need to be followed or the expectations about a project shift based on the whim of the project applicant.

Residents, businesses, developers, decision makers, and staff all use the governing general plan as tool for understanding what is in store for the community now and in the future. This “rule book” is like a compact between developers, the local government, and residents. It sets the stage for future development and change and offers predictability. Residents often find themselves at odds with projects because developers ask for modifications to the “rule book.” In other words, what the developer wants is not what is codified in the general plan, and so they opt to change the plan—instead of changing the project. This changes the playing field for every project and makes the work that has gone into the general plan moot. Perhaps more importantly, the community’s compact with the governing agency is broken and trust can be lost.

There are many instances where we (the “public”) provide numerous solutions to the problems a particular development faces—and when it comes time to vote on a project, our leaders ignore those suggestions. If there were better training for elected officials on how to interact with the public, address concerns, and listen—many of the issues could be resolved. This type of “blind eye” mentality only perpetuates the “blame game” that public involvement is bad and only leads to opposition.

Within the “Final Growth Vision” (Pg. 22) the SCS states: “...decisions about how growth will actually occur are up to each local jurisdiction.” In other words, the cities can ignore the goals of this plan and do what they want. This is why our point about educating the local jurisdictions about opportunities related to transportation, housing, land use, and conservation are so very important. It is more difficult to ignore good policy when you understand it and its impacts.

One of the items that seems lacking from the “Protect the Environment and Conserve Natural Resources” section (Pg. 24) is that when land is consumed (converted from greenfield to urban uses), GHG emissions and VMT are increased. This should be acknowledged—or alternatively state that leaving natural lands in their existing state sequesters carbon instead of emitting carbon. We suggest the following modifications:

Proposed Modification (SCS, Pg. 24)

By contrast, a pattern that places a greater share of new growth in dispersed standard development patterns consumes more greenfield land. *Additionally, converting greenfield and agricultural lands typically adds GHG and VMT to the region.*

We support the approach to this plan to avoid high hazard areas for wildland fires, sea level rise, flooding, etc. The less we build in those locations, the less we have to defend them and rebuild them in the future.

Within the “Promote a Green Region” (Pg. 27), “reducing consumption of resource areas, including agricultural areas” does not actually protect the land. The conservation mechanism is missing.

Proposed Policy Modification (SCS, Pg. 27)

“Protect ~~Reducing consumption of~~ resource areas, including agricultural land.”

This gets at the same intent (not converting it to urban uses), but actually takes the step forward of protecting it so the possibility of future potential conversions never has to happen again.

Page 29 covers the “Tools” that can be used to help with sustainable placemaking, specifically urban heat island reduction. This component easily benefits disadvantaged communities throughout the Southland and should be incorporated as a tool for the Environmental Justice Appendix. Inclusion of trees makes urban areas cooler, provides more shade for those on bike or foot, improves the sense of community, and cleans the air.

FHBP supports, in full, the absolute constraint (Pg. 32) that growth cannot or should not occur in existing open spaces or on conserved land. We would urge that easement lands and mitigation sites also get included in this list. As for the variable constraints, we agree with this list as well—especially the inclusion of wildland-urban interface and wildfire prone areas (Calfire Very High Fire Severity Zones).

Proposed Policy Modification (SCS, Pg. 32)

- *Conserved and easement lands, as well as mitigation sites*

On Page 33, the list of Data and GIS Maps referenced in this document are helpful. We’d offer the California Conservation Easement Database (CCED) as a future tool. It can be found at: <https://www.calands.org/cced/>.

Demographics and Growth Forecast Appendix

Within the Demographics and Growth Forecast Appendix, it states:

“Following public input and SCAG’s analysis of the GHG/VMT benefits of the alternative scenarios, a preferred growth forecast scenario was chosen which prioritizes

growth in areas such as job centers and transit priority areas which have regional transportation benefits. (see **EXHIBITS 1-9**.)”

Exhibits 1-9 appear in conflict with the description of the “absolute constraints.” For example, the absolute constraint of not building in existing open spaces or on conserved lands (as described in the SCS, Pg. 32) conflicts with the growth forecast areas. We recognize these growth forecasts were built using the transportation area zones (TAZ) and those zones that do not necessarily align with boundaries of conserved lands, but, these maps provide a false projection of growth in the region and within specific TAZs. The map should depict what is and is not an area of absolute constraint to align with what has been stated previously about where growth can and cannot occur.

Natural & Farmlands Appendix

Vision

FHBP supports the inclusion of natural and farmland preservation as a tool to reduce GHG and VMT. However, we are concerned that the goal of “Promote conservation of natural and agricultural lands and restoration of habitats” lacks the specific actions needed to actually conserve land. We suggest an action-oriented emphasis like “conserve” or “partner to conserve...” as follows:

Proposed Modification (N&FL Appendix, Pg. 2)

~~“Promote conservation of~~ *Conserve* natural and agricultural lands and ~~restoration of~~ habitats.”

Proposed Modification (Plan, Pg. 9)

~~“Promote conservation of~~ *Conserve* natural and agricultural lands and ~~restoration of~~ habitats.”

Further, FHBP just completed a yearlong study of restoration projects and their rate of success or failure. What we found was that most projects struggled to meet the mitigation measure requirements necessary under the California Environmental Quality Act (CEQA). In several instances (Pg. 2 & 11), the Appendix mentions removing non-native plants. Our study shows that this goal was part of the restoration project too, but the non-native seed bank was able to outcompete the native plants and dominate the landscape after the restoration. So, while improving habitats through removal of non-native plants is a commendable goal, it can be difficult for some to achieve without the proper site preparation, funding, experience, long-term stewardship, etc. Since restoration is a possible focus of this policy, we encourage SCAG to review the information and recommendations from our study. It can be accessed at: <https://www.fhbp.org/resources/studies-reports/ceqa-mitigation-study/>.

Policy & Regulatory Framework

As noted previously under Chapter 2 (the Plan), it is not prudent to rely on cities and counties (1) to protect our natural lands, or (2) to develop plans and policies to conserve them. Specific actions must be taken to ensure the preservation happens in perpetuity—acquisition and

ownership by a park/non-profit, a conservation or agricultural easement, or enrollment in a Conservation Plan.

Regional Conservation Approach

De-emphasizing growth in wetlands, wildlife corridors, and wildfire prone areas is a great step in identifying areas of regional importance. SCAG should consider supporting local, regional, and statewide efforts already underway in the conservation arena—especially where broad coalitions already exist. Along these lines, we suggest the following modification:

Proposed Modification (Plan, Pg. 9)

“To further prioritize natural habitat areas and avoid impacts to the environment, Connect SoCal will seek to deemphasize growth in wetlands, wildlife corridors, high-biodiversity areas, wildfire prone areas, and floodplains. *Aligning SCAG’s role and support with those of local, regional, and statewide conservation efforts is another opportunity.* This approach intends to focus regional growth in existing communities, and reflects various goals of the plan such as adapting to a changing climate and promoting conservation of agriculture and natural lands.”

For example, the Coast to Cleveland Connection focuses on connecting the 22,000+ acres of the Laguna Coast to the Santa Ana Mountains. Efforts are underway with the resource agencies, cities, transportation agencies, non-profits, and park managers to make this happen. When these partnerships are available, SCAG should support them.

Another example is the Hillside Open Space and Education Coalition, which, in 2004, united the cities of Brea, La Habra, La Habra Heights, and Whittier and the unincorporated communities of Hacienda Heights and Rowland Heights. The goal was to seek ways to preserve strategic hillside parcels in the Puente-Chino Hills and to mobilize public resources to preserve and acquire the parcels threatened by development. This Coalition is working with State Parks, local cities, residents, and non-profits. Again, this is another opportunity to support an existing effort—if and when the need arises.

Conservation Policies and Programs in the SCAG Region

We were pleased to see the addition of Agrihoods, the Liberty Canyon Wildlife Crossing, and Ventura County Habitat Connectivity and Wildlife Corridor Ordinance in the lineup of new activities being undertaken in the SCAG region.

For the Orange County Transportation *Authority* (not *Association* as listed on Pg. 14 of the N&FL Appendix), it may be helpful to provide context that the funding available in the Environmental Mitigation Program is five percent of the freeway revenues, which in 2005 dollars was \$243.5 million.

Proposed Modification (Plan, Pg. 9)

“Thirty million dollars for approximately 1,300 acres of land and \$10 million on 350 acres of habitat restoration have been funded through Measure M2. *The Measure provides five percent (\$243.5M in 2005 dollars) of the freeway revenues to fund this program.*”

On Page 16 the first paragraph indicates there are five adopted major conservation plans, but actually demonstrates in the text there are six. This should be corrected as follows:

Proposed Modification (N&FL Appendix, Pg. 16)

“Currently, there are ~~five~~ *six* adopted major conservation plans made up of multiple jurisdictions within SCAG’s boundaries (**EXHIBIT 5**).”

Within the OCTA Measure M2 NCCP/HCP, there have actually been 12 restoration projects funded. The addition of dam removal projects within the Cleveland National Forest were approved by OCTA’s Environmental Oversight Committee in May 2016 and the full OCTA board in February 2017.

Proposed Modification (N&FL Appendix, Pg. 16)

“Since the initial funding round in 2010, 1,300 acres of natural lands have been acquired and ~~eleven~~ *twelve* restoration projects have been funded.”

Exhibit 5 fails to include the Southern HCP in Orange County. Since the OCTA Plan overlays the entirety of both the Central-Coastal and Southern Plans, it may be helpful to have the OCTA plan displayed in a patterned texture on top of the other Orange County plans.

Opportunities

We are pleased to see the inclusion of an opportunities section within the Appendix (Pg. 18). However, we’d like to see this section expanded to more than just the Greenhouse Gas Reduction Fund (GGRF) Resources—there are many other tools, strategies, and techniques that can be utilized to conserve natural lands and simultaneously reduce GHG and VMT. Some other funding sources to conserve natural lands are listed in the Environmental Coalition letter to be submitted January 23, 2020.

Additionally, FHBP completed a study of innovative ways to link housing, transportation, and conservation through policies and funding mechanisms. This study is available for download at: <https://www.fhbp.org/resources/studies-reports/healthy-communities-toolkit/>.

The tools mentioned include items such as:

- Urban Growth Boundaries
- Crowdfunding
- Social Impact Bonds
- Real Estate Transfer Fees
- Community Benefit Fees
- Landfill Tipping Fees
- Differential Development Fees

We recommend extending past the GGRF as the only listed source to support the conservation of natural resources—as there are many others that currently exist at the local, regional, state, and federal level.

Recommended Policies

We have been a supporter of SCAG and its efforts to include natural land preservation in the RTP/SCS. However, we were disappointed to see that of the 10 policies recommended in the Natural and Farmlands Appendix all 10 policies were replicated word for word from the 2016 Appendix. It is as if no further thought into how the natural world has changed or where the locations of intense development pressure now exist. In the four years since the last plan, new policy recommendations could have been created and incorporated. New policies could be pulled from the list above described in the Opportunities section. We recognize that there may be an internal issue with adding “new” policies in an appendix that aren’t captured in the RTP or SCS itself. One solution to this is to rename the section “Strategies” because what is included in the list are actually implementation strategies for achieving a reduction in GHG and VMT using land conservation and restoration as a tool.

Next Steps

Of the five “Next Steps” described in the Appendix, three of them were from the 2016 plan. The only creative next step is the development of the regional greenprint, as SCAG is already engaging stakeholders via the Working Group. What we would have expected from the Next Steps section is a forward advancement of the 2016 activities. Our suggestions are below.

“Encourage Advance Mitigation Programs” could have forward motion by:

- Identifying infrastructure agencies about to adopt major programs/policies that could incorporate these advance mitigation programs.
- Working to retroactively adopt mitigation programs or policies within existing transportation measures.

“Align with Funding Opportunities and Pilot Programs” could have forward motion by:

- Assisting local agencies with tax increment financing measures that include conservation and parks as a key goal.
- Apply for state or federal conservation funding to complete projects of regional and/or statewide significance.
- Launch a pilot program that advances sustainable activities like water quality improvements, natural land acquisition, agricultural easement purchases, or restoration project implementation.
- Feature conservation funding in a Toolbox Tuesday for how local jurisdictions and/or non-profits can fund local projects.

“Provide Incentives for Jurisdictions to Work Across County Lines” could have forward motion by:

- Engaging with cross-jurisdictional conservation alliances to add support, value, and funding to the effort.
- Focus SCAG grants on conservation projects of regional significance as a tool for connecting habitat lands together cross-jurisdictionally.
- Identify locations where cross-jurisdictional alliances should exist and bring the parties together.

Thank you for the opportunity to comment the Connect SoCal documents. We hope our feedback is constructive and helps SCAG achieve its overarching goal of 714-964-0516.

Sincerely,

Michael Wellborn
President

January 20, 2020

Dear Connect SoCal Team:

Thank you for the opportunity to comment on the Southern California Association of Governments (SCAG) 2020 Regional Transportation Plan (RTP) and Sustainable Community Strategy (SCS) (collectively called Connect SoCal). In 2012, with release of the prior RTP/SCS, Friends of Harbors, Beaches and Parks coordinated a cross-county regional conservation coalition focused on the inclusion of natural lands mitigation and policies within that SCAG plan. Our organization, Sierra Club's Hobo Aliso Task Force is now a part of this growing coalition in 2020.

The Hobo Aliso Task Force works in Orange County and has since 2001. Our mission is to protect and preserve finite natural resources and uphold the Coastal Act and other applicable laws and policies that support our mission. We have had important successes since our inception including saving many acres of land from develop, protecting and preserving ESHA and endangered species from poorly planned fuel modification, and implementing crucial restoration projects to bolster the biodiversity in areas that are considered hot spots.

We offer the following comments on the Natural and Farmland policy, goals, and next steps.

We are pleased to see conservation of our natural and agricultural lands as one of the 10 main policies of Connect SoCal. Land preservation that not only reduces greenhouse gas (GHG) emissions, but also sequesters carbon. Any investment in habitat restoration improves this sequestration potential as well. When land is left in its natural state, no new "vehicle miles travelled" are added to the region's transportation system. We believe including land conservation is a step in the right direction. SCAG has demonstrated that Metropolitan Planning Organizations can play a vital, thoughtful, and science-based role in mitigating impacts to our natural environment from transportation, infrastructure, and other development projects. By incorporating natural and farmlands protection strategies into your policy document, we believe the many benefits of this broad-based conservation approach will be realized sooner than expected. Thank you for your leadership.

Our organization supports the idea that as new growth occurs it should be focused in existing city-centers and near transit. When developments are built in the city center, it relieves pressure from the fringe.

However, the Plan fails to outline exactly how (or with what conservation mechanism) these fringe lands (or any lands) will actually be protected. Just because the pressure is relieved by focusing development elsewhere, doesn't mean the land then automatically becomes protected. We know this is a fact due to multiple experiences our organization has experienced. Numerous organizations, ours included, focus our work on protecting important habitat lands. A lot of time, energy, money, strategy, and political will are combined to create a successful conservation transaction that lead to permanently conserved lands. And once the land is conserved, it needs care and attention, AND ongoing protection. Further, just because local agencies may be contributing to the conservation arena, in no way should you discount the roles of the conservation non-profit community. In short, SCAG must identify the actual mechanism, process or plan on how the greenfields and agricultural lands will be protected.

Many of the benefits of open space and parkland have been outlined in the Plan and Natural Lands Appendix. In addition, there are many economic benefits of open space. These are realized through increased property values, ecosystem services, support of local businesses through park visitor purchases, and a reduction in the urban heat island effect. Further, conservation of natural lands has many on-the-ground co-benefits like access to recreational opportunities, preservation of important habitats and species, protection of cultural and archeological sites, increased job opportunities, protection of threatened/endangered species, and environmental education experiences. Our natural lands also filter water, clean the air, and provide homes for wildlife. Natural lands preservation also protects our watersheds, rivers, and water sources. Voters consistently support measures that benefit their local water resources. And last, but not least, our future generations must not be forgotten – they too must have open space and parkland. Our children have taken to the streets to let adults know how much they care about the planet, we must support them and make sure we are doing our very best to protect and preserve our finite natural resources.

The Plan outlines that the region anticipates an additional 3.8 million people by 2045 providing increased pressure to our existing parkland. Existing studies document that many communities in the Southern California region already do not have enough parkland as outlined by the Quimby Act (five acres per 1000 residents). As cities grow, more parks and more park access will be needed. What is the mechanism for this? Additionally, and more importantly, these city parks are fundamentally different than habitat-focused parks. Usually city and regional parks include high intensity activities, like turfed soccer and baseball fields. The types of land acquired as mitigation or through local conservation efforts typically focus on preservation of natural habitat and less intensive uses (birding, hiking, etc.). In fact, many of these mitigation lands have limited or managed public access. Providing “more” access to either high or low intensity parks and/or habitat lands may have significant consequences for the land manager. How additional access will be provided should be addressed, as well as how additional lands will actually be preserved.

Wildlife corridors are getting more and more attention these days. Ensuring survival of the top predator and the suite of species in the ecosystem means our natural lands must also maintain environmental functions, be sustainable over the long term, and include plans for long-term stewardship. The issue is that many housing and transportation projects eliminate the wildlife movement corridors and fragment the landscapes into smaller, less viable pieces of land, or they completely ignore the need for these corridors. Ensuring our open spaces are connected to one another is essential for species survival. Wildlife corridors allow landscapes to maintain ecological functions, allow places for regeneration after natural disasters such as fire, flood or landslide, and improve the resiliency in the face of climate change impacts. The Plan would be stronger if it supported the enhancement of and/or protection of documented wildlife corridors prior to commencing impactful projects.

1

Many non-profits are working to ensure additional bays, estuaries, wetlands, bluffs, and beaches are preserved forever. Additionally, one way our coasts are connected to inland areas are through our rivers and streams. These riparian areas serve as recreational trail corridors, water recharge and infiltration locations, and serve as places our wildlife use for watering sources. However, transportation and land use generated urban runoff are still problems. Our beaches and coastline are inundated with pollution, and a 303(d) listing is simply not acceptable, and can be prevented. Litter, debris, and pollutants should be decreased prior to reaching the coast. Ensuring everyone has a positive experience on the sand and in the surf should be our goal and is our collective responsibility, but we need to address Southern California's trash and contaminants problem.

One key way to improve the environment is through restoration projects. Our organization works very hard at finding creative ways to fund and maintain restoration projects. These can be on land, in riparian areas, on the beach, as well as in the ocean. Restoration provides benefits by adding native plants, removing the non-native plants and their seedbank, as well as increasing carbon storage, and providing improved habitats for our wildlife. Our environment benefits from these improvements, as do our watersheds, our air, and our communities. Having improved habitats means that our water is cleaner, our soils won't erode as easily, it creates jobs for local residents, and our unique biodiversity is maintained. Further, the many endemic and threatened/endangered plants and animals benefit from these restoration projects as well. Thank you for including restoration as a key component in the natural lands and agricultural policy.

Thank you for reviewing our comments and we look forward to working with SCAG on the implementation of this Plan, especially as it relates to the conservation policy and Natural and Farmlands Appendix. Should you need to contact me, I can be reached at . In addition, we request to be included on any notifications (electronic or otherwise) about this policy's creation and implementation, please send information to

Sincerely,

California Cultural Resource Preservation Alliance, Inc.
An alliance of American Indian and scientific communities working for
the preservation of archaeological sites and other cultural resources.

Dear Connect SoCal Team:

Thank you for the opportunity to comment on the Southern California Association of Governments (SCAG) 2020 Regional Transportation Plan (RTP) and Sustainable Community Strategy (SCS) (collectively called Connect SoCal). In 2012, with release of the prior RTP/SCS, Friends of Harbors, Beaches and Parks coordinated a cross-county regional conservation coalition focused on the inclusion of natural lands mitigation and policies within that SCAG plan. Our organization, California Cultural Resource Preservation Alliance, Inc. (CCRPA), is now a part of this growing coalition in 2020.

CCRPA works in Los Angeles and Orange counties and has since 1998. Our mission is to protect and preserve cultural resources such as sacred sites, archaeological sites, historic sites, and Traditional Cultural Places in Southern California with a focus on Orange and Los Angeles Counties. Preservation of natural and farmland results in the preservation of these cultural resources. We have had important successes since our inception including the preservation of the 100-acre, 7,000-year-old Tomato Springs site in east Irvine.

We offer the following comments on the Natural and Farmland policy, goals, and next steps.

Many of the benefits of open space and parkland have been outlined in the Plan and Natural Lands Appendix. We wish to make sure that the protection of cultural resources is not overlooked. It has been estimated that 90% of archaeological sites in southern California have been destroyed to make way for development. We strongly support the preservation of open space as the means of protecting the remaining cultural and archaeological sites that are an important part of our national patrimony. In addition, there are many economic benefits of open space. These are realized through increased property values, ecosystem services, support of local businesses through park visitor purchases, and a reduction in the urban heat island effect. Further, conservation of natural lands has many on-the-ground co-benefits like access to recreational opportunities, preservation of important habitats and species, increased job opportunities, protection of threatened/endangered species, and environmental education experiences. Our natural lands also filter water, clean the air, and provide homes for wildlife. Natural lands preservation also protects our watersheds, rivers, and water sources. Voters consistently support measures that benefit their local water resources.

The plan outlines that the region anticipates an additional 3.8 million people by 2045 providing increased pressure to our existing parkland. Existing studies document that many communities in the Southern California region already do not have enough parkland as outlined by the Quimby Act (five acres per 1000 residents). As cities grow, more parks and more park access will be needed. What is the

Cheers

Connect SoCal Plan

- Page 9: The Goals need to be re-ordered. It would be great for current #6 to move to the top spot and #1 to move down quite a bit.
- Page 129: Outcome 2 lacks measures for active transportation delay.
- Page 138: plan has too much business-as-usual to reasonably expect to meet GHG Emissions Reduction targets and electrification shouldn't be seen as the magical panacea that will waltz into town over the next decade to cure the problem of relying too much on cars.

Active Transportation Appendix

- Page 8: There might be decisions to be made about phasing as we retrofit the legacy of the existing environment, but the expectation needs to be that bicycle and pedestrian infrastructure will be at a minimum, built everywhere roads are paved.
- Page 13: Gentrification concerns are real, but they arise due to an absolute dearth of quality active transportation infrastructure in essentially the entire SCAG region. Thus, the construction of any amenities are unfortunately also going to be likely to attract people who can afford to spend more on housing and to the extent that it also allows them to reduce car use and free up household cashflow, that can find its way into the local economy, giving it a boost. However, especially given the safety issues, we cannot let fears of gentrification dominate the ability to provide safety improvements via improved bicycle and pedestrian infrastructure and indeed, research by Lusk et al. has identified that residents of lower-income communities are still quite interested in high-quality bike facilities.¹ Instead, it makes it even more important to make them basic expectations by including them in all standard plans for new build and refurbishments as well as prioritizing expanding the networks of the provisions as fast as possible to lessen the potential for any one neighborhood or community bearing the brunt of the changes in a particular area.
- Page 14
 - GoHuman is an invaluable tool for improving Public Opinion and should receive more funding to be able to do more events to help showcase both short-term and more permanent investments. However, as mentioned in the comments on gentrification, there is a need to move beyond small pilots both to avoid gentrification concerns as well as to maximize the potential by way of expanding improvements to be within reach of more communities.
 - Given the lack of funding, what is available needs to be directed to where it will provide the maximum impact. That makes it absolutely essential to provide best practice accommodation for bicyclists and pedestrians in standards to make them a routine part of ongoing projects. That also could help address Public Opinion by changing the framing of the situation. There will not be controversy at all over something that has existed from the beginning.

¹ Lusk et al. (2017). Biking practices and preferences in a lower income, primarily minority neighborhood: Learning what residents want.

- Page 24: Cost Assumptions & Mode Shift should look at national and international guidance and experiences as well as take a clear-eyed approach to the topic. Many of the current bike facilities in the region are simply not on par with best practices of even yesteryear in places that have substantially more ridership. In addition, a number of studies have identified the potential improvements that would come from including world-class infrastructure, particularly when done to form entire networks to connect to destinations and transit.²³ That literature should be reviewed to identify the true potential for better investments based on the completeness of networks (including by filling in critical gaps) and by building the infrastructure itself to higher standards (e.g. a six-foot bike lane next to a multilane arterial is NOT best-practice).
- Page 31: As noted above, additional research by Lusk et al. has identified that there is great interest for improved bike facilities in low(er)-income communities, the same communities that Connect SoCal already notes are more likely to have people biking even as they're also less safe. These facts should be leaned on more heavily, not in a patronizing way, but to impart the importance of making the changes necessary to support riders. That ultimately is a point directly related to the next section on Environmental Justice.
- Page 44: A discussion about Class III bikeways being part of the total needs to be had because the classification is too ambiguous and a number of jurisdictions simply use it as an excuse to not do anything meaningful and they remain high-stress environments under the LTS system developed by Furth referenced elsewhere in the document.
- Page 51: Broadly speaking, micromobility is best served by what is traditionally known as bike infrastructure. However, legal definitions mean that use by those modes is technically illegal because certain facilities are defined as being for the exclusive use of bicycles. Nevertheless, the bike facilities are still the best place for most of them to be used, but they do underscore the importance of adequate designs for bikeways, something which has not necessarily been anywhere close to truly taken to heart in the region in all but a scant few projects.
- Page 59: It's encouraging to see that the Local Bikeway Infrastructure component recognizes that big changes will be necessary in some areas and the four Strategies listed will if followed, all be influential in creating the positive changes necessary. However, an additional Strategy is needed to ensure that any and all new-build developments are built to avoid the need for retrofits in the first place. Such a Strategy needs to emphasize providing direct connections to transit, including with parking at transit stops and stations, and local destinations as well as laying out an integrated network as part of the initial planning and design of **all** greenfield and large-scale brown-/greyfield projects in the region.
- Page 60: Though called "first-last mile," it should be acknowledged that with bikes and especially e-mobility devices, that distance can reasonably and easily be extended to be several miles. Thus, it would be helpful to identify a FLM Infrastructure Strategy to target

² Lowry, Furth, & Hadden-Loh. (2016). Prioritizing new bicycle facilities to improve low-stress network connectivity.

³ Karens. (2007). Promoting bike-and-ride: The Dutch experience.

bike infrastructure to an increased radius around stations beyond a single mile and place priority on making sure it offers users as few necessary stops as possible.

- Page 63: Complete Streets Strategies need to place a focus on making sure that the plans include defined and recognized low-stress facilities and networks.
- Page 69: Table 11 lists changes under Connect SoCal that are appallingly anemic. Research from London's work shows that even in suburban areas, changes can have broad impacts and substantially increase walking and biking.⁴
- Page 82: Table 12, Colton has completed their ATP.

Aviation and Airport Ground Access Appendix

- Page 8: Section about KONT trails off mid-sentence.
- Page 34: There are additional opportunities to provide rail access to KONT that merit serious consideration. Those are described in my comments on the Passenger Rail Appendix below.

Highways & Arterials Appendix

- Page 13: The regional express/HOT lane network is pathetically inadequate at present and the plans fall FAR short of what is needed. **Every** single limited-access highway in the entire region that has more than two travel lanes per direction should *immediately* have at least one (but preferably two if available) of the additional lanes **converted** to be HOT lanes, with the revenue being reinvested into maintenance needs, active transportation infrastructure, and transit service in the corridors. Doing so would be the single-most cost-effective measure possible to dramatically improve the congestion issues in the region while also greatly expanding the options available to people by filling critical funding gaps that currently exist for active transportation, transit, and even arterial/highway investments.
- Pages 17 & 18: Performance results need to include delay incurred by bicyclists and pedestrians, particularly the impact that signal timing issues have on the latter group.

Passenger Rail Appendix

- Page 7: The Thruway services mentioned in the Pacific Surfliner subsection can now (or will soon be possible to) be booked as standalone trips without a linking rail segment thanks to SB742 which Gov. Newsom signed into law last year.
- Page 12: Metrolink should work with local partners to improve the bike parking at its stations.
- Page 20: SCRRA section notes that "VCTC has one votes" which should presumably be singular.
- Page 24: The segment on the Metrolink San Bernardino Line is also true for the Metrolink Inland Empire/Orange County Line, so it should be mentioned as well.

⁴ Alred, Croft, & Goodman. (2019). Impacts of an active travel intervention with a cycling focus in a suburban context: One-year findings from an evaluation of London's in-progress mini-Hollands programme.

- Page 27: Discussion of Los Angeles to Coachella Valley service needs to include planning to bridge the gap between the tracks into Redlands which will soon host Redlands Rail and the UP Yuma Subdivision. Doing so would allow passenger service from LA to the Coachella Valley to serve both Riverside *and* San Bernardino via the same trains as well as provide more direct service directly into LA via the agency-owned tracks of the San Bernardino Line. The most logical place to do so is likely along California Ave. on the border between Loma Linda and Redlands. The inclusion of a station in the vicinity of the Barton Rd./CA Ave. intersection would provide easy access to the community and be a valuable point for extending Omnitrans' sbX Green Line service from its current terminus at the VA hospital in Loma Linda, serving daily commuters traveling to Loma Linda University's campuses as well as into Redlands via the existing fixed-route services. This is an urgent and critical gap to fill to vastly improve transit service in the entirety of the SCAG region and beyond as it would be a natural part of the Southwest High-Speed Rail Network discussed on Page 28. Also, service beyond Indio into Imperial County should be considered. The new DMU options that are now available make it more realistic to serve that market and provide service all the way to Calexico using the existing right-of-way. UP will undoubtedly be a significant barrier and their single-tracked corridor of the Yuma Subdivision from east of Indio will be a problem for many opportunities to improve transit throughout the SCAG region, so a plan should be made to at a minimum, provide additional sidings and double-track through that area to mitigate their concerns.
- Page 28: Southwest High-Speed Rail Network would derive immense benefit from a "California Connector" to be constructed on the Loma Linda/Redlands border to bridge the gap between the UP Yuma Subdivision and the agency-owned tracks approximately a mile north which would provide expedited services and transfer opportunities to LA, Riverside, San Bernardino, and beyond.
- Page 34: There is an opportunity directly east of Ontario Airport to provide a rail connection along Haven Ave. that would link the UP Alhambra Subdivision to the UP Los Angeles Subdivision. That would enable a reroute of the Riverside Line trains over that alignment and provide comparatively immediate relief to the current lack of any direct rail connection at the airport. It would also present the ability to provide residents living in downtown Ontario daily Metrolink service, a connection which they currently lack. Doing so would support the Transformative Communities grant that the City already received and is implementing by adding additional high-quality transit service. However, in the longer-term, rail service to ONT would be best provided by an entirely new Metrolink line. This San Gabriel Valley/KONT Line would leverage public investments in the Alameda Corridor-East program to provide a competitive running time for the service. An ideal routing would be via the UP Alhambra Subdivision with stops at the USC Keck School of Medicine Hospital complex, El Monte, which would provide transfer opportunities to the Metrolink San Bernardino Line, a Cal Poly Pomona station, Downtown Pomona, Downtown Ontario, and Ontario Airport. From there, the first option would be to continue to Riverside and on to Perris, but a second option would be to route some trains north to the existing San Bernardino Line tracks via either an existing

siding by the Fontana Speedway, the UP Palmdale Subdivision, or the BNSF San Bernardino Subdivision through Colton. Exactly which of those three options is the best would be determined via further study, though it's perhaps worth noting that the latter option means that there could be another station that could be added in Colton.

- Exhibit 3: The marker for improvement #5 from Table 3 is misidentified as improvement #8 and nothing identifies the marker for improvement #8.
- Page 44: The opportunities for filling gaps and providing new service identified above would presumably need to be studied, but that should be done with haste.

Albert Perdon – Email

The following input is provided for inclusion in the public comments on the 2020 PEIR. SCAG has not sufficiently analyzed or documented the environmental impacts that will result from adoption of the current draft Program Environmental Impact Report (DRAFT) for the "Connect SoCal" 2020-2045 RTP (Regional Transportation Plan/Sustainable Communities Strategy).

The reason is, the DRAFT does not take into adequate consideration the impacts that will result, both within and outside of SCAG's geographic boundaries, from implementation of the 2008 Proposition 1A bond (BOND) measure approved or not opposed by 74% of eligible voters. This measure and the law (LAW) it enacted mandates (1) quick construction of an 800-mile high-speed train (HST) system from Sacramento to San Diego and to San Francisco/Oakland, connecting and serving up to 24 new very high-density and largely auto-free new and improved cities (NEW CITIES) that are required to be planned, built and partially funded by the up to 24 NEW CITIES in coordination with the California High Speed Rail Authority, and (2) improvements to HST-connected transit systems and services of the CITIES, as defined in the LAW.

SCAG cannot use as an excuse for skirting the requirements of CEQA/NEPA, that the cities, not SCAG, are responsible for and have exclusive authority over controlling land use. Exclusive land use authority within the HST station influence areas of the CITIES is overridden by the LAW

Henry Fung

Include consideration of intercity bus, similar to passenger rail, as a mitigation of aviation impacts (i.e., Flyaway Bus to LAX, intercity bus for medium distance trips like Los Angeles to Fresno or Las Vegas).

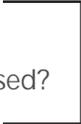

1

Discuss changes necessary to incorporate increases in density and shifts in growth after adoption of final RHNA and Housing Elements. What amendments are projected to the PEIR?

2

Jordan Sisson

When will the program EIR be released?

Re: THE 2020-2045 REGIONAL TRANSPORTATION PLAN/SUSTAINABLE COMMUNITIES STRATEGY OF THE SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENT PROGRAM ENVIRONMENTAL IMPACT REPORT

Thank you for the opportunity to comment on the *SCAG 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy Environmental Impact Report*. The Plan states as its goals:

1. *Encourage regional economic prosperity and global competitiveness*
2. *Improve mobility, accessibility, reliability, and travel safety for people and goods*
3. *Enhance the preservation, security, and resilience of the regional transportation system*
4. *Increase person and goods movement and travel choices within the transportation system*
5. *Reduce greenhouse gas emissions and improve air quality*
6. **Support healthy and equitable communities**
7. *Adapt to a changing climate and support an integrated regional development pattern and transportation network*
8. *Leverage new transportation technologies and data-driven solutions that result in more efficient travel*
9. *Encourage development of diverse housing types in areas that are supported by multiple transportation options*
10. *Promote conservation of natural and agricultural lands and restoration of habitats*

1

While I agree that supporting healthy and equitable communities for all residents is an admirable goal, the Plan, does not address the possible or probable denigration of the quality of life for the residents of San Marino due to increased traffic.

The stated environmental impact thresholds of significance include the following criteria and defers to local jurisdiction.

3.17.3 ENVIRONMENTAL IMPACTS

3.17.3.1 Thresholds of Significance

The impacts related to transportation, traffic and safety resulting from the implementation of the proposed project would be considered significant if they would exceed the following significance criteria, in accordance with Appendix G of the State CEQA Guidelines:

- **Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.**
- *Conflict or be inconsistent with CEQA Guidelines section 15064.3(b).*
- *Substantially increase hazards due to geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).*
- *Result in inadequate emergency access.*

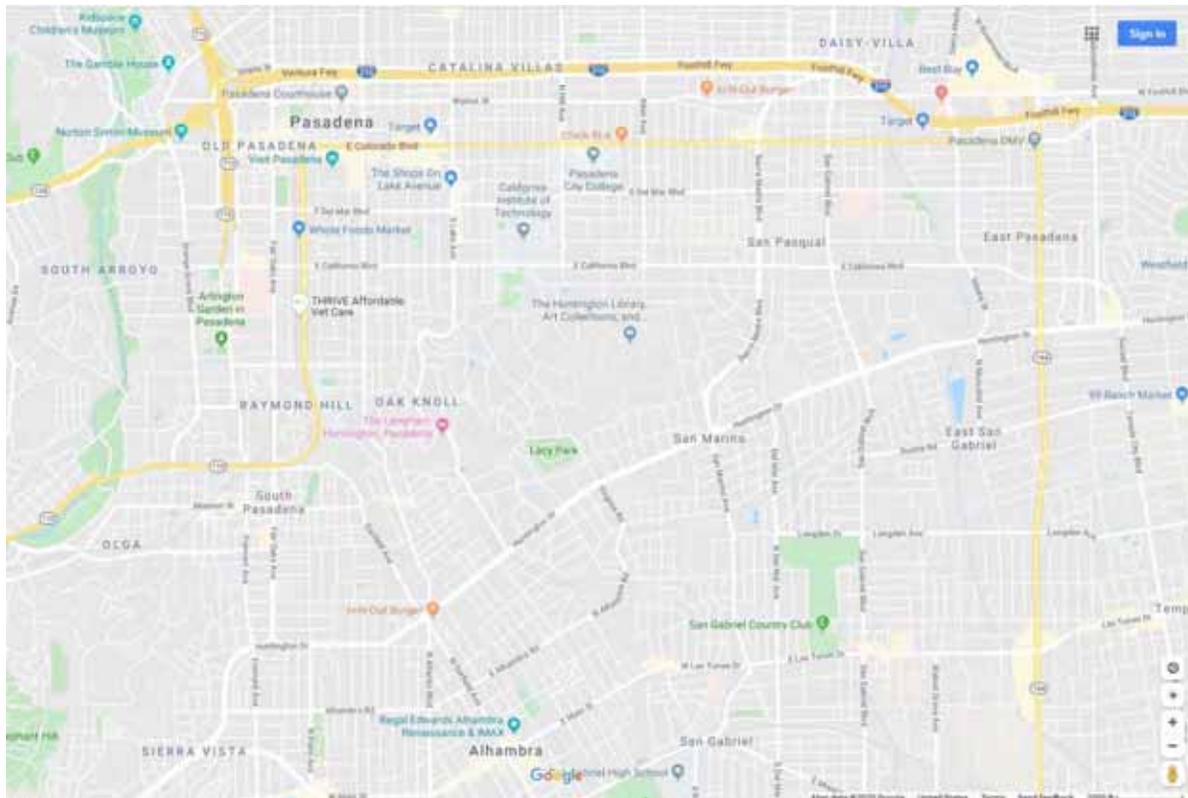

2

Planned Projects

1. There is one project located in the City of San Marino. The objective of this project is to increase traffic flow on Huntington Drive, Sierra Madre Boulevard and San Gabriel Boulevard in a residential area. We object to this project based upon its stated objective.

LOS ANGELES, LOCAL HIGHWAY, LAF7119, 1AL04, 0, \$1,445,000

HUNTINGTON DRIVE MULTIMODAL CAPACITY ENHANCEMENTS: (1) CONSTRUCT A SECOND LEFT-TURN LANE AT THE 2 INTERSECTIONS AT SAN MARINO AV AND AT SAN GRABIEL BL (EASTBOUND ON HUNTINGTON DR AND NORTHBOUND ON SAN MARINO AV AND SAN GABRIEL BL) TO INCREASE CAPACITY AND TRAFFIC FLOW. (2) MODIFIES SIGNAL TIMING TO SHORTEN THE LEFT-TURN MOVEMENT ON HUNTINGTON DR. (3) EXTENDS SIDEWALKS AND ENHANCE PEDESTRIAN FACILITIES.

3

2. The Technical Report for Highways and Arterials describes Adaptive Traffic Control Systems:

TECHNICAL REPORT HIGHWAYS AND ARTERIALS

ADAPTIVE TRAFFIC CONTROL SYSTEMS According to the AASHTO Sustainability Peer Exchange Briefing Paper (2009), Caltrans implemented Adaptive Traffic Control Systems (ATCSs) on seven corridors in Los Angeles County as a demonstration project. **Traffic signal systems that respond in real-time to changes in traffic patterns are known as "adaptive."** ATCSs continuously detect vehicular traffic volume, compute "optimal" signal timings based on detected volume and simultaneously implement them. Reacting to these volume variations generally results in reduced delays, shorter queues and decreased travel times. ATCSs are designed to overcome the limitations of pre-timed control and respond to changes in traffic flow by adjusting signal timings in accordance with fluctuations in traffic demand. The purpose of Caltrans' demonstration project is to deploy and evaluate the effectiveness of the future ATCS on the State arterial street network that experiences both

4

recurrent and non-recurrent delay. The ATCS system was shown to reduce travel time by 12.7 percent, reduce average stops by 31 percent, and decrease average delays by 21.4 percent

The following project is planned for South Pasadena. We object to this project based upon its functionality and objective of increasing traffic flow.

11TS04

SOUTH PASADENA'S ATMS, CENTRAL TCS AND FOIC FOR FAIR OAKS AV. THIS PROJECT IS LOCATED IN SOUTH PASADENA ON FAIR OAKS AV BETWEEN COLUMBIA ST AND HUNTINGTON DR. IT WILL ESTABLISH A FIBER-OPTIC BACKBONE COMMUNICATION SYSTEM CONNECTION BETWEEN 12 SIGNALS ON FAIR OAKS AV AND CITY HALL AND INSTALL THE ATMS/CENTRAL MANAGEMENT/CONTROL SYSTEM AT ITS CITY HALL BUILDING. FUNDS ARE FOR DESIGN AND CONSTRUCTION COSTS.

4

Concerns

The City of San Marino has been established as a residential community for over 100 years. It is entirely built, with no room for growth and is located in the San Gabriel valley such that an abundance of cut-through traffic utilizes the residential streets. We are being overwhelmed by ever increasing traffic. There is little in the EIR that addresses this issue. The planned projects for the surrounding areas risk negating the stated Plan goals with regard to the City of San Marino.

The increasing traffic is a public nuisance, exacerbates environmental conditions and diminishes public safety. Of particular concern to us are the following:

- Increasing northbound-southbound traffic utilizing residential streets as cut-through routes.
- Increasing eastbound-westbound traffic utilizing residential streets as cut-through routes.
- Increasing eastbound-westbound traffic utilizing Huntington Drive with significant safety risk to students and residents. Residences and six schools are located on the segment of Huntington Drive in San Marino.
- The implementation of Adaptive Traffic Control Systems.

5

The environmental impacts defer to local jurisdiction and cannot *conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities*. The SCAG Regional Transportation Plan, is just that: **regional**, and proposes many projects for increasing mobility and traffic flow, that do not originate in the city of San Marino, but will adversely affect it by increasing its ongoing operating costs, decreasing property values and diminishing the quality of life of the residents. It appears that the city of San Marino, with local jurisdiction, is left to fend for itself.

Sincerely,

Stephanie Johnson and Ghassan Roumani

 Steve Talt, Council Member, City of San Marino

10.0 CORRECTIONS AND ADDITIONS

10.1 OVERVIEW

The *California Environmental Quality Act (CEQA) Guidelines* Section 15088.5 requires:

- (a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice of its availability ... “significant new information” requiring recirculation includes, for example, a disclosure showing that:
 - (1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
 - (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
 - (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project’s proponents decline to adopt it.
 - (4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.
- (b) Recirculation is not required where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in the adequate EIR.
- (c) If the revision is limited to a few chapters or portions of the EIR, the lead agency need only recirculate the chapters or portions that have been modified.
- (d) Recirculation of an EIR requires notice pursuant to Section 15087, and consultation pursuant to Section 15086.
- (e) A decision not to recirculate an EIR must be supported by substantial evidence in the administrative record.

New information is “significant” if as a result of the additional information “the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect.” *Laurel Heights Improvement Ass’n v. Regents of Univ. of Cal.* 864 P.2d 502, 510 (1993) (*Laurel Heights II*). *State CEQA Guidelines* Section 15088.5(a). Recirculation is not mandated when the new information merely clarifies, amplifies, or makes and insignificant modification to an adequate draft EIR. (*Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova*, 150 P.3d 709 (2007) (quoting *Laurel Heights II*, 864 P.2d at 510); see also *Marin Mun. Water Dist. v. KG Land California Corp.*, 235 Cal.App.3d 1652, 1667 (1991) (citing *Sutter Sensible Planning v. Board of Supervisors* 122 Cal.App.3d 813 (1981)).

In response to public comments received, clarifications to the mitigation measures, as well as staff-initiated text changes have been made to the Draft Program EIR (“Draft PEIR”). Additional information has been identified in comments to the Draft EIR and responded to in **Chapter 9.0, Responses to Comments**, of this Final Program EIR. These changes made since publication of the Draft PEIR do not substantially affect the analysis contained in the Draft PEIR, do not result in a substantial increase in the severity of a significant impact identified in the Draft EIR and do not change the conclusions in any way.

All public comments to the Draft PEIR, as well as these Corrections and Additions to the Draft PEIR have been carefully reviewed to determine whether recirculation of the Draft PEIR is required. All the new information in these Corrections and Additions to the Draft PEIR and in the comments and in the responses to comments merely clarify or amplify or make insignificant modifications to an adequate Draft PEIR. Therefore, the Draft PEIR need not be recirculated prior to certification.

Corrections and Additions

This section consists of corrections and additions to the Draft PEIR that have resulted from responses to comments received from agencies and the public. All corrections and additions to the Draft PEIR were made to increase the understanding of the PEIR. These changes are minor and do not change the findings or conclusions of the PEIR.

The corrections and additions presented in this section provide information that is not required as a result of the following: new significant environmental impacts; substantial increases in the severity of the environmental impacts that have been proposed; the presentation of new, considerably different, and feasible alternatives or mitigation measures that would lessen the environmental impacts and were not adopted by the applicant; or the inadequacy of the Draft PEIR. The updates presented in this section are consistent with the findings as presented in the PEIR and/or are minor. In accordance with *CEQA Guidelines* Section 15088.5, recirculation of the PEIR document is not required where the new information added to the PEIR merely clarifies or amplifies or makes insignificant modifications in an adequate PEIR.

Page numbers refer to the Draft PEIR. Text deleted from the Draft PEIR is shown in strikethrough, and new text is underlined.

As noted in Chapter 8.0, Introduction, SCAG models are used to provide gross estimates of regional environmental parameters (in particular VMT, criteria pollutant emissions and GHG emissions).

However, the inputs to these models are subject to variability (location and density of land uses, travel patterns, fuel make up, pricing assumptions and many more). Because of this, minor changes to assumptions, resulting in minor changes to modeling results, are not statistically significant. Final

modeling data results from both the SCAG Regional Travel Demand Model and the Scenario Planning Model offered improved performance in some measured areas of Connect SoCal, including VMT per capita (5.0% reduction from 4.2%) and daily delay per capita (25.7% reduction from 22.4%). Several of the economic opportunity indicators also were improved by the final model runs, with the benefit/cost ratio for Connect SoCal investments increasing from 1.54 to 2.06, and the annual number of new jobs generated by improved regional economic competitiveness increasing from 195,500 to 264,500. As noted above, SCAG has made a number of refinements to the Connect SoCal Plan (as well as alternatives) including to land use patterns, transportation projects and policies. None of these refinements result in substantial changes to the information presented in the Draft PEIR, including modeling results.

Executive Summary

The first sentence under the heading “Transportation Network” on page ES-8 is revised to clarify the term “roadways.”

The region’s transportation network comprises more than 9,000 miles of public transit, 5,000 miles of bikeways, 135,578 lane miles of roadways, including highways and freeways, and 94 miles of express lanes.

The first full paragraph on page ES-9 is revised to read as follows:

There are many contributors to the overall housing shortfall, such as state regulations, zoning, costs and fees... Additionally, population and employment growth in metropolitan areas in California has slowed in recent years, in part, because wages cannot compensate for the high cost of housing.

On page ES-10, the following sentence is modified:

Since the Plan envisions ~~foresees~~ regional growth with transportation system improvements, it identifies strategies to...

On page ES-11, under the subheading for “Highway and Arterial Network,” the following sentence is clarified:

Since the Plan envisions ~~foresees~~ regional growth with transportation system improvements, it identifies strategies to...

On page ES-11, following the subheading “Highway and Arterial Network,” the following revision is made:

Highway and Arterial Network. Connect SoCal emphasizes working with partner implementing agencies to prioritize projects that preserve and optimize the existing highway and arterial network. Projects include interchange improvements, auxiliary lanes, general purpose lanes, carpool lanes, toll roads, toll lanes and Express/HOT lanes.

On page 2.0-29, and page 3.4 -85 or Section 3.4, Biological Resources, mitigation measure PMM BIO-3 sub bullet (d) is revised as follows:

- d) Where avoidance is determined to be infeasible and proposed projects’ impacts exceed an existing Nationwide Permit (NWP) and/or California SWRCB-certified NWP, and/or County Special Area Management Plans (SAMPs), the lead agency should provide USACE and SWRCB (where applicable) an alternative analysis consistent with the Least Environmentally Damaging Practicable Alternatives in this order of priorities:

The following mitigation measures included in Table ES-5 on pages 2.0-18 through 2.0-71 and throughout the document are revised to include the phrase “as applicable and feasible” PMM BIO-1, PMM BIO-2, PMM BIO-3, PMM BIO-4, PMM BIO-5, PMM BIO-6, PMM CULT-1, PMM GEO-1, PMM CULT-2, PMM GEO-1, PMM GHG-1, PMM NOISE-2, PMM TRA-1, PMM TCR-1.

In Table ES-5 and throughout the document SMM GEO-3 and PMM GEO-3 are renumbered to SMM GEO-2 and PMM GEO-2, respectively.

Introduction

On page 1.0-3, the text before the heading 1.1 SCAG Region and Authority is revised to include the term “and counties” after. This change is made throughout the document.

...cities and counties....

On Page 1.0-3, text regarding the regions airports in the third paragraph has been corrected:

The total area of the SCAG region is approximately 38,000 square miles. The region includes the county with the largest land area in the nation, San Bernardino County, as well as the county with the highest population in the nation, Los Angeles County. The SCAG region is home to approximately 19 million people, or 49 percent of California's population, representing the largest and most diverse region in the country. The region is home to the two largest container ports in the Western Hemisphere (Los Angeles and Long Beach), and the world's ~~fourth~~ fourth busiest airport system (Los Angeles World Airports).

On Page 1.0-4, text in the third paragraph is revised to clarify the roles of SCAGs committees:

SCAG provides opportunities to participate in regional planning through collaboration and participation in regional programs and dialogs. Responsible for regional policy direction and review, standing committees at SCAG include the Executive/Administration Committee, the Transportation Committee, the Community, Economic & Human Development Committee, the Energy & Environmental Committee, ~~and Legislative/Communication & Membership Committee, and Emerging Technologies Committee.~~ In addition to the standing committees, there are various subcommittees (such as the Regional Housing Needs Assessment (RHNA) Subcommittee). In addition, there are technical advisory committees, working groups, and task forces that advise SCAG staff through their input and support report to the, while other groups are established on an ad hoc basis to assist with specific projects or address specific regional policy.

On page 1.0-17, at the end of the first full paragraph, the following is added:

As appropriate and applicable, it is anticipated that individual jurisdictions would identify project-specific performance criteria consistent with the identified mitigation measures.

On page 1.0-13, a comma is added after "orientation" to clarify the following sentence:

However, because locations, densities, orientation, timing, and other site-sensitive factors related to development are not specified in the Plan, SCAG cannot reliably quantify the impacts from such anticipated development.

On page 1.0-15, an addendum is added to the sentence to refer the reader to more information about the “Accelerated Tomorrow Scenario.”

This alternative analyzes more aggressive densities and land use patterns than included in the Accelerated Tomorrow Scenario (further described in the Connect SoCal Sustainable Communities Strategy Technical Report).

Project Description

On Page 2.0-21, Table 2.0-6, Connect SoCal Guiding Principles, is deleted and replaced with the following table:

Connect SoCal Guiding Principles	
1	<u>Connect SoCal will be adopted at the jurisdictional level, and directly reflects the population, household and employment growth projects that have been reviewed and refined with feedback from local jurisdictions through SCAG’s Bottom-Up Local Input and Envisioning Process. The growth forecast maintains these locally-informed projected jurisdictional growth totals, meaning future growth is not reallocated from one local jurisdiction to another.</u>
2	<u>Connect SoCal’s growth forecast at the Transportation Analysis Zone (TAZ) level is controlled to not exceed the maximum density of local general plans as conveyed by jurisdictions, except in the case of existing entitlements and development agreements.</u>
3	<u>For the purpose of determining consistency with Connect SoCal for California Environmental Quality Act (CEQA), grants or other opportunities, lead agencies such as local jurisdictions have the sole discretion in determining a local project’s consistency; SCAG may also evaluate consistency for grants and other resource opportunities; consistency should be evaluated utilizing the goals and policies of Connect SoCal and its associated Program Environmental Impact Report (PEIR).</u>
4	<u>TAZ level data or any data at a geography small than the jurisdictional level has been utilized to conduct required modeling analysis and is therefore advisory only and non-binding, given that sub-jurisdictional forecasts are not adopted as part of Connect SoCal. TAZ level data may be used by jurisdictions in local planning as they seem appropriate. There is no obligation by a jurisdiction to change its land use policies, General Plan, or regulations to be consistent with Connect SoCal.</u>
5	<u>SCAG will maintain communication with agencies that use SCAG’s sub-jurisdictional level data to ensure that the “advisory and non-binding” nature of the data is appropriately maintained.</u>

Source: SCAG Connect SoCal Guiding Principles, 2020

On Page 2.0-21, Table 2.0-7, Connect SoCal Performance Measures, has been revised.

Table 2.0-7 Connect SoCal Performance Measures		
Outcome	Performance Measures	Connect SoCal Goals
Location Efficiency	Share of regional households located growth occurring in HQTAs	7, 9
	Share of regional employment located growth occurring in HQTAs	1, 7
	Land consumption	7, 10
	VMT per capita	2, 5
	Average distance traveled for (work and non-work trips)	2, 5
	Percent of trips less than 3 miles (work trips and non-work trips)	2, 5
	Work trip length distribution (<10 miles and <25 miles)	2, 5
Mobility and Accessibility	Person delay per capita	2, 4
	Person hours of delay by facility type (mixed flow/ HOV/arterials)	2, 4
	Truck delay by facility type (highways/arterials)	1, 4
	Travel time distribution by mode Percentage of trips less than 45 minutes by mode (PM Peak Period)	2, 8
	Transit mode share	4, 7
	Mean commute time (all modes)	2, 8
Safety and Public Health	Collision fatality rate (per 100 million VMT)	2, 6
	Collision serious injury rate (per 100 million VMT)	2, 6
	Air pollution-related health measures	5, 6
	Physical activity-related health measures	6, 7
	Mode share for walking and biking	6, 7
Environmental Quality	Greenhouse gas (GHG) emissions reduction	5, 6
	Criteria pollutant emissions	5, 6
	Non-SOV mode share	2, 4
Economic Opportunity	New jobs supported by improved economic competitiveness	1, 4
	New jobs supported by transportation system investments	1, 3
Investment Effectiveness	Transportation system investment benefit/cost ratio	1, 3
Transportation System Sustainability	Cost per capita to preserve multimodal transportation system in current state of good repair	1, 3
	Interstate highway pavement condition	1, 3
	Non-interstate National Highway System pavement condition	1, 3
	National Highway System bridge condition	1, 3
Environmental Justice	Environmental Justice Performance Measures	6, 9

Source: SCAG ~~2019-2020~~

Pages 2.0-10 to 2.0-12, are revised to include the following:

2.5.1 Growth Vision, Consultation, Local Input and Public Outreach

Growth Vision: The Growth Vision for Connect SoCal identifies areas enough to house the region's population, including all economic segments of the population, through 2045 – taking into account net migration to the region, population growth, household formation, and employment growth. It also identifies areas sufficient to house an eight-year projection of housing need for the region.

In developing this vision, SCAG engaged with all 197 towns, cities, and counties in the region one-on-one to seek feedback on local growth between 2016 and 2045. SCAG also sought feedback on potential sustainable growth strategies from a broad range of stakeholder groups – including local jurisdictions, county transportation commissions, other partner agencies, industry groups, community-based organizations, and the general public. Connect SoCal utilizes a bottom-up approach in that total projected growth for each jurisdiction reflects feedback received from jurisdiction staff, including city managers, community development/planning directors, and local staff. Growth at the neighborhood level (i.e. transportation analysis zone (TAZ)) reflects entitled projects and adheres to current general and specific plan maximum densities as conveyed by jurisdictions (except in cases where entitled projects and development agreements exceed these capacities as calculated by SCAG). Neighborhood level growth projections also feature strategies that help to reduce greenhouse gas emissions (GHG) from automobiles and light trucks to achieve Southern California's GHG reduction target, approved by the California Air Resources Board (CARB) in accordance with state planning law.

Connect SoCal's Growth Vision is utilized for long range modeling purposes. SCAG does not have the authority to implement the plan -- neither through decisions about what type of development is built where, nor what transportation projects are ultimately built, as Connect SoCal's adoption will be at the jurisdictional level. Achieving a sustained regional outcome depends upon informed and intentional local action. In addition, the proposed use of Connect SoCal's growth forecast in the Regional Housing Needs Assessment (RHNA) is described with detail in materials available at <http://www.scag.ca.gov/programs/Pages/Housing.aspx>.

Technical Consultation with SCAG's Technical Working Group (TWG): To ensure transparency and technical veracity during all phases of this process, SCAG has had regular engagements with the TWG to seek guidance. Membership on the TWG includes staff from local jurisdictions, county transportation commissions, subregional organizations, community-based organizations, and universities. Examples of consultation has included an assessment of the survey elements and datasets that underwent review by local jurisdictions and an overview of the scenario planning process, results of outreach, and technical

elements. The TWG also provided feedback on the approach for finalizing the Connect SoCal Growth Vision.

Bottom-Up Local Input and Envisioning Process: ~~Local Input Process:~~ The most recent RTP/SCS for the SCAG region was adopted by SCAG in April 2016. State law requires that it is updated every four years. Connect SoCal is an update that builds upon the growth patterns and strategies developed in the 2016 RTP/SCS but with updated planning assumptions that incorporate key economic, demographic and financial trends from the last four years.

SCAG developed a “Bottom-Up Local Input and Envisioning Process,” which assisted the agency in understanding ~~as to~~ what is happening at the local level – and formed the basis for projections and strategies in Connect SoCal. The local input process was approved and adopted by the SCAG Regional Council in October 2017.

SCAG held one-on-one meetings with all 197 local jurisdictions. In addition to seeking feedback on regional forecasts of population, household and employment growth, SCAG gathered data on land use, protected natural lands, farmland, flood areas and coastal inundation, regional bikeways, regional truck routes, planned major transit stops, high quality transit corridors, future transit priority areas, and other local data. In addition to the jurisdictions themselves, the data came from county assessors’ offices, county transportation commissions, and state and federal partners.

Approximately ~~82~~ 90 percent of local jurisdictions provided feedback on one or more data elements requested for local review. ~~Collectively, these towns, cities and counties represent an estimated 94 percent of the region’s residents.~~ SCAG staff also regularly convened a series of technical advisory groups that engaged local, state, and federal agencies in the transportation and sustainable communities planning process.

Regional Collaboration on Scenario Development: SCAG engaged with a diverse group of stakeholders through regional planning working groups, where monthly meetings began in May 2018 and served as a forum to obtain feedback on potential Connect SoCal strategies to better integrate land use, housing, and transportation. Feedback informed how data gathered through one-on-one sessions with local jurisdictions from the Bottom-Up Local Input and Envisioning Process could be utilized in developing Connect SoCal scenarios – principally how SCAG could envision a future that promoted regional outcomes for sustainability that also recognized the importance of local control. Moreover, outreach and events conducted in partnership with 18 community-based organizations across the region garnered feedback from stakeholders from traditionally underrepresented communities. These organizations assisted with workshop and survey outreach as well as hosting local gatherings for community members

to provide input on Connect SoCal.

Coordination with County Transportation Commissions: SCAG worked closely with each of the six county transportation commissions (CTCs) throughout 2018 to update the list of major local transportation projects that were listed in the 2016 RTP/SCS. Each CTC in turn worked with their partner transportation agencies (including applicable transit providers, rail operators, marine port and airport authorities and Caltrans District offices) to finalize a list of county-priority projects to submit to SCAG. This effort culminated in a comprehensive update to the list of programs and projects, capital list of projects, which numbers in the thousands. SCAG worked collaboratively with key stakeholders to identify additional regional initiatives that go beyond county-level commitments and projects that are intended to address challenges that are regional in nature.

Topic Specific Working Groups: SCAG has regularly convened topic-specific working groups, which bring together regional stakeholders to discuss the Plan's development and provide technical expertise. There were seven formal Regional Planning Working Groups, including Active Transportation, Environmental Justice, New Mobility, Natural Lands Conservation, Public Health, Sustainable Communities, and Transportation Safety. Additionally, SCAG convened an Emerging Technologies Committee (ETC). The ETC was formed to identify technological and societal trends (e.g. mobility as a service; zero emissions, automated and connected vehicles; smart cities and ITS; and the future of work) that may fundamentally alter the use of the region's transportation system and land use patterns. Emerging technology is a topic of intense speculation and interest at the regional planning level. Numerous popular press and academic articles have advanced the argument that the transportation sector is currently experiencing a period of changing transportation that has not been seen since the first decades of the previous century. Like that period, changes are now predominantly driven by private sector companies. In addition, the companies driving these changes are doing so through disruptive business models.

~~**Outreach to Community Based Organizations:** SCAG conducted a grassroots outreach initiative to engage diverse constituencies across Southern California. SCAG collaborated with 18 community based organizations (CBOs) from across the region. These organizations assisted with workshop and survey outreach as well as hosting local gatherings for community members to provide input on Connect SoCal.~~

A subsection describing SCAG's Growth Vision has been added on page 2.0-10:

Growth Vision

SCAG used the performance of each scenario as well as input gathered through the public workshops to develop a final growth vision for the plan. This vision aims to increase mobility options and reduce the need for residents to drive by locating housing, jobs, and transit closer together. To help the region achieve sustainable outcomes, Connect SoCal's final growth vision focuses growth within jurisdictions near destinations and mobility options and promotes an improved jobs-housing balance to reduce commute times. This is reflective of Connect SoCal's Core Vision, built upon and expanding land use and transportation strategies established over several planning cycles to increase mobility options and achieve a more sustainable growth pattern.

The growth vision and the forecasted regional development pattern carries forth many principles from the initial scenario development to ensure that growth is feasible in terms of existing land use planning. This forecasted regional development pattern directs growth to Priority Growth Areas (PGAs) outlined below including: near existing and planned transit, within existing job centers, in communities with existing and planned infrastructure to support more walkability and use of alternative transportation modes, and in areas identified for jurisdictional expansion (i.e. spheres of influence). The growth vision includes entitled projects, reflects the local input growth totals and follows currently adopted local plans to allocate growth within the existing general plan maximums. It also accounts for absolute constrained lands which are legally protected from development and variable constrained lands which are dependent on local policies or voluntary actions. For more information regarding growth vision, please refer to the SCS Technical Report of the Final Connect SoCal Plan.

On Page 2.0-29, a new subsection titled constrained areas has been added:

Constrained Areas

Absolute Constrained Areas:

There are inherent constraints to expansive regional growth and Connect SoCal recognizes locations that are susceptible to natural hazards and a changing climate. Options have been emphasized that conserve important farmland, resource areas and habitat corridors, while envisioned growth on lands that are vulnerable to wildfire, flooding, and near-term sea-level rise will be decreased. The growth constraints outlined below are used to articulate where future growth is not encouraged. Absolute constraints reflect areas where growth has been reduced and redirected to achieve Connect SoCal's regional vision. Variable

constraints reflect goals of Connect SoCal and were only applied to growth when there was not capacity in non-constrained areas per a jurisdiction's general plan or specific plans (as conveyed).

Tribal Nation Lands: SCAG utilized the Census Bureau's American Indian/Alaska Native/Native Hawaiian (AIANNH) Areas database for 2017 to identify tribal nations in the SCAG region.

Military Lands: Locations of military lands are derived from SCAG's 2016 Existing Land Use Database, which underwent review and refinement by local jurisdictions through the Bottom-Up Local Input and Envisioning Process.

Open Space and Conserved Lands: Data on conservation areas, open space, and parks from year 2017 comes from the Save Our Agricultural Resources (SOAR) protected areas in Ventura County, the California Conservation Easement Database, as well as the California Protected Areas Database (CPAD). Together, these data inventories represent protected open space lands, conserved areas, and conservation easements in the SCAG region and the greater State of California. Several elements were developed by aggregating and cross-checking various open space data from multiple public agencies by GreenInfo Network, and also benefit from feedback provided by local jurisdictions through SCAG's Bottom-Up Local Input and Envisioning Process.

Sea Level Rise Areas (2 feet): Data on coastal inundation were obtained from the National Oceanic and Atmospheric Administration (NOAA) Coastal Services Center's online mapping viewer depicting potential sea level rise and its associated impacts on the nation's coastal areas (accessed by SCAG in 2017). These data depict the potential inundation of coastal areas resulting from a projected 2 feet rise in sea level above current Mean Higher High Water (MHHW) conditions, and underwent review by SCAG's local jurisdictions.

Farmlands in Unincorporated Areas: Farmland information was obtained from the Farmland Mapping & Monitoring Program (FMMP) in the Division of Land Resource Protection in the California Department of Conservation. Established in 1982, the FMMP is to provide consistent and impartial data and analysis of agricultural land use and land use changes throughout the State of California. For SCAG's purposes, data from year 2016 (and 2014 in areas where 2016 data was unavailable) underwent review and refinement by local jurisdictions through the Bottom-Up Local Input and Envisioning Process.

The first paragraph of Page 2.0-30 has been updated to reflect the latest financial assumptions:

Anticipated land use patterns as part of Connect SoCal provide a strategic opportunity to build a smart transportation system that is responsive to the region's changes and challenges. Connect SoCal includes

proposed strategies for transportation investments, totaling approximately \$638.69 billion.

On Page 2.0-30, language describing Variable Constrained Areas has been added:

Variable Constrained Areas:

Wildland-Urban Interface (WUI): Data on areas where housing and vegetation intermingle (“intermix WUI”) and areas with housing in the vicinity of contiguous wildland vegetation (“interface WUI”) were derived from the 2010 national Wildland-Urban Interface dataset developed by the SILVIS Lab at the University of Wisconsin-Madison.

Grazing Lands and Farmlands within Incorporated Jurisdictions: Similar to farmlands identified in unincorporated areas, grazing lands and farmland information within incorporated areas were identified through the Farmland Mapping & Monitoring Program (FMMP) in the Division of Land Resource Protection in the California Department of Conservation, which underwent review by local jurisdictions.

500 Year Flood Plains: Information on flood areas were derived from the Digital Flood Insurance Rate Map (DFIRM), obtained from Federal Emergency Management Agency (FEMA) in August 2017. The DFIRM Database is a digital version of the FEMA Flood Insurance Rate Maps (FIRM) that is designed for use with digital mapping and analysis software. The FIRM is created by FEMA for the purpose of floodplain management, mitigation, and insurance activities for the National Flood Insurance Program (NFIP) and was included for local jurisdiction review through SCAG’s Bottom-Up Local Input and Envisioning Process.

CalFire Very High Severity Fire Risk (state and local): Information on areas with very high fire hazards was derived from CalFire’s state responsibility area and local responsibility area Very High Fire Hazard Severity Zone (VHFHSZ) data, accessed by SCAG in early 2019.

Natural Lands and Habitat Corridors: Data on habitat corridors was derived from California Essential Habitat Connectivity Project, as developed by the California Department of Fish and Wildlife, which identifies large blocks of intact habitat or natural landscapes with connectivity corridors essential for local wildlife. This dataset benefits from feedback from a selection of federal, state, local, tribal, and non-governmental organizations throughout California, and was made publicly available in 2010.

Page 2.0-26, 2nd bullet point under “Focus Growth Near Destinations and Mobility Options” has been revised:

Focus on a regional jobs/housing balance to reduce commute times and distances and expand job opportunities near transit and along center-focused main streets

Page 2.0-26, 2nd bullet point under “Promote Diverse Housing Choices” has been revised:

- Identify funding opportunities for new workforce and affordable housing development

Page 2.0-27, 2nd bullet point under “Leverage Technology Innovations” has been revised:

- Improve access to services through technology- such as telework and telemedicine as well as ~~commuter~~ other incentives such as a “mobility wallet”, an app-based system for storing transit and other multi-modal payments

Page 2.0-27, 3rd bullet point under “Support Implementation of Sustainability Policies” has been revised:

- Support ~~cities~~ local jurisdictions in the establishment of Enhanced Infrastructure Financing Districts (EIFDs), Community Revitalization and Investment Authorities (CRIAs), or other tax increment or value capture tools to finance sustainable infrastructure and development projects including parks and open space.

Page 2.0-31, language under “Congestion Pricing” has been revised:

Congestion Pricing. ~~Connect SoCal identified three congestion pricing strategies, two of which were incorporated into the 2012 and 2016 RTP/SCS:~~

- Develop a network of express lanes, that connects to existing express lanes in order to accommodate growing inter-county travel
- Establish a mileage-based user fee to generate a funding source for aging infrastructure and construction of other travel options
- Develop Cordon/Area Pricing which involves charging a variable or fixed fee to drive into or within a highly congested area.

Page 2.0-34, 7th bullet point under “Transportation Safety” has been revised:

- ~~Improve research and data collection~~ Leverage emerging technologies

Page 2.0-34, first bullet point under Transportation Demand Management has been revised:

- Reduce the number of SOV trips and per capita VMT through ~~ridesharing~~ ridesharing (which includes carpooling and vanpooling) and providing first/last mile services to and from transit

Page 2.0-34, a discussion regarding Transportation Systems Management has been added after the discussion about Transportation Demand Management:

Transportation Systems Management. Transportation Systems Management (TSM) employs a series of techniques designed to maximize the capacity and efficiency of the existing transportation system. Effective TSM strategies reduce traffic congestion, improve air quality, and reduce or eliminate the need to construct new and expensive transportation infrastructure. Many TSM strategies seek to optimize the operation of the existing transportation system through use of Intelligent Transportation Systems (ITS). For example, advanced technologies can anticipate changing traffic conditions and inform drivers about driving conditions on a real-time basis so that drivers can make more informed decisions. SCAG recently updated the Regional ITS Architecture which identifies a significant number of planned ITS projects, including those related to connected vehicle applications, transit signal priority, emergency response, express lanes, and goods movement.

On page 2.0-35, the sentence below is revised to include toll roads:

Projects include interchange improvements, auxiliary lanes, general purpose lanes, carpool lanes, toll roads, toll lanes and Express/HOT lanes.

Aesthetics

On page 3.1-40, mitigation measure PMM AES-3 has been revised:

PMM AES-3: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to address potential aesthetic impacts that substantially degrade visual character, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a) Use lighting fixtures that are adequately shielded to a point below the light bulb and

reflector and that prevent unnecessary glare onto adjacent properties.

- b) Restrict the operation of outdoor lighting for construction and operation activities to the hours of 7:00 a.m. to 10:00 p.m. or as otherwise required by applicable local rules or ordinances.

Agriculture and Forestry

Page 3.2-23, Mitigation Measure SMM AG-3 has been revised:

SMM AG-3: SCAG shall align with funding opportunities and pilot programs to begin implementation of conservation strategies through (1) seeking planning and implementation funds, such as cap and trade auction proceeds that could advance ~~help~~ prepare for local action on acquisition and restoration projects locally and regionally, (2) supporting CTCs and other partners, and (3) continuing policy alignment with the State Wildlife Action Plan 2015 Update and its implementation.

Air Quality

Page 3.3-1, the following text is added following the first paragraph:

The U.S. EPA, California Air Resources Board and the South Coast Air Quality Management District describe air quality, environmental impacts and public health impacts from air quality based on three major categories of emissions:

- Criteria Air Pollutants
- Toxic Air Pollutants / Toxic Air Contaminants
- Greenhouse Gases (refer to **Section 3.8 Greenhouse Gas Emissions**)

On Page 3.3-7, additional language has been added as the opening paragraphs for the environmental setting:

Although air quality has improved significantly over the past decades, the SCAG region still experiences among the worst air quality in the country. Almost the entire SCAG region fails to meet the health-based federal air quality standards for one or more transportation related air pollutants. In addition to public health impacts from unhealthy air quality, the challenge of meeting health-based federal air quality standards has serious implications for the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), the Federal Transportation Improvement Program (FTIP), and transportation

projects in the SCAG region.

A particularly pressing challenge is for the South Coast Region to meet the 2023 statutory deadline of attaining the 1997 ozone standard. Pursuant to the federal Clean Air Act (CAA), a Contingency Measure Plan was recently developed jointly by the South Coast Air Quality Management District (SCAQMD) and the California Air Resources Board (ARB) and subsequently submitted to U.S. Environmental Protection Agency (EPA). The Contingency Measure Plan highlights the critical need for federal regulatory actions and/or funding to address emission sources under federal jurisdiction including aircraft, ships, trains, and out-of-state trucks in order to meet the air quality standard. This is in addition to the regulatory actions, programs and incentive funding SCAQMD and ARB have developed to achieve emission reductions.

If U.S. EPA disapproves the air plan, a federal sanctions clock will be triggered which will lead to federal highway sanctions if the underlying deficiency cannot be resolved within 24 months. Highway sanctions restrict federal funding to transportation projects that expand highway capacity, nonexempt project development activities, and any other projects that do not explicitly meet exemption criteria. If imposed, highway sanctions have the potential to impact billions of dollars of federal funding and tens of billions of dollars of important transportation projects in the SCAG region.

Transportation especially the goods movement sectors contributes to the overwhelming majority of air pollutant emissions causing ozone pollution. A comprehensive and coordinated regional solution including aggressive regulations, advancements in clean technologies, innovative solutions, and integrated land use and transportation planning from all levels of governments and all stakeholders will be required to achieve the needed emission reductions from the goods movement sectors.

Finally, the emissions of air pollutants come from a wide range of sources and may be transported upwind. Therefore, a mitigation strategy should be in place to assist impacted communities, even if the emissions are not being locally produced.

Page 3.3-19 is revised as follows:

Existing Motor Vehicle Criteria Pollutant Emissions

The existing conditions (base year 2019) of the motor vehicle criteria pollutant emissions for the six counties in the SCAG region are shown in **Table 3.3-5, Motor Vehicle Criteria Pollutant Emissions by County—Existing Conditions (2019)**. [The table title is similarly revised.]

The first paragraph on page 3.3-55 is revised to read as follows:

As mentioned above, air quality management and air pollution control districts are responsible for addressing air pollution from stationary sources, construction equipment, airplanes, trains, and ships within the SCAG region. These air quality and air pollution control districts include SCAQMD, MDAQMD, VCAPCD, AVAPCD, and ICAPCD. ~~The SCAQMD includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties.¹ Therefore, SCAQMD's 2016 AQMP's analysis of the emissions resulting from stationary sources, construction equipment, airplanes, trains, and ships is discussed below as a proxy for these emissions throughout the entire SCAG region. A review of the air district's emissions is summarized below.~~

The second paragraph on page 3.3-55 is revised to include the following:

In addition to on-road mobile sources provided by SCAG, SCAQMD's 2016 AQMP provides emissions estimates for stationary, and off-road mobile sources from 2019 to 2031, see **Table 3.3-12, 2016 AQMP Forecast of Annual Average Total Emissions in SCAB Through 2031**. VCAPCD's 2016 AQMP provides ROG and NOx emission estimates for stationary and off-road mobile sources from 2018 to 2035 for the SCCAB, see Table 3.3-13, 2016 AQMP Forecast of Annual Average Total Emissions in SCCAB. AVAQMD and MDAQMD regulate emissions in the MDAB and their *Federal 8-hour Ozone Attainment Plans* estimate stationary and off-road mobile sources for 2018 to 2016, see Table 3.3-14, AQMP Forecast of Annual Average Total Emissions in MDAB in 2026. The ICAPCD's 2018 Resignation Request and Maintenance Plan for Particulate Matter Less than 10 Microns in Diameters includes projected PM10 emissions from 2018 to 2030 for the SSAB, see Table 3.3-15, 2018 Maintenance Plan Forecast of Annual Average Total Emissions in SSAB in 2030. MDAQMD's 2008 Ozone Attainment Plan includes projected emissions only to 2020, as a result, an analysis was not included. Stationary sources include both point and area sources...

Page 3.3-56, last paragraph, third sentence is revised as follow:

Portions of the SSAB (City of Calexico) are also in nonattainment for PM2.5. The rest of the SSAB and SCCAB (Ventura Portion) ~~is and portions are the SSAB are also in nonattainment for PM2.5.~~

¹ South Coast Air Quality Management District. Map of Jurisdiction. Available online at: <http://www.aqmd.gov/docs/default-source/default-document-library/map-of-jurisdiction.pdf>, accessed October 2, 2019.

On page 3.3-56, the following text is added following the last paragraph:

~~Other air basins in the SCAC region include the South Central Coast Air Basin (SCCAB), Salton Sea Air Basin (SSAB), and the Mojave Desert Air Basin (MDAB). As demonstrated in Table 3.3-4, similar to SCAB, all three air basins are in nonattainment for ozone and PM10. The SCCAB and portions of the SSAB are also in nonattainment for PM2.5. Each of these air basins has an AQMP to plan the basin's attainment status pursuant to the federal CAA Amendment. P to address nonattainment of ozone in the southwestern desert portion of the basin.²~~

As shown in Table 3.3-13, 2016 AQMP Forecast of Annual Average Total Emissions in SCCAB Through 2035, in the SCCAB region total VOC and NOx emissions are anticipated to decline from 2018 to 2035, although VOC emissions reach the lowest point in 2030 and start increasing by 2035.³

**Table 3.3-13
2016 AQMP Forecast of Annual Average Total Emissions in SCCAB Through 2035**

Year	Tons/Summer Day	
	VOC	NOx
<u>2018</u>	<u>34.72</u>	<u>35.23</u>
<u>2020</u>	<u>33.5</u>	<u>32.06</u>
<u>2025</u>	<u>32.44</u>	<u>26.57</u>
<u>2030</u>	<u>32.21</u>	<u>24.62</u>
<u>2035</u>	<u>32.27</u>	<u>23.93</u>

Source: Ventura County Air Pollution Control Board. 2017. Final 2016 Ventura County Air Quality Management Plan. Available online at: <http://www.vcapcd.org/pubs/Planning/AQMP/2016/Final/Final-2016-Ventura-County-AQMP.pdf>, accessed February 6, 2020.

Within the VCAPCD, the majority of ROG emissions are anticipated to come from areawide sources, specifically consumer products. Moreover, the majority of NOx emissions are anticipated to come from mobile-source emissions, especially off-road equipment.

² MDAQMD. 2017. *Federal 75 ppb Ozone Attainment Plan (Western Mojave Desert Nonattainment Plan)*. Available online at: https://ww3.arb.ca.gov/planning/sip/planarea/wmdaqmp/2016sip_mdplan.pdf, accessed November 5, 2019.

³ Ventura County Air Pollution Control Board. 2017. *Final 2016 Ventura County Air Quality Management Plan*. Available online at: <http://www.vcapcd.org/pubs/Planning/AQMP/2016/Final/Final-2016-Ventura-County-AQMP.pdf>, accessed February 6, 2020.

As shown in **Table 3.3-14, Attainment Plan Forecast of Annual Average Total Emissions in MDAB in 2026**, in the MDAB region total NOx emissions are anticipated to decline from 2018 to 2026, although VOC emissions are anticipated to remain similar from 2018 to 2026.^{4,5} It should be noted that the AVAQMD and the MDAQMD regulate different portions of the MDAB, however review of their Federal 8-Hour Ozone Attainment Plans demonstrates that the projected emission estimates for VOC and NOx are the same.

**Table 3.3-14
Attainment Plan Forecast of Annual Average Total Emissions in MDAB Through 2026**

Year	Tons/Day	
	VOC	NOx
2018	38.82	83.40
2020	38.49	80.29
2023	38.61	72.24
2026	38.67	68.56

Source: Antelope Valley Air Quality Management Plan. 2017. AVAQMD Federal 8-hour Ozone Attainment Plan. Available online at: http://www.scag.ca.gov/programs/Documents/AQMPSIP/AVAQMD_2017SIP.pdf, accessed February 6, 2020.

Review of the projected emissions demonstrates that the largest emitters of NOx emissions within the MDAB are HDDT and train traffic. Emissions from these sources are expected to decline into 2016, however these sources remain the largest contributor to area-wide NOx emissions.

As shown in **Table 3.3-15, 2018 Maintenance Plan Forecast of Annual Average Total Emissions in**

⁴ Antelope Valley Air Quality Management Plan. 2017. AVAQMD Federal 8-hour Ozone Attainment Plan. Available online at: http://www.scag.ca.gov/programs/Documents/AQMPSIP/AVAQMD_2017SIP.pdf, accessed February 6, 2020.

⁵ Mojave Desert Air Quality Management Plan. 2017. MDAQMD Federal 8-Hour Ozone Attainment Plan. Available online at: https://ww3.arb.ca.gov/planning/sip/planarea/wmdaqmp/2016sip_mdplan.pdf, accessed February 7, 2020.

SSAB in 2030, in the SSAB region’s total PM10 emissions are anticipated to slightly increase from 2020 to 2030.⁶

Table 3.3-15
2018 Maintenance Plan Forecast of Annual Average Total Emissions in SSAB Through 2030

<u>Year</u>	<u>PM10 (tons/day)</u>
<u>2020</u>	<u>284.99</u>
<u>2021</u>	<u>285.19</u>
<u>2022</u>	<u>283.84</u>
<u>2023</u>	<u>284.44</u>
<u>2024</u>	<u>284.66</u>
<u>2025</u>	<u>284.88</u>
<u>2026</u>	<u>285.02</u>
<u>2027</u>	<u>285.24</u>
<u>2028</u>	<u>285.48</u>
<u>2029</u>	<u>285.71</u>
<u>2030</u>	<u>285.96</u>

Source: Imperial County Air Pollution Control District. 2018. Imperial County 2018 Resignation Request and Maintenance Plan for Particulate Matter Less than 10 Microns in Diameter. Available online at: <https://ww3.arb.ca.gov/planning/sip/planarea/imperial/sip.pdf>, accessed February 6, 2020.

According to the ICAPCD’s SIP, the largest sources of PM10 emissions is fugitive windblown dust and unpaved road dust. Emissions of both windblown dust and unpaved road dust are anticipated to remain stagnant from 2020 to 2030.

On page 3.3-57, table number in the first paragraph under the heading “On-Road Mobile Source Emissions” is revised as follows:

ROG, NOx, and CO emissions in every county are expected to decrease with implementation of the Plan (Table 3.3-1316, On-Road Mobile-Source Criteria Air Pollutant Emission by County – Existing Conditions [2019] vs Plan [2045]).

⁶ Imperial County Air Pollution Control District. 2018. Imperial County 2018 Resignation Request and Maintenance Plan for Particulate Matter Less than 10 Microns in Diameter. Available online at: <https://ww3.arb.ca.gov/planning/sip/planarea/imperial/sip.pdf>, accessed February 6, 2020.

On page 3.3-58, the table number is revised as follows:

Table 3.3-1316, On-Road Mobile-Source Criteria Air Pollutant Emissions by County- Existing Condition (2019) vs Plan (2045)

On page 3.3-58, the table number in the first full paragraph is revised as follows:

According to the SCAQMD 2016 AQMP, when compared to the 2012 AQMP, mobile-source emissions from airplane, train, and ship transportation sources have decreased VOC, NO_x, CO, and PM_{2.5} emissions in the SCAB region and will continue to decrease to 2031,⁷ see **Table 3.3-1417, AQMP Forecast of Annual Average Off-Road Mobile Emissions in SCAB.**

On page 3.3-59, the table number is revised as follows:

Table 3.3-1417, AQMP Forecast of Annual Average Off-Road Mobile Emissions in SCAB

On page 3.3-59, table number in the second paragraph is revised as follows:

As shown in **Table 3.3-1417**, emissions from off-road mobile VOC, NO_x, CO, and PM_{2.5} emissions within the SCAB region are anticipated to decrease.

On page 3.3-59, the following text is added following the last paragraph before the subsection “Stationary Sources”:

VCAPCD

According to the VCAPCD’s Final 2016 AQMP, the total mobile sources are anticipated to decrease substantially from 2018 to 2035. Off-road mobile sources of NO_x and VOC emissions are anticipated to decrease by approximately 2 and 1 tons/summer day from 2018 to 2035, respectively, see **Table 3.3-18, AQMP Forecast of Annual Average Off-Road Mobile Source in SCCAB.**

⁷ SCAG acknowledges that AQMD, nor the other air districts in the region, has not identified emissions beyond 2031 (except the VCAPCD that estimated emissions until 2035). However, due to the overall downward trajectory and the substantial state requirements, it is assumed that emissions will continue to decline through 2045.

Table 3.3-18
2016 AQMP Forecast of Annual Average Off-Road Mobile Sources in SCCAB

<u>Year</u>	<u>Tons/Summer Day</u>	
	<u>VOC</u>	<u>NOx</u>
<u>2018</u>	<u>6.97</u>	<u>7.69</u>
<u>2020</u>	<u>6.63</u>	<u>7.25</u>
<u>2025</u>	<u>6.12</u>	<u>6.27</u>
<u>2030</u>	<u>5.91</u>	<u>5.83</u>
<u>2035</u>	<u>5.94</u>	<u>5.74</u>

Source: Ventura County Air Pollution Control Board. 2017. Final 2016 Ventura County Air Quality Management Plan. Available online at: <http://www.vcapcd.org/pubs/Planning/AQMP/2016/Final/Final-2016-Ventura-County-AQMP.pdf>, accessed February 6, 2020.

As shown in **Table 3.3-18**, emissions from off-road mobile VOC and NOx emissions within the SCCAB region are anticipated to decrease.

AVAQMD and MDAQMD

According to the AVAQMD and MDAQMD's *Federal 8-hour Ozone Attainment Plan*, VOC and NOx off-road emissions are anticipated to decrease by approximately 0.4 and 10 tons/day, respectively, within the MDAB from 2018 to 2026, see **Table 3.3-19, Attainment Plan Forecast of Annual Average Off-Road Mobile Sources in MDAB.**

Table 3.3-19
Attainment Plan Forecast of Annual Average Off-Road Mobile Sources in MDAB

<u>Year</u>	<u>Tons/Day</u>	
	<u>VOC</u>	<u>NOx</u>
<u>2018</u>	<u>4.64</u>	<u>25.56</u>
<u>2020</u>	<u>4.38</u>	<u>22.82</u>
<u>2023</u>	<u>4.29</u>	<u>19.48</u>
<u>2026</u>	<u>4.21</u>	<u>15.49</u>

Source: Antelope Valley Air Quality Management Plan. 2017. AVAQMD Federal 8-hour Ozone Attainment Plan. Available online at: http://www.scag.ca.gov/programs/Documents/AQMPSIP/AVAQMD_2017SIP.pdf, accessed February 6, 2020; Mojave Desert Air Quality Management Plan. 2017. MDAQMD Federal 8-Hour Ozone Attainment Plan. Available online at: https://www3.arb.ca.gov/planning/sip/planarea/wmdaqmp/2016sip_mdplan.pdf, accessed February 7, 2020.

As shown in **Table 3.3-19**, emissions from off-road mobile VOC and NOx emissions within the MDAB region are anticipated to decrease.

ICAPCD

Review of the ICAPCD's 2018 PM10 Plan, PM10 emissions are anticipated to increase from off-road mobile sources from 2020 to 2030, see **Table 3.3-20, 2018 Maintenance Plan Forecast of Annual Average Off-Road Mobile Sources in SSAB.**

**Table 3.3-20

Source: Imperial County Air Pollution Control District. 2018. Imperial County 2018 Resignation Request and Maintenance Plan for Particulate Matter Less than 10 Microns in Diameter. Available online at: <https://www3.arb.ca.gov/planning/sip/planarea/imperial/sip.pdf>, accessed February 6, 2020.

As shown in **Table 3.3-20**, PM10 emissions from off-road mobile sources is anticipated to increase by approximately 0.55 tons/day in the SSAB.

On page 3.3-59, the first paragraph under the subheading “Stationary Sources” was revised as follows:

According to the SCAQMD 2016 AQMP, when compared to the 2012 AQMP, stationary-source emissions from NOx will decrease in the SCAB region by approximately 17%. All other pollutants from stationary sources are anticipated to increase by 2031, see **Table 3.3-1521, AQMP Forecast of Annual**

Average ~~Off-Road Mobile~~ Stationary Source Emissions in SCAB.

On page 3.3-59, the table number from the second paragraph under the subheading “Stationary Sources” was revised as follows:

As shown in **Table 3.3-1521**, stationary source emissions from all criteria air pollutant, except NOx are anticipated to increase when 2019 conditions are compared to 2031.

On page 3.3-60, the table number is revised as follows:

Table 3.3-1521, AQMP Forecast of Annual Average Stationary Source Emissions in SCAB

On page 3.3-60, the following text is added following Table 3.3-15:

VCAPCD

According to the VCAPCD’s Final 2016 AQMP, stationary source emissions are anticipated to increase from 2018 to 2035, see Table 3.3-22, AQMP Forecast of Annual Average Stationary Sources in SCCAB.

**Table 3.3-22
AQMP Forecast of Annual Average Stationary Sources in SCCAB**

Year	Tons/Summer Day	
	VOC	NOx
2018	8.54	1.89
2020	8.67	1.87
2025	8.82	1.88
2030	8.95	1.89
2035	9.12	1.92

Source: Ventura County Air Pollution Control Board. 2017. Final 2016 Ventura County Air Quality Management Plan. Available online at: <http://www.vcapcd.org/pubs/Planning/AQMP/2016/Final/Final-2016-Ventura-County-AQMP.pdf>, accessed February 6, 2020.

As shown in Table 3.3-22, VOC and NOx stationary source emissions within the SCCAB region are anticipated to increase by approximately 0.58 and 0.03 tons/summer day.

AVAQMD and MDAQMD

According to the AVAQMD and MDAQMD’s Federal 8-hour Ozone Attainment Plan, VOC and NOx off-road emissions are anticipated to decrease by approximately 0.4 and 10 tons/day, respectively, within the MDAB from 2018 to 2026, see Table 3.3-23, Attainment Plan Forecast of Annual Average

Stationary Sources in MDAB.

Table 3.3-23

Request and Maintenance Plan for Particulate Matter Less than 10 Microns in Diameter. Available online at: <https://www3.arb.ca.gov/planning/sip/planarea/imperial/sip.pdf>, accessed February 6, 2020.

As shown in **Table 3.3-24**, PM10 emissions from stationary sources are anticipated to increase by approximately 1.46 tons/day in the SSAB.

On page 3.3-60, the first paragraph under the sub-section “Summary” is revised as follows:

Total emissions in the SCAB region (as indicated in 2016 AQMP) and likely across the SCAG region are expected to generally decline through at least 2031 except for small increases in PM 2.5 and SO_x (**Table 3.3-12**). Total NO_x and VOC emissions in the SCCAB and MDAB regions are expected to decline through at least 2035 and 2026, respectively (**Table 3.3-13** and **Table 3.3-14**). Additionally, PM10 emissions in the SSAB region are expected to increase slightly through at least 2030 (**Table 3.3-15**). SCAG is responsible for assessing on-road mobile source emissions through 2045. In general, in 2045, when compared to existing conditions, on-road mobile-source PM2.5 would increase in Imperial, Riverside, and San Bernardino Counties and mobile-source PM10 would increase in Imperial, Orange, Riverside, and San Bernardino Counties due to increasing traffic (see **Table 3.3-1316**).

On page 3.3-63, the last paragraph is revised as follows:

Implementation of Connect SoCal, when compared to existing conditions, would decrease on-road mobile-source ROG and NO_x emissions (**Table 1-1316, On-Road Mobile-Source Criteria Air Pollutant Emissions by County – Existing Conditions [2019] vs Plan [2045]**). Additionally, within the SCAB area NO_x emissions are anticipated to decrease through at least 2031 from off-road vehicle and stationary source (**Table 3.3-1417, AQMP Forecast of Annual Average Off-Road Mobile Emissions in SCAB**, and **Table 3.3-1521, AQMP, Forecast of Annual Average Stationary Source Emissions in SCAB**). Through at least 2031, ROG emissions are expected to decrease from off-road vehicle emissions (**Table 3.3-1417, AQMP Forecast of Annual Average Off-Road Mobile Emissions in SCAB**) but will increase from stationary source (**Table 3.3-1521, AQMP Forecast of Annual Average Stationary Source Emissions in SCAB**). Overall, the total ROG and NO_x emissions from on-road, off-road vehicle, and stationary sources are expected to decrease in the SCAB area through at least 2031 (**Table 3.3-12, 2016 AQMP Forecast of Annual Average Total Emissions in SCAB Through 2031**). Moreover, VOC and NO_x emissions in the SCCAB and the MDAB are expected to decline from off-road mobile and stationary sources through at least 2035 and 2026, respectively (**Table 3.3-18, AQMP Forecast of Annual Average Off-Road Mobile Sources in SCCAB; Table 3.3-22, AQMP Forecast of Annual Average Stationary Sources in SCCAB; Table 3.3-19, Attainment Plan Forecast of Annual Average Off-Road Mobile Sources in MDAB; and Table 3.3-23, Attainment Plan Forecast of Annual Average Stationary Sources in MDAB**). Overall, the

total ROG and NOx emissions from on-road, off-road vehicle, and stationary sources are expected to decrease in SCCAB and MDAB (Table 3.3-13, 2016 AQMP Forecast of Annual Average Total Emissions in SCCAB Through 2035 and Table 3.3-14, Attainment Plan Forecast of Annual Average Total Emissions in MDAB Through 2026). SCAB was re-designated as in attainment of federal standards for CO in June 2017 and the last exceedance of state standards within the region for CO was in 2015. CO presents a significant health risk as it can interfere with oxygen transport within the body. Compared to existing conditions, mobile-source CO emissions in the future with implementation of Connect SoCal would decrease between now and 2045 despite increasing traffic, as a result of stringent emissions controls. (Table 3.3-13~~16~~, On-Road Mobile-Source Criteria Air Pollutant Emissions by County – Existing Condition [2019] vs Plan [2045]).

On page 3.3-64, the table number in the first full paragraph is revised as follows:

Compared to existing conditions, mobile-source SOx emissions would not change substantially despite increasing traffic (Table 3.3-13~~16~~, On-Road Mobile-Source Criteria Air Pollutant Emissions by Country – Existing Conditions [2019] vs Plan [2045]).

On page 3.3-67, PMM-AQ-1 is revised as follows:

- o) Develop a traffic plan to minimize community impacts as a result of traffic flow interference from construction activities. The plan may include advance public notice of routing, use of public transportation, and satellite parking areas with a shuttle service. Schedule operations affecting traffic for off-peak hours. Minimize obstruction of through-traffic lanes. Provide a flag person to guide traffic properly and ensure safety at construction sites. Project sponsors should consider developing a goal for the minimization of community impacts.
- q) ~~Require projects within 500 feet of residences, hospitals, or schools to use Tier 4 equipment for all engines above 50 horsepower (hp) unless the individual project can demonstrate that Tier 4 engines would not be required to mitigate emissions below significance thresholds. Require projects to use Tier 4 Final equipment or better for all engines above 50 horsepower (hp). In the event that construction equipment cannot meet to Tier 4 Final engine certification, the Project representative or contractor must demonstrate through future study with written findings supported by substantial evidence that is approved by SCAG before using other technologies/strategies. Alternative applicable strategies may include, but would not be limited to, construction equipment with Tier 4 Interim or reduction in the number and/or horsepower rating of construction equipment and/or limiting the number of construction equipment operating at the same time. All equipment must be tuned and maintained in compliance with the~~

manufacturer's recommended maintenance schedule and specifications. All maintenance records for each equipment and their contractor(s) should make available for inspection and remain on-site for a period of at least two years from completion of construction, unless the individual project can demonstrate that Tier 4 engines would not be required to mitigate emissions below significance thresholds. Project sponsors should also consider including ZE/ZNE technologies where appropriate and feasible.

- r) Projects located within the South Coast Air Basin should consider applying for South Coast AQMD "SOON" funds which provides funds to applicable fleets for the purchase of commercially available low-emission heavy-duty engines to achieve near-term reduction of NOx emissions from in-use off-road diesel vehicles.
- s) Projects located within AB 617 communities should review the applicable Community Emissions Reduction Plan (CERP) for additional mitigation that can be applied to individual projects.⁸
- t) Where applicable, projects should provide information about air quality related programs to schools, including the Environmental Justice Community Partnerships (EJCP), Clean Air Ranger Education (CARE), and Why Air Quality Matters programs.
- u) Projects should work with local cities and counties to install adequate signage that prohibits truck idling in certain locations (e.g., near schools and sensitive receptors).
- v) As applicable for airport projects, the following measures should be considered:
 - a. Considering operational improvements to reduce taxi time and auxiliary power unit usage, where feasible. Additionally, consider single engine taxing, if feasible as allowed per Federal Aviation Administration guidelines.
 - b. Set goals to achieve a reduction in emissions from aircraft operations over the lifetime of the proposed project.
 - c. Require the use of ground service equipment (GSE) that can operate on battery-power. If electric equipment cannot be obtained, require the use of alternative fuel, the cleanest gasoline equipment, or Tier 4, at a minimum.

⁸ South Coast Air Quality Management District. *AB 617 Community Air Initiatives*. Available online at: <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134>, accessed February 7, 2020.

w) As applicable for port projects, the following measures should be considered:

- a. Develop specific timelines for transitioning to zero emission cargo handling equipment (CHE).
- b. Develop interim performance standards with a minimum amount of CHE replacement each year to ensure adequate progress.
- c. Use short side electric power for ships, which may include tugboats and other ocean-going vessels or develop incentives to gradually ramp up the usage of shore power.
- d. Install the appropriate infrastructure to provide shore power to operate the ships. Electrical hookups should be appropriately sized.
- e. Maximize participation in the Port of Los Angeles' Vessel Speed Reduction Program or the Port of Long Beach's Green Flag Initiation Program in order to reduce the speed of vessel transiting within 40 nautical miles of Point Fermin.
- f. Encourage the participation in the Green Ship Incentives.
- g. Offer incentives to encourage the use of on-dock rail.

x) As applicable for rail projects, the following measures should be considered:

- a. Provide the highest incentives for electric locomotives and then locomotives that meet Tier 5 emission standards with a floor on the incentives for locomotives that meet Tier 4 emission standards.

y) Projects that will introduce sensitive receptors within 500 feet of freeways and other sources should consider installing high efficiency of enhanced filtration units, such as Minimum Efficiency Reporting Value (MERV) 13 or better. Installation of enhanced filtration units can be verified during occupancy inspection prior to the issuance of an occupancy permit.

z) Develop an ongoing monitoring, inspection, and maintenance program for the MERV filters.

- a. Disclose potential health impacts to prospective sensitive receptors from living in close proximity to freeways or other sources of air pollution and the reduced effectiveness of air filtration systems when windows are open or residents are outside.
- b. Identify the responsible implementing and enforcement agency to ensure that enhanced

- filtration units are installed on-site before a permit of occupancy is issued.
 - c. Disclose the potential increase in energy costs for running the HVAC system to prospective residents.
 - d. Provide information to residents on where MERV filters can be purchased.
 - e. Provide recommended schedule (e.g., every year or every six months) for replacing the enhanced filtration units.
 - f. Identify the responsible entity such as future residents themselves, Homeowner’s Association, or property managers for ensuring enhanced filtration units are replaced on time.
 - g. Identify, provide, and disclose ongoing cost-sharing strategies, if any, for replacing the enhanced filtration units.
 - h. Set criteria for assessing progress in installing and replacing the enhanced filtration units; and
 - i. Develop a process for evaluating the effectiveness of the enhanced filtration units.
- aa) Consult the SCAG Environmental Justice Toolbox for potential measures to address impacts to low-income and/or minority communities

On page 3.3-68, the table number in the second full paragraph is revised as follows:

Mobile-source particulate matter emissions would remain the same or decrease from existing conditions for all other pollutants (see **Table 3.3-~~13~~16, On-Road Mobile-Source Criteria Air Pollutant Emissions by County – Existing Conditions [2019] vs Plan [2045]**).

On page 3.3-76, the table number in the first full paragraph is revised as follows:

However, as shown in **Table 3.3-~~16~~25**, cancer risk would decrease considerably in the future, and local jurisdictions are requiring more robust air filtration and other ways of reducing exposure to existing sources of pollutants in particular proximity to freeways (see above discussion regarding the City of Los Angeles).

On page 3.3-77, the table number in the first full paragraph is revised as follows:

As shown on **Table 3.3-1425, Summary Maximum Exposed Individual Residential 30-Year Exposure Cancer Risk** (also see **Appendix 3.3**), the maximum 30-year exposure to residential cancer risk for each transportation segment is significantly reduced when compared to existing conditions.

On page 3.3-78, the table number is revised as follows:

Table 3.3-1425, Summary Maximum Exposed Individual Residential 30-Year Exposure Cancer Risk

On page 3.3-78, the table number in the first paragraph is revised as follows:

As demonstrated in **Table 3.3-1425**, six of the transportation segments under the No Project scenario would have lower cancer risk than under the Plan.

Biological Resources

On page 3.4-58, under the heading “Orange County” the text is updated as follows:

The Resources Element of the Orange County General Plan has established one goal and one policy related to biological resources.⁹ The one goal and one supporting policy relevant to SCAG projects provide protection to wildlife, plants and vegetation communities.

The Orange County Central-Coastal NCCP/HCP is one of the first regional HCPs developed in the country. It represents a voluntary, collaborative planning effort among a variety of partnerships having both conservation and development interests. Its purpose is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. The Plan was approved in 1996 and has a planning area of 208,000 acres, and covers 39 species, including six federally listed species. Habitat and focal species covered under the plan include: coastal sage scrub, grasslands, riparian, coastal California gnatcatcher, coastal cactus wren, and orange-throated whiptail.

⁹ Orange County Land Use Planning and Subdivision Services. 2005. *Orange County General Plan 2005: Chapter 6: Resources Element*. P. VI-32. Available online at: <http://ocplanning.net/civicax/filebank/blobdload.aspx?blobid=40235>, accessed January 10, 2019.

On Page 3.4-71, Mitigation Measure SMM BIO-2 has been revised:

SMM BIO-2: SCAG shall continue to develop a regional conservation strategy in coordination with local jurisdictions and other stakeholders, including the county transportation commissions. The conservation strategy will build upon existing efforts including those at the sub-regional and local levels to identify potential priority conservation areas. SCAG shall develop new regional tools, like the Regional Data Platform and Regional Greenprint to help local jurisdictions identify areas well suited for infill and redevelopment as well as critical habitat and natural lands to be preserved, including natural habitat corridors. SCAG will also collaborate with stakeholders to establish a new Regional Advanced Mitigation Program (RAMP) initiative to preserve habitat. The RAMP will be supplemental initiative to regional conservation and mitigation banks and other approaches by evaluating, advocating and highlighting projects that support per capita VMT reduction.

On page 3.4-72, PMM-BIO-1(d) is updated as follows:

Temporary access roads and staging areas will not be located within areas containing sensitive plants, wildlife species or ~~non~~-native habitat wherever feasible, so as to avoid or minimize impacts to these species.

On page 3.4-85, PMM-BIO-3(d) is revised as follows:

Where avoidance is determined to be infeasible and proposed projects' impacts exceed an existing Nationwide Permit (NWP) and/or California SWRCB-certified NWP, or applicable County Special Area Management Plan (SAMP), the lead agency should provide USACE and SWRCB (where applicable) an alternative analysis consistent with the Least Environmentally Damaging Practicable Alternatives in this order of priorities...

On page 3.4-90, PMM-BIO-4(e) is updated as follows:

Prohibit construction activities with 300 ~~250~~ feet of occupied nest of birds afforded protection pursuant to the Migratory Bird Treaty Act, during the breeding season.

On page 3.4-90, PMM-BIO-4(m) is updated as follows:

Evaluate the potential for installation of overpasses, underpasses, and culverts to create wildlife crossings in cases where a roadway or other transportation project may interrupt the flow of species through their habitat. Retrofitting of existing infrastructure in project areas should also be considered for wildlife crossings for purposes of mitigation.

On page 3.4-90, PMM-BIO-4(q) is added:

Incorporate Federal Highway Administration guidance (FHA-DOT 2015) as appropriate including best management practices to benefit pollinators with a focus on native plants.

Cultural Resources

On page 2.5-35 Mitigation Measure SMM CULT-1 has been updated as follows:

SMM CULT-1: Impacts to cultural resources shall be minimized through cooperation, information sharing, and SCAG's ongoing regional planning efforts such as web-based planning tools for local governments including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications¹; and direct technical assistance efforts such as Toolbox Tuesday series and sharing of associated online Training materials. SCAG shall consult with resource agencies such as the National Park Service, Office of Historic Preservation, and Native American Heritage Commission, and with Native American tribes¹⁰, to identify opportunities for early and effective consultation to identify archaeological sites, historical resources, and cemeteries to avoid such resources wherever practicable and feasible and reduce or mitigate for conflicts in compatible land use to the maximum extent practicable.

On page 2.5-37 Mitigation Measure PMM CULT-1 has been updated as follows:

h. During the project planning phase, obtain a qualified archaeologist or architectural historian (depending on applicability) to conduct archaeological and/or historic architectural surveys as recommended by the qualified professional, the Lead Agency, or the Information Center. ~~In the event the qualified professional or Information Center will make a recommendation on whether a survey is warranted based on the sensitivity of the project area for archaeological resources.~~ Survey (s) shall be conducted where the records indicate that no previous survey has been

¹⁰ Note that no confidential cultural or tribal cultural resource location information will be housed in SCAG's GIS Database. All regulations pertaining to cultural resources site location confidentiality will be respected.

conducted, or if a survey has not been conducted within the past 10 years. If tribal resources are identified during tribal outreach, consultation, or the record search, a Native American representative traditionally affiliated with the project area, as identified by the NAHC, shall be given the opportunity to provide a representative or monitor to assist with archaeological surveys.

i. If potentially significant archaeological resources are identified through survey, and impacts to these resources cannot be avoided, a Phase II Testing and Evaluation investigation should be performed by a qualified archaeologist prior to any construction-related ground-disturbing activities to determine significance. If resources determined significant or unique through Phase II testing, and avoidance is not possible, appropriate resource-specific mitigation measures should be established by the lead agency in consultation with consulting tribes, where appropriate, and undertaken by qualified personnel. These might include a Phase III data recovery program implemented by a qualified archaeologist and performed in accordance with the OHP's Archaeological Resource Management Reports (ARMR): Recommended Contents and Format and Guidelines for Archaeological Research Designs. Additional options can include 1) interpretative signage, or 2) educational outreach that helps inform the public of the past activities that occurred in this area. Archaeological materials collected from a significant resource should be curated with a recognized scientific or educational repository. Should the project require extended Phase I testing, Phase II evaluation, or Phase III data recovery, a Native American representative traditionally affiliated with the project area, as indicated by the NAHC, shall be given the opportunity to provide a representative or monitor to assist with the archaeological assessments. The long-term disposition of archaeological materials collected from a significant resource should be determined in consultation with the affiliated tribe(s), where relevant; this could include curation with a recognized scientific or educational repository, transfer to the tribe, or respectful reinternment in an area designated by the tribe.

j. In cases where the project area is developed and no natural ground surface is exposed, sensitivity for subsurface resources should be assessed based on review of literature, geology, site development history, and consultation with tribal parties. ~~If a records search~~ this archaeological desktop assessment indicates that the project is located in an area sensitive for archaeological resources, as determined by the Lead Agency in consultation with a qualified archaeologist, the project should retain an archaeological monitor and, in the case of sensitivity for tribal resources, a tribal monitor, to observe ground disturbing operations, including but not limited to grading, excavation, trenching, or removal of existing features of the subject property. The archaeological

monitor should be supervised by an archaeologist meeting the SOI PQS.

- k. Conduct construction activities and excavation to avoid cultural resources (if identified). If avoidance is not feasible, further work may be needed to determine the importance of a resource. Retain a qualified archaeologist, and/or as appropriate, a qualified architectural historian who should make recommendations regarding the work necessary to assess significance. If the cultural resource is determined to be significant under state or federal guidelines, impacts to the cultural resource will need to be mitigated.
- l. Stop construction activities and excavation in the area where cultural resources are found until a qualified archaeologist can determine whether these resources are significant, and tribal consultation can be conducted, in the case of tribal resources. If the archaeologist determines that the discovery is significant, ~~it should be~~ its long-term disposition should be determined in consultation with the affiliated tribe(s); this could include curation with a recognized scientific or educational repository, transfer to the tribe, or respectful reinterment in an area designated by the tribe.

On page 3.5-42, Mitigation Measure PMM CULT-2 is revised as follows

PMM CULT-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to human remains, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

- a. In the event of discovery or recognition of any human remains during construction or excavation activities associated with the project, in any location other than a dedicated cemetery, cease further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the coroner of the county in which the remains are discovered has been informed and has determined that no investigation of the cause of death is required.
- b. If any discovered remains are of Native American origin as determined by the county Coroner, an experienced osteologist, or another qualified professional:
 - Contact the County Coroner to contact the NAHC to designate and notify a Native American Most Likely Descendant (MLD). The MLD should make a recommendation to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods. This may include obtaining a qualified archaeologist or team of archaeologists to properly excavate the human

remains. In some cases, it is necessary for the Lead Agency, qualified archaeologist, or developer to also reach out to the NAHC to coordinate and ensure notification in the event the Coroner is not available.

Greenhouse Gases

On page 3.8-1, the nitrous oxide abbreviation is revised as follow:

The six major GHGs are carbon dioxide (CO₂), methane (CH₄), nitrous oxide (~~NO₂~~N₂O), sulfur hexafluoride (SF₆), hydrofluorocarbons (HFCs), and perfluorocarbon (PFCs).

On page 3.8-1, the definition for “Greenhouse Gases” is revised to delete the words “thought to be linked” from the third sentence.

On page 3.8-2 and throughout the document, the nitrous oxide abbreviation is revised from ~~NO₂~~ to N₂O

In the first paragraph on page 3.8-5, is revised to remove the words “significant” and “have caused or will”

In the first paragraph under section “Existing Conditions” on page 3.8-5, the sentence is revised to add the word “longwave” to describe infrared radiation.

In the first paragraph on page 3.8-6, the paragraph below is revised as follows:

These feedback loops include, but are not limited to: loss of sea ice, which reflects heat back into the atmosphere rather than the ocean, causing further melting; the melting of permafrost, which would release new methane emissions into the atmosphere; and the cooling effects of sulfate pollution in the atmosphere, the loss of which would lead to additional warming. In California, the average maximum daily temperature is projected to increase by 5.6°F to 8.8°F, depending on the GHG emission reductions taken by 2100. Climate change within the state is expected to make forests more susceptible to wildfires, lead to complete beach erosion in 31 to 67 percent of Southern California beaches by the end of the century, increases in heat-related deaths, increases in residential electricity demand, increased vulnerability in the state’s agriculture, and degradation of coastal and marine environments. Other
~~a~~Adverse impacts from global climate change worldwide and in California may include...

On page 3.8-6, the second bullet is revised as follows:

Since the early 1970s, glacier mass loss and ocean thermal expansion from warming together explain about 75% of the observed global mean sea level rise. Over the period 1993 to 2010, global mean sea level rise is consistent with the sum of the observed contributions from ocean thermal expansion due to warming from changes in glaciers, Greenland ice sheet, Antarctic ice sheet, and land water storage. Sea level in California has risen approximately 7 inches from 1900 to 2005, according to the National Climate Assessment. In California, glaciers in the Sierra Nevada have retreated dramatically. From the beginning of the twentieth century to 2014, some of the largest glaciers have lost an average of about 70 percent of their area, with losses ranging from about 50 to 85 percent.

On page 3.8-6, the fourth bullet is revised as follows:

Declining Sierra snowpack levels, ~~which account for approximately half of the surface water storage in California, by 70 percent to as much as 90 percent over the next 100 years~~ the mean snow water equivalent declines to less than two-thirds of its historical average by 2050 and decline by less than half of the historical medium by 2100.

On page 3.8-6, footnote 10 is revised as follows:

California's Office of Planning and Research. 2019. *California's Fourth Climate Change Assessment*. Available online at: <https://www.energy.ca.gov/sites/default/files/2019-07/Statewide%20Reports-%20SUM-CCCA4-2018-013%20Statewide%20Summary%20Report.pdf>, accessed February 18, 2020. ~~California Environmental Protection Agency, Climate Action Team. 2006. *Climate Action Team Report to Governor Schwarzenegger and the Legislature.*~~

On page 3.8-8, the last sentence in the first paragraph is revised to replace "from" with "by."

On page 3.8-8, the first full paragraph is revised as follows:

Though no single wildfire can be attributed solely to climate change, evidence shows that the increase in average temperatures statewide is creating conditions more prone to wildfires. Over the past five decades, fire occurring during dry Santa Ana wind conditions and non-Santa Ana wind conditions spread three times faster, occurred closer to urban areas, and burned in areas with greater housing values. Non-Santa ana condition fires were more sensitive to age-dependent fuels, often occurred in higher elevation forests, and last for extended periods of time. The area burned in non-Santa Ana condition and Santa Ana condition fires is anticipated to increase by 77% and 64% by the mid-21st century, respectively.²² Southern California has warmed about three degrees Fahrenheit in the last

century, and every additional increment of warming speeds up evaporation, dries out soil and vegetation, and increases the amount of fuel available for a wildfire.²³

On page 3.8-8, the second full paragraph is revised as follows:

As temperatures warm and GHG concentrations increase, more carbon dioxide dissolves in the ocean, making it more acidic. More acidic ocean water affects a wide variety of marine species, including species that people rely on for food.²⁵ Additionally, climate change is resulting in the alteration of marine habitats that may result in shifts in species distribution from lower to higher latitudes, shifts from near-surface to deeper waters, declines in calcifying species, and increases in the abundance of warm-water species. Local adaption may also occur, however environmental changes might presently occur faster than species with long generation times are able to adopt, while organisms with short generation times, such as microbes, are better suited to keep pace with environmental changes.²⁶

On page 3.8-9, the first paragraph is revised as follows:

These extreme precipitation events, together with the rising snowline, often cause devastating floods in major river basins (e.g., California's Russian River). According to the *Santa Ana Watershed Basin Study*, climate change may result in increased flash flooding and inland flooding, increased coastal flooding, inundation of coastal community storm drains, and damage to coastal community sewer system from sea level rise. Sea level rise in Southern California is expected to rise by 1.5 to 12 inches by 2030, 5 to 24 inches by 2050, and 16 to 66 inches by 2100 thereby making the coastal areas more vulnerable to flooding.²⁸ Looking ahead, the frequency and severity of atmospheric rivers on the U.S. West Coast will increase due to higher atmospheric water vapor that occurs with rising temperatures, leading to more frequent flooding.^{29, 30}

On page 3.8-11, under Table 3.8-2, the following paragraph was included:

Table 3.8-2 represents the annual GHG emissions produced by each country. However, looking at the cumulative CO₂ emissions emitted from each of these countries from 1850 to 2011 demonstrates that the United States has emitted approximately 27% of the world's total GHG emissions emitted. The European Union has emitted approximately 25% followed by China which has emitted approximately 11% of the world's total GHG emissions. Russia, India, and Indonesia have emitted 8%, 3%, and 1%, respectively. Therefore, while China emitted approximately twice as many emissions as the United States in 2014, the United States that cumulatively emitted over twice as much as China from 1850 to 2011.⁴³

On page 3.8-14, the following additions were added to the first paragraph under subsection “SCAG Region”:

Transportation emissions accounted for approximately 38 percent of total emissions in the SCAG region, compared to 26 percent of total emissions in the United States in 2008.⁵⁴ According to CARB, statewide emissions from transportation sources were relatively constant from 2002 to 2007, declined through 2013, then increased by 9.0 MMT CO₂e (or 6 percent) from 2013 to 2017. Emissions from gasoline used in on-road vehicles are the main driver of that increase. It is expected that the SCAG region followed similar trends.

On page 3.8-16, the “Public Health” section was revised as follows:

As a result of extreme heat days there may be longer and more severe droughts. Extreme heat can lead to excessive drying of soil and vegetation as well as melting of California’s Sierra snowpack. During the next few decades, the projected average temperature is expected to risk between 1°F and 2.3°F in California. Imperial County’s historical average temperature is approximately 73.4°F. By 2099, Imperial County is expected to have an average temperature increase of 3.4°F to 6.4°F. Los Angeles County’s historical average temperature is approximately 65.2°F. By 2099, Los Angeles County is expected to have an average temperature increase of 3.6°F to 6.1°F. Orange County’s historical average temperature is approximately 61.3°F. By 2099, Orange County is expected to have an average temperature increase similar to Los Angeles County of 3.6°F to 6.1°F. Riverside County’s historical average temperature is approximately 63.5°F. By 2099, Riverside County is expected to have an average temperature increase of 3.7°F to 6.5°F. San Bernardino County has a historical average temperature of 64.3°F and by 2099 the average temperature will increase by 3.8°F to 6.7°F. Finally, Ventura County has a historical average temperature of 60.0°F. By 2099, Ventura County’s average temperature will increase by 3.6°F to 6.0°F, like Los Angeles and Orange Counties. San Bernardino County is expected to see the greatest increase in average temperature; however, Imperial County will remain the warmest County in the SCAG region.⁵⁸

Climate change can also lead to sea level rise. Orange County has the greatest risk for inundation within the SCAG region, with 3.6 percent of the population in an inundation zone. Los Angeles and Ventura Counties have 1.6% and 0.17%, respectively, of their county population living within inundation zones. Sea level rise can lead to flooding in these areas and can create important health consequences such as contaminating drinking water or respiratory issues from mold in flood-damaged homes.

Finally, climate change can lead to food insecurity. Climate change is expected to have global impacts on food production and distribution systems. These changes can cause an increase in food prices, making food less affordable and increases food insecurity, obesity, and malnutrition is economically constrained

households.

While all Californians are vulnerable to the health impacts of climate change, certain groups are more susceptible to extreme heat and weather events such as the young and the elderly. Additionally, those with chronic medical conditions, psychiatric illness, people taking multiple medications, people without means of evacuation (such as no access to private or public transportation, medically fragile people, and people living in institutions may be more susceptible to climate change. The size of vulnerable populations in California expected to increase in the coming decades, for example, the share of individuals ages 65 or older within the state will increase from 13 percent in 2010 to 19 percent in 2050.⁵⁹

The second bullet on page 3.8-16 is revised to replace the word “low” with “no.”

On page 3.8-17, the following bullet was added:

- Transitioning from use of flurochlorines in industry

On page 3.8-17, the following bullets were added to the list of climate adaptation solutions:

- Incorporate climate considerations in emergency planning efforts at all levels
- Enhance preparedness and coordination to address climate change impacts and inform emergency management policy
- Support and coordinate adaptation efforts across jurisdictions and policy areas to maximize community resilience
- Increase climate resiliency in low-income and disadvantaged communities
- Increase restoration and enhancement activities to increase climate resiliency of natural and working lands
- Prepare California for flooding
- Support regional groundwater management for drought resiliency
- Improve water storage capacity
- Protect and restore water resources for important ecosystems
- Require closer collaboration and coordination of land use and water planning activities to ensure

sustainable development

- Continue to assess community and ecosystem vulnerability to climate impacts
- Promote “cool streets” and parking lots
- Advance water management and energy efficiency in agricultural operations
- Improve transportation system resiliency
- Improve public health preparedness and emergency response

On page 3.8-17, the following sentence is revised as follows:

These actions take the form of climate action plans, general plan policies, Local Hazard Mitigation Plan (LHMPs), GHG reduction plans, sustainability plans, and ordinances.

On page 3.8-35, the following additions were made to the state regulatory framework:

Senate Bill 379

SB 379 (Jackson) was signed into law by Governor Jerry Brown on October 8, 2015 and requires the safety element of a city or county’s general plan to be reviewed and updated as necessary to address climate adaptation and resiliency strategies applicable to that city or county. The update is required to include a set of goals, policies, and objectives based on a vulnerability assessment, identifying the risks that climate change poses to the local jurisdiction and the geographic areas at risk from climate change impacts.¹²³

Senate Bill 1000

SB 1000 (Leyva) was signed into law by Governor Jerry Brown on September 24, 2016 and requires planning agencies to review and revise the safety element of general plans in order to address flooding and fires. Additionally, the bill would add to the required elements of the general plan an environmental justice element, or related goals, policies, and objectives integrated in other elements, that identified disadvantages communities, as defined, within the area covered by the general plan of the city, county, or both should there be a disadvantaged community within its jurisdiction. The bill would require the general plan to identify objectives and policies to reduce the unique or compounded health risks in disadvantaged communities, such as, identify objectives and policies to promote civil engagement and identify objectives and policies that prioritize improvements and programs that address the needs of disadvantaged communities.¹²⁴

Senate Bill 1035

SB 1035 (Jackson) was signed into law by Governor Jerry Brown on September 23, 2018 and requires the safety element of a general plan to be reviewed and revised as necessary to address climate adaption and resiliency strategies and would require, after these revisions, the planning agency to review and, if necessary, revise the safety element upon each revision of the housing element or local hazard mitigation plan, but not less than once every 8 years, to identify new information relating to flood and fire hazards and climate adaptation and resiliency strategies applicable to the city or county that was not available during the previous revision of the safety element.¹²⁵

On page 3.8-37, the following additions were made to the state regulatory framework:

Executive Order B-55-18

On September 10, 2018, Governor Brown issued Executive Order B-55-18 to establish a target of carbon neutrality in California by 2045, and to achieve and maintain net negative greenhouse gas emissions thereafter. The EO calls on CARB to address this goal in future Scoping Plans, which affect other major sectors of California’s economy, including transportation, agriculture, development, industrial, and others.

On page 3.8-40, the following additions were made to the state regulatory framework:

Emergency Response Plan / Emergency Evacuation Plan

California updated its State of California Multi-Hazard Mitigation Plan in 2018.¹¹ The state is required to adopt a federally approved State Multi-Hazard Mitigation Plan to be eligible for certain disaster assistance and mitigation funding. The State Multi-Hazard Mitigation Plan is an evaluation of the hazards California faces and the strategies, goals, and activities the state will pursue to address these hazards. It:

- Documents statewide hazard mitigation planning in California,
- Describes strategies and priorities for future mitigation activities,
- Facilitates the integration of local and tribal hazard mitigation planning activities into statewide efforts, and

¹¹ California Governor’s Office of Emergency Services. 2019. State Hazard Mitigation Plan. Available online at: <https://www.caloes.ca.gov/cal-oes-divisions/hazard-mitigation/hazard-mitigation-planning/state-hazard-mitigation-plan>, accessed July 29, 2019.

- Meets state and federal statutory and regulatory requirements.

All six SCAG counties and a number of cities within the SCAG region have completed LHMPs, although Ventura County is currently in the process of updating its documents. California Emergency Management Agency (Cal EMA) dictates that these plans must be updated every three years.¹³⁸ See Section 3.20, Wildlife, for an additional discussion of emergency response plans and emergency evacuation plans.

The following text is added to the end of the paragraph under the subheading Ventura County on page 3.8-49:

The County of Ventura is currently developing a Climate Action Plan (CAP) that is being integrated into its General Plan Update 2020-2040. It also contains General Plan Implementation Measures for GHG-reductions and General Plan Policies related to climate change. The Draft EIR for the CAP was publicly released on January 13, 2020. The General Plan Update contains General Plan Implementation Measures for GHG-reductions and General Plan Policies related to climate change.

On page 3.8-50, the following additions were made to the regional and local regulatory framework:

COG Climate Action/Climate Adaptation Plans

Councils of Governments (COGs) are regional agencies that can undertake any action in which their member cities and counties share in common. Although many COGs are formed to focus on transportation planning and programming, some COGs have been tasked by their local governments to address regional issues such as climate change. The South Bay Cities COG (SBCCOG) prepared their *Sub-Regional Climate Adaption Plan* on September 13, 2019 which will allow cities to assess and mitigate the extent to which climate change will negatively impact South Bay communities. The Climate Adaption Plan includes a Vulnerability Assessment for the sub-region and selected adaptation strategies designed to support cities in mitigating their climate risk through education, training, planning, and outreach.¹⁶⁵

On page 3.8-52, Table 3.8-4, California Jurisdictions Addressing Climate Change in the SCAG Region (2019), the line for City of Lakewood is changed to remove the second A.

Page 3.8-58, Table 3.8-4 California Jurisdictions Addressing Climate Change in the SCAG Region (2019), the line for Ventura County in the column for Climate Action Plan is changed from “A” (adopted) to “IP” (in progress).

Page 3.8-58, Table 3.8-4 the line for City of Indio is updated as follows: GHG Reduction Plan changed from “IP” to “A”, Climate Action Plan changed from “IP” to “A”, and General Plan Policy changed from “IP” to “A”.

On the last paragraph on page 3.8-63, the text is revised as follows to reflect the final numbers in the Connect SoCal Plan:

In order to assess the impacts of direct emissions as a result of Connect SoCal, the transportation emissions from on-road (light and medium duty vehicles, heavy duty vehicles, and buses) and other sources transportation (rail, aviation, and ocean-going vessels) were evaluated in **Table 3.8-5, Greenhouse Gas Emissions from All On-Road Vehicles in the SCAG Region**, and **Table 3.8-6, Greenhouse Gas Emissions from Other Transportation Sources in the SCAG Region**. **Table 3.8-7, Greenhouse Gas Emissions from All On-Road Vehicles and Other Transportation Sources in the SCAG Region**, provides a summary of **Tables 3.8-5 and 3.8-6** to demonstrate that the SCAG region will decrease mobile-source GHG emissions by approximately ~~12~~ 13 percent from 2019 to 2045.

On page 3.8-72, an additional item is added to Mitigation Measure PMM-GHG-1:

k) Consult the SCAG Environmental Justice Toolbox for potential measures to address impacts to low-income and/or minority communities. The measures provided above are also intended to be applied in low income and minority communities as applicable and feasible.

Land Use and Planning

The term “Livable Corridors” is defined after “Land Use Element” and before “Natural Lands” on page 3.11-2.

Livable Corridors: Livable corridors are arterial roadways where jurisdictions may plan for a combination of the following elements: high-quality bus frequency; higher density residential and employment at key intersections; and increased active transportation through dedicated bikeways.

The term “Neighborhood Mobility Areas” is defined after “Livable Corridors” on page 3.11-2.

Neighborhood Mobility Areas (NMAs): Neighborhood Mobility Areas are intended to provide sustainable transportation options for residents of the region who lack convenient access to high-frequency transit but make many short trips within their urban neighborhoods. NMAs are conducive to active transportation and include a “Complete Streets” approach to roadway improvements to encourage replacing single- and multi-occupant automobile use with biking, walking, skateboarding, neighborhood

electric vehicles and senior mobility devices.

On page 3.11-3, the definition for “Regional Housing Needs Assessment” is revised as follows:

Regional Housing Needs Assessment (RHNA): ~~Regional Housing Needs Assessment~~ ~~Quantifies~~ ~~Statutorily mandated state program that quantifies~~ the need for housing within each jurisdiction of the SCAG region based on population, household and employment growth projections. Jurisdictions ~~Communities~~ then address this need through the process of updating ~~completing~~ the housing elements of their General Plans.

The term “Urban Infill” is defined after “Urban Areas” and before “Vacant Land” on page 3.11-4.

Urban Infill: Urban Infill refers to building within unused and underutilized lands within existing development patterns in existing urban areas.

On the bottom of page 3.11-5, the following sentence is revised as follows:

Military lands are included in a separate category and include, but are not limited to, Barstow Marine Corps Logistics Base, Edwards Air Force Base, El Centro Naval Air Facility, Fort Irwin, Joint Forces Training Base-Los Alamitos, Los Angeles Air Force Base, March Air Reserve Base, Naval Warfare Assessment Station Corona, Naval Weapons Station Seal Beach, Point Mugu Naval Air Weapons Station, Twentynine Palms Marine Corps Combat Center, and Chocolate Mountains Aerial Gunnery Range.

In the first paragraph on page 3.11-12, the following sentence is removed for inaccuracy:

~~City and county general plans must be consistent with each other.~~

The fourth full paragraph on page 3.11-15 is revised as follows:

Multi-Family Residential (Attached units)

The term “multi-family units” is used to describe those housing units that are attached residences. This includes apartments, condominiums, and townhouses, even if townhomes are typically categorized as single-family units.

In the first paragraph on page 3.11-20, the sentence below is revised as follows:

In yet other instances, lands may be designated or zoned as open space or as agriculture but still allow for development of a single-family home.

In Table 3.11-4 on page 3.11-21, the number of acres of San Manuel tribal lands is revised as follows:

San Manuel	San Bernardino	1,124,673
------------	----------------	-----------

In the final paragraph on page 3.11-22, the sentence below is revised to describe how far inland is considered to be in the coastal zone:

Each local jurisdictional authority (city or county) with lands within the coastal zone (extending inland generally 1,000 yards from the mean high tide line of the sea) is required to develop, and comply with, a coastal management plan.

On page 3.11-32, a clarification is added to the following sentence:

The purpose of the housing element is to identify the community’s housing needs, as determined by the RHNA process, state the community’s goals and objectives with regard to housing production, rehabilitation, and conservation to meet those needs.

On page 3.11-38 reference to the following report is added to the regulatory framework:

South Coast AQMD Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning

The Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning provides suggested policies that local governments can use in their General Plans or through local planning to prevent or reduce potential air pollution impacts and protect public health. The objective of the guidance document is to facilitate stronger collaboration between local governments and the South Coast AQMD to reduce community exposure to source-specific and cumulative air pollution impacts.

On page 3.11-43, under Impact LU-2, the sentence below is modified as follows:

Land use strategies included in the Plan aim to redistribute ~~focus~~ most of the new housing and job growth in high-quality transit areas... Land use strategies also seek to concentrate ~~focus~~ growth in other PGAs such as job centers and neighborhood mobility areas (NMAs) to maximize existing infrastructure and encourage infill development.

On page 3.11-45, the following sentence is clarified to define the term “smaller individual numbers.”

For example, while the Plan includes strategies for compact development and higher densities as a means to accommodate increased population in an efficient manner, many jurisdictions are planning for smaller populations individual numbers and may assume lower smaller densities.

On page 3.11-45, the following sentence is as follows:

It is possible that local general plans have not been updated to reflect the land use assumptions within the Plan, because jurisdictions do not have to change their general plans to be consistent with the SCS. ~~despite SCAG’s outreach and bottom up planning process for the reasons stated above.~~ As a result, there exists the potential for SCAG’s projected land use pattern to conflict with a local general plan ~~to conflict with SCAG’s projected land use pattern.~~

Noise

On page 3.13-39, the following is added to PMM NOISE-1:

y. Consult the SCAG Environmental Justice Toolbox for potential measures to address impacts to low-income and/or minority communities.

Population and Housing

On page 3.14-1, an addendum is added to the definition of “household” as follows:

A person living alone in a housing unit, or a group of unrelated people sharing a housing unit such as partners or roomers, is also counted as a household. There is no more than one household per housing unit.

On page 3.14-1, the following is added to the definition of “housing.”

Housing data presented herein represents the most recent, reliable, and representative data to describe current regional conditions at the time of publication of the NOP for the PEIR, January 23, 2019. In most instances, the most recent available data was for 2018 or 2019. For population, land use and related modeling analyses (air quality, transportation and noise), base year information is collected every four years as part of the Plan. The base year for the Plan is 2016. For purposes of the PEIR, 2019 data has been estimated based on an interpolation of 2016 to 2045 projections. Department of Finance is the source for housing data provided in this section.

On page 3.14-2, under the subheading “Population,” the American FactFinder is cited as footnote 1. Although the population data referenced in the sentence remains the same, the citation has been revised to 2018 to reflect the latest available population data:

¹ American FactFinder. ~~2018~~ ~~2017~~. 2018 ~~2017~~ *Population Estimates*. Available online at: <https://factfinder.census.gov/faces/nav/jsf/pages/index.xhtml>, accessed ~~February 6, 2020~~ January 29, 2018.

Sources for Table 3.14-1, Population Growth in the SCAG Region (2000-2019 for Incorporated Cities and Unincorporated Areas), on Page 3.14-3, have been updated:

¹ ~~SCAG. 2016 Draft RTP.SCS. 3.14 Population, Housing, and Employment. Table 3.14.2-3 “Population Growth in the SCAG Region for 2000-2014.” Available online at: <http://scagrtpscsc.net/Pages/DRAFT2016PEIR.aspx>, accessed September 3, 2019. U.S. Census Bureau of Decennial Census 2010.~~
² ~~California Department of Finance (DOF). 2010. E-5 Population and Housing Estimates for Cities, Counties, and the State. January. Available online at: <http://www.dof.ca.gov/Forecasting/Demographics/Estimates/E-5/>, accessed August 30, 2019. U.S. Census Bureau of Decennial Census 2010.~~

On page 3.14-5, in Table 3.14-2 on page 3.14-4, the source for Number of Households in 2010 and 2019, respectively, is revised as follows:

Source: ~~SCAG. 2019. U.S. Census Bureau Decennial Census 2010 and SCAG 2019 (interpolation).~~

Language regarding household size on Page 3.14-4, 2nd Paragraph has been updated:

Household size in the SCAG region (Incorporated Cities) increased between 2000 and ~~2018-19~~, from ~~3.16~~ 3.01 persons per household to ~~3.2~~ 3.09 persons per household, or an increase of the equivalent of an average of ~~0.04~~ 0.08 persons per household

On page 3.14-4, the first complete sentence on the page is revised as follows:

At a fundamental level, there is simply not enough housing for everyone who wants to live in the state in the type of housing unit they can afford in the jurisdiction they prefer.

Sources and data for Table 3.14-3, Households Size in the SCAG Region (persons) on Page 3.14-5 have been updated:

**Table 3.14-3
Household Size in the SCAG Region (Persons)**

County	2000¹	2018²	2000–2018 Change
Imperial	3.42 <u>3.33</u>	3.6 <u>3.54</u>	0.18 <u>0.21</u>

On page 3.14-8, the last paragraph of the page is updated as follows:

Growth Forecasts

In order to develop growth forecasts, SCAG encourages and utilizes the participation and cooperation of all local government partners within the SCAG region. SCAG uses a bottom-up planning process by which all local governments are informed of the Connect SoCal planning process and have clear and

adequate opportunities to provide input. Growth forecasts and land use updates for development under the Plan have been developed through this bottom-up local input process, reflecting the following guiding principles ~~approved by SCAG's Regional Council on August 1, 2019.~~

SCAG's Guiding Principles on Page 3.14-9 have been revised:

~~Principle #1: The draft plan forecast for Connect SoCal shall be adopted by the Regional Council at the jurisdictional level, thus directly reflecting the employment, population and household growth projections derived from local input and previously reviewed and approved by SCAG's local jurisdictions. The draft plan growth forecast maintains these projected jurisdictional growth totals, meaning further growth is not reallocated from one local jurisdiction to another. Connect SoCal will be adopted at the jurisdictional level, and directly reflects the population, household and employment growth projects that have been reviewed and refined with feedback from local jurisdictions through SCAG's Bottom-Up Local Input and Envisioning Process. The growth forecast maintains these locally-informed projected jurisdictional growth totals, meaning future growth is not reallocated from one local jurisdiction to another.~~

~~Principle #2: The draft plan forecast at the Transportation Analysis Zone (TAZ) level is controlled to be within the density ranges of local general plans or input received from local jurisdictional in this most recent round of review. Connect SoCal's growth forecast at the Transportation Analysis Zone (TAZ) level is controlled to not exceed the maximum density of local general plans as conveyed by jurisdictions, except in the case of existing entitlements and development agreements.~~

~~Principle #3: For the purpose of determining consistency for California Environmental Quality Act (CEQA) streamlining, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the Plan. For the purpose of determining consistency with Connect SoCal for California Environmental Quality Act (CEQA), grants or other opportunities, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency; SCAG may also evaluate consistency for grants and other resource opportunities; consistency should be evaluated utilizing the goals and policies of Connect SoCal and it's associated Program Environmental Impact Report (PEIR).~~

~~Principle #4: TAZ level data or any data at a geography smaller than the jurisdiction is included in the draft plan forecast only to conduct the required modeling analytical work and is therefore, only advisory and non-binding as SCAG's sub-jurisdictional forecasts are not formally adopted as part of the Plan. TAZ level data or any data at a geography small than the jurisdictional level has been utilized to conduct required modeling analysis and is therefore advisory only and non-binding, given that sub-jurisdictional~~

forecasts are not adopted as part of Connect SoCal. TAZ level data may be used by jurisdictions in local planning as they seem appropriate. There is no obligation by a jurisdiction to change its land use policies, General Plan, or regulations to be consistent with Connect SoCal.

Principle #5: SCAG will maintain communication with agencies that use SCAG's sub-jurisdictional level data to ensure that the "advisory and non-binding" nature of the data is appropriately maintained.

Page 3.14-14 in the last full paragraph on the page, the text is updated as follows:

As discussed above in the discussion of SB 375, state law requires preparation of a RHNA allocation plan every eight years. SCAG's 6th Cycle RHNA quantifies the regional need for housing and then allocates the regional need to each jurisdiction for a planning period between October 2021 and October 2029. Local jurisdictions are required to plan and zone to accommodate their respective RHNA allocation (housing units) by income categories through the process of updating the Housing Elements of their General Plans. ~~The RHNA does not necessarily encourage or promote growth, but rather allows communities to anticipate growth and address existing need, so that they can grow in ways that enhance quality of life, improve access to jobs, transportation and housing, and not adversely impact the environment.~~¹²

In the last paragraph of page 3.14-20, the sentence below is revised as follows:

SCAG holds growth projection numbers constant at the jurisdiction, county and regional level, meaning that as the distribution of population, housing and employment changes, the total numbers remain constant.

In the last paragraph on page 3.14-23, the sentence below is revised as follows:

Specifically, improved accessibility and connectivity potentially gained from transportation investments in the Plan could facilitate population and economic growth in areas of the region that are currently not developed or are underdeveloped and in areas not currently planned for the type of density the Plan proposes.

¹² SCAG. *Regional Housing Needs Assessment (RHNA) & Housing*. Available online at: <https://www.scag.ca.gov/programs/Pages/Housing.aspx>, accessed August 29, 2019.

In the second paragraph on page 3.14-27, the sentence below is revised as follows:

Supported by other public amenities and transit services, housing in these areas tends to cost more ~~command higher premiums~~ and may be attractive to more affluent residents and unaffordable for ~~to~~ current residents in these areas.

Parks and Recreation

On page 3.16-9, discussion of the parkland to resident ratio is revised as follows:

~~The Los Angeles County General Plan has established a standard of 4 acres of local parkland per 1,000 residents in the unincorporated areas and 6 acres of regional parkland per 1,000 residents of the total population in Los Angeles County. According to the General Plan (2015), the County has a substantial deficit in local parkland, providing approximately 0.6 acres of local parkland per 1,000 unincorporated residents but 7.02 acres of regional parkland per 1,000 residents (total), which is above the regional standard. According to the Los Angeles County Parks Needs Assessment (2016), there are 3.3 acres of local parkland per 1,000 residents, which is less than the 4.0 acres per 1,000 goal in the Los Angeles County General Plan. There are 86.2 acres of regional open space and natural areas per 1,000 people, which exceeds the goal of 6 acres of regional parkland per 1,000 in the Los Angeles County General Plan.~~

The first sentence on page 3.16-10 is corrected as follows:

Los Angeles County has 181 ~~177~~ County parks and 24 state parks, the most of any county in the SCAG region.

At the top of page 3.16-18, two new subsections are added as follows:

Los Angeles Countywide Parks and Recreation Needs Assessment

The Parks & Recreation Needs Assessment, adopted May 2016, documents existing parks and recreation facilities in cities and unincorporated communities and uses the data to determine the scope, scale, and location of park needs in Los Angeles County. The Parks & Recreation Needs Assessment also establishes new ways of understanding about parks, recreation, and open space by: considering parks as key infrastructure; using a new series of metrics to determine park needs; supporting a need-based allocation of funding for parks and recreation; and emphasizing community priorities and deferred maintenance projects. As part of the assessment, the Los Angeles County Department of Parks and Recreation collaborated with 86 cities.

Transit to Parks Strategic Plan

The Transit to Parks Strategic Plan by Metro presents a systematic vision for increasing access to parks and open space countywide. The goal is to find targeted, holistic ways to increase access to parks and open spaces, especially for communities of need. These communities, especially those that are not within walking distance or without convenient public transit to a park, are the focus of the Plan. Expanding access is a key priority for the region, as demonstrated in the Countywide Parks Needs Assessment, which highlights the lack of park and open space access in communities across the county, particularly for lower income, disadvantaged residents.

Transportation, Traffic and Safety

On page 3.17-55 footnote 75 is updated to remove the date from the link :

75 National Center for Sustainable Transportation. Induced Travel Calculator. Accessed at <https://blinktag.com/induced-travel-calculator/about.html>.

Tribal Cultural Resources

The following details regarding the tribal consultation process under AB 52 have been added to page 3.18-5:

On December 10, 2019, SCAG sent all parties on the NAHC list copies of the draft PEIR and the draft version of this technical report by mail. Two comments were received. The Santa Ynez Band of Chumash Indians Tribal Elders' Council replied in a letter dated December 27, 2019 and indicated that they requested no further consultation on the project; however, they requested that if supplementary literature reveals additional information, or if the scope of the work changes, they be notified. The San Manuel Band of Mission Indians responded in an email dated January 6, 2020 indicating that they had no concerns or comments regarding the project, but noted that the acreage of the San Manuel Reservation is actually 1,243.68 acres, not the 673 acres referenced from a Bureau of Indian Affairs source in the draft PEIR.

SCAG followed up with the five tribal parties who requested AB 52 consultation on the project via email on February 19, 2020 to confirm receipt of the December 2019 draft PEIR and technical report and to solicit input. A response was received from the San Manuel Band of Mission Indians, who referenced their January 2020 correspondence described above. The Gabrieleno Band of Mission Indians – Kizh Nation responded via email on March 3, 2020. The Fernandeno Tataviam Band of Mission Indians requested a consultation call to discuss their comments. The consultation conference call was held on

March 4, 2020. Jairo Avila of the Fernandeño Tataviam Band of Mission Indians relayed comments on the proposed mitigation measures for cultural and tribal cultural resources. A written comment letter detailing the comments was received on March 13, 2020. The mitigations measures were revised based on the input received from tribal parties. Follow up calls were placed to the Agua Caliente Band of Cahuilla Indians and the Jauneño Band of Mission Indians, Acjachemen Nation on March 3, 2020, but no additional comments were received. The results of the Native American outreach effort are further detailed in Appendix E. Copies of relevant correspondence are included in Confidential Appendix F.

On page 3.18-20 Mitigation Measure SMM TCR-1 is revised as follows:

SMM TCR-1: ~~Impacts to tribal cultural resources shall be minimized through cooperation, information sharing, and SCAG's ongoing regional planning efforts such as web-based planning tools for local governments including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts and sharing of associated online Training materials.~~ SCAG shall consult with the Native American Heritage Commission, as well as Native American tribes, to identify opportunities for early and effective consultation to identify tribal cultural resources to avoid such resources wherever practicable and feasible and reduce or mitigate for conflicts in compatible land use to the maximum extent practicable.

Utilities and Service Systems

Page 3.19.1-1, Table 3.19.1-1 is revised to correct the tonnage in Ventura County to be 1,904,702 (rather than 1,908,462).

SMM USWS on page 3.19.3-20 has been revised:

SMM USWS-1: SCAG shall coordinate with local agencies as part of SCAG's Sustainability Program regarding the implementation of Urban Greening, Greenbelts and Community Separator land use strategies. Primary features of land use strategies address the following:

- Increased trail and greenway connectivity;
- Improved water quality, groundwater recharge and watershed health;
- Strategies for stormwater and rainwater collection, infiltration, treatment and

release

- Reduce urban runoff;
- Expand the urban forest;
- Provision of wildlife habitat and increased biodiversity;
- Expand recreation opportunities and beautification;
- Preserving agrarian economies;
- Restore severed wildlife corridors.

Glossary

The following change is made to page 7.0-1 of the PEIR:

The following terms are used in the PEIR:

Development Center – are centralized developments such as town centers, or urban centers

Urban infill - is defined as new development that is sited on vacant or undeveloped land within an existing community, and that is enclosed by other types of development.

Compact/walkable communities – communities with high urban density with mixed land uses

Large lot single family homes – varies among zoning for each specific community and can range from 5,000 square foot lots and up.

Small lot single family homes - Typically, small lot developments involve multiple-level, townhome-style single family homes with little or no back yards and minimal setback from the property boundaries

ROW - Right of Way

PEIR Appendix

Appendix 3.5, Cultural Resources Technical Appendix, is replaced in its entirety.

Page 12 and page 15 of Appendix 3.13, Aviation Noise Technical report, is revised as follows:

There ~~is~~ are residential land uses interspersed among the commercial uses with single-family and multifamily land uses. ~~.25 miles south west~~ of the runway. ~~and~~ There are also residential land uses (single family and multi-family) ~~beyond the commercial land uses~~ approximately .75 miles to the north, .5 miles to the west, and one mile to the east. ~~and approximately .25 miles to the south~~. Figure 6, John Wayne Airport Location, illustrates the airport relationship to these land uses.
